THE PRESIDENT'S VETO.

TERR will be but one opinion in Europe as to the line good sense and courage which has been displayed by he Exsister of the United States in placing his voto on he Bill forthe inormse of the paper currency. The measure was in itself mischievous, as it to a certain extent tended the line good sense, and consequently to affect the conditions the good sense was in itself with the conditions which we would have involved a gain to every debtor and have involved a gain to every debtor. money would have involved a gain to every debtor and a corresponding loss to every creditor; but the greatest damage would in the first instance have fallen on the nation itself, in the form of a disparagement of its credit. The vicious psinciple of degreciating the currency admitted of indefinite extension. The classes which have lately raised s clamour for additional money would again and again have demanded, on precisely the same grounds, another boon of the same kind. It is probable that the rapid growth of population and trade would after no long interval have shorted the proposed increase, so that the premium on gold would again have fallen to its recent level. When the circumstances which supplied the pretext for the present agitation recurred, the adjugates of expansion would have been enabled to cito the procedent of 1874. The crops require to be moved every year; and the farmers who produce them advance more rapidly in political power than in scenomic knowledge. Among the numerous delusions which the wait in the Western States, and which found expansions the helical that the additional pression in Congress, was the belief that the additional paper money to be issued by the Pressury and by the banks could be appropriated to certain States or districts which were supposed to be most argently in need of pecuniary accompandation. If the Bill had come into operation, the were supposed to be most urgently in need of pecuniary specimendation. If the Bill had come into operation, the hopes of many of its promoters would have been disappointed by the irresistible tendency of money, as of other semandibles, to flow in the direction where it may be most profitably employed; but, the experience which is derived from complicated and obscure processes conveys little instruction to the popular mind. If, after the inflation of the currency, money had still been scarce in the West, the interventions would have been generally attributed to the instructions, would have been generally attributed to the instructions. Whereafter had voluntarily entered into an application of the Bostwarl's illegal reissue of the green-backs which had been withdrawn from circulation by Mr. Modelling. The argument was evidently the production of a valorate mind insufficiently furnished with special knowledge, and only resently familiar with the subject of the country wasty. Hany instances have been known of the attraction which financial questions exercise on intellects which, have previously been exercised only on military

previously been enercised only on military may be distingt whether General Grant ap-the bearings of the dispute on which he has migad whether around the has not of the dispute on which he has advagion, but there is every reason a firmed his judgment for himself.

RECHARDSON, was un-

It would be an payments at the earliest possible moment. obvious inference that a larger additional issue of greenbacks and bank notes tended to postpone resumption, and, if it were repeated, to perpetuate the evils of an irredeemable currency. The President may perhaps have been further enlightened by the failure of Mr. Richardson's absurd scheme of a large increase of the circulation of absurd scheme of a large increase of the circulation of silver. No economic subtlety is required to discern the truth that the specie currency will be easily restored as soon as the notes in circulation approach to their nominal value. In his Message the President broached some questionable theories on the advantage which was to accure to the United States Treasury from the production of precious metals in California. Gold, whether it is produced at home or abroad, must be bought when it is wanted; but if some fallacies have impaired the economic orthodoxy of the President mode, of represident the President's mode of reasoning, he has nevertheless decided rightly on the main issue.

It was correctly anticipated that the PRESIDENT'S veto would be sustained, inasmuch as it would be impossible to procure a majority of two-thirds for the Bill in the Senate, and probably in the House of Representatives. In Mr. Andrew Johnson's time the extreme unpopularity of the President created a prejudice against every political decision which he announced; but General Geant is still highly popular with the Republican party, and more especially with the majority in Congress. General Butler's success in carrying the inflation Bill through the House was probably facilitated by the erronous assumption that on financial as on political questions he expressed the PRESIDENT'S opinions and wishes. The check interposed by the veto has given members of both branches of the Legislature an opportunity of reconsidering their recent vote. The unanimous opinion of every theoretical and practical economist in the United States will derive fresh weight from the official support which the President has for the first time afforded to sound principles of currency. Timid politicians who are in the habit of conforming to every delusion which they believe to be popular will now perceive the possibility of resistance. The Republican party will be compelled to remain neutral, because it cannot afford, after the many rude shocks which have been given to its credit, to repudiate the Persident as its most conspicuous ornament. It may even occur to party managers that plausible professions of public and private honesty might not be wholly useless at future elections. There are many indications of a tendency on the part of the people at large to rebel against the unscrupulous domination of General Butler and his associates. The candidate whem Butler opposed has lately been elected Governor of Massachusetts; and in American politics the tide is wont to turn rapidly. The veto on the Currency Bill will deprive General BUTLER of one of his main resources, by proving that the Presument is not absolutely under his control. If places are no longer at General Butler's disposel, his influence will be largely cartailed.

The extraordinary power which has just been exercised was deliberately, and perhaps wisely, entrusted by the founders of the Constitutions to the PRESIDERY. The veto counters of the Constitutions to the Personer. The veto constitutes the only immediate connexion between the linecultive authority and the Legislature. Checks on the alpase of power are nowhere more increasely than in demogradise, and in the United States the most elaborate impairments, are provided against hasty decisions. The General Manual hise profile opinion is strong and

r can only cause a short delay by the exercise

It is not to be regretted that a numerical pority even of both branches of Congress should be prevented from passing a measure which is condemned by all competent and independent authorities. There is indeed no reasonable presumption that a President chosen for his personal eminence in another branch of the public service will be more capable than the Senate or the House of Representatives of deciding a financial question on sound principles. In this case the Phesiderr happens to be in the right, and he might possibly at other times have the opportunity of preventing more flagrant scandals than a dilution of the currency. Not many years have passed since the House of Representatives, then as now under the baneful influence of General BUTLER, passed by overwhelming majorities resolutions for the partial repudiation of the National Debt. It is true that the danger and disgrace were averted by the interposition of the Senate, and that the President of the day was an advocate of the wildest projects of spoliation; but experience shows that it is well to have a complex security against rash and unprincipled legislation. The credit of the United States will be sensibly improved by the action of the PRESIDENT, who will have determined the fiscal policy of the country at large till the end of the present Session of Congress. Refere schemes of inflation are again introduced, instructed opinion will perhaps have time to provail over popular clamour. The advantages of honesty and the convenience of specie currency cannot but approve themselves to the judgment of the best part of the community.

ELECTION PETITIONS.

THERE was much violence, some intimidation, and A some treating and bribery at the last election; but, so far as the evidence on the various petitions as yet decided shows, there was not so much as in days before the Ballot Act. Lying, of course, there was to a wholly unprecedented extent; but then lying is a part of the machinery of the Act, which would be almost wholly inoperative unless it gave the honest liar a sense of British independence and security. Fortunately for him, scrutinies are very expensive and very uncertain in their result, or else he might drend detection after all. Possibly the history of the Petersfield scrutiny will make the process seem even less attractive to defeated candidates than it used to be. Formerly the agents for the two candidates knew that, if they showed that a vote was invalid, they clearly scored a point in the game, and one vote less was reckoned to the credit of their opponents. But now, after the voter has been shown not to have been entitled to vote, his vote is traced as the Act prescribes; and then it may be found, as was actually found more than once during the Petersfield inquiry, that the voter voted precisely the other way from that which had been supposed, and the adventurous agent has only succeeded in knocking off a vote from his own side. But the threat of a scrutiny may be used with very considerable effect in small constituencies, although there may be no real intention of having one. When every man is known, and strong pressure is put on voters personally by those who have in one way or another authority over them, the assumnce that the Ballot will give no protection, and that votes will be known sooner or later through a scrutiny, will carry with it some terrors to the ignorant and timid. Soon after the last general election the history of contest in a small constituency was related with great apparent fidelity in a letter to the Times, and the narrator asserted that the voters were freely plied with threats that the Ballot was not to be trusted, and that their votes would be known some day. Bribery was no doubt checked in a vory considerable degree by the Ballot, although it still survives in many constituencies as one of the traditions of the place. The sitting member for Wakefield has been displaced on account of the indiscretion of his agents in giving money; and the town seems to have been long accustomed to get money out of elections, and unwilling to give up the custom. The presiding to make the election generally had, without the distinct acts had been brought home to persons that agents, the sitting member was responsible.

had taken it. They treated it as a matter of course, and owned that they had been bribed without any sense of shame. The evil, however, had not extended far enough into the constituency to make it necessary for a special inquiry to be held, and a new writ was issued for Wakefield circulty the Judge's report was received. At Barasaple for was charged with having personally bride work, a charge which is exceedingly seldom made. It was made on the sole testimony of a retired policeman, who saw, as he swore, Mr. Cave drop two sovereigns into the hands of a voter under pretence of shaking hands withhim. The Judge decided that Mr. Cave was too intelligent to have committed himself by so very foolish an act in broad daylight, in a public place; and he remarked that the whole story probably grew out of the fervent fancy of the retired policeman, who, even in his leisure hours, remembered his ancient business, and was delighted to think that he could show how keen is the vision of a practiced detective.

The question who is an agent at elections is one that is always turning up under some new form, and Mr. Justice Grove, in delivering his judgment in the Wakefield case, said that it was essential that this question should never be answered judicially. If it was snoe laid down who is an agent, the ingenuity of election managem would get all the dangerous things done by persons who were just outside the definition. All that Mr. Justice George would say was, that the candidate was responsible generally for all those who, to his knowledge, carried on the purpose of promoting his election. This is a very wide pose of promoting his election. This is a very wide measure of responsibility, and in the case of the Strond Petition it was fatal to the two sitting candidates. There, a breakfast given on the morning of the election in a Congregational school, arranged by ladies and blessed by the countenance of the minister himself, was held enough to make void the return of the candidates for whom the ladies were innocently striving, and the heedless pastor was stimulating his flock. There could be modoubt that this minister was a person whom the candidates knew to be desirous to promote their election, and he prosecuted it without having a suspicion that he was doing wrong by taking part in getting up a breakfast for voters on their way to the poll. It was, however, principally the ladies of his congregation who did this act of disastrous kindness, and it was apparently the ladies who bore the expense. The treating was of the very mildest kind. No one had any notion that it was illegal, and the candidates themselves had never heard of it. That any voter was in the very smallest degree influenced by this chaste repast is altogether improbable. The British voter, when he lots his great soul be influenced by treating, is not the sort of person to let himself be corrupted for so poor an inducement as ten and toest early in the morning in a Congregational schoolroom. But it was held that the details must be left out of sight. The Judge held that the details must be left out of sight. The Judge forced himself to forget the ladies, the minister, the tea and toast, the rigid purity of the locality, and to attend only to the fact that batchesof persons, sometimes numbering twenty-five at once, had been provided with refreshments on the morning of the election by a person who, according to the canons of election law, was an agent of the candidates. But the Judges all agree in saying that the decision in one case must never be taken as a precedent. The Judge does not lay down any general propositions. He only decides what, in the case before him, shall be taken to have been agency and refreshment and treating. Unfortunately for the sitting members at Strond, one of their avowed agents, who was charged with direct bribery, had taken to flight when it was known that the petitioners were in carns nor was he the only person who had vanished in millis-guised fear of what the petition might neveral. There was something, therefore, in the history of the processity which the sitting members had been returned which would not bear investigation; and the perception of this probabily quickened Baron Branwell's acuteness when the community look at the story of the breakfast in its legal hight.

or get money out of elections, and make void an election, Windsor Yazzished an example of what little things may be up the custom. The presiding enther there had not been enough but striking of what a candidate may do and not retain bis sent. Mr. Chappens, the nitting member, will been for some years most diligently engaged in nursing the borough. He had begint a large amount of antique to the control of the

good as good men, and that, if the House Government is more that its men are good, it need not in the second into the measures they adopt. In this consider the ment had full confidence in Lord Normantics, and full confidence in Sir Grosce Campeter. The change of Ministry happily made no difference in this respect. Lord Salisbury's attitude towards the Vermey is the same as the Duke of Arcyll's. No proise can be greater or better deserved than Lord Salisbury's praise of Lord Northbrook in his speech on Friday week. "The resolution to maintain his own opinion between two adverses

"forces of criticism acting on him at the same time in a "capricious and fitful manner, and yes with extreme "violence; the resolution to adhere steadily to the views "he had formed upon thought and inquiry, and to carry "them out to a successful issue—these are the qualities "which make a great administrator and secure lasting and "never-failing fame"; and these are the qualities which the Secretary of State attributes to the Vigneor.

We have now the means of estimating the amount of difference between Lord Northbrook and Sir Grougs CAMPUELL, both on the question of prolabition of exports and on the nature and extent of the relief to be provided by the Government. As regards the first point, it appears that Sir GLORGE CAMPHALL'S appeal for prohibition was mainly founded on his belief that the requisite supplies of rice could be obtained in no other requisite supplies of rice could be obtained in no other way. On the 22nd of October he represented that, "in the "face of a general failure in Bengal, any supply that could "be derived from British Burmah... would go but a very "little way." Two months later he had seemingly abandoned this view. His letter of the 23rd of December rests the case for prohibition on the plea of superior simplicity... "After all that is being done," he says, "the food supply "of the country will be much loss than if the Government "had simply prohibited excepts and had unposted actions." " had simply probabited exports and had imported nothing." If for "much less" we read "about the same," this is probably an accurate statement of what has proved to be the fact. The policy of purchase as opposed to that of prohibition had, in Sir Giorda Campbell's opinion, the further disadvautage that it kept down prices, and so tended unduly to lessen the general food supply of the country This is the very disadvantage attributed by the Vickney to the opposite policy. It had been urged upon him that "the action of "the Government in prohibiting exports would have given "confidence to the country, and have had a great effect in "reducing prices," and in his Minute of the 30th of Janu-"reducing prices," and in his Minute of the 30th of January Lord Northmook argues that no interference of the Government could have been "more unwise than the "reduction of prices below their natural level at the begin-"ning of a period of scarcity," which "would have been "the effect which would probably have followed a prohibit ton of exports." It will be seen that Sir George Camputation of the standard of th BELL does not touch upon Lord Nouthercon's other objection to prohibition -that by lessening the inducement to grow in average years more food than is required to meet the home demand, it would lessen the natural and ordinary reserve of grain, and so "weaken the power of "the country to meet any future period of scarcity." In Sir George Campbell's letter of the 23rd of December there is another curious instance of the same argument being used by him and by Lord North-BROOK to establish opposite conclusions. "In all these BROOK to establish opposite conclusions. "In all these "matters," he says, "the action of the Government has an "effect quite disproportioned to the actual magnitude of "its operations. . . In the height of a famine the quantity of grain which Government could throw in, by " allaying panic and bringing out private stores, cases the "people and the country to a degree far beyond the actual food supplied." Lord NORTHBROOK makes this disproportionate effect of Governmental action a reason for keeping his imports strictly secret. In the height of a famine the knowledge that the Government is prepared to do a great deal may allay panic among the people, but in the beginning of a famine the knowledge that the Government is preparing to do a great deal may generate a panic among the traders. The keynote of Lord NORTHBROOK'S policy was his desire that this should not happen, and he thoroughly succeeded in impressing this desire on the Home Government. When the Date of When the Pales ABOYLL asked the House of Lands to consider which be the extent and energy of a private trade which foed for a population of seventy millions, mostly a livery from hand to mouth, and insisted that any missions. with this trade " might have led to a select

e all round presents of coal in winter. scense there happened to ople in their sodien distr d to bee fined, and he Afterwards, his own frank l in his own frank language, he continued the gifts, flood or no floed. He stated that he had originally bought the cottings because he was influenced by a hope that the cotting a might help him to become member for the borough. Within 1868 he found that several of his tenants had voted inst him, he owned that he did not like it. Immediately stion two or three men were turned out at once, and Mr. GARDNER could only say that there might have been other reasons why they were turned out besides the fact that they had voted against him. He would not own to having told a tenant that, if he became a member of the Conservative Working Men's Association, he would allow him to remain in his house; but he acknowledged, in reply to a question put to him by the Judge, that he could not hopestly deny that he was in such a frame of mind that such a remark might naturally have fallen from him. Mr. GARDNER had the power of preserving a most convenient haziness of mind. When he sent out the coal he was, he said, thinking of getting hold of voters, but it did not occur to him that he would influence them in that way. He believed kindness of feeling often produced support at an elections. He could not say he intended it should, but he boped that it would. This, no doubt, is exactly the state hoped that it would. This, no doubt, is exactly the state of intelligence in which a judicious man will strive to be who sets himself to nurse a borough; and Baron Branwell laid down that a man may nurse a borough, may give gifts in the liope of awakening a beneficial spirit of kindness towards him, and may turn out tenants or let them go on without paying, according to their political opinions, provided only that he stops his nursing so nicely and critically that it cannot be shown to have been going on in distinct connexion with the election when he is returned. Mr. GARDNLR's nursing scens to have got itself established so effectually soon after the election of 1868 that he had no occasion by distinct acts of continuance to bring it down to the eve of the election of this year. But Baron Bramwell enunciated a doctrine that must be full of comfort to those who may be afraid lest their nursing should be found to have been dangerously protracted. He held that the Ballot Act must be taken into account. The voter may now vote safely, and the future candidate cannot reckon on him. Those voters, therefore, who come under the operation of nursing must be taken to have been approached as mon who might just as likely as not disappoint their kind friend or watchful landlord, and as this must make the intentions of the nurser very vague, all he does must be regarded as done with very vague intentions One decision, however, is not to be taken as a precedent for another; and some day a case may arise in which very judicious nursing may be regarded with severity by a judge, and this peculiar theory as to the effect of the Ballot Act may be found to have been discarded as suddenly as it was invented.

LORD NORTHBROOK AND SIR GEORGE CAMPBELL

THE true relation between the Government of India and the Home Government was very well described by the Duke of Arctle on Friday week. The Home Government is a Government of Control—a Government which decides the policy to be pursued in India, but does not, and cannot to any good purpose, prescribe the particular measures by which that policy is to be carried out It is responsible for the choice in the first instance of the men whom it commissions to frame these particular measures, and for the continuance or withdrawal of its confidence in them; but it is not responsible—not, that is, immediately and directly responsible for particular acts of administration. It is conceivable, of course, that these acts of administration may be such conspicuous failures as to reflect decisive discredit either upon the policy of which they are the expression or upon the choice of administrators, and in this way the Home Government may indirectly become responsible for thems: But this is necessarily a responsibility after the event. The duty of the Home Government on the first news of any emergency in India is to decide what is to be desired who is to do it; the decision how it is to be decided who is to do it; the decision how it is to be desired a quite right when he says that no measures are so

"previous famines would have borne no comparison," he gave utterance to the dread which in the early months of the famine took precedence perhaps of all other causes of alarm in the Vicebox's mind. Here is a private trade which in ordinary years feeds seventy millions of people. In a year of famine it will only feed perhaps sixty-five millions, leaving the remaining five millions to be feed by the Government. But if the determination of the Government to feed these five millions becomes known too early, it will paralyse the private trade and leave so many more millions to be fed by the Government. We know of no answer to this reasoning, and Sir George Campell did not attempt to offer any.

This apprehension on the part of the Vicerov necessarily affected the policy adopted as regards the provision of relief. In a letter written on the 10th of November, Sir George Campbell pointed out that, if the object of the Government was to avert distress altogether, it was scarcely possible to begin relief soon enough, or to carry it far enough. "We must scatter relief houses broad-"cast, so as to have one for every group of villages, within "reach of every one's home. . . . To be on the safe "side, he would at once undertake very extensive measures "indeed; he would buy grain very largely wherever it is to "be had, procure and use every possible means of transport, "and prepare food depôts in almost every part" of the threatened districts. Sir George Campbell admits that these endeavours must be controlled and limited by considerations of Imperial finance. But it does not seem to have struck him that they ought also to be controlled and limited by considerations of the effect which the creation of such a vast apparatus at the first appearance of scarcity must have had both on the nest appearance of scarcity must have had both on the people and on the private traders. As regards the former, the result would probably have been to induce a general abandonment of work as unnecessary in presence of the munificent provision contemplated by the Government. As regards the latter, there would have been a corresponding abandonment of all efforts to meet the wants of a propolation which instead of having to be a first to be a first to be a first to the fi population which, instead of having to buy food for itself, relied upon having it furnished gratuitously. The native dealers would not have troubled themselves to calculate the precise percentage of the population which the Government was preparing to take off their hands. They would have retired submissively before the omnipotent agency which had supplanted them, and have either taken their stores to other districts or have themselves become pensioners of the Government. In both the points, therefore, on which Lord Νοκτηβρίος and Sir George CAMPBELL took different views, the former had the right on his side. It is to be regretted that there should have been any divergence of opinion between two such high authorities as the VICEROY and the Licutenant-Governor of BENGAL as to the policy by which the famine was to be met. But now that the reasons alleged on each side are before now that the reasons alleged on each side are before us, there is no room for doubt that, in supporting Lord NORTHBROOK rather than Sir George Campbell, the Home Government showed a sound appreciation of the dangers as well as the necessities of the situation.

MR. GLADSTONE ON THE DISSOLUTION.

THE controversy or one-sided discussion on the policy of the late dissolution of Parliament is, it may be hoped, finally closed. It is clear from Mr. Gladstonk's indignant justification of his conduct that he is conscious of having committed a grave mistake. His irritation may be attributed partly to the injustice of Mr. Smollett's attack, and in no small degree to the weakness of the case for the defence. A great orator and statesman less single-minded than Mr. Gladstone would not have failed to avenge himself on a troublesome and insignificant assailant by contemptuous silence or by tranquil sarcasm. Mr. Smollett's position would have been painfully ridiculous if he had been the only speaker, or if he had been merely followed by Mr. Whalley. A stickler for precedent and for historical accuracy who believes that the Peace of Amiens lasted till 1806 is not a formidable critic of political conduct. It is but just to admit that Mr. Smollett scarcely affected to be in earnest, and that Mr. Smollett scarcely affected to be in earnest, and that Mr. Smollett scarcely affected to be in earnest, and that Mr. Smollett scarcely affected to be in earnest, and that Mr. Smollett scarcely affected to be in earnest, and that Mr. Smollett scarcely affected to be in earnest, and that Mr. Smollett scarcely affected to be in earnest, and that Mr. Smollett scarcely affected to be in earnest, and that Mr. Smollett scarcely affected to be in earnest and that Mr. Smollett scarcely affected to be in earnest and that Mr. Smollett scarcely affected to be in earnest and that Mr. Smollett scarcely affected to be in earnest and that Mr. Smollett scarcely affected to be in earnest and that Mr. Smollett scarcely affected to be in earnest and that Mr. Smollett scarcely affected to be in earnest and that Mr. Smollett scarcely affected to be in earnest and that Mr.

phorical or indirect sense. It seems that the dissolution and its failure reminded Mr. Sholler of an "engineer hoist with his own peterd, of a plot which had "failed, of a trickster whose stratagem recoiled on himself," and perhaps of half-a-dozen other commonplace illustrations. If he called Mr. Gladstons a trickster, he must also have called him an engineer, and have pledged himself, the identity of the Greenwich address with the observation of the Greenwich address with the

The theory that Mr. GLADSTONE devised and executed a tortuous plot is not only untrue, but the reverse of the truth. It is perfectly clear that the dissolution resulted from a sudden impulse, which must have arisen after a deputation had been invited to Downing Street to "tinker "the British Constitution." Mr. GLADSTONE'S peculiarities. of intellect and temperament are not those of a conspirator. A tendency to believe profoundly in the convictions of the moment is scarcely compatible with far-reaching and subtle contrivances. There can be no doubt that the financial projects which occupied the most conspicuous place in the Greenwich proclamation also furnished the principal motive for a sudden political experiment. The occasional elections, resulting almost uniformly in defeats of the Government candidate, showed that the constituencies no longer felt the enthusiastic confidence in Mr. GLADSTONE which had prevailed at the beginning of his Administration. It seemed probable that the progress of reaction might be checked if the attention of the country were diverted to a brilliant scheme for the readjust-ment of taxes. The innovation of appealing to the country on a Budget, instead of submitting it to Parliament, admits of no excuse; but the opportunity of distributing an unprecedented surplus so as to revive the popularity of his Government imposed on the imagination of a Minister who is incapable of looking at the same time on both sides of a question. Mr. GLADSTONE confesses that he had, in common with the rest of the world, taken for granted that a Liberal majority would be returned to the next Parliament. He was therefore more auxious that his party should be decile and zealous than that it should be extraordinarily strong in numbers. In the previous Session there had been many indications of relaxed discipline, which in the matter of the Irish Universities Bill had assumed the form of open mutiny. A Ministerial majority fresh from the constituencies, and virtually pledged to Mr. GLADSTONS'S. election Budget, might have been trusted to follow his guidance. In a hasty moment, probably without consultation with any competent and independent adviser, he was guilty, not of a dark intrigue, but of an act of rash impatience. Many of his supporters, even though they were not, as Mr. WHALLEY erroneously fancies himself to have been, in prison, must have been annoyed at the disregard of their convenience which was shown in the hasty dissolution. Mr. GLADSTONE's argument that the interval between the dissolution and the elections is regulated by uniform practice was quite irrelevant to the charge. Nothing is easier than to give notice of an intended dissolution in sufficient time to allow of preparations for the contest.

One of Mr. GLADSTONE'S intellectual characteristics is a habit of first forming conclusions and then devising reasons by which they may be justified. When he was suddenly converted to the Ballot, he persuaded himself that he must previously have become convinced of the expediency of universal suffrage; and he then proceeded to prove by some recondite process of reasoning that secret voting was the natural result of a promiscuous franchise. In the same manner Mr. GLADSTONE in his recent apology informed the House of Commons that it had become necessary to dissolve Parliament because the Government meditated a Bill on local rating. Only the day before Mr. GLADSTONE expressed a qualified approval the STAFFORD NORTHCOME's proposal to contribute a million from the national revenue in aid of the rates. On Thursday nothing interfered with the candid consideration of a simple

short without objection from any quarter was proved to lave been absolutely installabilities on the part of their productions. It was, according to Mr. Glapstone, impossible that any relief should be afforded to interprete and their miletive liabilities among themselves were finally settled, and also until in elaborate and parties scheme of local government until in elaborate and parties scheme of local government until in elaborate and parties scheme of local government until in elaborate and parties scheme of local government undertaking it will undoubtedly probable that some difficulties might occur; and on some disputed points the Ministerial majority might perhaps have been impaired. The consequence might have been a dissolution in the middle of the Session, to the serious detriment of public business. If the excuse for the precipitate measure of January last is valid, it will equally apply to the most capricious repetition of the unsuccessful experiment. Fortunately, future Ministers, when they are tempted to risk their fortunes on the past of a die, will be warned by Mr. Gladstone's example, and will probably have forgotten the excuses which have been produced by an afterthought. Mr. Gladstone might have spared himself the trouble of explaining that he had not before him the alternative of resigning office in preference to the plan of dissolving Parliament. Although he has not yet forgiven Mr. DISRAELI for refusing to accept office a year ago, he apparently understands that a Minister with a majority of sixty can scarcely resign because he thinks it possible that some of his supporters may waver on disputed questions. In January there was no reason for a dissolution except the unfounded hope of strengthening the Government, and there was no reason, good or bad, for resignation.

The alarms which were caused by the rumour of Mr. GLADSTONE'S intention to retire from Parliamentary debate have been happily dissipated. In the short interval since the commencement of the Session he has delivered four or five elaborate speeches, extending over a longer time than has been occupied by all the Ministers together, if the special statements of the heads of department are omitted from the comparison. The Session will probably have been the least exciting within living memory; but it would have been duller still if Mr. GLADSTONE had abdicated the post which he may probably long continue to adorn. Mr. DISEALLI during the later part of his conduct of Opposition maintained a silence which was rarely broken, and he has been equally reserved since his accession to office. Success may perhaps have confirmed his opinion that speech is rather an instrument for attaining certain ands than an object or occupation of independent value. It is highly desirable that there should be a variety of tastes in Parliament and among its principal members. It would be a great loss if Mr. GLADSTONE were to internit opportunities of instruction, of criosim, of apology, and of all other applications of a copious and impressive cloquence. Any opponent can with the utmost case let loose the torrent at the risk of being himself submerged; nor is the pleasure of provoking retaliation from an indignant statesman of the highest rank likely to be despised by candidates for Parliamentary notoriety. If Mr. SMOLLETT had been still more reckless in his imputations, and still more inaccurate in his historical dates, he would have done some service by inducing Mr. GLADSTONE to deliver an aloquent speech containing a negative demonstration that the late dissolution admitted of no tenable excuse.

THE POPULATION OF FRANCE.

RAUDOT, who has for some years made it his melancholy business to record and lament over the decreasing population of France, has published in a recent number of the Correspondant a summary of the deductions he draws from the Census Returns of 1872. The proper year to terminate the usual quinquennial period was 1871, but France had other things to attend to in that year, and it is therefore a period of six years that is included in the Beturns which M. Raudor discusses. In 1866 France had a population of 38,065,594, and France had in 1872 1,964,173 less, which, after allowing about 1,600,000 for the loss of the population of the ceded provinces, shows an actual diminution of 369,110. But M. Raudor is not satisfied with this figure, and thinks that the real decrease is considerably larger. There must first be added those Alsatians and Lorrainers who exercised the option of making in the property of the considerable of the property of the considerable in 1872 to 126,243. Then there were the population of more foreigness living in

Brance in 1872 than in 1866, of whem 64,000 were Alestians or Lorrainers who changed their nationality, but chose to reside as foreigners in France. If the births but chose to reside as foreigners in France. If the births and deaths during the six years are compared, there appears to have been an excess of 368,580 of deaths over births, and this is the first period since the beginning of the century when this deficit has shown itself. It is true that in 1854 and 1855 the deaths exceeded the births; but in the other three years of the quinquential period the hirths so largely exceeded the deaths that the average showed a preponderance of births, and the total increase of population was at nearly the normal rate, or a quarter of a million in five years. It is of course in the agricultural dismillion in five years. It is of course in the agricultural di million in five years. It is of course in the agricultural districts that the diminution of population most shows itself. The towns have increased, and it is worthy of notice that, in spite of the siege and the Commune, the population of Paris was larger by 26,518 in 1872 than in 1866, and the town population of France generally showed a gain of 276,000. If we add to this figure that of the general diminution of population in number, we find that the country districts have lost no less than 645,000; or, if the department of the Seine is locked on, as M. RAUDOT thinks it ought to be, as containing a population that is really urban, the total loss of the country districts reaches 700,000. It is also to be noticed, in the opinion of M. RAUDOT, that the immigrants into the in the opinion of M. RAUDOT, that the immigrants into the cities from the rural districts are mostly persons in the flower of life; and the drain on the labouring strength of the country is therefore more severe than the mere figures would indicate. The consequence is, M. RAUDOT says, that there is a deficiency of hands to carry out agricultural operations properly. Unfortunately he considers it enough to state this without entering into any details, and yet it is precisely at this point that details are needed. There may have been too large an agricultural population. In England the number of the agricultural population decreased in the ten years between 1861 and 1871, and yet it is evident that in many districts there are still more hands than can be employed at remunerative wages. 700,000 is no doubt a very large decrease for so short a period as six years, but whether the supply of agricultural labourers is short in France, or whether it is merely that those who pay wages find they have to give more than is agreeable to them, is the real point to be decided, and it is one on which M. RAUDOT throws no light whatever.

It is natural to suppose that the war may have been the principal cause of the decrease of population, but such a supposition harmonizes too imperfectly with M. Rat ben's general gloomy views for hun to subscribe to it. Ho cannot allow accidental influences to interfere with his persuasion that his country is going to the dogs. If the French soldiers, he says, had really died in any very great numbers, whether from wounds, cold, sickness, or want, we should see a striking difference between the numbers of men and women in the returns of the last Consus. But in 1872 there were 137,000 more women than men as against 37,000 in 1866. We may breathe a sigh in passing over these unfortunate 100,000 Frenchwomen for whom there is no demand, but M. Raupor thinks the number small, considering all that has happened to thin the main population. The war has come and gone, and there are only 100,000 men less. Then it may be remarked that the diminution of the population did not take place exclusively, or even principally, in those departments which the war weekely to departments where ments which the war reached; 30 departments were invaded, and 56 were not. Of these 56, although 14 gained in population during the six years, yet 42 lost, and they even lost more in proportion than the departments that were invaded. The whole number of persons who died from the war, according to M. RAUDOT, is 100,000. Whether such statements are to be quite trusted in how Whether such statements are to be quite trusted is, however, very doubtful; for when the calculations are extended over so many years, it is almost impossible to say whether the general result gives the true key to any particular set of facts. The deaths of the year beginning July 1870 and closing with the end of June 1871 were nearly 450,000 beyond the average, and as the average is only 865,000, the death-rate was more than half as large again' as it usually is. M. RAUDOT points out that the death-rate was also unusually large in the first half-year of 1870, before the war began, and therefore all the increase of the year dating from the commencement of the war must not be set down to the war itself, as other causes were probably at work which would have swollen the rate. But is it to be supposed that all the soldiers who fell in the bloody battles round Metz were really entered in any proper

list of deaths? This seems most improbable, and it is certainly very unlikely that the war and the Commune really cost France only 100,000 men. No doubt, however, it is true that war does not affect a population so much as it is natural to suppose. The total population of France was greater at the date of Waterloo than it had been ten years before, although those ton years had been years of incessant fighting; and Germany gained a million in population in the four years ending with the close of 1871. Germany, it may be mentioned, has now, with Alsace and German Lorraine reckoned as part of it, as nearly as possible 41 millions of population, whereas the total population of France, now that Alsace and German Lorraine are gone, is as nearly as possible 36 millions; and in Germany the rate of increase is much more rapid than it was in France, even in happier days. The rate of increase in Prussis happens, if reliance is to be placed on tables prepared in 1865, to be exactly the same as it is in England, and is such that the population would double itself in 55 years; while in France the population, which was increasing in 1865, was increasing so slowly that 183 years would have elapsed before, at the then rate, it would have doubled itself.

M. RAUDOT is perfectly right in thinking that the diminution of population in France is in some ways injurious to the country. The relative greatness of France must suffer if her neighbours keep growing in numbers and she does not; and France, by having no spare population to send abroad, must exercise less influence on the world generally in face of the emigration of the English and the Germans, and the spread of Russia over Eastern Asia. Thirty-six millions of a brave, wealthy, and energetic race are not likely to be often molested if they are content to act on the defensive, and give no trouble to their neighbours. But France can no longer take the place which Frenchmen love to claim for it, that of the glory, and it may be added the bully, of the civilized world, if even so much humbler a country as Italy gains in ton years, as it did between 1861 and 1871, nearly two millions. M. RAUDOT does not inform us whether he makes allowance for the additions of Venice and Rome, which took place in that period, but we must suppose for his credit as a statistician that he did so, and the rate of increase he assigns to Italy is less than that which is observable in the instances of Austria and England. But what weighs upon him most is that his countrymen actually like to think that the population of France is decreasing, or at any rate they are quite content that it should be stationary. They think it shows how sensible and prudent the French people must be, and certainly it must be said that the French only carry into practice the doctrines of stern political economy which Malthus and Mill have preached in vain to more than one improvident and prolific generation. It is in some of the wealthiest districts of France that the population of France refuses to increase. In Normandy, for example, the people are well off, and they avow that, as they like being well off, and intend, to be well off, they will not contract foolish marriages. M. Raupor is full of scorn for contract foolish marriages. M. RAUDOT is full of scorn for such creatures. They are, he says, like heirs who are rich because they have buried all their relations. They go on lazily and happily in their despicable comfort; and the worst of it is that their countrymen—not the mere silly and uneducated of their countrymen, but men who affect and even attain high places in literature and philosophy—insist on admiring them. They pronounce that everything is for the best, and that France is much happure and richer than she would be if she degraded herself to the richer than she would be if she degraded herself to the level of misery by having a teeming, ill-fod, demoralized population. She does not lack wealth or vital force, as her recovery from the war has shown. She can amuse the world with the splendours of her capital, and will soon open to it the finest, the largest, and the most costly of opera houses. At such reasoners M. RAUDOT laughs as gaily as so sad a philosopher can laugh, and he does not even think their arguments worth a reply. But he raises a question which it is much easier to raise than to answer. Does a country lose or gain most by having a large population and wages kept down by the competition of numbers? England answers the question in one way and France in the other; but if England is wholly right and France wholly wrong, then the lessons of our most respected teachers in political economy have been as theo-retically valueless as they have been practically unheeded.

THE LICENSHING BELL.

VIIII difficulties of this embject arise chiefly cost of treestment it hen undergone. Attempts to ches violently the habits of the people provoke resistance of evasion, but gradual change may be accomplished by judicious legislation. If is generally expedient to premete the early closing of public-houses, and Mr. Chour is able to make the satisfactory announcement that the publicance desire that which regard for health and econes alike dictate. We might indeed have assumed without proof that publicans and their servants would share the general feeling in favour of aborter hours of labour. and all the more so because the publican is necessarily kept hard at work when all the world is making holiday. It is almost universally agreed that twelve o'clock is too early an hour for elosing in London, and no supprise could have been felt if the publicans had proposed. one o'clock. But Mr. Choss tells us that half past twelve is the latest hour that has been suggested to him by say person connected with the trade. The only question of person connected with the trade. The only question of any difficulty is that raised by Mr. MELLY, who contends for uniformity of hours as regards public-houses and beer-shops. It must be remembered, however, that Mr. CROSS has to deal with an embarrassment created by his predecessor. The Act of 1872 requires general closing at twelve, but permits the Commissioner of Police to grant "exemption licences" to particular houses. In order to escape the manifest evil of this system of exemptions, Mr. escape the manifest evil of this system of exemptions, Mr. Cross proposes that all public-houses shall be open till half-past twelve, and then it is said that the same liberty ought to be granted to the beer-shops. But in general the public-houses are under greater security for good behaviour than the beer-shops, and to come extent the "Licensed Victualler" supplies food as well as drink. Whatever difficulty the police may experience from the public-houses remaining open until half-past perience from the public-houses remaining open until half twelve, we do not think that it would be lessened by allowing the beer-houses to remain open to the same time. Upon this point Mr. Cross has doubtless taken the opinion of the Police authorities, and he and they together ought to be better judges of it than anybody else. As regards any hardship upon beer-house-keepers from this distinction being made between them and publicans, that might easily be remedied by some abatement of the duty payable by the former class. As regards the hours of Sunday closing, we think that the additional restriction imposed by the Act of 1872 was unnecessary, but we also think that Mr. Cross has done wisely in maintaining that which he finds established. While it is generally desirable that the laws should be adapted to the habits of the people, it is possible up to a certain point to adapt the habits of the people to the laws. On this account constant changes are to be deprecated, and Parliament should as far as possible discourage the notion that the public convenience will be further sacrificed to Sabbatarian or prohibitionist agitation. If we wish the trade of liquor-selling to be respectable, we must not harass it unnecessarily. It is cortainly remarkable that the Adulteration Clauses of the Act of 1872 have been almost entirely inoperative. In the Metropolitan district there has been no prosecution, and in the Northern district there has been no conviction. If these facts may be taken to show that the liquors sold by publicans ar more genuine than is generally supposed, we ought, on behalf of the public, to rejoice at it. They show at any rate that customers must be telemble will rate that customers must be tolerably well satisfied with the articles supplied to them. We have heard so much lately of adulteration of food and drink that it is certainly surprising that beer and spirits should have escaped so easily. It begins to appear probable that the "cream of

"the valley" represents the only genuine milk.

The result which Mr. Cross derives from the statistics which he quotes ought to encourage the publicans, although it may not be altogether satisfactory to Parliament. There are fewer liquor-shops, and they are better conducted; but more liquor has been consumed, and there have been more convictions for drunkenness than there used to lie. This result he ascribes to the increased attention which the keepers of liquor-shops have given to their trade, to the vigilance of the police, to the largely increased wages of the working classes, to the suddenness of this increase, and to the increased leisure which has accompanied it.

In more drink is consumed there will be a drunkenness; but the number of convictions for drunkenness will depend much upon the vigilance of the police, and in the Metrocapolitan district the police have accompanied after drink-shops.

the probably effect delicious, more closely since the act of the primary was passed. As regards the increased consumption, Mr. Gaoes rightly secribes it to the want of sources of enjoyment in persons who have suddenly found themselves in the persons who have suddenly found themselves in the persons who have suddenly found themselves in the persons who have suddenly found them we consider where and how a collier or puddler is forced to live, it is perhaps wonderful that he does anything except set, drink, smoke, and sleep when he is not at work. Social reformers, to do any good, must strike at the root of social disorders. Mr. Cross truly says that drunkenness is one of the great causes of crime and misery, yet it is not the primary cause. "There is another cause, and that is "the want of happy homes." He believes that the movement set on foot to provide the labouring classes with improved dwellings would do more to promote sobriety than lay Bill that Parliament could pass. There are persons who expect great results from the Permissive Bill or some other pet project of legislation, but even these persons would agree in trying the method which Mr. Cross suggests; and if energy were concentrated on that which everybody allows to be useful, it would probably be accomplished. The followers of Sir Willerid Lawson would do well "to let alone the good which they cannot do," by exercising a wholesome and legitimate influence over their friends and relations. If working-men who are carnest in the matter could produce in their own class a general feeling that it is disgraceful to be drunk, they would do more good than can be done by Parliament. The Alliance, however, are not likely to modify their grand design of prohibition.

But when Mr. Cross turns to the publicans he will obtain, as he deserves, attention. The leaders of that intenset ought to be well satisfied with the recent demonstration of their power, and should resolve to use it reasonably. "The great principle," says Mr. Cross, "in this, as in other trades, should be to encourage the best possible class of persons to engage in it." If Parliament will set consistently on this principle we believe that the will act consistently on this principle, we believe that the publicans have sufficient prudence to reciprocate the confidence thus shown in them. They must be aware that for many years to come the bulk of the population will resort to them for enjoyment whonever it has money at command, and experience shows that a well-conducted business is generally the most profitable. It is quite possible in this ss in other trades to sell by improved arrangements a larger santity in a shorter time, and the publican may be sure that his position may with prudence be made both liberative and impregnable. We have heard much from Lord ABENDARE and others about affording facilities for the sale of "innocuous beverages," and the publican may be well content with the result hitherto of the attempt to raise up against him a now class of rivals. Under an Act of Parliament passed about ten years ago, certain houses were left open which went by the name of night-houses; and in London, says Mr. CROSS, there were ever one thousand of these night-houses which had a licence to keep open the whole night. They did not actually sell intoxicating liquors, but it was found that they were really the resort of persons who went there because they were driven out of the public-houses; and it was therefore prowided that all these houses should be closed at one o'clock, when the public-houses closed. The Act of 1872 did not affect the existing regulations as to these houses, which are allowed therefore to keep open until one o'clock. "We "find," says Mr. Choss, "from the police that the nightes which now exist ere not resorted to in the st by people who want refreshments, but are simply frequented by persons who have been turned out of the public-houses, and who go to them the moment the public-houses are closed." The police report to him are refreshment-houses are simply the resort of preslitudes and their companions, and moreover that they carry titudes and their companions, and moreover that they carry on an illicit trade in spirits; and he proposes that they should be required to close at the same time as the public houses, which, under the Bill, will be half-past implies. We are not save that the description given by the pelice of these houses would be applicable to all of them, but undoubtedly it is generally correct. The closing of public houses at twelve o'clock has produced than illicit of in spirits" at another class of houses which has o'clock. It is better to modify that the think cannot be suscented. We think

of getting a glass of spirits after midnight, and therefore the supply of that article can be best entrusted to the most responsible bands, which are dearly those of the class which the law calls Licensed Victualiers. This class has therefore a position in London which, with predent management, will be unassailable.

RAILWAYS AND THE STATE.

BOTH Houses have within the last week discussed different questions connected with railways; and some instructive speeches were on both occasions delivered. Lord Drlaware failed to establish any plausible case for a Commission of inquiry into the management of railways, but the majority of the House of Lords shared the general alarm as to the accidents which so frequently occur. Lord HOUGHTON was perhaps imprudent in undertaking the advocacy of railway directors and managers in opposition to the prevailing sentiment; but Lord Samsuurr, who has, like Lord Houseron, the advantage of practical experience, explained in concise language the extreme difficulty of applying the greater part of the remedies which are commonly suggested. One side of the case has already been stated so strongly that the arguments on the other side deserve especial attention. It is asserted that the Government functionaries who are employed in the supervision of railways are in most instances mere amateurs until they acquire special knowledge in the discharge of their office, and that at the best they are far below the level of railway managers and engineers in professional position. It is probable that in some instances jealousy of interference may produce an indisposition to accept useful suggestions; but, on the other hand, it is desirable that those who administer any complicated and difficult business should be responsible for the details of management. Lord Salisbury left it in doubt whether he considered it expedient to enforce absolute punctuality on the Companies. Conformity with the time-tables would certainly remove one cause of accidents; but it can only be insured by a general diminution of the speed of trans throughout the kingdom. When the excitement caused by a series of extraordinary disasters was at its height in the course of last winter, railway directors took no trouble to conceal their sanguine hope that they would be compelled by public opinion to lower the speed which they have been induced by the wishes of their customers to maintain. Leisurely and occasional travellors may sometimes be indifferent to the addition of half an hour to the time spent in a railway journey of a hundred miles. Men of business feel that a difference in speed would involve a daily loss of time which has a pocuniary value, and that in some instances it would defeat the calculations on which they have fixed their residence or arranged their habits of life. Two hours added to the journey between London and Edinburgh or Chasgow would greatly increase the fatigue and inconvenience which are to a certain extent inseparable from a journey of four hundred miles. If Parliament meets the wishes of railway directors by compelling them to subside into a Continental mode of conducting their business, the change will be followed by universal discontent. If the Committee of the House of Lords recommends that all Companies shall provide additional lines for the conduct of their truffic, some mode of raising the vast capital which would be required for the purpose ought at the same time to be suggested.

because the same that the night-shieh new exist are not resorted to in the people who want refreshments, but are simply in people who want refreshments, but are simply in the opinion of the great majority of the House that the opinion of the great majority of the House that the opinion of the great majority of the House that the opinion of the great majority of the House that the opinion of the great majority of the House that the opinion of the great majority of the House that the opinion of the great majority of the House that the opinion of the great majority of the House that the opinion of the great majority of the House that the opinion of the great majority of the House sentatives of the most part conducted with creditable calmness the most part tondered with creditable calmness the logical or rhetorical error when he founded his argument for the purchase of Irish railways on the wider proposition that the same course ought to be adopted with respect to all the railways of the United Kingdom. It may perhaps be true that the same principles apply to great Buitain and to Ireland, but the advocate of the less ambitions scheme was injudicious in challenging the opposition which could not fail to be raised against a project for the speculative investment of many hundred millions of public money. The analogy of the Poet Office is entirely inapplicable to milways; and the opinion of the House of countries that the description of the density of the most part to order that the sent countries of the most part or project of the proposition and the proposition that the same course ought to be adopted with respect to all the railways of the United Kingdom. It may perhaps be true that the same principles apply to great Builties and to Ireland, but the advocate of the less ambitions scheme was injudicious in challenging the opposition with respect to all the railways of the United Kingdom. It may perhaps be true that the opinion of the less ambitions scheme was injudicious in challenging the opposition with respect to

of the department is strictly confined to the simple and uniform object of despatching letters and telegraphic messages with regularity and speed. No week passes in which the manager of a large railway is not required to exercise a larger discretion than that which devolves on the Postmaster-General and his assistants in the course of a year. The number of different rates contained in the lists of the different Companies cannot be less than fifteen The number of different rates contained in the or twenty millions. Several Companies own from twenty to seventy thousand waggons, which must be distributed for the convenience of consumers in the system to which they belong, and which can only be reclaimed with due regularity from the foreign lines which they traverse by the exercise of unceasing vigilance. The letter-book of a local superintendent at any large centre of traffic would frighten a Post Office clerk who might be required to deal with all the requests and reclamations of consignors and consignces who resent the smallest interruption of their traffic. Railway officials are, luckily for their customers, not at liberty to repress complaints by the peremptory generalities which are familiar to those who address remontrances to great public departments. The discretion which Railway Boards exercise in the investment of additional capital is regulated by calculations which may be sometimes mistaken, but which are always founded on a careful consideration of the probable advantages of the outlay. No theorist has yet suggested any plausible method of securing on the part of the State the exercise of an equally unbiassed

Having established to his own satisfaction the general expediency of State ownership of railways, Mr. BLENNER-HASSETT proceeded to show that if the soundness of the rule were denied, the Irish railways formed an exception. It may be fairly contended that the small magnitude of the Irish railway system makes the experiment comparatively practicable. It is easier to deal with twenty or thirty millions than with twenty times the same The sacrifice which must be incurred by comamount. pulsory purchase might be endurable if the acquisition of the railways were otherwise likely to produce great public advantage. The speakers in the debate of Tuesday abstained for the most part from repeating the exaggerated or irrelevant statements which have generally been used in support of the proposal. It would be absurd to undertake a vast speculation because there are too many smaller Companies in Ireland with a proportional and superfluous staff of directors and officers. The remedy for excessive division is union, and the little Companies can, if they think fit, amalgamate themselves with one another, or become annexed to the larger systems. It is not the case that Irish railways are uniformly small or poor. The Great Southern and Western of Ireland is equal or superior in mileage to the Great Northern of England, and on an average of twenty years it has paid a better dividend. Both the directors and the shareholders have repeatedly expressed the strongest repugnance to the transfer of their property to the Government. The Midland, Great Western, and some other larger Companies are prosperous and efficient; and those lines which at present produce no dividend command a price in the market which represents the hopes of the present holders. The State would in the contingency of purchase be required to pay, even at the market price, a considerable sum for lines which at present yield no profit. The promoters of the plan simultaneously propose to lower the rates, to increase the accommodation, and in general to swell the original outlay of capital by a large addition to the working expenses. All that was valuable would be taken against the will of the owners; the properties which were voluntarily sold would be of little value, and the purchaser would be expected to deteriorate both classes of railways still further by increasing the cost of working and by contenting himself with diminished receipts. The further difficulty of dealing with incessant demands for extension would be both financially and politically embarrassing.

The Irish members are perfectly in the right when they hold that the prosperity of their country would be greatly advanced by the construction of additional railways. Unfortunately Irish railway enterprise offers little attraction to English capitalists; and the large sums which are accumulated ir. Ireland, chiefly by thrifty farmers and tradesmen, are naturally destined to investments which involve neither epopulation nor risk. Within a few years some large pro-printers in the West, with the aid of the Midland Great Wintern Company, enabled by liberal guarantees a line of

a hundred miles to be constructed through a desciate region of bog where there had never been any kind of traffic. Within a year from the opening of the line it produced a dividend sufficient to cover the guarantees, and the price of a great part of the produce of the remoter districts was immediately doubled. In other parts of Ireland, counties and barcaies have, in accordance with the resolutions of grand juries and presentment sessions, guaranteed for limited persods a dividend on the cost of railways sufficient to secure their construction. Lord CARLINGFORD'S motion of Thursday. last was suggested by an unfortunate decision of a Committee of the House of Lords against a proposed line from Sligo to Enniskillen, which was almost unanimously supported by the landowners of the districts concerned. Committee further affirmed the doctrine that no guarantee should be sanctioned if it was opposed by any fraction of the ratepayers. Unless their inconsiderate and pedantic theory is repudiated by Parliament, railway extension is probably at an end in Ireland. The existing Companies are for the most part unwilling to encourage new projects, and capitalists will not risk their money without accurity. The enormous benefits which would be conferred by new lines would in many districts greatly outweigh any burden which might be imposed in the form of a guarantee, Grand juries and presentment sessions are perhaps imperfectly constituted as local Parliaments; but their members understand local interests, and they are extremely unlikely to indulge in extravagant enterprises.

IMPERIAL RESPONSIBILITIES.

T is well that there should be a full discussion of the question as to the continuance of British rule at the Gold Coast, but it is impossible to imagine that there is any room for doubt as to what the decision will be. Mr. HANBURY has moved a Resolution expressing the opinion of the House of Commons that, " in the interests of civiliza-"tion and commerce, it would not now be desirable to " withdraw from the administration of the Gold Coast." No one, however, has ventured formally to propose the immediate abandonment of the Gold Coast, and much narrower considerations than those referred to in the Resolution would point to the same conclusion. We have Resolution would point to the same conclusion. just been engaged in a war with the King of ASHANTEE, which may perhaps have impressed him with a sense of our power, but which is not very likely to have inspired him with feelings of affection towards the native tribes, who, if they did little to help us, at any rate took our side in defiance of the Ashantees. It is obvious that the withdrawal of the English from the Gold Coast would at once bring down on those weak and helpless people the full weight of the King's vengeance, and in that case the only result of the war would be to have exasperated the Ashantees, and exposed the tribes which were friendly to the English to the most fearful punishment. The latter would certainly have s right to protest against such monstrous and wanton cruelty. "If," they might say, "you had gone away without a war, "we might have made terms for ourselves with the "Ashantees; but you tempted us to go out against them, "and now, with cowardly treachery, you leave us to bear the brunt of their fury, and our last state is worse than our " first." The Treaty which was exacted from King Correct required him to renounce all authority over the Kings of Denkara, Assim, Akim, Adansi, and other allies of Hss MAJESTY, formerly subject to the kingdom of Ashantes and in the case of the Adansis, Sir G. WOLSELEY has himself stated that his reason for permitting them to unite with another tribe was to preserve them from massacre by the Ashantees. It is difficult to conceive a greater acted criminal folly than the recent campaign would be if it was to be followed up by an immediate retreat. It is not a much a question of the interests of civilization and well merce as of common humanity. It may be taken there fore as certain that, for the present at any rate, the Gol Coast will remain under English administration. How Mr. Holms, who opposed Mr. Hansuer's motion, only was mr. FIGLMS, who opposed Mr. HANBUER'S motion, only so far as to propose withdrawal, "as soon as the entare "ments of the late war gould be got rid of," which we seem to imply a prolongation of Englishments for an ifinite period.

As to the actual state of the settlements, it is difficult decide between the conflicting statements of the most the motion and those of his opponent. Mr. History watch wo

maintained that the position of the Gold Coast Settlements had greatly improved during the last eight or nine years. Human sacrifices had been put down among the natives, trade had been largely extended, and the revenue of the country developed. The recent war had revived the prescountry developed. The recent war had revived the pres-tige of England and would tend to discourage any further attacks. All the is contrary to the anticipations of an authoritative Committee of the House of Commons which inquired into the subject in 1865, and recommended the restriction of our settlements within their then limits, and the preparation of the natives for self-government with a to our ultimate withdrawal from all parts of the coust, except perhaps Sierra Leone; and it may perhaps be doubted whether Mr. HANBURY has not been tempted to draw rather too rosy a picture of the prosperity of the settlements. Mr. HOLMS contended that trade, so far from increasing, was, if the statistics were rightly interpreted, declining; and that British taxpayers had spent 2,090,000l. in order that merchants might dispose of goods to the value of 2,300,000l. The annual expenditure had also risen from 10,000l. to some 54,000l. It is evident at least that the Dutch took a low view of the commercial value of Elmina, as they came down from 80,000%, which they first demanded as the price of surrender, to the modest sum of 3,800L As to the circumstance under which this addition to our settlements was obtained, official explanations have yet to be given. It may be assumed that there was a certain degree of obscurity as to the rights of the King of ASHANTER, and that the English authorities thought they could trust to the representations of the Dutch Government. The important question, however, is rather as to the future than the mast. It is clear that we cannot on the instant quit the Gold Coast, and in the meantime prudence would seem to suggest that an efficient government ought to be maintained. To put things on a temporary footing, as if the English were only watching for the moment to slip away, would be the strongest temptation which could be offered to the Ashantees to resume the offensive, in order to hasten our departure. On one point both Mr. HANBURY and Mr. Holls were agreed, and that was as to the mischief of frequent changes of Governors. Governor M'LEAN remained at his post for seventeen years, and it is admitted that he accomplished important results. Since then there have been no fewer than twenty-six different Governors. How many of them succumbed to the climate has not been stated, but it may be doubted whether the advantages of the office are sufficient to secure the conservices of good men. Mr. HANBURY remarked that, without military support, it was impossible for merchants to force an inland trade; but it may be questioned whether it is a national duty that trade should be forced upon a reluctant population, and there is certainly something startling in hearing from the benches behind Mr. DISPABLIA proposal for suppressing the Protectionists of the East Coast of Africa by force of arms. Between pushing trade to this extent and altogether abandoning the country there is surely some safe and honourable middle course to be discovered.

Every question of this kind, with reference either to the continuance of an old settlement like that of the Gold Coast, or the acceptance of a new Sovereignty like that of Fiji, must necessarily be argued out on its own nearits; but the decision which is come to will naturally pend in a considerable degree on the view which is taken of the external duties of a great nation like Inglind. One set of politicians, whose influence has been rather declining in recent years, would make short work of all difficulties of this kind, by simply cutting adrift all existing colonies and dependencies, and resolving to connot no fresh relations of this kind. It is the sim of this chool to reduce England to a position of selfish isolation, in so far as it may offer profitable markets to English The administrative area of the English Governent would thus be reduced to the United Kingdom, and driven be no doubt that administration would thereby be reach se so doubt that summine ration would be relieved to a great many troublesome and dangerous responsition. This is a perfectly consistent and in some respects to the distribution of the great object of existence is to the distribution of the second more source is to think only of the immediate comfort transferice of people at home, and to shut our

millions to keep up anything like a decent navy at present, but if we had only our own coasts to defend, a smaller and cheaper fleet might be found to answer the purpose. This policy would also get rid of a great many risks of collision with other Powers, which are, of course, only another name for expenditure. It is possible that in this way England might become a richer country than at present; at least, taxes would be less, and there are economical philanthropusts who think that the happiness of a country depends on the smallness of its taxation, not on what it gets in return. It is evident, however, that England would cease to be a great country in the sense in which it has hitherto played its part. It would coase to be an active and propagating force, spreading its language, its ideas, its religion over the world, opening up new regions to the light of civilization and Christianity, making other nations take an interest in the objects which it has at heart, and in all sorts of ways carrying the rest of the human family along with it. Regarded as a mere commercial investment, it may be doubted whether colonies and settlements are worth all the trouble and money which are spent on them. Some of them have turned out better than others, but, on the whole, the mother-country gots very little out of them, at any rate directly. Yet, when Mr. HOLMS argues that the only question to be asked about the Gold Coast, for example, is how much it costs to keep up the settlement, and what amount of trade is done there, he may be reminded that this is only one side of the subject. Canada, New Zealand, Australia would assuredly not now be what they are if such considerations as these had uniformly governed English policy. Yet it will hardly be denied that it is a good thing for the ground at large that these communities should exist in world at large that these communities should exist in their present condition; and England not only has its share in this advantage, but a special share. The inshare in this advantage, but a special share. The in-habitants of other countries are as free to trade with or settle in our colonies as we are ourselves, but how-ever mixed the nationalities of the settlers, there can be no question that these new and thriving States are thoroughly English in their habits and ideas, and a genuino embodiment of English character Nothing can be more certain than that, if England had been conducted from the safe business point of view, it would at this moment have been a very different country from what it is, and the world would in many ways have been different too It would of course be absurd to say that a nation like ours is bound to take upon itself all at once the regeneration and management of the whole universe. It can only do what it can do, and it is bound to have some reasonable regard for its own immediate interests. Yet mere tireside comfort and economy may be prized too highly, and it is well, when questions of Imperial responsibility have to be determined, that a large and generous view should be taken of the mission of a great nation.

BUILDING AND HEALTH.

THE Metropolitan Buildings Bill has been referred to a Select Committee, and, considering its length, its complexity, and the number of interests which it affects, it is exceedingly uncertain how long it will remain under consideration, and in what shape it will ultimately become law. It would be well if the Government could be induced to employ the interval in framing a general Building Act which, though it should extend to the whole country and not be limited to London, need not for all that be very cumbrous. It is true that there are many sources of disease and discomfort which are peculiar to houses standing in crowded districts In the country the air outside a honse is commonly fairly pure, though occasionally a local confusion between the functions of a ditch and those of a sewer succeeds in poisoning even this. As a rule, however, the contribution of evil savours which every cuttage makes to the surrounding atmosphere is too much diluted to be appreciably injurious. It is not as in London or Manchester where, in some of the worst parts of the town, the natural atmosphere seems to have retreated in despair of making itself felt, and to have yielded its place to a concentrated extract of all the had smells which an undrained and unventilated court can give birth to. But as soon as the threshold is crossed, the parallel between houses in towns and houses in the country becomes very close. The chief causes of disease as regards dwelling-houses are two—bad air and bad water; and in the

first of these respects the country is no better off than the towns, while in the second it is usually worse off. Air may become bad either from want of sufficient provision for its renewal, or from the existence of a provision for its being renewed direct from the drains. Water may become bad either from improper storage or from the addition of poisonous matters. Of these four sources of mischief, the last is almost confined to the country, including under that head all towns and villages in which water is not supplied by any corporate agency. London water, for example, is often faulty, and the analyses of it which are published every month are as good as advertisements to the makers of filters. But London water is purity itself compared with the water drawn from many country wells, water which looks sparkling and tastes fresh, but which derives these very merits from the presence of poisonous gases. The other three evils are evenly distributed over the whole of England. The town garret and the country loft may be alike destitute of ventilation; the town sewer and the country cesspool may alike contribute their miasma to the air of the houses they drain; the town cistern and the country water-butt may alike beloul the water which they profess to store. If these four causes of ill-health could be removed, an immense strade would have been made towards rendering the sanitary condition of England really satisfactory. There would remain special evils generated by the pressure of a crowded population or by the practice of noxious trades, but in comparison with the evils generated by foul air and foul water in dwelling-houses they would be almost insignificant.

As regards all houses hereafter built it would not be difficult to guard against these evils; but as regards those already in existence the attempt to bring them up to the very modest standard here indicated might be surrounded by many difficulties. It is scarcely possible to make a clean sweep of all the houses which fall below a by many difficulties. cortain sanitary standard, because many of them are so built as to be altogether beyond the reach of improvement. By degrees more and more of them may be pulled down and the ground they occupy filled by houses of a better order; but until some plan of this kind can be devised they must be accopted as in many parts the only houses at the disposal of the poorer class of tenants. Again, as regards houses of a higher type, there are many which in a sanitary point of view are little better than those just mentioned. The miles of villas which surround London on all sides have been built in a great number of cases with a disregard for considerations of health which quite rivals the carelessness shown in building houses for the poor. This was strikingly shown in a cause tried a few There is a suburb wooks back at the Kingston Assizes. on the South-Western Radway called Worcester Park, at which a great deal of building has lately been going on. Either before it was begun, or whilst it was in progress, the builder seems to have cast his eye upon a little brook which runs through the estate, and in the end finds its way to the Thames, and it at once occurred to him that here was a system of drainage ready to hand. It was necessary to get rofuse matters out of the houses, but so long as they could be poured into a running stream his conscience was satisfied. Unfortunately for the success of this arrangement the Kingston authorities objected to a method of sewerage which simply sent the refuse of Worcester Park to Kingston, and the Court made an order that the Worcester Park houses should be provided with cesspools. It was urged, with some show of reason, that this would be to create a muisance in Worcester Park by way of abatung one at Kingston. But the judge had only to determine what was due to the inhabitants of Kingston. The unfortunate inhabitants, if there be any, of Worcester Park were not formally before him. It was admitted that the soil of Worcester Park nuade it difficult to construct cesspools so as to ensure that there should be no communication between them and the drinking water, but it was not shown that it was im-possible. Probably, like many other difficulties of the kind, it is a question of cost. But when once a composition dug out and covered over, there is no obvious means of assertaining in what manner the work has been done; and assortanting in winter manner one were non-sen cone; and supposing that some of these houses should be furnished with cosspools which do not notate their contents, the fact may remain unknown until an epidemic of cholera or typicoid fever reveals on what sold of fraudation Woreaster hip is prigr

This may be an extreme and annual case, but some of a

almost as widely distributed as the art of building its How this evil is to be doubt with as regards on is a part of general sanitary legislation, and, as such, in surrounded with many difficulties. But as regards how becarter to be built there are no such difficulties. very fact that, when once an unwholesons because have been built, it is often so difficult to change its character, is the best possible reason for taking care that no more unwholesome houses shall be built. What is wanted to meet the need is a short and intelligible Act of Parliament enacting that in future no houses shall be let or sold which have not been declared to be wholesome by What shall constitute a competent sanitary authority. wholesomeness might in the first instance be set out in the Act itself, and power might be reserved to the Local Government Board to make additions from time to time to the statutory requirements. In this way a series of sanitary standards would in time grow up resembling the standards of instruction fixed from time to time by the Education Department, and like them gradually increasing in stringency as the spread of sanitary knowledge made such an increase possible. In the Act itself it would be expedient only to lay down a few universally admitted rulesversally admitted, that is to say, by all persons who have not a vested interest in disputing them. There could be no great difficulty in defining what shall constitute the minimum of ventilation in a room, or in requiring that every pipe communicating either with a sewer or with a cesspool shall have some outlet to the external air, or that where craspools and wells are both in use a minimum distance shall be main. tained between them, and the walls of the cesspool shall be constructed so as not to allow any sewage matter to escape. If these three requirements were everywhere insisted on, the progress of sanitary education would be extraordinarily rapid, because the inhabitants of the houses built since the passing of the Act would be unmistakably healthier than the inhabitants of houses built before the passing of the Act. As it is, it is often difficult to convince people that such and such sanitary defects generate discase and shorten life, because they say, and say with truth, that the health of persons living in houses which command a high rent is not appreciably better than the health of persons living in houses which are constantly reported as destitute of the simplest sanitary requirements. The answer is that there are many houses commanding a high rent in which sanitary laws are as completely, though not as conspicuously, deflect as in the hovels which make the text of a medical officer's report. If such a Building Act as has been suggested were enforced, without respect of persons or neighbourhoods, the superiority as regards healthness of the houses to which it has been applied would soon remove all doubts as to the necessity of Parliamentary intervention.

COMPETITIVE REAMINATION.

To stop often humiliating to compare the actual working of any new piece of political machinery with the expectations entertained on first setting it in motion. Schemes deviaed on the best possible principles have an awkward way of developing the very tendencies for which we were least prepared. A recent article in the Edinburgh Review illustrates this familiar truth from the case of competitive examinations. Neither the good nor the evil effects articipated at the first introduction of that system have been entered articipated at the first introduction of that system have been entered articipated at the first introduction of that system have been entered articipated at the first introduction of the system. Civil Service within wormout, afferminate, narroweshested, and spectacled students. But it has developed, and especially in the Indian Civil Service, which was to have been its great field of success, certain tendencies which was to have been its great field of success, certain tendencies which demand serious consideration. That service, it is said, contains an increasing number of men at once less contential and at least in certain important respects, less competent than these predecessors. Plans are being entertained for a serious modification of the system; and it is very generally held that the described in the first serious of the case against the competitive against the public schools. When has attended by private to dealers and the public schools. When has attended by private tendence. Hearth has been that, the a considerable interesting the first and advantages in a serious of distribution, in a said, cause first and the first and the public schools. When has attended by private tendence.

we have only a set of inde trained by some Mr. Smith or Jones, who is shilled in the art of viscourvesting assemblers. The great simulus which was to have been given to the existing educational rodies handless wanting, and the practical consequence has rather seen that therefore number of promising pupils have been withdrawn itself the influence. At first eight this will doubtees be denitted to be an evil; but, to avoid energy-ration or mistentiment, it is necessary to consider more precisely in what the
will exists.

Will exists.

Orange in the state of evil reports. It is generally understood to mean the filling of the youthful mind with a mass of imperfectly assimilated knowledge which produces no permanent effect. A distinguished Professor recently suggested that when ada presented themselves for examination they should be sent to see without books, pens, or ink, for six months, and exemined on their return. Such a system would have time for the evaporation of all that superficial knowledge which is acquired exclusively for immediate consumption. It would, in fact, avert the evils for immediate consumption. It would, in fact, avert the evils thurscateristic of the grosser forms of cremming; but we fear that it would not be effective against a more subtle mischief. It does not be the constant of the not, in fact, seem to be true that the comming practiced for the indian examination is of this martistic kind. In answer to the complaints of the Edinburgh Reviewer that the crammers encourage a supplied to the commence of the complaints of the complaints of the complaints of the commence of the comme courage a superficial knowledge of many subjects instead of a horough knowledge of one, the most successful member of the mofession wrote a sufficiently pertinent letter to the Times. According to him, success is generally attained by a thosough brilling in a small number of subjects. "Quality, set quantity," he irilling in a small number of subjects. A Quality, not quantity," he mays, is a phrase constantly in his month; and some of his most mecessful pupils had taken up a very small number of subjects. We could find some fault with this statement; but we are quite eady to believe that, as a matter of fact, cramming as practised by the best teachers does imply much thorough study; and that, for example, the mathematical knowledge of a candidate for the Indian examinations is the same in kind, if not in degree, with that of a maddidate for honours at Cambridge. It includes a real knewledge of certain subjects, not a mere learning by heart of a few books. The "crammer" in question—if we may use the word without offence—proceeded to say that the success of their work. They sell a good article, and therefore secure customers. They depend entirely upon their work, instead of having endowness to fall back upon, and therefore they can compete successfull "coach" used to do at the Universities. We believe that it the present day a distinguished private tuter occupies a position was accounted to the Mathematical Thirm and would be that the present day a distinguished private tuter occupies a position was a market. at the present day a distinguished private tuter occupies a position in regard to the Mathematical Tripos not unlike that which the mammer concupies in regard to the Indian examinations. In each mae, the prestige which has been acquired may lead young men to stach an exaggerated value to their extm-edicial teaching; but it any rate the prestige was won and is maintained by thorough and conscientions lebour.

But, admitting that the commer does his work well, it loss not follow that the education which he imparts is really ill that could be desired. He preaches, it may be, "quality, not quantity," but there is another become which he is bound to impress upon his pupils—namely, to read what "pays." Success in on examination, not a thorough intellectual and moral training, is necessarily his ultimate aim; and the pursuit of one of these purposes may imply a divergence from the other. This is in fact the middle was a divergence from the noral training, is necessarily his ultimate aim; and the pursuit of one of these purposes may imply a divergence from the other. This is, in fact, the vital weakness of the competitive system, and it is easy to see how it works. The Ridmine of the competitive of example, says that concentration rather than diffusion of ntellect should be the rule for education. We cannot accept his tatement without serious modification. Suppose, for example, hat an appointment to India was obtainable simply by mathematical excellence. It would then be worth while for a boy, as two as he showed decided mathematical talent to decore is many con as he showed decided mathematical talent, to devote himself reclusively to mathematics, and the natural consequence would so that several years of his life would be devoted to what is se that several years of his life would be devoted to what is adeed an adminable branch of intellectual gymnastics, but a very nor training when taken by itself. A yearth of twenty-one, leveld of all other culture and endowed with an exceptannal sower for the manipulation of abstract symbols, would be about power for the manipulation of abstract symbols, would be about a poorly prepared for a state in the government of a great Empire any one could be who was not an absolute fool. In short, the arrowing tendency of an education directed exclasively to secure moose in examinations is often mose marked and more permecular han its tendency to produce superficiality. An ideal scheme of dinection would include a general subtraction of all the faculties, ogether with a correlal development of any special aptitudes. A them guided by examinations because these considerations altopolicy out of account. If it deep not tend to fill the Indian tiber out of account. If it does not tend to fill the Indian pather out of account. If it does not tend to fill the Indian strice with a number of smart smatters in universal moviedge, it tends to fill it with a number of specialists, and if specialists whose incowledge has no seference to their duties. I judicious teacher would endeavour to supplement the knowledge of his mathematicies by giving him some wider or more invasible; cultury. The eranner will see him, then you learn lating the Unselvanium to get the minimum of market. If not, look multiparts alterather. If you can, he cannot above all these not to allow them to distance you from the subjects on thick may really rely. The two selects of getting the heat possible mailing, and of getting as many marks as possible, see

only estacide by ascident; and a system altograther out of account will be macause

And this suggests one seemet of the crammer's power of non-peting with the Universities and achoels which is not quite so creditable as the secret of thorough tenshing. Me has andoubtedly the advantage of not being burdened, the erhodsmaners can college tutors, with a mass of uttor idlences. Everybudy who sames to him wants to learn. No distractions are provided. The youth who is under his hands probably takes lodgings in London, lives by himself, and devotes himself for a secule of years ex-clusively to his crammer. Such a system removes many diffi-cultion. There is no discipline to be enforced; there are no bost-chub to tempt lasts to warte their time; there are no social answer ments or debating societies; and, in fact, nothing of that which constitutes a very essential part of University training, though, it must be admitted, a part very liable to be abused. A certain proper-tion of the best hoys from our public schools and elsewhere, instead of going through a University career and being aspected to all the tion of the best boys from our public schools and sleewhere, instead of going through a University career and haing exposed to all the multifarious influences which it implies, are simply put into peas to be fatted for examination. Granting that the food supplied to them is sufficiently solid, and that they are not tempted to waste their time on mere frivolities; and granting that such a plan is conducive to the production of mark-making animals, still it must be conferred that it implies but a wastehed section of allestics. We confessed that it implies but a wretched system of education. fully agree with the Reviewer that this is not the wey to bring up the members of the reverning body of our great dependency. Under the members of the governing body of our great dependency. Under the old system, the youths at Halleybury were frequently incom-petent and generant enough; but at any rate the effect of bringing them together was to encourage that corporate spirit which a to be rapidly declining under the present arrangements. The objection made when the competitive plan was started, that it would produce awkward recluses instead of men of the world, had after all promoting in it. The stimulus added to intellectual cultivation was in itself narrow, and was not combined with any atimulus to the general educational system. The inventors of the new plan hoped, as we have said, to draw the most premising material from our Universities. They hoped that the other of great prices would invigorate the whole adjection of the country as well as attent a contain remiser of electrical from invigorate the whole edgestion of the country as well as ething a certain number of clever lads. But, as is too often the case in our fragmentary methods of reform, this part of the eyestem broke down. The effect has been not to send a fulfer stream through the old channels, but to open a little side channel of edgestion, which is allowed to regulate itself. The object was, or should have been to obtain men of the widest and most thorough cultivation that the country could appeal a supply. the widest and most thorough cultivation that the country could supply. The actual result has been to set up a demand for the products of a new kind of industry which, if it is not tarrly open to all the papaler objections to learning, extensive sets up a very false and narrow standard of excellence. The obvious remedy suggested by the Reviewer is to establish a new Indian college which should do in a better way what was formerly done by Haileybury. The successful candidates, he thinks, should be brought together at Oxford or Cambridge, where they would be exposed to the influences of the best system of education which the country supplies. It would be premature to discuss a scheme of this kind before any definite proposal has been worked out. Many difficulties might easily be suggested. The lieviewer does not, for example, propose to touch the preliminary been worked out. Many difficulties might easily be suggested. The lieviewer does not, for example, propose to teach the preliminary education at all, though the evils of the present ylan are in great measure those which are inseparable from the mode in which candidates are prepared. No dealt, moreover, the jealouses of different Universities would cause obtacles upon which we must not dwell at present. We agree, however, that some such achaine would at least tend to remedy the evils which result from filling the ranks of the service with a number of men who have had no common a of training, and no tre of corporate feeling except such as is supplied by suffering at the hands of crammers.

PROSELYTISM IN RUSSIA.

LONG extract from the Grashdanane of St. Petersburg, mid A LONG extract from the Grashdamer of St. Petersburg, said to represent "the ingless and most influential circles at Court," was printed the other day in the letter of the James Correspondent at Berlin. It gives a curious account of the Correspondent at Berlin. It gives a curious account of the prenching of the trooped by the "modern English apostle," Lord Radstock, who has, it seems, for the present transferred his appritual summitmations from Exeter Hall to the Russian capital, where he has established the same sort of reputation as "apostle of the Cienteels" which preachers of a very different creed enjoy nearer home. It is no new thing indeed for the thir sex to be nearer home. It is no new thing indeed for the fair sex to be gried with itching ears, and the traths of the Gorgel, whether according to Rome or to Geneva, are apt to come with peculiar persuasiveness from aristocratic lips. Sight considerations would go a good way to explain what may be after all, as the Grashdenine go a good way to explain what may be after all, as the Grandswine supposes, a merely ephemeral success. There are however other causes, not far to seek, which may help to explain the religious serivalism at fit. Peterabury. Lord Radstock is not the first missionary, nor is his the only faith, that has greatly troubled the sensewhat engannt waters of Rastera Orthodoxy. And the very segan which so severely condemns the "erratic behave our of these enlightened ladies" supplies hints which to those who have any segmentatures with the Russian Church are sufficiently significant. But it will be only fair in the first place to hear what the Elembianies has to say about the matter. After deploring the

Protestant tendencies which have displayed themselves in some villages of Southern Russia, and the formation of a Protestant Propaganda at Berlin, the report proceeds as follows; the particular point being, it will be observed, that, unlike the early days of Christianity, it is only to neophytes of unimpeachably blue blood that the Gospel is in this case preached:—

Worse than this, there is Countess M., a Russian Orthodox lady, and the mother of four children, who the other day told Lord Radstock that she had only learnt to love Christ from his exposition of the Anglican doctrine; that the Greek Church was so cold and stiff, and that she only now knew what it was to be really a Christian. Princess G., another Russian Orthodox lady, and the mother of two children, after attending Lord Radstock's Bible class, has been heard to exclaim, "I only now know what the religion of Christ really is. It is Protestantism !" "Yes," added another Orthodox lady—Princess P.—"Protestantism is the only religion I ever understood. It is hased upon love, not upon rite and ceremony, as is ours." "My dear lord, O pray teach me how to love Christ. Tell me, my dear Lord Radstock, how to make the necessary and proper distinction between the love I feel for my husband and the love I owe to Christ." These words have recently fallen from the lips of Princess D., likewise an Orthodox lady and the mother of four children. The above few authentic utterances will give the reader an idea of the religious condition of St. Petersburg society early in the year 1874. Balls are forgotten, and fine dresses discarded, the fair owners having taken to loving Christ and receiving religious instruction from a modern English apostle. English apostle.

There is even, we are told, a predilection for Protestantism among the male portion of "our fashionable society." But it is to Countesses and Princesses that Lord Radstock's teaching chiefly commends itself. He evidently does not think much of "the Holy Eastern Church," for the object of his visit to St. Petersburg is expressly stated to be "to convert its inhabitants to Christianity." Since his arrival in the Russian capital he has received ten or twelve since his arrival in the Russian capital he has received ten or twolve invitations daily to discourse "in aristocratic saloons," and has also been preaching in the American Church both in French and English. And wherever he appears, in public or private, he is beset by ladies who "entreat him to teach them how to love Jesus." The special assemblies—we had almost said seances—held for this purpose are thus described by an eye-witness:-

At an early hour the room is filled to overflowing with princesses and countesses. They are all clad in black or gray, are accompanied by their little children, and hunger and thirst after the spiritual food they have come to receive. Lord Radstock first kneels down with his back to the assembly, entreating Christ to inspire him with fitting words. Then, rising and turning round, he says, "Let us pray," an injunction which is immediately obeyed by all present. After this he opens the Bible, reading the first text upon which his eye happens to fall, and commenting upon it in elequent and impressive language. The ladies are gradually excited to the highest pitch of religious enthusiasm. As they sit weeping before him, they resemble so many heathen women admitted to the first knowledge of Christ by the powerful teaching of St. Paul. The close of the discourse is marked by loud sobbings. The fair devotees rise from their sents, and crowding round the evangelist lord, thank him in passionate terms for showing them the way of salvation, and directing them and their children into the paths of peace. Every now and then it happens that one of the children present, startled by the contrast between the language of Lord Radstock and that of the Russian clergy, asks his mother whether it is necessary to attend the teachings of the Orthodox pastors at all, after this attractive experience of the foreigner's religiou. "Ah," she says, "you had better look to the dear lord for your future religious instruction." Such scenes are being enacted daily before our eyes.

The writer goes on to criticize the conduct of these Countesses and Princesses in no very complimentary terms. They would not, he thinks, be by any means ready to listen to the equally sincere and pious teaching of a poor unpretending Russian priest in shabby clothes, or even to admit him into their houses. They understand nothing whatever of the doctrine to which they listen so eagerly. They had no idea the day before Lord Radstock's arrival that they were "hungering and thirsting after Christ," and they will have forgotten all about him and his preachments a fortnight after he is gone. In short, they have simply transferred to this new apostle the enthusiasm they not long ago exhibited for Mr. Home, the Spiritualist. But what the writer thinks much more serious is that their conduct proves their ignorance of Orthodox doctrine and their open want of sympathy with their own Church. "If they were really Russian Orthodox ladies, they would not ask Lord Radstock to teach them his religion, but simply tell him that they are ready to co-operate with him in contributing to the approximation of the two Churches." After some comments on Lord Radstock's peculiar methods of propagandian, the The writer goes on to criticize the conduct of these Countesses ments on Lord Radstock's peculiar methods of propagandism, the writer again reverts to the contrast between him and the "poor, destitute, common Russian pope." These deserters, he says, will defend their apostasy by the old excuse that there are no will delend their apostasy by the old excuse that there are no powerful preachers among their own clergy, who are in fact only "coarse ignoramuses and vulgar drunkards." And he concludes by urging the clergy of St. Petersburg to ascend the pulpit, and "speak loud enough to be heard even beyond the walls of the sacred edifices," on behalf of the doctrines and rites of "a Church founded by Church Himself and destined to address for a Church founded edifices," on behalf of the doctrines and rites of "a Church founded by Christ Himself, and destined to endure for ever, whereas Lord Radstock's Church ceases to exist when he breathes his last." How far the Russian elergy may be willing or competent to profit by this advice we cannot undertake to say, but of its being far from superfluous there can be little doubt. It is perfectly true that the ignorance and vulgarity of the Russian "popes"—not to dwell here on graver charges—proves nothing against the doctrines they profess or the authority of their Church. But the female mind is not apt to be logical, and even laity of the sterner sex, and far removed from the refinements of aristocratic society, do not always take pains to distinguish socurately between the personal defiarits of their pastors and the marits of their creed. The well appears for apostasy is indeed a very old one in Russia, and after making full allowance for exaggression and calmany, it

is impossible to doubt that it rests on a solid basis of fact. is impossible to doubt that it rests on a solid basis of fact. The difficulty of gaining theoreughly trustworthy information on the subject arises from our informants being usually either Russian ecclesiastics, who naturally paint things in a rosy hue, or Latin missignaries who are likely to see the worst side of the rival communion and to take the most unfavourable view of what they do see. But still the general ignorance, and we fear it must be added the very prevalent insolviety, of the Russian priest-hood, are patent facts, and not difficult to account for. From its social and recognized position no Church has been savet so little hood, are patent facts, and not difficult to account for. From its social and geographical position no Church has been sayet so little influenced by the advancing wave of modern culture; and there is moreover a special ground in its peculiar constitution for that sharp. line of demarcation between the higher and lower ranks of the ministry which distinguishes it from all other episcopal communions. The compulsory marriage of the parochial clergy—for they are as strictly bound to marry before ordination as the Latin clergy are to remain single—makes it impossible for them ever to rise to the episcopate. The necessary consequence of this is that the bishops, who are bound to be celibates, are invariably taken from the religious orders, and therefore have no common antecedents or common sympathics with their diocessa clergy, whom they are apt to look down upon socially and intellectually, and to govern at best with formal strictness, if not with harshness and injustice. It is not easy to see how, under the existing system, njustice. It is not easy to see how, under the existing system,

injustice. It is not easy to see how, under the existing system, it could be otherwise.

What is chiefly remarkable about Lord Radstock's Russian apostolate is that it should be so quietly permitted; and we are inclined from this to suspect that the Government take much the same view of the movement as the Grashdanine, regarding it as a mere passing phase of fashionable excitement. Certainly Russia has not formerly been tolerant of assaults on the established faith, and, if we are not mistaken, apostasy from the Orthodox Church is still an offence punishable with banishment. The danger has not indeed usually come from the side of Protestantism. For centuries nast the Popes have laboured assiduously to gain a footing in indeed usually come from the side of Protestantism. For centuries past the Popes have laboured assiduously to gain a footing in Russia, and their overtures have been sternly repulsed by successive Czars or put aside with cold and inflexible politeness. Catharine II. indeed, with a kind of cynical generosity, like Frederick II. of Prussia, maintained the Jesuits in her dominions after their suppression by the Holy See, and for forty years under shelter of Russia they successfully defied the edicts of Rome till Pius VII. restored the Order in 1814. But they were strictly enjoined to confine their services to their co-religionists, and to abstain from all attenuts to make converts from the Orthodox sbatain from all attempts to make converts from the Orthodox Ohurch. It was to their persistent, though at first cautious and secret, evasion of this injunction that they owed their final expulsion from the country in 1820. At the beginning of this century the Russian Jesuits were under the generalship of one of the ablest men their order ever produced, Father Gruber. In direct contravention of the law they admitted into their schools children of other confessions, and even opened a pension for the sons of the native nobility, many of whom were converted by them. White Russia was however the main centre of their operations. They had a powerful patron in the famous Count Joseph de Maistre, who then represented Sardinia at the Court of St. Petersburg, and who through his friend Prince Galitzen, the Minister of Public Instruction, could always gain the ear of the Czar. His wife, the Princess Galitzen, heart of the Czar. His wife, the Princess Galitzen, became a convert in 1807, but took the precaution of being received into the Latin Church in Germany; about the same time the Princess Dolgorouky was received in Holland, and Prince Odoewski at St. Petersburg. But a greater commotion was caused by the conversion of the wife of Count Rostopchin, Governor-Governo of Mossow. She was a privately received by here Governor-General of Moscow. She was privately received by her Jesuit confessor, who was very angry with her—or, as he expressed it, "quite stupefied at her thoughtless conduct"—when, contrary to "quite stupefied at her thoughtless conduct"—when, contrary to his injunctions, she communicated the secret to her husband. In 1816 Count de Maistre was able to say:—"Conversions to our faith are very rapid, and strike one as much by the number of the converts as by their social rank. It is truly an admirable sight, for"—and here one is strongly reminded of Lord Radstock's fair disciples—"the conversions are chiefly among the highest orders of society." At last matters were brought to a crisis by the discovery that Prince Alexander California and the crisis by the discovery that Prince Alexander Galitzen, son of the Minister of Instruction, had been privately received by the Jesuits. The Emperor (Alexander I.) was very indignant, and in December, 1815, appeared an Imperial ukase denouncing their practices in no very gentle terms, and banishing them from the capital. De Maistre was accused by the Emperor, not without reason, of having a hand in some of these important conversions, and he soon afterwards left St. Petersburg. Finally, in March 1820, a fresh ukase was issued banishing the Jesuit Order from 1820, a fresh ukase was issued banishing the Jesuit Order from Patential to ukase was issued banishing the Jesuit Order from Russia altogether, and forbidding them under any pretext whatsoever to re-enter the Empire. The restriction, which has since then been adopted by Catholic States such as Bavaria, has never been removed. But the principle, or at least the practice, of toleration has advanced so rapidly during the last half contury that it might be difficult even for the Russian Government to enforce the prohibition of religious conversions in the present day with the same stringency as of old. We must confess, however, that, with every respect for the seal and sincerity of Lord Radstock, we should be a good deal serviced to learn that he had achieved even such a limited measure of successes as fell to the lot of the Jesuit missionaries who preceded him. If the Grandstocks is at all accurate in the description of those intestating accordances who assured as Radio Westings on the con-

and with the c

fortishle consciousness of being seved, and that there is no further need of going to church or receiving the Secrements," it is hardly uncharitable to surmise that such "centatic states" are not likely to be very permanent. At the same time, as it is always easier to suggest doubts than to satisfy them, the Orthodox belief of some of the rising generation may not improbably be shakes without their leving any other belief in particular to put in its place. How far welfare need not be discussed here, but it would hardly perhaps realize Lord Radstock's professed aim of converting the inhabitants of Russia to Christianity.

A PENNY SHOW.

ONDON now presents many attractions to visitors, and it has at least one advantage which should recommend it to those whe study to combine pleasure and economy. There is probably no other city where you can see so good a show for so absurdly small a charge. A devotee of cheap and simple enjoyments may find his ideal realised by an afternoon visit to Hyde Park. The entertainment which is there provided is accessible to every one and expense. ment which is there provided is accessible to every one and extremely inexpensive. The Park is open to all, and a stranger has only to walk in and make himself at home. For a penny he gets the use of a comfortable seat from which to view one of the most wonderful spectacles in the world, or, if luxuriously inclined, another penny will enable him to riot in the extravagance of an arm-chair. For several hours a stream of carriages flows up and down in front of him. All the greatest and grandest people in town come out in handsome carriages to contribute to his diversion, and put on their handsome carriages to contribute to his diversion, and put on their best clothes for the occasion. The, historian of the travels of the Best clothes for the occasion. The historian of the travels of the Shah of Persis has not yet completed the great work upon which he has been engaged since his return to his own country with his clirculations master, but the following passage has obtained direulation in an enterprising journal of Teheran, which has since been suppressed for its impertinent violation of State secrets. "In this country," says the learned scribe, speaking of England, "the Government does not consider it part of its duty to provide for the amusement of the people by keeping up opera-houses and theatres at great expense, as is the fashion in some other European countries, but the object is fully attained by the yoluntary efforts of private benevolence. A attained by the voluntary efforts of private benevolence. A peculiar kind of dramatic performance is given during several months of the year in one of the Royal palaces at Westminster, which is set apart for the purpose. The performance are divided which is set apart for the purpose. The performers are divided into two companies, each of which has a theatre of its own. The first is composed of the nobles, and the other of patriotic citizens who are willing to devote themselves to the recreation of their who are wining to devote themselves to the recreation of their fellow-countrymen. The performances take place on several nights a week during the season, and consist of recitations, which are cometimes accompanied by strange cries, and sometimes by a general humming, as if of many bees. None of these performers are paid; on the contrary, they not only give their time and services for nothing, but those who are not nobles have to spend a great deal of money in getting enrolled in the corps. Yet there are always a great many wenting to get in. Nothing indeed in more great deal of money in getting enrolled in the corps. Let there are always a great many wanting to get in. Nothing indeed is more wonderful in this country than the way in which persons of rank and wealth are not only willing, but eager, to sacrifice their private case and comfort in order to amuse the multitude. Another instance of this may be given. All persons having incomes of unpwards of 2,000% a year are expected, when resident in the capital, to appear daily in the principal park at certain fixed hours, and to exhibit their chariots, horses, servants, and gayest dresses, so that poorer persons, who can have none of these fine things for themselves. may enjoy the sight of them. It is clear that the themselves, may enjoy the sight of them. It is clear that the pleasure of such things must be in looking at and not in having, them. They are in fact a great expense and trouble to the possessors, and the parade in public every afternoon is in itself a severe infliction. The grandees have to drive very alowly, so that they may be well seen, and are stopped every few minutes by policemen and compelled as the stand still for the ways reweight the stand still for the ways reweight and the stand still for the ways reweight. to stand still for the more perfect gratification of public curiosity.

Thus, by a wise rule, the accumulation of wealth in the hands of the minority is made to minister to the contentment of the people, who have the pleasure of beholding the splendour of wealth while at the same time they are taught to commiserate the possessors who have to pay the penalty of being bound to exhibit it. The eadness on the faces of the people in carriages is accounted for by the depressing nature of the ordeal which they have to go through; yet it should be said that they perform the penance, if not cheerfully, yet dutifully; and even many persons whose incomes do not being them within the regulation seize the opportunity of making martyrs of themselves in this way. The Royal Family even are not exampted from the obligation of this national custom, and gratify the people by setting a good example to the aristocracy. The only expense the Government is put to for these exhibitions is in providing the Park, as in the other case it provides the theatre. No allowance is made to the performers out of the public fands. It is a strange proof of the perversity of human nature that objection should be taken to the use of the Park in this way by some of the very people for whose assumement the show is prothe minority is made to minister to the contentment of the peop by some of the very people for whose answement the show is pro-pided. Yet one Vernon Hisrourt, who, called himself 'friend of the youghs,' not long since complained of it. If the poor people in appriagre had cried out, it would have been more natural."

It is murcaly necessary to point out the errors into which the mother has fellen; but there can be no doubt that he has hit off

the aspect under which this strange coresnessy must necessarily present itself to the mind of an intelligent stranger. It is impossible for anybody not in the secret to conjecture that the people who daily drive up and down the same little strip of the Park derive any personal gratification from the exercise; and it is naturally assumed that it must be an obligation imposed, if not by law, at least by some custom with the force of law, or by a deep sense of religion. The procession has certainly all the solemnity of a function. The wearisome monotony of the scene; the same dusty trees, and dirty backs of houses, and grimy, tumble-down barracks, which have to be passed and repassed half-a-dozen or a dozen times in the course of daily duty; the funereal slowness of the pace, the jerky halts, the general jostle and overgrowding, everybody's pole in the back of somebody-alse's carriage—all help to keep up the idea of an imposed papanes. Indeed the downcast resignation of the victims, and the way in which they are ordered about by the police, might almost suggest the notion of a very superior sort of convicts having their penal servitude within doors-varied by a regulation airing under the charge of gaolers on horse-back. Mr. Orton and his friends at Millbank no doubt take their daily round in the grey stone-flagged yard, one behind another, in a dull, sleepy trot, in much the same spirit and with much the same mism. The police is of course an excellent force in its way, but it is perhaps employed a little too indiscriminately. On the day of the Prince of Wales's thanksgiving the inhabitants of London were startled and scandalized by seeing the Archbishop of Canterbury ignominously taken to St. Paul's in the custody of a mounted policeman. It appears that the working classes resent the intrusion of the police into the parks which they chiefly frequent; but it may perhaps be said that, if the upper classes choose to go about in a mob, they must expect to be treated like other mobs. Still it might be worth while to gi

As there is no law to compel anybody to drive in the Park, it must be supposed that those who do so have some object in view, and that object can hardly be their own pleasure. The motive, we suspect, must be sought in an overpowering sense of social duty, or perhaps in a morbid desire for social distinction. It is not overybody whose dinners are in the Morning Post or who can command tickets for Lady Blank's receptions. But anybody who likes can drive in the Park, and can get mixed up with great people, if only in a crowd and under the charge of the police. The only condition is that the carriage must be a private carriage, or must look like a private carriage, but there is no restriction as to style; and occasionally an aspiring butches or greengroeer may be seen—perhaps an omen of the future—jogging along with his missus and blooming family, in the spring-cart hitherto reserved for Sunday jaunts to rustic tap-rooms. At present, however, the small shopkeeper is content with his congenial obscurity. It is the large dealers who swamp the Ride. The statistics of the increase of the national wealth by leaps and bounds at first sight inspire one with a natural feeling of elation, but there is also a sad side to the picture. All this prosperity puts large fortunes into the pockets of people who dont know what on earth to do with it, and to whom, on account of the vain ambition it excites, it is only a misery and a snare. They were happy and honoured in their local sphere, but successful trade drifts them to town. They become eager for admission into society, but society except in its shady fringes is not to be taken by storm. The block in the Park represents the struggle for social existence. Anybody with a carriage can at least make a beginning there. And so the crush continues and the cry is still they come. Already carriagos are two or three lines deep on each side, and if things go on at the present rate, they will have to go over each other's heads. As it is, the scene has certainly attractions for poor philoso

THE NEW SWISS CONSTITUTION.

THE NEW SWISS CONSTITUTION.

INCRY one who has thought of such matters at all must have known some time back that the revised Swiss Constitution was accepted by a large majority both of the people and of the Cantons at the voting of April 19th. But the full force of the vote can be understood only by going through the returns from the several Cantons and the several parts of the Cantons, which have been somewhat slow in coming in. We have, first of all, the main fact that, while the scheme of revision in 1872 was rejected by a large majority of the Cantons and by a narrow majority of the people, the scheme of 1874 is carried by a large majority of the Cantons and by an overwhelming majority of the people. We see also that several Cantons have changed sides, and especially one large and one small, Vsud and Appenzell-ausser-rhoden. The one large and one small, Vsud and Appenzell-aussor-rhoden. The majority on the popular vote was so small in 1872, a majority of 5,411 among the 516,681 votes given, that a reversal of the vote of Appenzell-aussor-rhoden—if the Yeas in that one small Canton had been Nays and the Nays Yens—would have turned the scale; much more would the vote of Vaud. In 1872 Appenzell-aussermuch more would the vote of Vaud. In 1872 Appenzell-ausserrhoden had 8,921 Nays to 3,804 Yeas; now it has 9,858 Yeas to
2,040 Nays. In 1872 Vaud had 51,465 Nays to 3,318 Yeas; now
it has 25,692 Yeas to 18,076 Nays. The conversion of the amaller
Canton is more decided than that of the larger, but both are remarkable. And these are both Cantons when the Protestant Romance
Cantons: Appenzell-ausser-wholes stands along stands and the amaller
Cantons: Appenzell-ausser-wholes stands along stands are stands. Cantons; Appenzell-ausser-rhoden stands alone among the small German Cautons of the East in being at once Protestant and manufacturing. Glarus, otherwise resembling it, is much divided in religion. Glarus however has only repeated its former vote of Yea, while Appenzell-ausser-rhoden has turned right round. With Vand, the other Protestant Romance Cantons of Geneva and Nonthe châtel have also changed from Nay to Yea, and Graubunden, with its mixture of religion and languages, has made the same change also. On the other hand, no Canton which in 1872 voted Yea has voted Nay in 1874. Nor are the majorities very widely different from what they were then. In Zurich, where the Yeas had before a very large majority, they now have an overwhelming one; in Freiburg, on the other hand, the former large majority of Nays is now larger still; but it is only in Ticino that there seems to have been any large change of opinion in a negative direction. This Canton, which rejected the scheme of 1872 by the not very decisive majority of 6,902 to 5,871, now rejects it by 12,200 to 6,130; it is plain then that in Ticino several thousand people who did not vote at all in 1872 have voted Nay in 1874. St. Gallen, which in 1872 accepted revision by a mere shave, 22,534 to 22,505, has now a majority of nearly 7,000 in its favour. The other Cantons remain much as they were. The three primitive Cantons, with Wallis and Appensell-inner-sheden, are as set against change as ever, while the majority of Nays is only slightly lessened in Zug, and rather more so in Lusern. Solothern remains, as before, the only decidedly Catholic Canton which is strongly in favour of change.

The inference from all this is that, as we histed when speaking of these matters in former articles, the accidental union of quite distinct, and even otherwise hostile, parties which threw out the scheme of 1872 has now been dissolved. In 1872 Uri, Vand, and Appensell-ausser-rhoden pulled together; new Uri stays where it was, while Vand and Appensell-ausser-rhoden have gone over to the other side. That is to say, the Remance element which feared being swallowed up by a German majority is now satisfied; the small Canton which leaved being swallowed up by the large ones is now satisfied; but the strongly Catholic Cantons which, whatever else they feared, feared mainly for their religion, are now as little astisfied as ever. Nor is this wonderful, for the changes yean the two schemes are all made to meet the objections both of the Remanco Cantons and of the small Cantons as such. Nothing has been done to meet the objections of the purely Catholic party; indeed the scheme of 1874 has been made distinctly more offensive to them than the scheme of 1872 was. The accidental alliance has therefore fallen asunder; the parties to which concessions have been made have accepted those concessions as a fair compromise, but the party to which no concessions have been made, but to which the new proposals were studiously made more distasteful than the old ones, naturally remains more

hostile than ever.

It is not easy to tell whether much difference would have been ade if, as we have always maintained to be the only fair com the proposals on different subjects had been voted on separately, instead of being all put to a single vote of Yea or Nay. As it was, the sealous Oxtholic who thought his religion was in danger was constrained to vote against various measures an other subjects which he might possibly have voted for if they had been put by themselves. So the man who was bent on judicial, military, or themselves. So the man who was bent on judicial, military, or strictly constitutional changes, could carry them only by also voting for an ecclesiantical logislation which, if Ostbolic, he might think galling to his own religion, and which, if Eretcetant, it is just possible that he might think unfair to the religion of his neighbour. Or again, among the provisions which do not dead with ecclesiantical matters, a man who was anxious to give a better position to the final matters, a man who was anxious to give a better position to the final matters, a man who was anxious to give a better position to the final matters, a man who was anxious to give a better position to the final matters, in the different proposals had been put, as the limited in, articlesia, instead of its globo, some parts of the schools might have hear carried and others thrown out. But the authors of the newton have been when their generation; they have played

for a high stake, and they have wen, and there can be little doubt that in the present form it has been on the ecclesiasital question the more than on any other that the voting has now turned. The strug-gle has been one phase of the great struggle which is going on in so many places at once. The Chibblian have won another victory; for the experience of Pisa and Siens teaches us that we may sp of Ghibelius in a commonwealth, and there is no place where should more naturally look for Guelfs than at Altdoff. And is as everywhere else where the same struggle is raging, we are use with the same difficulties, with the same arguments on opposite sides, which make us fully understand the course taken by both parties, but which hinder us from fully sympathizing with either. We can fully understand how the recent attitude of the Roman Church, with its new dogmas and all the rest of its late doings, has called forth against itself a thoroughly hostile spirit in every country where its presentance are at all prominent, or our with any probability be booked on as dangerous. The Romanism of the propositive so something quite different from the Romanism with which men have had to deal at any earlier time. When, by an analogy which is so tempting that there is no resisting it, we call up again the old familiar names of Guelis and Ghibelina, we must remember the wide difference between the strangle in those days and the strangle in these. The same distinction comes in which we pointed out when we were speaking of the dialike which modern Roman Catholics have to large portions of mediaval literature The old writers could feeely expose me corruptions at in their days, because there were no heretics looking on. They could write, without harm to their arthodoxy, what the modern Roman Catholic, living in a wilderness of hereey, The old writers could freely expess the corruptions of the Church thinks it dangerous for the youth of his communion to read, it is with the old struggles between the ecclesiastical and civil powers. They were, after all, domestic quarrels; they were disputes within a single religious communion; however galless or sacrilegious this or that King might be, he was still an undustrated and not a more stranger. Henry the Fourth, and the same all and struggless of the struggless of l'rederick the Second, would have indignantly denied any charge of heterodox belief. Or even if an Emperor like Frederick could be personally charged with hereay, he was a heretic all by himself; he was not a member and a chief of an heretical communion. The struggle of the one true Church against heretical powers, whether those powers take the form of a Protestant Emperor of a Protestant centon, is something quite different from the struggles of the old time. The Pope and the Emperor might dispute as to of the old time. The Pope and the Emperor might dispute as to the limits of their respective authority; but the Emperor had nowish whelly to get rid of the Pope, nor had the Pope any wish wholly to get rid of the Emperor. As things are now, each side may, as a matter either of principle or of expediency, be civil and tolerant to the other; but each side in its heart would be better. tolerant to the other; but each side in its heart would be better pleased if the other were not there at all. For the true Church to have to submit to have passed by an heretical Legislature is in some respects more, and in some respects less, galling than to have to submit to the same laws if passed by an orthodox Legislature. But at all-events the two cases are quite different. The Popes still keep up a power of miling which is by no means contemptible; still Pius the Ninth does not rail so fiercely at the Emperor William as Hildebrand miled at Lienty the Fourth. The difference is of course the difference between the undutiful son and the stranger. But the war with the the undutiful son and the stranger. But the war with the stranger is, after all, the more steadly. The defenders of the new Swiss legislation rater with pride to the fact that the very new Swies legislation rator with pride to the fact that the way earliest piece of Federal legislation was a law to restrain the ecclesiastical power, namely the famous Pfafforbrief of 1330. But then that was the act of a body all whose members belonged to one communion. Orthodox Zurich and arthodox Uri might agree to act in common to bridle their respective priests, but it is quite another thing when orthodox Uri is called on to bridle its priests at the bidding of heretical Zurich. We can quite understand how a Protestant mejority, looking at the Roman Chamb, show all in the form which it has lately taken, as a thing which it would cladly get rid of if the received principles of telegration would let. all in the form which it has lately taken, as a thing which it would gladly get rid of if the received principles of toleration would let it, may be tempted to go as mear to the edge of presecution as decency would allow. We can also understand how a Cathelic body may be inclined to fight to the death against laws ferred agon it by a Protestant majority, while, if there were no such thing as a Protestant in Europe, it might very likely be inclined to exact the same laws for itself.

the same laws for itself.

The struggle is in some scot analogous to the old struggle, but sircumstances have been constantly changing; there was first the great change of the Reformation, the division of Western Europe into two or more apparate theological bodies, and every event since has tended to change the circumstances of the struggle meter and more. In a hundle of Swiss papers which we have just been tanning ever we have to change the eisemetances of the struggle more and more, hundle of fewiss papers which we have just been turning over we lighted on an article in the Journal de Genève of April 12, we foreibly ests forth the difference between the ald Galliem Catlicism of France and the motion Ultramontanian. Gallies was something national; religious and actional feeling were into one; the Galliesn was a Catholic, but his Ontholicism tempered by the fact of his being a Franchmen. A whole we of events for every year tended to not Chanch and State of a in opposition to one another. The Chanch should be in opposition to one another. The Chanch should absorb the Ultramoutane. At this moment the tendency in France is other way, but shouldness and the France and the few the districtions for the control of the change of the control of the con

college season bears helped to give the strength a new shameter, many specially in Gloran part of the strength of the rule parasited. Ching season the season of the Rectardard religion, the strength of the strength of the Rectardard religion, it make the season of the Rectardard religion, it make the season of the Rectardard religion, the catholic power which forbade them might meet together in a common list to discuss the many might meet together in a common list of the religion. Each might agree to leave the other to settle the internal affairs of his own turnitary as he thought good. But as the mal principles of tolerations have advanced—as man have found out that religious freedom means the right of each min to prestice his own religion, not the right of each prince and each State to enforce their own religion on all their subjects—and as the separate States which make up Germany and Systemics there we have growing closer together, these two causes have combined whelly to upset the former state of things. It was simple justice to enforce toleration for the Catholic at Barn and for the Protestant at Lauren. But from this the process is easy to making common ecclasiastical laws for the whole Swins Coufoleration and for the whole German Empire, and it can hardly fail but that such laws should press on the Catholica in a way in which they do not press on the Protestants. There is the neverfalling difficulty that the Catholic does, after all, hold himself bound to an obedience of some kind or other to a power external to his own country. We cannot think that it is dignified for a Federal Constitution to talk about "resisting the encroachments of the ecclasiastical power." The law ought to be strong enough to assert itself in practice without having in this way to assert itself in words. We shall look with great anxiety to the result of this new legislation. It may be a more sentimantal feeling, but we cannot help regretting that, from whatever cause or with whatever necessity, another blow has been dealt to the

NATIONAL BEVERAGES:

IN the discussion on the Budget the other day Mr. Orr Ewing, the member for Dumbartonshire, raised the delicate question of national beverages. According to Mr. Ewing, the Scotch have been much maligned in the matter of intemperance. It is not the habit of the lower orders to recreate themselves with dramdrinking, least of all on Sundays, when profane appearances in public are discouraged. On the contrary, they are merely butrayed into the excessive use of stimulants on special occasions, when they are swept off their legs in a genial flow of good fellowship, and the inherent sprightliness of their nature gets the better of them. On occasions like these they are demonstrative, Mr. Ewing admits, which we take to be a polite cuphemism for getting quarrelsome in their cups, referring arguments to the ordeal of battle,
or knocking their boon companious on the head in playful exuberance of spirit. The English, on the other hand, perpetually
beset themselves. From morn to dewy eve and into the small
hours they are always drenching their muddled brains with muddy hours they are always drenching their muddled brains with muddy and adultarized als. Consequently our English clodhoppers and artisans are altogether wanting in French esprit—and, we suppose, in Scotch cost also—and there is as little of the flow of soni as of the feast of reason in our city public-houses and village bearshops. We fear there is too much truth in Mr. Ewing's estimate of our national habit and its consequences. Unquestionably Englishmen drink a great deal more beer than is good for them, even when their drink is pure malt and hops, which it seldom is. I was fancy, Mr. Ewing's statistics notwithstanding, that many unprejudiced Scotchmen will be slow to recomize the nicture of his we fancy, Mr. Ewing's statistics notwithstanding, that many unprejudiced Scotchmen will be slow to recognize the picture of his countrymen's habits which he paints in such rosy colours. In the rural districts of Scottand, which are often sparsely settled, drink is generally heard to come by. When a man must wind up the labours of the day by walking three or four miles to a public-house, he will naturally heaitate. If he is as prudent as the Scotch are supposed to be, the price of the luxury will act as an additional deterrent, for a gill of whicky costs at least twice as much as a put of been, and has the disadvantage of being disposed of far more quickly. But in Scotland, as elsewhere, it all resolves itself into a question of temptation; and when the temptation is brought question of temptation; and when the temptation is brought tchman's door, even his stemer nature is usually too feeble to a Scotchman's door, even his etermer nature is usually too feeble to maist it. The country inns, as Mr. Ewing implies, may do but amoderate local business, except perhaps on Saturday nights. The host may have to she out his moones by the cultivation of his cases, or rely on the patronage of tramps and passing carriers. But lack at what goes on in the villages, and still more in the towns. In the villages, the rivel public-houses drive a trade from week's and to weak's east which must be extremely satisfactory to their embryasining proprietors; while in the crowded quarter of the great cities, in the Gallawagate of Glasgow and the Channesto and Cownets of Edinburgh, the number of the spiritgreat cities, in the compute of Edinburgh, the number of the spiritis the sorrow and seemdal of philanthropists. There are
shops for almost every class. There are the drinkingor class and well-to-do tradesman which conciliate popular shops for element every chine. There are the or clerks and well-to-do tradessmen which concilis so of descruss by the plates of sandwiches are counters. These are the manutricious catal to popular gildi

and entitions the resident debaushess of both senses by their flushy extenctions. There are the old-Rebishest publishins insurance disaly lighted and unpresenting in their severs simplified, which studiously respect old traditions and the testes of the respectable members of the community. These are chiefly fragmented by carnest drinkers who fiddle or inturients themselves with solution, regularity, being for the most part punctual as clockwork in their habits. Leatly there are the inflamous "laigh cellars," to which you descend by a flight of greesy steps from the prevenent; sundaughterances pandemonia, the haunts of the unfortunate cutomic subtarrances pandemonia, the haunts of the unfortunate cutomic subtarrances pandemonia, the haunts of the unfortunate cutomic in the day-time the doors of these days keep moving passity constantly on their hinges, although where the ragged, happend customers collect the coppers they squander there is a myssery which is very difficult to fathom. But in the evenings, and especially on the Saturday evenings, they are positively overflowing with seething crowd who seem to revel in the fattle atmosphase; as very likely they do, for the currents of warm air that set up from the open door are laden with the sickening funes of whisky.

We fear then that the Scotch can hardly pride themselves pharissically on exceptional sobriety, and indeed we have never heard that they did. On the centrary, we know that their lamporate in any other lamporates and content of seambles are always loud in their lamporates.

We fear then that the Scotch can hardly pride themselves, wharisaically on exceptional sobriety, and indeed we have never heard that they did. On the centrary, we know that their clergy in synods and general assemblies are always loud in their lamentations over the crying sin of the people. We have understood that comparatively steady mechanics, excellent workmen five days in the week, are in the habit of devoting Sunday to debauch and consecrating the Monday to repose from their Sahbath pleasures. We remember the joynal traditions of the days when winsflowed in freely from France and small stills were running all over the country; we have read the stories in Dean Ramesy's Recollections of the Gargantnan banquets of Forfarshire lairds, confirmed the other day in the amusing Memoirs of Archibabled Constable. We know that where the laird used to breach his Bordeaux, the farmer and minister were generous of their toddy; that the steaming beverage was soductive, and its ingredients reasonably cheap; that every casual visit came as a godsoud, and an excuse for prolonged and hospitable convivality. We are told that to this day at curling client each strong-built enthusiast in the rousing game; and what the strength of the glasses may be as the evening draws on is a secret only known to the mixer. Keepers, gillies, guides, and beatmen, the class of Celts who get their living by vigorous exercise in the mountain air, can swallow down with almost absolute impunity any quantity of spirits that is likely to be offered them. The people, in short, drink freely; but, notwithstanding the potency of their spirits and the depth of their potations, they are relatively no worse behaved than their neighbours. Nature, which generally orders things wisely, arranges that the drink of a people shall be tempered to them by their constitutions and their climate. The only difficulty she seems to have is in providing anything sufficiently weak to suit excitable Southorn temperaments.

There will be excess everywhere, with its invitable consequences; but, as a rule, free drinking in Northern latitudes goes forward overywhere in a decorous and matter-of-fact fishion. Scandinavians and Russians, for instance, inhorit the more than Hemeric drinking powers of their ancestors, and can beast of even stronger heads than Scotchman. Like young Bailey in Martin Chumbesis, the more they drink, the fuller of good nature they become. Dutchmen nurtured in the North Sea Togs are perfect sand-beds in the way of absorption, and, sitting in their summer-houses over their weed-grown canals, will consume any number of glasses of schiedam without quickening their stagmant pulses. Every one knows that a German's capacity for beer-drinking is only to be gauged by the condition of his purse, although beer, in Havaria at least, has a good deal of substance in it. Yet in all these countries crimes of violence are rare, and public decorum is soldom very grossly outraged. It is very different in Southern France, and still more in Southern Italy. Take, for instance, the secons that may be witnessed any day in the Outerias outside the gates of Rome, or under the hanging bush displayed corredors in the long street of villages that skirts the fay of Naples. The sum is heating down on the burning ground till you can see the warm sir dancing and flickneing in the sambline. A group of swarthy men, their loose blooses hanging back from their naked cheets, are refreshing themselves round a table under a pent-house in the open air. They are excellent friends as yet, although you might easily mistake them for mortal enemies if you did not understand the ways of the country. They are bending across and grimning in each other's faces with their not teeth, as they brandish their arms wildly about and bring their cleanies if you did not understand the ways of the country. They are bending across and grimlammable, and thew income and sunshine are working on their brises. Anything weaker than the purple earth-flavoured fluid beione them

agreeable to its object, and he retorts with another still more offensive. The violence of the gesticulations increases, if possible; the voices rise to screams and yells; the people in the neighbourhood, if there are any, gather around; the presence of onlookers foments the quarrel; every man of course has his knife ready to his hand; the knives are out and stabs interchanged before any one cares to interpose; there is maining, if not murder, and the foundation is laid for a blood feud between families. Scenes like this are of constant occurrence, as the records of Italian police-courts show, while a great deal of bloodshed goes not only unpunished but unrecorded; and they rather incline one to the conclusion that nature acts kindly and ensibly in obstructing the agricultural development of Italy. the vineyards are neglected, the wines are made with shameful carelessness, and consequently there is no possibility of keeping them till they acquire decent strength and flavour. If they were made much more heady than they are, these Southern paradises would be depopulated by the passions of the people.

Nature usually works wisely if we leave well alone; but every now and then civilization, inspired by cupidity and the spirit of commerce, steps in to disturb her arrangements. When a race of troublesome aborigines obstructs the course of business and the spread of white colonization, if you wish to get rid of them, you need only supply them with a beverage that was never intended for them or their them with a beverage that was never intended for them or their climate. Then the process of extermination will proceed apace, and you will do a brisk trade in the meantime, for they will pay any price for the seductive poison. Had it not been for the serviceable agency of spirits, we should have had a great deal more trouble with the "black fellows" in Australia, while the Maoris of New Zealand would in all probability still have been keeping the field against us. As for the Americans, with their accustomed shrewdness they have always appreciated a judicious development of the liquor trade as a national blessing, and have confined any earnest attempts at enforcing the liquor laws to the tranquil States on the Atlantic seaboard. Now that the relics of the Indian tribes are being swept up into small settlements, the authorities begin to reconsider, as they well may, the morality of a promiscuous trade in fire-water. fire-water.

TWO STRANGE STORIES.

TWO French steamers belonging to the same Company have been abandoned at sea under circumstances which scarcely seem to have justified that extreme step. The captain of one of these steamers, the Amérique, has published a report, in which, after describing the lowering sky, the furious wind, and the sea terrible to witness, he says that the fact became evident that the after describing the lowering sky, the furious wind, and the sea terrible to witness, he says that the fact became evident that the ship had a leak, and it was assuming dangerous proportions. The water continued to gain, and all hope of saving the ship was gone, so he assembled his officers, and all decided to abandon her. Fortunately three ships were in sight, and to these the passengers and crew were transferred. The captain and the chief engineer were the last to go, and before departing they took a final and rapid survey of the sinking ship. "The catastrophe was fast approaching." The captain was landed by the ship which took him on board at Brest, and there he has doubtless learned that the catastrophe did not arrive. In fact the sinking ship did not sink, but was found floating and derelict, and was boarded and carried into l'lymouth. It is not often in these quiet times that anything like a prize is met at sea, and the salvage of a large steamer must amount to a considerable sum. In the other steamer, the Europe, a leak was discovered soon after leaving Brest, and the heavy strain of stormy seas increased it. In this case also help was near. A safe transfer of passengers and crew was effected to the steamship Greece, which carried them to New York, while a salvage crew went on board the Europe had been certain that she would sink, but a new commander for her was easily found among the officers of the Greece. It is indeed alleged by the Franch captain that he wished to mander for her was easily found among the officers of the Greece. It is indeed alleged by the French captain that he wished to return to his ship and was prevented, and it may be that all the circumstances of this abandonment will be judicially investigated. We shall not hastily conclude that France has ceased to produce deemed impracticable by Frenchmen has been undertaken by Englishmen or Americans. If this kind of thing goes on, the whole of our seaside population will do nothing else but look out for salvage. A Deal boat would cruise for a year on the chance of the c meeting a fine steamer derelict, and we cannot help thinking that this steamer's crew were safer on board of her than are the crew of a coaster in their ordinary fluty of carrying coal or stone. A captain in charge of passengers has anxious work, and he may do well to remove them at the earliest moment from a position of unusual risk. But it is a new thing that he and his crew should quit their ship because there happens to be another ship at hand to receive them. If personal safety is to be the first consideration, it might be better not to go to sea at all.

not to go to sea at all.

The attempt of the salvage crew to carry the Europe into Queenstown failed, and they were taken out of her by another steamer, and left her to her fate. If she has perished, as appears probable, the resolution which is imputed to her captain to abandon her would be to a great extent justified, but he insists that that resolution was never definitely adopted. He charges the captain of the Greece with a new form of piracy. His passengers and crew, as well as himself, had got on board the Greece in the evening, and next morning, when he desired to return to her, he was nearlify mashed back, and refused permission to return. Several of

his officers were willing to return with him, but were prevented. The statements of the passengers of the Europe show that they believed she was sinking before help appeared, and they considered themselves fortunate to be put on board the Griece as they stood, although afterwards they complained that their baggage had not been saved. If it be true that the ship had been lengthened, and thus weakened, the circumstance will not restore confidence in the unlucky Company which owned her. She was built in temperatments, so that a leak might only affect one of them; but his fortunately this was the central compartment, which contained her boilers. It begins to be quite a common incident of the tradic between France and America that passengers should suddenly beboilers. It begins to be quite a common incident of the traffic between France and America that passengers should suddenly be told to prepare for death unless help appears. There are so many ships at sea, that help usually does appear, but it seems scarcely necessary that a voyage across the Atlantic should be prolific in thrilling adventures. A strange recklessness seems to prevail both in equipping and managing these French steamers. The Burges carried a valuable cargo, including a large quantity of champague, and if the salvage crew had brought her into port, and had sustained their claim at law, their fortunes would have been sade. Putting aside the question whether the French captain voluntarily surrendered the task to them, one cannot but applied the gallantry surrendered the task to them, one cannot but applied the gallantry of their undertaking. They were not far from mid ocean when they went on board, and they doubtless put her head toward the east went on board, and they doubtiess put her head toward the east because the prevailing heavy gales were westerly. It is a pity that the bold attempt did not succeed, both as an interesting experiment in seamanship, and because it would doubtless have been followed by an interesting lawsuit. But as the attempt failed, and the ship has probably perished, there is perhaps hardly sufficient motive for trying the question between the French captain and the alleged salvors. It appears that the French crew numbered 150, whereas the salvage crew numbered only twenty-two; and if there were a the salvage crew numbered only twenty-two; and it there were a chance of saving the ship, it might have been better to employ more hands upon the work—that is, if their hearts would have been in it. The salvage crew took possession of the Europe on 3rd April, and abandoned her on the 6th. They were rescued by the Egypt, a steamer belonging to the same Company that owned their own ship the Greece. It is a little confusing to have to deal with several ships all named after continents and countries. For the sake of clearness we may notice that the Amérique was abandoned on her way to Europe, and the Europe on her way to doned on her way to Europe, and the Europe on her way to America. The crew and passengers of the Europe were saved by the Greece, and the salvage crew of the Greece were taken from the

America. The crew and passengers
the Greece, and the salvage crew of the Greece were taken from the
sinking Europe by the Egypt.

Either of these two events would be in itself surprising, but the
occurrence of both within a fortnight is little short of marvellous.
The Europe received a salvage crew on the 3rd inst., and the
Amérique was abandoned on the 14th. As the attempt to save
the former was given up, we may assume that it was from the outset hopeless. But the latter is or was lately lying in Plymouth
Harbour, apparently in tolerable condition, and perhaps by this
time she may have departed for France. The townsmen of
Plymouth have heard many strange stories told by sailors, but
it must be a long time since they listened to anything more
surprising than the log of the steamship Spray. Being in
company with the barque Auburn, on her way to the Mediterranean, she found rolling among the waves a fine Atlantic
steamer with a signal of distress flying, and no signs of life or
management. The wind was blowing a gale, and with great difficulty she was boarded. She had evidently been abandoned by the
passengers and crew in hurry and confusion. Her engines were passengers and crew in hurry and confusion. Her engines were perfect, but her fires had been drowned out, and over eight feet of water was found in her engine-room. Upon examination of the hull it was thought that if the weather moderated the vessel could hull it was thought that if the weather moderated the vessel could be saved. Accordingly the Spray took her in tow, and made for Brest, which was about one hundred miles distant. The Auburn left two men to help the salvors, and proceeded on her voyage. Another steamer afterwards appeared, and gave assistance. The wind having shifted and the sea moderated, the course was changed for Plymouth, where the prize was safely anchored.

One cannot help inferring that, if the French captain and his grow had attack to their thin they would have performed no process.

One cannot help interring that, it the French captain and macrew had stuck to their ship, they would have performed no very dangerous act of duty. Help would have almost surely come to them if they had needed it, as is shown by the fact that the deserted Amérique was found by the Spray and the Spray was afterwards joined by another steamer. The occurrences immediately before the abandonment of the Amérique have been described by before the abandonment of the Amerique nave been described by her passengers and captain, and it appears that, as might have been expected from Frenchmen, they quitted their ship with a grace-and dignity which the Gods might have admired if they had that make them busy in making a gale of wind. We not at that moment been busy in making a gale of wind. We may admit that Englishmen would not have made such an elemay admit that Englishmen would not have made such an elegant exit, for this, among other reasons, that they would have stayed on board. "Save your life and lose your ship" is not as principle upon which anything great is ever likely to be done at sea. An early navigator would probably have admonished this sea. An early navigator would probably have admonished this French crew in some such terms as Frederick of Prussia used to runaway soldiers after he had subdued his own early impulsationard flight. "Vile refuse of accumdrels," said he, "do you want then to live for ever?" It must, however, he a great comsolation to this French captain to remember that he called his passengers on deck and hade them put on their life-balts and show their coolness and courage. Indeed, the leading actor at a summitted these trying circumstances. The captain maged the whole of the company on the bulwarks in the order in which they were to

the women and children first, the male pessengers next, and then the crew. Then the beats were lowered, and with great danger and difficulty the passengers were trar ferred to the three ships which had fortunately come up to their rescue. A pilot of Brest exhibited in the performance of this duty "a spectacle of sublime here, m." The captain saw all the people under his charge put into the people in the charge put into the people in the people with the people of the contract here, and in the morning she had disappeared. All her officers believed that she had foundered, and it must have astonished them to learn that she had found her way to Plymouth, and that them to learn that she had found her way to Plymouth, and that her builders had examined her, and declared that the damage done to her was very small indeed. This ship is like the hospital patient who, after having his time of decease duly calculated by

patient who, after having his time of decease duly calculated by the doctors for the instruction of their pupils, had the audacity to become better, and declined to die until it might please Heaven. It is only lately that another ship belonging to this unlucky Company, the Fille du Havre, came into disastrous collision with a sailing ship under circumstances which only French eyes could view as otherwise than discreditable to the steamer's management. In that case also a number of passengers were suddenly called from security to face, apparently, instant death. Of course the Company to whom all these things occur may be only unlucky, like the naval officer who was three times shipwrecked with total loss. Notwithstanding his approved skill and courage, the Admiralty could scarcely be blamed for being shy of giving him a fourth ship.

THE ROYAL ACADEMY.

A GAIN we have to announce a pleasing exhibition of average excellence, and no more. The old stagers play their accustomed parts indifferently well; the worst pictures again come as a matter of course from Academicians and Associates whose waning reputation is allowed to throw into shade the rising talent of the day. Still, when full allowance has been made for the injustice incident to vested interests, we readily admit that the game is afterwards played out among the outsiders with a tolerably even hand. Doubtless here and there cruel deeds have been done in the way of thrusting to the sky pictures which deserve to be seen on the horizon level, yet we are willing to admit that for the most part the Academy is so far awake to its own interests as to make the best show out of the wares submitted to its choice. The Council has this year at all events opened the door of admission more widely than ever it did before. When Burlington House was first has this year at all events opened the door of admission more widely than ever it did before. When Burlington House was first taken possession of, the idea obtained favour that the Exhibition should be kept select, choice, and proportionably exclusive. Accordingly, in the year 1869 the number of works entered in Catalogue was only 1,320, in 1870 the total sank to 1,229, and in 1,523; last season the numbers touched 1,600; and now a climax is reached at 1,614, the greatest number ever accommodated. These figures show an increase in the works exhibited of twenty-three per cent, since the opening of the present Galleries in 1869. Opinions are naturally divided both within and without the Academy as to the advantage or otherwise of the more liberal course now adopted. The notion for the moment uppermost is that a place in the Academy, even on the worst of terms, is a privilege—in other words, that admission is better than exclusion. But when experts differ, who shall decide? Yet the last experimental measure now before us determines at least three points—(1st) that the extra pictures placed at the cornice cannot be seen; (2nd) that they are useful as masses of colour and generally as wall-decorations, especially in the absence of a single scrap of drapery; (3rd) that, strange to say, the average quality of the Exhibition does not suffer. In fact the present collection can only be rightly estimated or charitably excused under the law of averages. There are few surprises no accountered declarate of averages. There are few surprises, no exceptional flashes of genius; the general level, in short, ranges from a little below to a little above that modest mediocrity in which the Academy plays, as its peculiar privilege, the first fiddle. And yet, taken altogether, things are so well managed that the present Exhibition can scarcely fail of the success of its predecessors.

Seldom, if ever, have more forces been brought into the field, and the statistics presented by the muster-roll show some points of interest which it may be worth while to register. It is true that the whole company of Honorary Foreign Academicians, including M. Gallait, M. Gérôme, and M. Meissonier, with three besides, either shirk their duties or despise their privileges. And as these distinguished were here. either shirk their duties or despise their privileges. And as these distinguished members make themselves over successive years conspicuous chiefly by their absence, we venture to suggest that the time is come when more zealous men should be appointed to reign in their stead. The competitors are many, as the contributions by M. Israels, M. Tidemand, M. Frère, and others prove. As for our English members, they are but too eager to insist on their privileges. Of forty Academicians and twenty Associates, the only absentees of consequence are Mr. Cooke, Mr. Goodall, Mr. Richmond, and Mr. Frederick Walker. From within the Academy 52 artists produce 167 works, and from 911 outsiders come a total of no less than 1,457 products. These figures speak volumes. On the one side it has been urged that the Academy owes its success to the outsiders, on the other that the Academy ages lips success to the outsiders, on the other that the Academy ages lips success to the interest of artists at large by the free

admission of talent wherever found. Each alternative finds support in the crowded galleries to be thrown open to the public on Monday next.

Monday next.

The Academy this year will be wanting in salient points, yet several artists have been liberal in their favours—some too liberal. Mr. Millais exhibits seven pictures, one or two of which might have been spared; Sir Francis Grant has of course been prolifer, but he is kindly content with six portraits only; Mr. Frith, who this year has a religious fit upon him, is fortunately able to say his say within the limit of five compositions—processional, spiritual, and other; Mr. Watts has also five pictures; Mr. Leighton four; and Mr. Poynter, we regret to find, only one. Yet, us we have said, the efforts of genius which can arouse a sensation come few and far between. Among Academicians, Mr. Millais undoubtedly must again be the most loudly talked of, Mr. Leighton the most quietly commended, while among the outsiders favour and possibly improved position will be won by Mr. W. B. Richmond, Mr. Murcus Stone, Mr. Alma Tadema, Mr. Brett, Mr. Briton Rivière, Mr. Archer, Mr. Leader, Mr. Eyre Grows, Mr. Ouless, Mr. Peter Graham, Mr. MacWhirter, Mr. H. Hardy, Mr. Armstrong, Mr. Albert Moore, Mr. Henry Moore, and others. It is evident then that the lists from which the next Associates may be elected are more than sufficiently stocked with candidates.

be elected are more than sufficiently stocked with candidates.

A glance at the rooms in succession will bring into view the pictures which seize the eye on a first visit.

Galleries Nos. 1 and returns which seize the eye on a first visit. Galleries Nos. I and 2 open rather flatly from the preponderance of poor or felse products; indeed the first room is saved from flasco chiefly by two landscapes by Mr. Millais, "Scotch Firs" (68), and "Winter Fuel" (75). We have at present only space to say that these bold and unflinching yet conscientious studies from nature have little of the slightness and incompleteness of former and more experimental efforts. On the whole, these companion landscapes are the most remarkable products of the year. The other pictures best worthy of note are "Our Northern Walls" (20), by Mr. P. Graham; "Under the Lee of a Rock" (26), by Mr. Hook, R.A.; and portrait of the "Rev. James Martineau" (51), by Mr. Watts, R.A. On entering the second Gallery the eye is assaulted by a well-meant monstrosity, one of the few aspirations here to be seen in the way of Christian art. Mr. Horsley's "Healing Mercies of Christ" (128), an incongruous compound of traditional styles and common nature, will find, we are informed, a resting place in the chapel of St. Thomas's Hospital, in accordance with the wish of the late Sir William Tite. If the modical staff of the Hospital have no better art at their command their putients must Hospital have no better art at their command their patients must suffer cruelly. Among other pictures which remain in the memory are "My Lady is a Widow, and Childless" (106), by Mr. Marcus Stone; "Summer Noon in the Scilly Islos" (139), by Mr. Brett; "Calling the Roll after an Engagement, Crimea" (142), by Mrss E. Thompson, and the "Picture Gallery" (157), by Mr. Alma Tadema.

Alma Tadema.

The Banqueting Hall, otherwise Gallery No. 3, in which the President gives proof at the annual dinner of his well-known literary tastes and of his profound studies in the history of art, again presents an aspect, if not quite historic, at any rate fashionable and commercial, by virtue of a display of portraits unusual in number, even within the Academy. The hanging has the advantage of being decorative in the upholstering sense; this, the grand Gallery, is so well filled and furnished that the topmost row, reaching to a fourth stary, exhibits a sky outline of tress and vantage of being decorative in the uphoistering sense; this, the grand Gallery, is so well filled and furnished that the topmost row, reaching to a fourth story, exhibits a sky outline of trees and mountains barely visible. Figures, in an Academy which for the most part cannot draw the figure, have, by the rule of contrary, the advantage over landscapes. Here is the place of honour, for about fifty chefs-dauere of Academicians and Associates, among which the following are the favourites:—"Capital and Labour" (179), by Mr. Marks, A.R.A.; "A State Secret' (223), by Mr. Pettie, R.A.; "Forgiven" (227), by Mr. Fasd, R.A.; Portrait of "The late John Stuart Mill" (240), by Mr. Watta, R.A.; "Charles II. and Lady Rachel Russell" (252), by Mr. Ward, R.A.; "The Adoration of the Magi" (308), by Mr. Herbert, R.A.; "The Queen of the Tournament" (335), by Mr. Calderon, R.A.; and "An Antique Juggling Girl" (348), by Mr. Leighton, R.A. This great Gallery, which is proverbally difficult of hanging, and in which the speeches of the President, Her Majesty's Ministers, the Lord Mayor, and others are frequently inaudible, makes itself most conspicuous to the eye at two foci on opposite Ministers, the Lord Mayor, and others are frequently inaudible, makes itself most conspicuous to the eye at two foci on opposite walls. Upon one is seen Mr. Millais's masterpiece, "The North-West Passage" (320), with the suggestive motto "It might be done and England should do it." The picture is far too artistic to be dismissed with a word; we hope to describe it hereafter. As a wis-d-vis hangs a picture scarcely less clever, though in a very different way—"Blessing Little Children; an episode in the great annual Procession of Our Lady of Boulogne" (243). Mr. Frith, who, like the President, is evidently much more studious and profound than the world imagines, inserts as an explanatory text to this religious procession the following misuade stood passage from a well-known profane author, whose name the Catalogue kindly gives us:—"One touch of nature makes the whole world kin." We think the artist is more true to his genius when in this religious revel he paints in aharp satirs outside one of the shops crowded with a Gallic galaxy, "Priex pon. 'Angleterre." The pictura, were it seen in the Paris salon, could not fail to move French artists to a like merciful petition.

Bulkrequent rooms lead the spectator pleasantly caward; subjects some of which are new are treated with that independence and

May 2, 1874.

honesty which never fail to give value and freshness to our English school. Yet "The Applicants for Admission to a Casual Ward" (504), by Mr. Fildes, though one of the marked pictures of the year, is a mistake; the materials are too revolting for an art which should is a mistake; the materials are too revolting for an art which should seek to please, refine, and elevate. In like manner Mr. Holman Hunt's elever portrait of "Mr. Thomas Fairbairn" (660) sinks art, and does scant justice to nature. Gallery No. 7 still shows unexhausted resources; among other pledges of genius soars high the giant form of "Prometheus Bound" (687), by Mr. W. B. Richmond. "The Lecture Room," sometimes a place for odds and ends, now assumes a varied yet symmetric guise. Here appear "A Dream of Fair Women of Ancient Greece" (1020), by Mr. Armitage, R.A.: "A Girl Watching a Tortoise" (1029), by Mr. Armstrong; and another like classic figure, "Shells" (936), by Mr. Albert Moore. We mention these three works as (936), by Mr. Albert Moore. We mention these three works as signs of a coming time; we hope, though against hope, that decorative art, mural and monumental, may yet be practised in England as in Italy of old. Amongst the "water-colour drawinga" the most noteworthy is the portrait of "Mrs. George Smith" (869), by Mr. Frederick Burton, the new Director of the National Callery. And in the room set apart to architectural designs &c., a conspicuous place is assigned to models showing, in form, colour, and relief, the design by Mr. William Burges for the decoration of the nave and choir of St. Paul's Cathedral (1327-1328). The projected work is of such national importance as to claim further and separate notice.

The Academy has inevitably again given offence by the rejection, the reception, and the hanging of contributions which year

tion, the reception, and the hanging of contributions which year by year grow more and more beyond control. But we are bound to say that, with every desire to be watchful and critical, we find on the whole the spirit of fairness; indeed, were not justice the rule and injustice only the exception, the Academy would long ago have turned a success into a failure. As to the hanging, we gladly note in the "Lecture Room" and elsewhere an inclination to break the line and to arrange in blocks. Nowhere else in Europe has the prejudice and falsely assumed privilege of the "line" been so unreasonably cherished as here, and the sooner the arrange in approximately the better it will be for all resting. Burling. system is superseded the better it will be for all parties. Burlington House has wall space sufficient to show all that needs or deserves to be seen sufficiently well, though not precisely on the line; and after making liberal allowance for the preposterous privileges of sixty Members and Associates, the remaining mishaps in hanging may be set down chiefly to accident or to inevitable exigencies. The Academy gives earnest of good intentions for the future in the promise now put forth to continue for the instruction of students and of the public at large the Winter exhibitions the masterpieces of ancient and modern times." The announcement is made that the next exhibition will "be more especially devoted to presenting as complete a collection as possible of the works of Sir A. W. Öallcott, R.A., W. Etty, R.A., and D. Maclise, R.A." Within these walls the living are thus brought into communion with the dead, and what may be false in the fleeting fashion of the moment receives correction when tried by the stricter standards of historic times.

NEWMARKET CRAVEN MEETING.

WHEN things come to the worst they usually mend. So at VV least the proverb says, and we shall be curious to see whether it will hold good in regard to racing at Newmarket. It is not possible for the sport at the headquarters of racing to fall to a lower sob than it reached during the past Cravon Meeting; but we confess we see few signs of any rise of the tide. It must be said in fairness that there were unusually depressing circumstances attending the resumption of racing this year at Newmarket. Foremost among those was the death of Baron Rothschild, one of the most munificent supporters of racing, and who was peculiarly attached to Newmarket, and rarely lost an opportunity of engaging attached to Newmarket, and rarely lost an opportunity or engaging his horses in the small as well as large races. We could nearly always recken on seeing the Baron's colours twenty times during a Newmarket week; and it is easy to see therefore what a difference the absence of the blue and yellow has made in the appearance of the card, especially as the ranks of owners have suffered other serious losses since the termination of the last racing campaign.

Still when all allowances are made, the fact ranking that there are Still, when all allowances are made, the fact remains that there are more than eight hundred horses in training at Newmarket, and that there were five races on the first day of the Craven Meeting—two of which were reduced to matches, while one was contested by three horses; four on the second day, two of which brought out three horses, and the third a couple only; and three on the concluding day, when the so-called sport lasted exactly one hour. We do not pretend to suggest the reasons why, with so many horses on the spot, the best racecourse in the world should be left thus barren of competitors; nor do we say whether it is owing to the apathy of owners or the obstinate adherence of the Jockey Club to their oldowners or the obstinate adherence of the Jockey Club to their old-fashioned programmes, that racing at Newmarket is so rapidly leaing its former reputation. But we may venture to remark that there is little use in keeping up a farce, and that it is unnecessary trouble to continue to prolong meetings ever four and five days when the sport provided is not sufficient to hast through two.

The very few items of interest which came under our notice last wask will not detain us long. Drummond opened the hell by an excesses causes in the Oraven Stakes, thus securing the first victory

for M. Lefevre, without whose support it would be difficult to imagine how any racing at all could be carried on at Newsariant under present circumstances. In the Bretby Plate, Blenheim also made a gallant struggle for the tricolour; but though the old horse was looking wonderfully well, his crushing weight prevented him from getting quite home, though he was an excellent third to the Finesse galt and Morocco. The Biennial for three-year-olds was of course the race of the day, and of the week also. Take wore ten competitors, M. Lefevre being represented by Miss Tote and Exile, Lord Falmouth by Aquilo, and Mr. Cartwright by George Frederick, while the remainder included Reverberation (who ran a dead heat with Quantock in the Spencer Plate at Northampton), Sugarcane, Trent, Sister to Ryshworth, and Cambyses. On public form the lot were all moderate, with the exception of Miss Toto, and her appearance was by no means satisfactory, as she seems neither to have grown nor improved since last year. George Frederick was the best-looking horse of the ten, but obviously short of preparation, while Aquilo did not seem likely to give even as good account of himself as he did last autumn. It was generally regarded as a certainty for Miss Toto, even allowing for her lack of improvement, and during the race, and up to within one hundred and fifty yards from the finish, she seemed to be winning as she pleased. She tired however so much at the final hill, and stopped so suddenly, that Reverberation, coming with a great rush, was able to make a dead heat with her, and it is more than probable that she has no great staying power. George Frederick was a moderate third, with Trent and Aquilo in former years the presence of such competitors as The Earl and Blue Gown, Albert Victor and Favonius, gave it; and moreover next. It will thus be seen that the race lacked that interest which in former years the presence of such competitors as The Earl and Blue Gown, Albert Victor and Favonius, gave it; and moreover it had little bearing on future events. Save that George Frederick ran with gameness, and that he is certain to make considerable improvement before the Derby Day, there is hardly anything to mention as regards the future about the horses which ran in the Biemnial; while Miss Toto's deterioration in form still further reduces the little band of horses whose claims to pre-eminence over their fellows were undisputed last year. Fcossais and Miss Toto stood quite by themselves last year above all the other two-yearolds; and now Miss Toto appears to be a non-stayer, the chances of Ecossais standing a preparation are very doubtful, and their most formidable opponent, Marsworth, is disqualified for all his most formidable opponent, Marsworth, is disquained for all his engagements. Should Ecossais not come to the post for the Derby, it may confidently be reckoned that the great three-year-old prize of the year will be contested by as moderate a field as has ever assembled on Epsom Downs. On the second day there was a spirited race between Requefort and Oxonian at even weights, which the French horse cleverly secured; and them eleven competitors faced the starter for the New-policy Marsworth Populary the winner of and then eleven competitions faced the states for the line of the Lincoln Handicap, Falkhard, Royal George, Tichborne, and Lydon—a six-year-old with 7 st. 1 lb. on his back. We need only say that the distance appeared too far for Tomahawk, who hung so much through distress as to interfere materially with the chances of Paris Character and Tichborne and Tichborne. of Royal George and Tichborne. There was, indeed, as nearly as possible a scrimmage between these three, and Lydon, taking advantage of it, came away at his leisure and won easily by lengths; but, considering his are and weight, the performance is no great feather in the cap of his sire Gladisteur. A very fine race between Flagcolet and Gang Forward over the severe course from the Ditch in resulted in the victory by a head of M. Lefevre's horse, for whom his stable companion Negro made the running to horse, for whom his stable companion Negro made the running to the best of his ability. Gang Forward appears to have quite re-covered from the effects of the accident which caused his with-drawal from the Leger. In the last race of the day Kaiser had no opponents worthy of his steel, but he both looked and went so well that he will probably do good service this year to Mr. Savile in Cup races. Of the three races which made up the bill of fare on the last day of the Craven Meeting we need only say that one of them was appropriately called the Refuse Plate, and that a horse named Rubbish ran in it. Refuse and Rubbish are indeed words that not unfitly suggest the character of much of the sport that was witnessed at Newmarket during the first meeting of 1874.

"The Jockey Club held their first meeting for the year last week, and the Duke of St. Albans brought forward his motion that no member of the Jockey Club should be allowed to run horses under an assumed name. The official report of the proceedings goes on to state that, his Grace having stated that he did not wish to press it to a division, the matter dropped. Why he should trouble himself to bring forward a motion if he does not wish to Why be should see it carried we are not told, and are at a loss to imagine. It may possibly be that no members of the Jeeksy Club at the present time are in the habit of availing themselves of the 22nd rule of racing; but it does not follow that their successors will equally abetain from the use of assumed names. In our opinion nasumed names are indefensible under any circumstances, and their use is calculated to do great damage to the interests of a antional sport. If people have reasons which make them anxious that their names should not be known to the world at large, it is their names should not be known to the world at large, it is very probable that they are such reasons as make their patienage of the Turf not altogether desirable. But certainly the encubers of the Jockey Clab, who are supposed to set an example of straightforwardness and independence in racing transactions, ought to be selected from among those who can afford to indulge their tastes without finding it expedient to opposed their identity. After this very mild proceeding on the part of the Duke of St. Albans, General Psoi brought forward and carried a useful resolution baving for its object the prevention of heaty legislation, or of sadden elements of the rules of racing. Great inconvenience, and we may add great scandal also, has been caused by the Jackey Club sevining its rules and rescinding its previous resolutions almost at a moment's notice, at any chance meeting, perhaps thinly attended and insufficiently advertised. The rule which, on the modify of General Peel, has now been added to the rules of racing provides that "no new rule can be passed, or any existing rule rescinded or altered, without being previously advertised three times in the sheet Recong Calendar, and notice given of the meeting of the Jockey Club at which it is to be proposed"; and power is reserved to owners and others affected by such new rule or alteration to petition the Jockey Club. The wording of General Peel's resolution is clumsy in the extreme, but its intention is excellent, and it will probably serve the purpose for which it was designed. aght forward and carried a useful resolution set the prevention of hasty legislation, or of designed.

designed.

It was hardly to be expected that there should be no grumbling at Mr. Anderson's new Betting Bill, but its rapid and unchallenged progress through the House of Commons must have convinced its opponents of the futility of any endeavours to hinder a much needed piece of legislation. No reasonable person can justify the examption of Scotland from the provisions of an Act applying to all other parts of the United Kingdom. The reason why the Betting Houses Act was not originally extended to Scotland was that Scotchmen were not believed to possess any tasto for betting on horse-races, and it was not considered necessary to apply a remedy where no evil existed. Nor are there any grounds for supposing that Scotchmen at the present day are more disposed to favour betting than they were twenty years ago. It is not the people of Edinburgh and Glasgow who are caught by the baits held out to them by commission agents and tipsters; but Edinburgh and Glasgow are cities of refuge for those gentry whence they may scatter broadcast through England those gentry whence they may scatter broadcast through England their invitations to the ignorant and the unwary. The electric telegraph enables the lucrative business of a commission agent to telegraph enables the lucrative business of a commission agent to be carried on as easily at Edinburgh as in London; and hence the intention of the Betting Houses Act has been successfully and systematically frustrated. But Mr. Anderson's Bill does more than extend the Act of 1853 to Scotland; it greatly enlarges the scope of that Act. The Betting Houses Act dealt, as its name imports, principally with houses; and the offence against it consisted principally in the possession or occupation of a local habitation used for purposes of betting. Mr. Anderson makes the publication of advertisements and circulars, whether appearing in nowspapers or issued through the post, an equal offence whether the advertiser has a house or not, or dates his advertisements from some specific address or not. His object is his advertisements from some specific address or not. His object is to deal a decisive blow at the whole tribe of commission agents, Turf advisers, and the like, who do not receive their victims personally, but conduct their transactions with them by correspondence only. We confess we are somewhat surprised that a Bill effecting so considerable a change and containing such stringent provisions should have passed through all its stages in the House of Commons with hardly any remark, but we are not the less gratified that a with hardly any remark, but we are not the less gratified that a piece of legislation which we have advocated for years should now be in a fair way of accomplishment. The Government having wisely resolved to support the Bill, the tongues of more than one zealous Conservative who in years past have angrily resisted the attempts of Mr. Hughes and others to deal with the question were tied; and we heard nothing more about the liberty of the subject, and the pick and one for the proof and other heavy and one law for the rich and one for the poor, and other hackneyed arguments which were duly paraded year after year. As a matter arguments which were duly paraded year after year. As a matter of fact, the suppression of commission agencies and betting advertisements will not interfere in the smallest degree with the liberty of the subject, or stop those who desire to gamble on horse-races from indulging their taste as much as they please. Mr. Anderson neither expects nor wishes to abolish betting, nor does the Legislature; and therefore a good deal that has been written about the hopelessness of endeavouring to compel the English people to give up a favourite taste might have been well spared. Those who like to bet may do so, and will find as good opportunities for betting as ever; but flattering and fallacious inducements will no longer be allowed to be held out to those who would never think of betting if they were not attracted by the glittering character of the prospects were not attracted by the glittering character of the prospects officed to their notice. As we have often observed, the lucrative nature of the business carried on by commission agents and Tut nature of the business carried on by commission agents and Turf advisers is abundantly shown by the amount of money they find it worth their while to pay for advertisements—often charged for at an extra price—in the sporting papers and in country papers, the country districts being the stronghold of their operations. From the country districts being the stronghold of their operations. From the country much same paid weekly to the proprietors of newspapers for the cost of advertisements of the class referred to, we may eafely infer that vary much comes in to the coffers of the commission agents, and that very little goes out. Mr. Anderson's Hill aims at nothing mose than the correction of this unsatisfactory state of affairs. The public may continue to bet, if the public likes; but that is no reason why a singularly unpleasant class of persons should be allowed to grow rich and to fatten at the expense of the public.

REVIEWS.

TOZER'S LECTURES ON THE GEOGRAPHY OF GREECE! MR. TOZER'S name must be well known to many persons as that of a diligent traveller, and one who travels with his eyes open, in Greece and the neighbouring countries. He has already given the world some record of his travels, and new he gives us the results, both of what he has seen and what he has read, in a more regular and scientific shape. The book consists of lectures delivered in Oxford—it is not said before what audienced "as one of a number of courses substantial numbers have been substantial." lectures delivered in Oxford—it is not said before what sudience—
"as one of a number of courses voluntarily undertaken by members of the University on subjects indirectly connected with the usual studies." Among these, Mr. Tozer was "requested to lecture on Greek Geography." He does not say by whom, but clearly by some one who knew where to go to get the matter in hand well done. Mr. Tozer has got hold of a good subject, and he has treated it thoroughly well. He acknowledges his obligations to earlier writers, but every word of the book is written in a way in which it could have been written only by one who thoroughly knew in his own person the places of which he is speaking. Mr. Tozer need hardly have set out with a quotation from Mr. Ruskin complaining how "scholars have only the names of the hills and rivers of Greece upon their lips, and never one line of conception of them. need hardly have set out with a quotation from Mr. Ruskin complaining how "scholars have only the names of the hills and rivers of Greece upon their lips, and never one line of conception of them in their mind's sight." Then there is something about "the great mountain vase of Arcadia" and about "mere airy syllabling of names," all which Mr. Tozer thinks that "it would probably require the Professor's eloquent pen to describe properly." The "airy syllabling of names," whatever that may be, may be safely left to Mr. Ruskin; but for describing Arcadia or any other intelligible part of the earth's surface, we would much rather have Mr. Tozer's pen than Mr. Ruskin's. Mr. Tozer gives us a clear account of the geography of Arcadia, but he does not call it a "mountain vase." He knows his subject too well to go off into mere talk or affectation about anything. He takes geography in the widest sense, and his special object is to point out the effect which the physical character of the country had in so many ways upon the political and intellectual life of its inhabitants, on their art, their mythology, and everything to do with them. The Greeks in Greece were placed in a land which gave their natural gifts the fullest play. Mr. Tozer says truly that a settlement of Mongols among the mountains, valleys, and islands of Greece, or again a settlement of Greeks on the plains of Hungary, could neither of them ever have been what the Greeks in Greece actually were. It was probably the difference of the countries in which they settled which made so early and so wide a difference between the Greeks and those other nations which inquiries of another kind have shown to be most closely connected with them. Scientific ethnology cannot draw any hard and fast line botween Greeks and harbarians. It looks on many of the nations which the Greeks called harbarians as being closely akin to themselves. The distinction fades gradually draw any hard and fast line between Greeks and harbarians. It looks on many of the nations which the Greeks called harbarians as being closely akin to themselves. The distinction fades gradually away through Ætolians, Epeirots, Macadonians, into Illyrians, Thracians, Phrygians, whose connexion with the pure Hellenes it still needs a good deal of faith in scientific research to believe. Mr. Tozer is not immediately concerned with than the content of the first party of the fourth and the Continuation. matters, nor does he touch on the question raised by Curtius and others about Ionians on the other side of the Argean ages before the commonly received Ionian colonization. His subject is the commonly received Ionian colonization. His subject is geography, and questions of this kind concern him only incidentally. But we see that, in treating the geography of Greece, he is no more able to draw any hard and tast line between what is Greece and what is not than it is possible to draw one between those who are Greeks and those who are not. Greece is the climax, so to speak, of the insular and peninsular system of the Mediterranean Strabo showed long ago, it is a system of peninsulas within peninsulas. And Pelopounesos itself is the Acropolis, as Mr. Strato showed long ago, it is a system of peninsulas within peninsulas. And Pelopounesos itself is the Acropolis, as Mr. Tozer calls it, of a whole region whose base must be sought far beyond the bounds of anything which would at any time have been called Greece. We must in fact start in our Greek geography with Hamus and the Illyrian Alps. From that range the country narrows and narrows, peninsula succeeds to peninsula. And, in the like sort, the Hellenic character of the inhabitants gets clearer and clearer, from the mere barbarians, through the kindred barbarians. There and Ulyria, through what we nay call the border races of clearer, from the mere barbarians, through the kindred barbarians of Thrace and Illyria, through what we may call the border races of Northern and Western Greece, till we reach the Peloponnesian Acropolis itself. Within this range we can well believe that the development of the various kindred races depended mainly on the country which they occupied. We may feel sure with Mr. Tozer that neither Mongols in Attica nor Hellanes in Hungary could have become what the Greeks in Greece did become; but it is quite possible that the difference between Athenians and Macedonians, or even Illyrians, was largely owing to the difference of the countries in which their early forefathers fixed themselves. In all ages it has been noticed that some pations have shown a power of accepting Hellenic civilization and becaming artificial Hellenics which others have not. The Sikels showed it in old times, and the Albanians, the representatives of the Hlyrians, have shown it in the most modern times. That the Sikels were a kindred race with the Greeks has been clear for a long time. That the Hlyrians were so it is much harder to believe, but the one fact now seems to be as undoubted as the other.

Mr. Tozer, after his general sketch of the geography of the region of which Greeks forms a part, goes on to speak of those

^{*} Lectures on the Geography of Greece. By the Boy, Henry Fanshaws Tener, M.A., F.R.G.S. London: Murray. 1873.

who have dealt with the subject in ancient and modern times. He here pays a deserved tribute to the services of Colonel Leake, as the man who really opened Greek geography to the world. He then takes us through the main features of Greek world. He then takes us through the main features of Greek geography—the mountains, the seas, the promontories, the rivers, lakes, caverns, and so forth. Through all these he carefully goes, dwelling on the effect which each of these elements had on the nature of the country and on the character of the people, and dwelling especially on the appropriateness of the names and epithets of the natural objects throughout Greece. As he says, it is the combination of the mountains and the sea which made the Greeks what they were, both in the political and intellectual character of the whole nation and in the special characters of each particular part of it. All this has been often pointed out before in a general way, but Mr. Toser has worked it out in detail in a specially instructive and interesting manner. What is distinctive of Greek geography is the close union of features which elsewhere specially instructive and interesting manner. What is distinctive of Greek geography is the close union of features which elsewhere are found apart. And so what is distinctive of the Greek character in history is the union of so many qualities which elsewhere are found apart. Compare Greece, for instance, with the two countries which have done most for freedom on the modern European continent. Fresh from Mr. Tozer's speculations, we are tempted to say that neither Switzerland nor the United Provinces applied be as Greece, because one had only the mountains and the other could be as Greece, because one had only the mountains and the other only the sea, while Greece had the sea and the mountains both together. But in speculations of this kind it does not do to talk in quite gether. But in speculations of this kind it does not do to talk in quite so general a way as this. Greece could not have been what she was without the union of the sea and the mountains, but the union of the sea and the mountains could hardly have made Greece what she was without the help of other peculiarities of soil and climate, which Mr. Tozer works out very carefully in detail. "The soil of Greece," he says, "was beneficent to its cultivators in what it denied as well as in what it gave." Had the soil of Attica and Ægina been more fruitful, their inhabitants would not have been driven to take to the sea and become great maritime powers. Ægina been more fruitful, their inhabitants would not have been driven to take to the sea and become great maritime powers. The climate of Greece as a whole helped the growth of Greek intellect and of the Greek language, while the soil, not fertile, as a rule, without cultivation and irrigation, but well repaying cultivation and irrigation, forced the inhabitants to agriculture and other industry. In this way the Greeks of old Greece were really better off than their colonists in more promising lands:—

In the cultivation of art, the continent of Greece was for a long time outstripped by its colonies. We have no coins from Greece Proper that will bear comparison with those of Magna Græcia, and by far the finest specimens of early architecture are the temples of Pastum, Selinus, and Agrigentum. In those countries, and on the fertile shore of Asia Minor, the rapid development of the wealth of the cities offered facilities for the cultivation of refined tastes; but the same cause undermined their vigour and their patriotism, and ultimately deprived them of their independence. In the products of continental Greece, also, there was nothing to minister to indulgence; they provided what was necessary for life, while articles of luxury had to be imported from abroad.

After Mr. Tozer's survey of Greece as a whole, he goes more in detail through its several parts, in which he cannot help taking in Macedonia, though he rules it perhaps a little too strongly to be "a country in no sense Hellenic." From "non-Hellenic" Macedonia he passes into "semi-Hellenic" Thessaly, the great plain surrounded by mountains and drained by a single river and its tributaries, and presenting in its political history a state of things intermediate between Southern Greece and the countries to the North. We are a little surprised when Mr. Tozer gots to the West of Thessaly, and says that "Little need be said of the countries which compose the West of Greece—Illyria, Epirus, Acarnania, and Ætolia—because they were only slightly hellenized." It is certainly rather strange to find all these countries put on a level, for Illyria has surely a much less claim to be called a part of Greece than Macedonia has; and about the Ætolians, rude as they were and bad as was the character which they commonly bore, the only person who is recorded to have called their Hellenic character into question was, oddly enough, the last Philip of Macedon. only person who is recorded to have called their Hellenic character into question was, oddly enough, the last Philip of Macedon. A people who appear in the Homeric Catalogue must not be spoken of as only alightly hellenized, nor was the Hellenic character of the Acarnanians ever questioned, though their country must have become Hellenic later than the Catalogue, as in Homer Acarnania appears aimply as part of Epeiros. We suspect that Mr. Tozer has been led to alur over the several distinct positions held by these countries through his sharing, as he gives signs of doing in one or two other places, the common fault of undervaluing the Federal period of Grecian history. He himself points out that Epeiros was one of the earliest seats of the Greek nation, and indeed the land where the nation first received the name by which it was known on the other side of the Hadriatic. Then comes the singular fact that this ancient seat of the nation, which contained the oldest and one of the most venerated of its sanccontained the oldest and one of the most venerated of its sanctuaries, should afterwards come to be very generally looked on as a non-Hellenic land. It has been often pointed out that the line in these parts was not very strictly drawn, and that Herodotus, the traveller, antiquary, and ethnologer, counts as Greeks several tribes whom Thucydides, the practical politician, counts as barbarians. Kings who were allowed to be Hellenic ruled over a people whose Hellenic character was at least doubtful, till in the and their dynasty gave way to a federal republic of the Greek type, which was fully acknowledged as a Greek State. All these countries, Illyria, Epsiros, Acarnania, and Ætolia, stand each in its own distinct relation to the general body of the Greek nation. But their importance comes out mainly at the two ends of Greek history; they play no very important part in the intermediate contained the oldest and one of the most venerated of its sanctimes. Another case where Mr. Tozer has gone wrong through neglecting the later Grecian history appears when he comise to Mantineia, and reckons up, as Dr. Smith has done before him in the Dictionary of Geography, five battles of Mantineia. But one of these, in which Agis is made to die in a battle against Aratos, is due only to a blunder of Pausanias, which has been pointed out by more than one historian of the later times of Greece. It is strange that two writers, one after another, should be contain to copy a statement so manifestly wrong, as we can hardly think it possible that either Dr. Smith or Mr. Tozer should never have heard how Agis really died. All this comes from one of the errors that we have often to fight against—namely, thinking that Greek history came to an end at Chairôneia. And, while we are on this head, we cannot help wondering a little that Mr. Tozer, who knows Greece so well, should have made so few attempts to connect the mediæval and modern history of the country with its history in what are called classical times. Surely it is part of the history of Athens that Alaric turned away from her walls scared, so men said, by her still protecting goddess, and that the Slayer of the Bul-Another case where Mr. Tozer has gone wrong through

Athens that Alaric turned away from her walls scared, so men said, by her still protecting goddess, and that the Slayer of the Bulgarians chose her Acropolis as the scene of his triumph.

But we are not in a mood for finding fault with so preiseworthy a book as Mr. Tozer's. He winds up with a suggestive chapter on Greek local nomenclature. In his view it is almost wholly, as all local nomenclature must be largely, descriptive; and he notices a point of difference between Greek nomenclature and our own, that there is nothing in the primitive Greek names of places at all answering to such endings as ham, ton, and chester among ourselves. This is perfectly true of the early nomenclature; names ending in wokç are almost always of late date, and it is only at a stage of much works are almost always of late date, and it is only at a stage of much later dates still that we get our own chester in Greece in the form of sacrpor. The difference is doubtless because the nomenclature of Greece belongs to a much earlier stage of national life than the Teutonic nomenclature of Britain. Mr. Tozer might also have men-Teutonic nomenclature of Britain. Mr. Tozer might also have mentioned that the tribe names, which form so large a part of local nomenclature both in England and Germany, play a much smaller part in that of Greece; names ending in $i\delta a_{\rm S}$ or $a\delta a_{\rm S}$, answering to our various uses of ing, are not uncommon. There are, for instance, a good many of them in the list of the Attic $\delta \tilde{\eta} \mu a_{\rm S}$, but they are in nothing like the same proportion as they would be in an analogous list of English names. And almost all the names of this form are those list of English names. And almost all the names of this form are those of small places; indeed, even in England the ing is not common in names of our larger towns; that is to say, the place either in Greece or in England which bore the gentile name was a settlement of a single gens only, while anything worthy to be called a city grew out of the settlement of soveral gentes. Mr. Tozer ends with a very short comparison of ancient and modern names in Greece. We only wish he had carried it out at much greater length. Lord only wish he had carried it out at much greater length. Lord Strangford used to tell a story of his indignation at a waiter at Corfu who spoke of his island as Κίρκυρα. First of all, he ought to have called it Κορυφούς, being as good a Greek name as the other; but, if he wanted to be archaic, he should have used the local Κόρκυρα instead of the Attic Κιρκυρα. This last blow might also have fallen rightly, not only on the shoulders of the waiter, but on those of some half-learned energy at Mr. Grote, who had never read their Strabo and Pausanias, and had never seen a Korkyrajan cain. kyraian coin.

We part with Mr. Tozer with all good will. Will he only give us a little more, coming down a little later?

STANLEY'S COOMASSIE AND MAGDALA.

MR. STANLEY is the first Correspondent to publish an All account of the Ashantee war. For no very sufficient reason he has added an account of the Abyssinian expedition. In the days when Mr. Stanley went to Magdala as Correspondent of the New York Herald he had not performed the feat to which he the days when Mr. Stanley went to Magdala as Correspondent of the New York Herald he had not performed the feet to which he owes his calebrity; and the public curiosity, we presume, was not thought to be sufficiently keen to justify the publication of his history of the earlier war. The opinions of a gentleman who reached Livingstone must, so runs the popular logic, be worth attention; and therefore he now gives to the world a narrative composed five years ago. He informs us that it will be found to be written "in a fresher style" than the story of Coomassie. There is in it, as we interpret his words, a greater aim at literary effect. A good many conversations are described in which English officers say, "Vewy sowwy, ole fellah," and otherwise adopt the dialect familiar to us from the pages of Punch. There is even a more or less imaginary Captain Smelfungus, with whom Mr. Stanley travels, and whose marvellous narratives of personal exploits are supposed to give a comic background to the more serious adventures. On the whole, however, we fail to see that one story is much better or much worse told than the other; or, to let out the truth at once, we fail to see that either of them possesses any remarkable merit. Mr. Stanley is undoubtedly a man of energy, and a smart Correspondent. His letters are well up to the average of such performances; he is generally, though not invariably, grammatical, and he does not indulge to an offensive degree in fine writing. He has a high impression of his own merits and of the dignity of a Correspondent's office; and though we cannot point to any definite assertion to that effect, we somehow come to see that, in Mr. Stanley's opinion, Mr. Stanley is one M. the most remarkable men of the time.

^{*} Connaesie and Magdah. By Henry M. Stanley. Landon; Sempson Low & Co. 1874.

Such weaknesses are wested in a Correspondent. A booyant selfconfidence is a desirable quality in a man who has to thrust
himself into besiness without any official position, and who is not
particularly welcome to those who are more directly concerned in
it. The most obvious conclusion to be drawn from the present work
is that Sir Garnet Welseley has a hearty dialite to newspaper
Correspondents when considered in the sharest. Whilst proceeding
the first Mr. Stanley borrowed Sir Garnet's Soldier's Pocket-Book,
and therein he read that Correspondents are a "curse to modern
armies." This unlucky remark evidently rankled in Mr. Stanley's
hosem. He recurs to it again and again. He is always indulging in
little reflections tending to show the extreme absurdity of the
dialite entertained by the professional officer towards the intrusive representatives of the outside world. Sir Garnet, he
admits, was personally "most urbane," and deserves a good
many compliments, though by no means unmixed compliments,
for his military skill. But on this matter Sir Garnet was terribly
antiquated in his notions. He did not perhaps share the opinions
of a member of his staff who, on Mr. Stanley's suggesting that
generals might trust to the honour of a reporter, declared that he
would rather trust to the influence of fifty lashes on the reporter's
bare back. The alternative is rather disagreeable, but we may
observe that, however unimpeschable may be the honour of all
newspaper Correspondents, their discretion may not always be
equal to their fidelity. A man writing full accounts from an army
of all that he has seen which he is not bound in honour to conceal,
can hardly fail to give much information which will be valuable
to an enemy: We need not pause to inquire whether there are
counterbalancing advantages. Mr. Stanley a indignation, however,
is natural enough. When a ramour came that a fight was going
on at Abracampa, Sir Garnet said nothing of his intention to
depart for the scene of action. In this Mr. Stanley caus see
nothing "

We confess that the evil, whatever it may have been does not seem to us to have been of a very serious character; but we admit that in one sense Sir Garnet was misguided. If he is anxious for a vates sacer, he should be more careful to treat Correspondents in such a way as to flatter their sense of dignity. Mr. Stanley does not actually pass any severe condemnation upon Sir Garnet as a soldier, though he finds fault with several of his arrangements; but he condemns him unreservedly as a diplomatist, and almost always writes about him in a perceptibly querulous tone. One of Sir Garnet's great faults, according to Mr. Stanley, was the neglect to disarm the scattered Ashantoes who flocked into Coomassie after the entrance of the British army. Lord Napier, it seems, disarmed the Abyasinians under somewhat analogous circumstances; and Mr. Stanley delights to point out the contrast in notes added to the narrative of the earlier expedition. But then Lord Napier asked Mr. Stanley to dinner. When, again, Sir Garnet writes a despatch a day after leaving Coomassie, giving an account of Captain Butler's expedition, and referring briefly to Captain Glover, of whose expedition he had yet heard next to nothing, Mr. Stanley adds an oddly ungrammatical note:—

It must strike the reader with what exceeding warmth Sir Garnet speaks of his personal friends. . . . Of Captain Butler who, though he possesses many vistues and many social qualities, Sir Garnet speaks as though he had made an unqualified success. But of Captain Glover he has scarcely a civil word. Undoubtedly Sir Garnet makes it clear that he is a man of strong friendships.

themships.

The insinuation is obvious. We cannot say whether there is any other ground for it; but the fact that Sir Garnet warmly apologizes for the failure of one subordinate, and explains why he cannot speak of the performance of the other, whose remarkable success was not yet known, surely does not justify an implied charge of gross partiality. Mr. Stanley pays Sir Garnet the necessary compliments; but we could wish that he had remembered his own very sensible remark about the Gameral, that whilst "any man of mortal mould is constantly under the ever-searching and critical eyes of a number of journalists, as he is, no man can escape entirely from blame." Mr. Stanley does not a course really mean that whilst "any man" is being critical eyes of a number of journalists, as he is no man can be free from blame; but what he is trying to say is true enough. It explains in some measure why men of mortal mould sometimes dislike journalists. But of this we have perhaps each enough. Sir Garnet Wolseley has no more right than any

other man to be free from fair criticism. We shall be quite prepared to listen to any fair discussion of the questions whether he retreated too quickly from Coomassie, whether he ought to have destroyed the Bantammah, whether he was inexcusably indifferent to Captain Glover's expedition, and whether he listened too easily to native promises. Mr. Stanley is evidently prepared to condemn him upon those points, though admitting his military talents. But Mr. Stanley certainly fails to impress us with any contidence in his impartiality.

Meanwhile the book may be read with sufficient interest while the memory of the expedition is fresh; and it is not

talents. But Mr. Stanley cortainly fails to impress us with any confidence in his impartiality.

Meanwhile the book may be read with sufficient interest while the memory of the expedition is fresh; and it is not often that newspaper correspondence claims a much longer life. The difficulty of giving permanent value to such work is obvious. The reader at any distance of time requires that full explanation of the plans and conditions of a campaign which it can rarely be in the power of the Correspondent to give. On the other hand, the Correspondent cannot be content simply to record his personal impressions. He is bound to take a bird's-eye view of all that is going on, and hastily to supplement his own eyesight by such stray facts as may luckily drift his way. It is with an effort that he resigns himself togive that present those bewildering combinations of movements characteristic of war on a great scale which baffle the individual observer. On the other hand, it was rarely, if ever, possible to get any general view of what was going on. All that Mr. Stanley has to describe is a dense mass of African foliage, with occasionally a line of men firing at indefinite puffs of smoke prosumably proceeding from Ashantees. No such scene as that of the "thin red line," or of the fight in the grand mountain scenory of Abyssinia, offered materials for graphic writing. Of such chances as he had Mr. Stanley has made respectable use. The battle of Amosful and the entry into Coomassic are described, not exactly in such a way that we can fancy ourselves to have been there, but still with a fair amount of vivacity. After all, one's first impression on reading almost all such storice is that the writer has omitted to answer precisely the questions which one would have wished to ask; but we do not think that Mr. Stanley makes more errors of this kind than were inevitable, and his book is a fair specimen of the class to which it belongs. He is rather obtrusively omniscient, and a little too fond of the stitude of the intelligent Amer

HYDRAULICS OF GREAT RIVERS.

OWING to the want of a truly great river in Europe, a large class of problems belonging to the science of hydraulics has been left in comparative darkness. Experiments and calculations have been conducted upon a limited scale, the phenomena themselves not presenting a magnitude of volume or grandour of aspect to give scope for investigation commensurate with the vastness and complexity of the whole subject; and much of our knowledge of river action or natural drainage has therefore remained vague, empirical, and without either base or system. It is to the magnificent scale on which nature carries on her hydraulics in magnineent scale on which nature carries on her hydrautics in the New World, and to the enterprise of one of the young and rising communities which have there had their birth, that we are indebted for an undertaking which already sets in a new light many delicate problems connected with the science of hydraulics, and which forms a starting-point for investigations on a scale never before contemplated into the whole subject of the science of them. The never before the contemplate the first street the first street the first street in the firs action of rivers. The survey of the giant stream, the Parana, set on foot by the Argentine Confederation, has been the means of elucidating many of the phenomena and laws of water-movement which little rivers could but shroud in obscurity. The work was begun three years ago on behalf of the Government, as a preliminary step to large engineering works then in contemplation. was then known of the mighty system of the La Plata beyond what was laid down in the charts of the British Admiralty. There is moreover much difference between a nautical and an engineering survey, both in their requirements and in their mode of operations. The facts relating to navigation are such as concern the outline and depth of channels, the banks, currents, tides, and winds. To the engineer the currents are of even more importance than to the navigator, whilst he is primarily occupied with the volume of water discharged under the varying conditions of the river, the nature of its bed, and the geological character of the surrounding country. The question of currents had been treated by mathematicians on abstract or à priori principles, or on assumptions resting on narrow and imperfect observation. Experiments made with little artificial channels had led even the best authors to lay down certain formula which they extended to canals and large rivers, covering any discrepancy which might occur between the formula and observed

^{*} Hydraulies of Great Bisers—the Parend, the Uruquay, and the La Plata Estuary. By J. J. Bévy, Memb. Ins. C.E., Vienna, &c. 1 vol. folio. London and New York: Spott. 1874.

facts of any kind by the introduction of a new co-efficient. In the hands of scientific engineers the reasonings of mathematicisms had been moulded anew under the influence of experiments, with the result that, the gulf between theory and observation widening with the scale of application, thore came to be almost as many co-efficients and constants introduced as there were engineers engaged upon the formulæ. Not less widely apart were the conclusions practically arrived at. One author would conclude that the velocity of a current ought to decrease from the surface downwards as the ordinates of a parabola having a vertical axis and its apex at the bottom of the river; another, that the current ought to decrease as the abscissæ of a parabola with a horizontal axis, the vertex of the parabola being at the surface. With other authors the law of decrease is made elliptic, or as one of the conic sections; with some, even a straight line. The calculations of Prony better suited small rivers; those of Eytalwein larger rivers. Those of D'Aubisson and Defontaine were far apart from the masterly work of Du Buat. All these uncertainties and discrepancies became magnified as the formulæ were extended to larger and larger rivers. On facing the stupendous problem opened to them by the survey of the La Plata and its affluents, the largest river system in the world next to that of the Amazon and the Oby, the engineers took the wise and safe course of assuming that nothing was known about great rivers at all. All their information was to be derived

about great rivers at all. All their information was to be derived from observation and study of the rivers themselves.

Recent proceedings in the Court of Chancery have made public the fact that the post of Engineer-in-Chief to the La Plata Survey was held by Mr. Bateman, C.E., by whom a motion was made in the Court of Vice-Chancellor Malins for an injunction to restrain the publication of M. Révy's book, on the ground of a prior right to the facts and observations from which it is made up. Into the merits of Mr. Bateman's motion, which was disallowed by the judge, we forbear to enter, referring our readers to the remarks of the Vice-Chancellor in reference to it. What concerns us is the valuable mass of information resulting from the survey itself, and embodied in the handsome and ably-written volume before us. A voiding analytical formulæ, the writer is content to set out the results of these various observations in terms which involve only the most rudimentary knowledge of figures. What we have most to complain of is this want of anything like an attempt at a mathematical expression or even a methodical generalization of the facts observed and tabulated. There are materials of great value for raising the science of river hydraulies into an edifice, but they remain for the most part disjointed and rough-hown. Little or no amends are made to mathematicians, whose labours have been somewhat brusquely swept aside, by the substitution of formulas of superior accuracy and breadth. Not a few points of great importance have, however, been sufficiently made pood to form solid ground for future progress. It has been shown with what ease and certainty the section of the widest and deepest river can be taken. Within two hours and sixteen minutes the cross section of the Paráná, in a line drawn at Rosario to the opposite shore of Entre Rios, was successfully carried out. A line calculated from a base of three thousand feet was marked out by flags on either shore, a floating raft, moored in the middle of the stream acros

More complex and difficult is the determination of the currents in a river of this magnitude. Here the simple instruments in use in operations on a small scale utterly fail. The necessary apparatus had in this case been heedfully prepared beforehand, and brought out from London. The improved current-meter, described at greater length in the Appendix, its construction and mode of use being made clear by diagrams (Plate VIII.), is based upon the same principle as the patent log. It is to the hydraulic engineer what the chronometer is to the navigator, and is as superior to the meter previously in use as is a chronometer to a common Geneva watch. A fan-screw of the ordinary propeller shape, but four inches only in diameter across the blades, is made to revolve with the current. On its axis there is a fine thread working in two worm-wheels, each of three inches diameter, each wheel containing a great number of teeth, and one of the wheels having one tooth more than the other. Each revolution of the screw, the axis being firmly set in the framework of the apparatus, makes the wheels move the distance of one tooth, and by the time the first wheel has made a complete revolution, corresponding to twenty-two revolutions of the screw, the second wheel has gained one tooth. By means of indexes it is easy to read off the total number of revolutions of the screw, and by computation based upon exparlment to indexes the rate of velocity of the current. In shallow water, where the apparatus out he attached to a red, its application is easy of the screw, and by attached to a red, its application is easy of the screw and by computation based upon exparlment to a part of the screw and by computation oversome, after one of the screw and by the current. In shallow water, where

two failures, with great ingenuity. The apparatus was stinched to an iron bar nine feet long with an eye at each end. Through each of these eyes a rope was rove, whereby the machine was lowered by two sailors from a boat anchored in the stream, the ropes being kept vertical, and the bar horizontal, at any depth from time to time required. All that was needful was that the apparatus should be kept at the same level during an operation. The operators who no more limited by depth or velocity. They could practicely go to any depth and register any current. Another great advantage was that they could integrate all the currents from the surface downwards in a vertical plane, and so find the absolute mean of all the different currents under the point of section, the point being mathematically correct independently of speculation or empirical adjustment, the limit of error being that of the working of the instrument, which it is for the engineer to look to and to take into account like the error of a chronometer. The instrument could be lowered out of gear, and thrown into gear, by pulling a wire at the instant of beginning an observation, the average duration of which was about five minutes. Calm weather was essential to accountly be taken near high and low water. For a large river or an estuary with a variable current, usually due to the effect of tides, a permanent observatory should be moored at a convenient point on the line of section in the deeper part of the river.

The first series of observations recorded by M. Révy were on the La Plata or River Plate, the great estuary which, from being always kept full of fresh water by the flood of the Paraná and the Uruguny, is called a river, although it has no drainage of its

always kept full of fresh water by the flood of the Parana and the Uruguay, is called a river, although it has no drainage of its own nor at all the form of a river. It is, in fact, a large shallow basin, which at one time reached 200 miles higher up and terminated in long. 60° 35′ W., lat. 32° 4′ S., at a point now called Diamante, where the delta of the Parana commences. It is now about 125 miles long, and at its narrowest 23 miles wide and 63 at its mouth. Its depth is about 18 ft. on the average at low water, nowhere exceeding 36 ft. Its waters are found to hold in suspension about 1-10,000th part by weight of solid matter, which being deposited at each turn of the tide, gives rise to banks and islands destined, as observation surely proves, at some distant time. islands destined, as observation surely proves, at some distant time, by reason of the law of currents, to unite in continuous banks, by reason of the law of currents, to unite in continuous banks, when the Plate will be no more. It will be merged in the Parana, the mouth of which will be where now the Plate terminates in the sea, forming a delta like that of the Mississippi, the Palmas and Guazú branches extending beyond Monte Video. The existence of tides in the Plate was for the first time established by these observations. The tidel wave was in fact traced a hundred these observations. The tidal wave was in fact traced a hundred miles up both the Parana and the Uruguay. The influence of the wind, to which all rise and fall in the surface of the water had wind, to which all rise and fall in the surface of the water had been heretofore attributed, is considerable, varying with the force and direction of the wind, but the gauge-observations (tabled in Plates II. and III.) indicate a regular tidal oscillation corresponding to the age of the moon. The highest point touched by the gauge is 8 ft. 7 in.; ordinary low water at Buenos Ayres marking 3 ft. 4 in. below the mean lovel, and spring tides lowering the surface another foot or so. But the influence of storms is traceable in all extreme figures. Thus a heavy storm on the toth of January 1870 harded up the surface to the extent on the 19th of January, 1870, banked up the water to the extent of fifty inches above ordinary low-tide level, producing a kind of revolution in the territory of these streams, and for a hundred miles up its course reversing the current of the mighty Parama. The currents of the Plate are by no means those of an ordinary river, affected as they are by the two great streams which run into it by manifold mouths, as well as by the tides which meet it at its embouchure into the ocean. Plates II. and III. exhibit the results of meter observations on both the Plate and the Parana, showing their variable velocities, and correlating them with the tidal wave. Taking as a test instance December 30, 1870, we find the velocity at the surface 108 ft. per minute, at 4 feet below it 95 ft. 2 in., at 7 feet 84 ft. 11 in., at 10 feet 77 ft. 1 in., at 16 feet 58 ft. 8 in., and at 1 foot from the bottom, 35 ft. 0 in., the river depth being 24 feet. The mean current observed by the intervence midware has and at I foot from the bottom, 35 ft. o in., the river depth being 24 feet. The mean current observed by the integrator, midway between the surface and the bed, was 83 ft. o in. per minute. The mean fall of the Plate on the same day was 0'388 in. per mile, reduced by ebb to 0'342 in., the maximum 0'444 in. On the Paraná stronger currents prevail, the velocity 4 ft. below the surface being in one observation, January 18, 206 ft. 7 in., and the mean from bank to bank 126 ft. 8 in. The Urugusy, on the 3rd of February, showed a velocity at the Salto section of not less than 333 ft. I in. The curves in these diagrams are drawn in a vertical plane on the river sections for easy comparison of the form of section with the outline of surface currents. The constant relation of depth to velocity is one of the most important results of these observations. Nowhere is this connexion more conspicuous than in the case of the Urugusy. At times a mighty river rivalling in volume the Parana, having a drainage area of 200,000 square miles, at others it sinks into comparative imag-200,000 square miles, at others it sinks into comparative insignificance, its whole volume during December being reduced shout two miles below Salto, within a rocky channel called the Correlito, 145 ft. in width, to a depth of water of 6 ft., with a current of about five miles an hour. The Correlito was submerged by the great size when the surveying party was there. About nine miles above the town of Salto are the great falls of the Uragusy, affecting the periodical rise and fall of the stream and, in consequence, it is navigation. A succession of reefs cross its channel, which is hore a mile and a half wife, is a diagonal line. When the river is low there is a difference of level between the survey show and below the falls of sweaty-live fact. Any attends to remove these obstacles

cown, seems all but impossible. On a scale far more stapendous are the Guaire Falls of the Farana, which were unfortunately not visited by our engineers, but which, as we are told in a glowing report to the Dictator of Paraguay, can be heard thirty miles off, their thunder being so loud that within a mile no voice can be heard, and the neighbouring settlements have had to be abandoned, the neighbouring deaf.

Mr. Révy's narrative is enlivened from the significant of the property of the country of the property of the prop

and picturesque notices of the scenery, the general physical features, and the natural products of the country, which forms part of the vast tertiary sheet, the largest in the world, extending east and west from the Andes to the Atlantic, and and south from the mountains of Brazil to the Strait of Magellan. His descriptive powers are shown in particular in the account of a dust storm which burst upon the party upon the Pavon one afternoon, after the thermometer had stood above 105° Fahr. in the shade. "The Andes seemed rushing upon them at Fair. in the shade. "The Andes seemed rushing upon them at express speed, in the form of clouds whose outline was hard and defined like those of cumuli, yet not rounded," threatening to bury the insignificant river-steamer Aquila and crow among the "boulders" of their outskirts. Before the tempest broke in a deluge of rain, the Aquila's deck and the whole land were covered with a deposit of fine impalpable clay, a tenth of an inch thick. At this exists, when nothing could be heard but the rearing of the storm, total devices a prevailed for five or six minutes the last thing seen total darkness prevailed for five or six minutes, the last thing seen being the "boulders" floating about fifty feet above the ground, just burying the tops of small trees. The clouds themselves, instead of floating a mile or two above the ground, were touching instead of floating a mile or two above the ground, were touching it, whilst a "number of straight projections, elevations, and ridges of a dark-brown and gray colour reached from the earth to the towering height of quite three miles." We should like to be assured that M. Révy's estimates of heights above ground rested on data as carefully observed as those of the waters under the earth. In the proper department of the survey there can be no doubt that a most valuable addition has been made to the science of hydraulics, and, to whomsoever the credit may be primarily due, the volume before us serves to mark a new and important stage in the work of river-surveying.

HALF A LIFE.

DR. DASENT, speaking, let us suppose, in the character of Frank Franklin, the hero and narrator of Half a Life, ushers his book into the world with the statement that he writes it because every life, and any part of it, if truly and faithfully described, must be full of interest to every thinking being." And in the next sentence the author observes, "As for amusement, perhaps if you wait you will find this account of my life quite amusing enough, even for the most thoughtless among you." It will be seen that the former of these announcements leaves no room for the possibility of Frank Franklin's adventures as told by Mr. Dasent appearing anything other than a true and faithful description of life. From the latter it is evident that any one who does not find a sufficiency of amusement in these adventures, any one whose faculties cannot bear the strain of investigating their humour, must rank lower even than "the most thoughtless" must indeed be classed among the imbeciles of the world. we must confess that, having read Half a Life, we cannot but regret that Dr. Dasent, whose translation and narration of Norse regret that Ir. Dasent, whose translation and narration of Norse legends are certainly first-rate in their way, should have departed from that way and east in his let with the crowd of ephemeral novelists. The subject with which he has chosen to occupy a considerable part of his book, that of school-life, is one of the most difficult with which a writer can deal. It may be in its difficulty that the fascination lies which has led so many writers to attempt it; or perhaps this is occasioned rather by a not uncommon kind of vanity, which leads a man to pride himself on the hearty boyish spirit which he supposes himself to have sustained throughout and in spite of all the cares and anxieties of his manhood. However that may be, out of many attempts to give a good and true picture of English school life only one—Tom Brown's School Days—has commanded or merited attempts to give a good and true picture of English school life, only one—Tom Brown's School Days—has commanded or merited any lasting attention. The boys in that book were like real boys collectively, and each one had an individual and well-marked character. It is hard to get up any interest in boys like those described as inhabiting Westminster in the pages of Dr. Dasent's book. There is no real character in any one of them, and they all talk with a peculiar flippant smartness which after a little time is indescribably wearisoms. This, however, is not confined to the Westminster boys; there is a singular likeness in the thoughts and speech of all the people whom the author introduces into his pages. One is reminded by them of the Italian marionette theatres, where one weige serves alike for here and bereine, ruffian and pages. One is reminded by them of the Italian marionette theatres, where one voice serves alike for hero and heroine, ruflian and prince; where the influence of the same guiding hand is plainly recognised in the wooden actions of various puppets. One of these puppets at Westminster, to whom the name of George Irwin is given, commands, or is supposed to command, a surpassing share of the reader's attention and admiration. If his character as expressed a model and deads had the most shadowy resemblance to the dein words and deeds had the most shadowy resemblance to the de-acription given of it, one would be most glad to have the opportunity of studying so admirable a person's sayings and doings. But the

* Half a Life. By Gossga Webbe Desent, D.C.L., Author of "Annals on Eventful Life," "Three to One," &c. 3 vols. Chapman & Hall. m & Mall.

author seems to think that, having labelled this paragon with every known virtue, he has done his duty by him, and may leave him to shift for himself as an apparently very commonplace young man. It is good for a writer to leave something to the languagement. It is good for a writer to leave something to the languagement of his readers to supply; it amuses their vanity and avvection of his readers to may, however, be carried too far; Dr. Dasent has in the matter of George Irwin left everything for his readers to supply, and to do this is to make too large a damand upon their will and power to assist him. He must be credited with a certain amount of originality in keeping Frank Franklin for a long time out of the meshes of love-making, which are apt no doubt to be tiresome in novels, by dint of filling his mind and absorbing his energies with friendship for Irwin. Unfortunately the friendship is quite as tiresome as the love-making could be. Here is a specimen of the talk which goes on between the two friends. Irwin has just arrived to take up his abode at Oxford, whither his Pylades has preceded him, and he is loitering over the ahops in the High on the way to his rooms, wishing to buy prints for his bedroom :-

"Wait till you see your bedroom," I said, and then I coaxed him to come on, and leave the shop.

"Yes," he said, " there is a time for all things, and it certainly is not the time to buy lithographs, however good, the very moment one has jumped off a coach on the first day of residence at Oxford. Tell ma, old fellow, how do you feel?"

So lonely till you came. I could have sat down and cried; but all is

you feel?"

"So lonely till you came. I could have sat down and oried; but all is changed since you came. How happy we shall be together!"

"Of course we shall," cried Irwin. "Do you know I have often thought of what that doar Mr. Chrysostom said, and of his story and the riddle of life, and yet, though it might have made me melancholy to reflect how many chances we have against us, and how very wretched we may be, yet what he said of the transitory nature of life, and of its only being one part of a much longer existence, has made me, on the whole, much happier. What we have both got to do is to trust in God, and then bear whatever befalls us with a stout heart."

I suppose he expected me to say separations but I calmand.

I suppose he expected me to say something, but I only mused on what he said, and so he went on—
"Well, it is rather hard to moralize on one's way from the coach to one's

"Well, it is rather hard to moralize on one's way from the coach to one's new rooms. And yet, after all, this passing and transit from the old Irwin, the Westminster boy, to the new Irwin, the Oxford man, is very like that passage from an inferior life here to that happy state to which we believe the good shall be translated in a moment, ay, in the twinkling of an eya."

It was so absurd to me to compare the miscrable rooms to which I was hurrying him with the mansions of the bleat, that I burst out laughing, much to Irwin's disgust.

"That you call friend-hip, because when I make a profound speculation, and treat you to it in the street, like one of the old peripatetics, you uncarnest fellow, you burst out laughing, as if the Kingdom of Heaven and the consideration of it were any laughing matter."

"All I say in self-defence is what one of the old sages would have said, and if there is any truth in history, did say: "Respice finem '---' Consider the end." Walt and see what your rooms are like before you compare them to the Kingdom of Heaven."

By this time we were in Tom Quad, and cutting diagonally across it to pass out at the entrance by the hall staircase, and so on, keeping to the right to the little quadrangle in which "Chaplains" stood.

"The way to the gate of life is dark and slippery," murmured Irwin, "and so it is here, that's one likenews," as we crossed the narrow space.

If in other respects Irwin appears a commonplace young man,

If in other respects Irwin appears a commonplace young man, it must certainly be admitted that as a prig he rises to remarkable eminence. One cannot help hoping that Dr. Dasent has not been so unfortunate in his experience of young men and their relations and conversations with each other as this passage might lead one to suppose. There is something almost monstrous in the idea of two undergraduates being impressed with such vapid, mawkish ideas and interchanging them in such vapid, mawkish words as these on their entry into University life. One is inclined to think that they must have studied the behaviour of the undergraduates in Julian Home, and, having fashioned their own upon it, succeeded in surpassing their models. That part of the half of Frank Franklin's life which is spent at Oxford is neither more interesting nor more natural than that which is passed at Westminster; the chief event which occurs during it is the death of Irwin by a fall from his horse just at the time when he is about to distinguish himself in his "Great Go." The spirit in which he is represented as regarding this examination, and the expressions which he uses concerning it, are of a strange kind. Probably the following passage was written with the view of inculcating the advantages to be derived from a due exercise of piety in everyday affairs cannot suppose that the effect which it produces of reducing religion to the merest bathos was intentional:—

"Now, do you know, this examination seems to me very like the day of indement; we shall be all right if we don't incur the anger of the examiners, but who can say if they may not be as fallible as the uncient gods, and be governed by crotchets and caprice? For myself, if they were as God I should not fear. For in His hands, with all my sine and weaknesses, which are manifold, I should feel safe. And as He rules the hearts of the examiners, I seem to have a firm assurance that all will be well, and that we shall, at least, not disgrace ourselves. And now good-night. For myself, I have cast away all care. This, too, like everything in life, is in the hand of God."

Little has been said of the home life depicted in Dr. Dasent's book; but in truth there is little to say. There is no plot, and no pretension to a plot; one would say that the book was intended to be a series of brilliant sketches of life and manners as they were a few years ago; and no doubt it is a series of sketches. But a writer must prove that he possesses very great powers before he can afford to throw away the so-called trammels of art, which are not really trammels so much as supports to stay the wavering and uncertain steps of those who have not the strength to make a road for themselves, and keep their footsteps in the path which

time has proved to be the safest. The only novels of the present day which, in spite of having no plot properly so-called, rank high among works of fiction, are those of M. Tourguénest. Even they, brilliant, true, biting as they are, sometimes leave behind them an after-taste, as it wers, of incoherence and want of due connexion; and Mr. Dasent's work will hardly bear comparison with M. Tourguoneff's. As the friend who has while living entirely filled Frank Franklin's heart and mind expires in the second volume, it is not surprising to find that the interest of love, delayed so much longer than usual, should be found a necessary ingredient in the inevitable third. That part of the last volume which is not taken up by this interest is mostly occupied with tales told to Frank and the girl to whom he is afterwards engaged, by an old man, half-gardener, half-ploughman, belonging to Mrs. Franklin's estate—tales for the most part of charms and witcheraft. So constant a demand is made upon this old man's talent for narration that it would be surprising if all his stories were new. Still one is scarcely prepared, even under those circumstances, to find the story of Lady Godiva related as a little-known legend. Thus it would seem as if the love-making were an agreeable relief to the story-telling; but it is hardly too much to say that any amount of stories of any age would be more tolerable than the kind of love-making which occurs. Another of Dr. Dasent's books, Three to One, was disfigured by certain love scenes in which the ordinary order of things was reversed, and the courtship was entirely on the woman's side. In that case, however, the woman who adopted this curious method was a widow of the *rusé* type; consequently, the manner in which affairs were conducted was less unpleasant there than here, where the love is made by a girl who, by dint of saying very little and being always highly spoken of, has up to that time secured more of the reader's sympathy than any one else in the book. Here, however, is a scene in which she makes a declaration to Frank which entirely robs her of all attraction:—

"I dare say," she said, when we had got quite down into the hollow between the hills and stood under our favourite butt—"I dare say, Frank, you think me a very strange, wayward creature."

"Yes, I do, Mary," I said; "I can't at all understand what has come over you, or, I might say, entered into you lately. It seems the same Mary in form and look and face, but another Mary in word and thought."

Mary Ball looked hard at me for a moment or two, and her lips quivered a little and her eyes flashed, and she said,

"Suppose I were to say that I saw a change in you, and that you were not the same Frank."

"Then I should say you were quite wrong," I cried, "for I am still the

"Then I should say you were quite wrong," I cried, "for I am still the same Frank you always knew."
"No, you are not--not at all the same," said Mary; "I see it quite plainly."

After this she explains to him that she carefully held him up to After this she explains to him that she carefully held him up to ridicule in another girl's eyes the day before, in order that she might the more surely keep him to herself, and after that the author says to the reader, "There, now you have heard enough." In this we are disposed altegether to agree with him. Although the hero's last words are to the effect that Mary "was and is all in all to him," it is difficult to feel much sorrow for him when they are separated in consequence of her father's ruin, wherein also Frank himself is involved. Besides sins against good tasts with which the last volume abounds there are very good taste with which the last volume abounds, there are very many lesser sins of carelessuess and hurry all through Half a Life. The fact of a writer having a certain name and reputation should lead him to exercise greater rather than less care; Dr. Dasent does not think so, however, to judge from the writing of this book. For instance, he gives an elaborate description of two separate games of hockey in which the hero joins on two different occasions after his arrival at Westminster, and says of each of them that it was his first game of hockey. Worse than this, however, especially from a supposed Westminster boy, is such a misquotation as,

Raro antecedentem scalestum, Deseruit pana pade claudo.

It is probably true for once that "every schoolboy knows" this to be a horribly false scansion. One cannot but be sorry that an author of so much merited repute in some directions as Dr. Dasent should have written such stuff as Half a Life.

COLEBROOKE'S ESSAYS.

OF Colebrooke's life and of his work generally we have said something on a former occasion.† In these two volumes of

Microllenzous Essays, by H. T. Colebrooke. With Life of the Author, is Son, Sir T. E. Colebrooke. Vols. 11. and 111. Miscellaneous Essays, 1973 Buttafalar States, April 26, 1873.

his Essays are brought together the results of that work, which have his Essays are brought together the results of that work, which have been thus far acattered in the Asiatic Researches, the Transactions of the Asiatic Society, or in prefaces to books scaled to all except Oriental scholars. In singular contrast to the multitude of "miscellaneous" papers poured out upon the world, these volumes form an astonishing monument of patient, clear-sighted, and accurate learning—a learning which cannot indeed be said to dress itself in the most attractive forms, but which presents a valuarry for diggers endowed with something like the perseverance and enthusiasm of the author. It would no doubt have been better if with his wonderful powers of research and clearness of arrangement Colebrooke had combined a little of that imagination which can light up the hardest and driest matters as with a living which can light up the hardest and driest matters as with a living which can light up the hardest and driest matters as with a living fire; but, in the midst of the complicated details of subjects in themselves singularly intricate, we are made constantly to feel that the explorer is fully alive to the bearings of his researches on the knowledge, the philosophy, and the social life of the European world. There is little or nothing here to attract the so-called general reader; but the scholar whose work has never carried him. specially to the history or the literature of Indfa will not feel, as he searches these pages, that he is in a wholly new land. He will even be startled to see how clearly, more than half a century ago, Colebrooke, addressing the first general meeting of the Asiatic Society, laid down the relations of Fastern with Western thought, and invisted on the connexion of Grask philosophy with that of and insisted on the connexion of Greek philosophy with that of

Whichever is the type or the copy, whichever has borrowed or has lent, certain it is that the one will serve to elucidate the other. The philosophy of India may be employed for a commentary on that of Greece; and, conversely, Greecan philosophy will help to explain Indian.

He was speaking at a time when the sciences of comparative grammar and comparative mythology could scarcely be said to exist; and we cannot therefore be surprised at the greater diffidence with which he claims that mythology should be studied chiefly as illustrating the history of the aberrations of the human chiefly as illustrating the history of the aberrations of the human mind, and that the Sanskrit language should be carefully analysed with the expectation that it will be found "to contribute something to the elucidation of Greek and other European languages." But even here we have the sagacity of the true philosopher in the assertion that "the analysis of language in general, which has been unsuccessfully attempted on too narrow ground, may be prosecuted with effect upon wider induction."

His own researches extend practically over the whole of the enormous field of ancient and modern Hindu literature, science, philosophy, and law. Among the papers, all of them elaborated with the same exhaustive care, we have essays on the Vedas; on the religious ceremonies of the Brahmans; on the Sankhya, Nyaya, and Vaiseshika systems of philosophy; on many of the Indian and Mohammedan sects and their doctrines; on Indian courts of Prakrit languages, and on their poetry; on Indian and Arabian divisions of the Zodiac; and, among many others, on Hindu astronomy and algebra. Of these subjects some have been more astronomy and algebra. Of these subjects some have been more fully treated by more recent scholars and workers, while many of the books which the readers whom he addressed fifty years ago could know only by name or by description have now been printed in the original, and in part translated and illustrated. Yet even in those subjects which have been most thoroughly handled Colebrooke's Essays have lost neither their interest nor their value. All contain a large amount of matter not to be found elsowhere, and on points which still involve questions of controversy his judgment comes with undiminished weight.

Among the most prominent of these questions, the student whe finds the fact forced upon him as he wades even through the cumbrous inds the fact forced upon him as he wades even through the cumbrous mythology of the Puranas will welcome his emphatic vindication of the real monotheism of the Rig Veda, and of the schools of philosophy founded upon it. The deities of these, the oldest books perhaps in the world, may bear a hundred names, and of these names every one may have given birth to a hundred uncouth conceptions and stories; but in Colebrooke's belief they "are all resolvable into different titles of three deities, and ultimately of one fled." If any doubts gould be unterstained by these why of one God." If any doubts could be entertained by those who compare the phrases applied to Brahma, Mitra, or Varuna, with those which are addressed to Indra, Mahûdeva, or Vishnu, they would be set at rest by the following passage:

The deities are only three, whose places are the earth, the intermediate region, and heaven—namely, fire, air, and the sun. They are pronounced to be (the deities) of the mysterious names severally, and (Prajapati) the lord of creatures is (the deity) of them collectively. The syllable Om intends overy deity: it belongs to (Parameshthf) him who dwells in the supreme abode; it appertains to (Brahma) the vast one; to (Deva) God; to (Adhyátmá) the superintending soul. Other deities belonging to those several regions are portions of the (three) goda, for they are variously named and described on account of their different operations; but, in fact, there is only one deity, the GREAT SOUL (mahan atmá).

there is only one deity, the GREAT SOUL (mahan atms).

Colebrooke concludes that "the ancient Hindu religion, as founded on the Indian scriptures, recognizes but one God, yet not sufficiently discriminating the creature from the creator" (i. 23). The remark the one which must never be forgotten in the study of Indian philosophy; yet any one must be wilfully blind whe fails to see that this monotheism is in no way weakened by the concrete images which exhibit this Great Soul as drawing from the waters, and framing, an embodied being, from whose mouth, opened as an egg, speech issued, and from speech fire, while from the nestrile breath passed and air was propagated; from his skin rose hair, and from this the foliage of herbs and true, while farther, the breast opened, to send forth mind, and from sized came the outh,

moon; from his navel deglutition, and from deglutition death. At a first glance we might be tampted to dismise all this, and much mare which follows it, as more pucifity; but we should be only refusing to lock upon the foundations of an elaborate system of philosophy, laid with the greatest care and with the most subtle arrangement of its narts, and moreover of a philosophy which errangement of its parts, and, moreover, of a philosophy which deals with problems now occupying most prominently the thought of Europe, and which solves many of them by methods and with results scarcely to be distinguished from those of certain schools of no small pretentions to something like infallible wisdom and absolute authority.

e great defect of Indian as of Greek philosophy was its subservience to words, as though words were things. It is remark to say nowadays that this verbalism must impro-upon, if it does not domineer over, the systems of men wh no language but their own. These chains were riveted at a very same round the thinkers of India. If we mark what is said about the soul as intelligence or the faculty of apprehension (i. 46), we shall not be surprised to find one school of the Sankhya philo-sophy denying the existence of a maker or ruler of things prior to creation, and asserting "that there is no proof of God's existence, anperceived by the senses, not inferred from reasoning, nor yet revealed." The philosophy of Iswara acknowledges an absolute intelligence which is the source of all individual intelligences and Yet this being is himself the result of development, and must come to an end with its consummation. The existence of any other creator he rejects utterly, his reasoning being clinched with the following argument:-

Detached from nature, unaffected therefore by consciousness and the rest of nature's trammels, he could have no inducement to creation; fettered by nature, he could not be capable of creation. Guidance requires proximity, as the iron is attracted by the magnet; and in like manner it is by proximity that living souls govern individual bodies, enlightened by animation as hot iron is by heat.—I. a64:

This seemingly elaborate reasoning resolves itself ultimately into the confession of our inability to form conceptions except through impressions made on our senses, and from this inability it infers a general impossibility, thus leaving the ultimate cause of development or evolution with no better solution than that of a great mundane egg which creates itself. The philosophy thus brought into existence dealt very freely with the books for which it claimed the sanctity of divine revelation. Its own remedy for all earthly evils was abstraction from the bonds of matter. means to this end—that is, to happiness—was meditation; according to the precepts of the Veda the road lay through a series of outward ceremonies, and it was so much the worse for the Veda. The method prescribed by revelation was not pure, for it was attended with the slaughter of animals, which, if not actually sinful, was at least not harmless; and if a particular present entitled the was at least not harmless; and if a particular precept enjoined the alaying of the accrificial victim, a general maxim forbade the hurting of any sentient being. But further, the method was defective, since even the gods, Indra and the rest, perish at the appointed period, and it was excessive, in so far as by it the happiness of one is made a source of unbampiness to another (i. 252).

made a source of unhappiness to another (i. 252).

With such a foundation for the transcendental systems of thought, it is not surprising that the popular systems should run out into a wild growth of verbalism, this verbalism making itself felt by a multiplication of ceremonies which laid on all who were subjected to them an appalling and intolerable slavery. Nowhere can we escape from that fearful power of words which has exercised a mighty influence on the scholastic theology of Catholic Europe. Under this system the phrases and hymns of the Veda ne magical incantations, or spells which can compel the deity to grant the spiritual grace for which the suppliant prays. Nay, the supreme act or series of acts which are regarded by the philosophers as the promptest mode of attaining beatitude, and which constitute devotion to God, consist in repeated mutterings of his mystical name, the syllable Om, at the same time meditating its signification (i. 263). When such is the "efficacious devotion" of the most advanced, we cannot be surprised if the Veda itself should be treated with the veneration paid to the image which fell down from Jupiter, and honoured by recitation "in various superstitious modes would be word by word at the superstitious superstitious words." modes, word by word, either simply disjoining them, or else repeating the words alternately, backwards and forwards, once or oftener. Copies of the Rig Veda and Yajur . . . are prepared for these and other modes of recital, and are called *Pada*, *Krama*," &c. Few things happily are absolutely without use; and such practices as these obviously reduces to a minimum, as Colebrooke has attempted the recepibility of computing and instantial intermediate in strongly insisted, the possibility of corruption and interpolation in the Vedic text. Of the general genuineness of this text we can have not the least doubt; that there has been here and there a have not the least doubt; that there has been here and there a alight impering with words, and with fatal results deliberately contemplated, has been clearly shown by Professor Max Müller in the instance of the passage which enjoins on widows the duty of following their husbands through the funeral fires to the paradise which lies beyond. But it is at least possible that these changes, infinitesimally slight in their extent, although deadlykin their effects, may have been made before the fully developed moordoutlism of the Brahmans devised these ingenious modes of paying humans to their sacrad hocks. honour to their sacred books.

honour to their secred books.

Not less oppressive are the more classifications of the Sankhya an Cother philosophical systems of the Hindus. When we are told that the intellectual creation is liable to suffer through four classes of affections numbering in all fifty; that there are five obstructions of the intellect, beginning with obscurity and going on

through illusion, extreme lilusion, and gloom into utter darkness; and that these five are subdivided into sixty-two sorts, error (or obscurity) and illusion comprising each eight species, extreme illusion ten, while gloom and utter darkness have each eighteen divisions—we may well turn with a feeling of indescribable refreshment to the hymn spoken by Vách (voice or speech) in graise of hereaff as the supreme and universal soul:—

I uphold both the sun and the acon, the firmament, and first. . . Me, who am the queen, the conferrer of wealth, the possessor of knowledge, and first of such as merit worship, the gods render universally present everywhere, and pervader of all things. . . I make strong whom I choose, I make him hely and wise. . . I pervade heaven and earth. I bore the father on the head of this (universal mind), and my origin is in the midst of the coesn; therefore do I pervade all beings, and touch this heaven with my form. Originating all beings, I pass like the breeze; I am above this heaven, beyond this earth; and what is the great one, that am I.

It is remarkable that Colebrooke, in quoting this hymn, should not notice its striking likeness to the still more magnificent sulegy which the writer of Ecclesiasticus places in the mouth of the Divine Wisdom, who declares that she encompasses the clouds and walks in the bottom of the deep, that she came forth from the mouth of the Most High, and that she shall never fail. The comparison seems to lay open one of the many tracks of investigation suggested by these Essays. Our gleanings have been confined to a few pages, and can give but a faint idea of the harvest to be reaped from the whole field explored with unwearying toll by a thinkeruggested by these Ess whose memory must be cherished by his countrymen with legitimate pride.

BYGONE DAYS IN DEVON AND CORNWALL.

A NY attempt to illustrate the customs and traditions of the "West Countreo" is sure to possess more or less interest, and it is courageous of Mrs. Whitcombe to venture upon a field one half of which has sufficed for Mr. Hawker and Mr. Rottrell. We must say, bowever, that, while she attempts more than they have done, she has performed less, and leaves the reader in an unsatisfied condition at the end of his task. Mrs. Whitcombe is apt to be inconsecutive; she does not seem to understand the difference between what is curious and what is trivial; and, besides lack of research, which lands her in curious mis-state-ments, she has a way of leaving a story or legend unfinished and an inference or moral unpointed. In her Cornish pages she goes over the same ground as several able predecessors, and exhibits by contrast her incapacity to discriminate what is noteworthy. In those which relate to Devenshire, where the field has been less worked, she has yielded to an inclination to "chronicle small beer" which curtails her space for what is really of interest. Thus a page is taken up with adages about the luck that will follow a child according to the day of the week on which it was born a child according to the day of the week on which it was born—adages not specially local, and certainly too trite to need repetition; she reproduces from Western the statement that "Julius Cæsar spent some time at Lydford" (at the head of Dartmoor Forest) "on his second arrival in England"—a statement not more worthy to be accepted as history than the legend that at Lydford Castle Judge Jeffreys reappears at intervals in the shape of a black pig; and though she can laugh at the local derivation of Marazion, or Market-Jew, from the first tinners, who are supposed to have been of the kin of Judas Iscariot, she quotes with approval a manuscript history of Lostwithiel which accounts for its nama by manuscript history of Lostwithiel which accounts for its name by the supposition of an earthquake that swallowed up the elder city, of which Lostwithiel or "Lost-with-all" commemorates the dis of which Lostwithel or "Lost-with-all" commemorates the dis-aster. Add to this a good deal of crudeness and defective arrange-ment in many parts of the volume; for example, in the case of the legends of Tavistock, which are given in a very confused fashion. First we have the anecdote of Prince Charles's visit to the town in 1645, when the incessant wet so annoyed him that ever after, when 1045, when the incessant wet so annoyed him that ever after, when any one said "it was a fine day," he rejoined that "it was sure to be raining at Tavistock." Seeing that 1645 was the year of Naseby, and but four years before the execution of Charles I., the probabilities are that any small joke about Tavistock weather would soon have been effaced from the mind of the Prince; and that the story is as apocryphal as it certainly is trivial. From Charles II. Mrs. Whitcombe skips back seven centuries to Ordgar, Duke of Devon, founder of Tavistock Abbey in A.D. 961; and from this, we should have thought, prehistoric Duke she flies off from this, we should have thought, premisoric Duke she mes on to Betty Grimshaw, a young woman murdered in the grounds of Tavistock Vicarage, from whom it is an easy leap back to a nameless Abbot who was drowned in the river Tavy, near the Abbot's Weir. To say nothing of graver faults in the notice of Johanna Southcott, these hops and skips seem to prove that Mrs. Whiteamba's chronology is somewhat inconsecutive. Whiscombe's chronology is somewhat inconsecutive.

Whitcombe's chronology is somewhat inconsecutive.

Notwithstanding these defects, however, Bygone Days is not wanting in interest. Mrs. Whitcombe's plan is to divide into three sections, under the heads of "Superstitions," "Oustoms," and "Legends," such matter as she has collected about each of the counties. Neither of them, in truth, can be said to have allowed the march of intellect to rob them of whatever credit attaches to a well-cherished faith in the darkest and most old-world superstitions. Mrs. Whitcombe's story of the farmer's wife near Launceston, whose pig was "over-looked" by a witch, and who had her revenge, through the aid of a white magician, is a melancholy example of West country ignorance

^{*} Bygone Dups in Duson and Curnicall, with Notes of existing Supersidious and Customs. By Mrs. Henry Pennell Whiteombe. Losson Bishard Bentley & Bon. 1874.

and superstition; and we should hardly have creamen as most read life. Bottleil's assessed of "Tom Tremoveth's bewitslied sow!" No doubt; there are some who lieve a vested interest in the maintenesses of this worse them Egyptian derinces—the "Wimrds," so called, who make a profit out of sharms which; to judge from a specimen or two quoted by our author from Mrs. Bray, outvie in garbling of Scripture the fabulous cross-answers of Oxford undergraduates in the Art of Pieck. Such a wixard was a certain "Old Belez," to whom, when he had in the early part of this century incited three wretched women to stab a witch, for which they were brought to trail, Judge Burrough sent a message, that "if he did not leave off his conjuring, he would be caught and charmed in a manner he would not like" (Hone's Year-Book, p. 212). This is a reminiscence of Deven; but Cornwall, as our readers need not be told; is not a whit behind in blind credulity. There is something poetic canes of Devon; but Cornwall, as our readers need not be told, is not a whit behind in blind credulity. There is something poetic and at least innocent in its superstitions about wells, such as those of Madron and Redruth, endowed with healing virtues; Lady Nant's well in Little Cowen, and St. Roche's, which can confer a gift of divination; or again in such wells as St. Keyne, to drink of which gives a husband or wife the whip-hand over his or her ne longer "better held." But "witchcraft," and "ill-wishing," and "the evil eye" ere types of superstition calculated to work mischief and foster a spirit of revenge and jeudousy, especially among benighted peasants, capable of believing that the best cure beiled"; and the cartain specific for the goltre "to go before sunrise to the grave of the last-buried young man, and apply the daw, gathered by passing the hand thrice from the head to the foot of gathered by passing the hand thrice from the head to the foot of the grave, to the part affected." Devonshire folk are said to believe that a locked or bolted door, or a beam overhead, impedes the passage of a dying man's spirit. Moribund Devonians also object to goose-feathers.

Between superstitions and customs the line is somewhat in distinct; as not unfrequently the latter take their rise from the former. And it is curious how many of these in Devon and Cornwall exhibit resemblances to those of Slavonic countries. Thus the belief that the chief nocturnal delight of the Cornish Piskies is riding the colts and plaiting their manes is quite in keeping with the tastes attributed to the Russian Domovoy; and the ill-luck supposed in Devonshire to attach to washing clothes on Good Friday has an affinity, casual or other, to the superstition which forbids washing linen in Holy Week in Little Devolution. Russia. In Russia this is a compliment to the Russikas, or Russia. In Russia this is a compliment to the Russikes, or female water-spirits, and a breach of the custom might be visited by death through drowning. In Devon it is said "to wash out one of the family." So, too, the Devonshire and Cornish custom of "crying the neck" at harvest, which consists in tying up a small sheaf (plaited and decorated with flowers, and consisting of the finest ears of the last wheatsheaf in a field), forming a ring and chanting a rhyma around it, and then carrying it to be hung up till next year's harvest in the farmhouse kitchen, resembles yer much the Russian carrying home of the sheaf, and placing is up till next year's harvest in the farmhouse kitchen, resembles very much the Russian carrying home of the sheaf, and placing is in the house beneath the Holy picture. The Furry Day (8th of May) at Helston, and St. Piran's Day (5th of March) which is a great day with the Corniah miners, have much in them akin to Slavonic customs and folklore. On Furry Day all the Helston folk wear flowers, and form a "halantow," which means in Cornish a procession for walking the boundaries. On St. Piran's festival the tinners dress up a figure called Jack-a-Lent, meant to represent Judas Iscariot, and set it up to be burnt, or shot at, or thrown down a chimney. It has been surmised that the former custom has some connexion with the Roman Floralia, while the custom has some connexion with the Roman Floralia, while the origin of the latter is more obscure. But may not both be relies of sacred rites typical of the birth of spring and the death of winter, and referable to Aryan origin, as are other customs kept up by Latin og Teutonic peoples? In Russia one mode of guessing as to a sture farther for life is to set a table for a chance comer at the season of Epiphany. In Devon the curious maiden carries hamp-seed to the church porch on St. Valentine's Eve, and scatters it on her way home in the faith that she will have a vision of her future husband eating it up. Clearly customs repeat themselves.

Amongst curious customs of Devonshire Mrs. Whitcombe gives a full account of "Wassailing the Apple-trees," kept up in the bellef that

bellef that

The more or less fruit they will bring, As you do give them wassailing.

This modern sacrifice or libation to Pomona is celebrated on Old Ohristmas Eve, and consists in a tribute of cakes and cider to the 4 old apple-tree" as well as to the guests. Mrs. Whitcombe omits old apple-tree to note, what Brand and Hone commemorate, that before sprinkling the cider on the roots, each of the ring of wassailers has a drink himself, and that the drink is compounded of roasted apples and cider in a milk-pun. She should have noted, too, that they do not waste the liquer on an unfruitful tree.

waste the liquor on an unfruitful tree.

A strange custom was in vogue till 1837 at Comb Martin, in North Devon, which had a legend, though an obscure one, at its back. It was called "Hunting the Earl of Rone," and was peculiar to Ascension Day, on which festival "a procession was formed of mummers—one representing the Earl wearing a grotesque mark, a smook-frock, and twelve sea-biscuits strung round his mack; a hobby-horse masked and armed with a mapper—i.e. an instrument abaped like a horse's mouth, with teeth; a fool masked; a donkey with a necklace of twelve biscuits, and a troop of the contract. These last "marched to Ledy's Wood, near the village, and the Earl-Eidden in the breakwood. They find a volley,

set him on the donkey face to tail, and thus took him to the thom with his mapper" (pp. 33-4). There is no mention of them with his mapper" (pp. 33-4). There is no mention of customs in Heat's Romanous and Drolls, or in similar bearing on the customs and legands of the West to which we referred; but Man Whitmombes cites a tradition which have a germ of truth, or may have been invented to accept for the custom—namely, that in the Prink Rebellion as Rail of Tyrons landed from a little vessel on the coast, and tech refuge in Lady's Wood, subsisting on a string of sea-biscuits until he was n by soldiers in pussuit.

From this misty story the transition to the "legenda" is natural. The rivers issuing from Dartmoor had a supermittious repute of old, and the moor-men still hear as ill owen in the "Cry of the Dart," or sound of the mountain stream. The wish-hounds haunt the moor in quest of unbaptized children, and frequent the narrow lanes on St. John's Eve, leaving marks of their cloven feet on their track homeward: to Dewerston Rock. In the valgar belief each kistvaen, circle, and cromleck betokens a treasure-hoard, and each is supposed to be weathed by the devil and his hounds, to the sudden destruction, not unheralded by brimstone fumes, of the covetous-minded. Crammers unheralded by brimstone filmes, of the covetous-minded. Crammers I'ool, in the same region, is the Devonian Tartazus, just as Sir Francis Drake represents the well-finder Danaus to the simple folk of Plymouth; and the "sow with its litter," which figures in the Æneid repeats itself in the legends of the windows of Braunton Church in Lundy Island. To Exmoor and North Devon belong the curious stories of one Fergus, a highwayman with a famous horse, which Mr. Blackmore has pressed into the service of Lorna Doons: and "the Warren" near Bridgeworthy, on the north coast, weathe retreat of as daring a gang of robbers as Lorna's north coast, was the retreat of as during a gang of robbers as Lorna's kinsfolk. The story of the Traceys who from time out of mind "have the wind in their faces," and whose ancestor could find no place for repentance, is also a North Devon legend. Sir William, piace for repentance, is also a North Devon legend. Sir William, according to old wives fables, still on stormy nights "malesbundles of sand and wisps of same" on "Woollacombe sanda"; a penance which the learned in Cornish legends will remember was one of the many imposed on their mythic bets noire, Tragesgle. From the latter part of Mrs. Whiteonbe's book we might cite some of the others, e.g. the task of drying and baling out Dosmary Pool with a bored limpet shell; but what little space we have left must be devoted to the least common space we have left must be devoted to the less common traditions of Devon. One of these is connected with the good deeds of Isabella de Fortibus, Countess of Devon, the reputed planter of Wistman's Wood in Durtmour. She was connected with Tiverton, and at a place near it, called the "Seven Crosses," a poor woman had seven babes at a birth. As her over-Crosses," a poor woman had seven babes at a birth. As her over-burdened husband was carrying them in a large basket to the river, "He answered 'seven whelps.' 'Lot me see tham,' said the Countess. 'They are only puppies,' he replied again, 'not worth the rearing.' However the Countess insisted on seeing them, and finding them seven babies, she took them from the father, hastaned home, and brought them all up; and tradition affirms that they became seven learned divines." The peasant who unintentionally conferred such a boon upon the Church seems to have regasted. his sevenfold litter in much the same light as a gardener's son. we have heard of, who, when shown his new-born twin beothers, remarked, "Father, we'll save this us." Another legend of the South-East of Devon introduces St. Dunatan, and contains a bit of weather-lore not noted in Mr. Swainson's recent book. St. Dunstan. had brewed "a peck o' maut" and wanted to sell it, when the devil appeared to him and bargained to blight all the apple-trees. and enhance the value of the Saint's ale by stopping the cider supply, on the usual condition of an assignment of his soul. "St. stan stipulated that the trees should be blighted in three days. which fell on the 17th, 18th, and 19th of May, St. Duneten's di being the last of these." It is said that the farmers still watch ti which fell on the 17th, 18th, and 19th of May, St. Dunstan's day, being the last of these." It is said that the farmers still watch the weather about this time with great auxiety as to their orchards, and attribute the untoward frosts which blight the apple crop to the Devil's compact with the Saint. How the Saint got out of his share in the covenant Mrs. Whitcombe does not tell us; but it is characteristic of more than one of Mrs. Whitcombe's stories that they lack a sequal. As we have already remarked, with so rich at thome she might have made a better book; but some gratifude in: due to her for what she has done.

THE VICISSITUDES OF BESSIE FAIRFAX.

WE have heard before now of Hamlet with the part of the out, of a novel without a here, and a story without a plots, but we have seldom met with one which enemylished the last consistent of things so fully as the Vicinitaties of Resis Paryline. Surely never were three substantial volumes based on a more similar foundations. But, seeing what they are, there is no reason industries should not have gone on to thirty; no reason industries should have ever ended until Bessie had died of obtage they should have ever ended until Bessie had died of obtage they are described in the family grave.

The "vicinitades" of which Halme has been has seathful the

* The Visionitation of Bessie Fairface. By Haban Long Anti-cantiful Mine Barrington, die. die. 3 vols. Lauring Lieu-

self the chronicler are by no means of a sensational kind, and may be summed up in very few words. Bessie's mother dies when she is a little child, and her father marries again, the second wife heing a woman who is as true a mother to her as if she had been really her own. Soon after this second marriage her father dies, but his family, a proud and rich set of people whom he has coffendiff by his two unworldly alliances, ignore both the widow and crystan, and leave them to struggle on together as they best may. Presently Mrs. Fairfax in her turn marries again, her husband being a Mr. Garnegrie, the doctor of the village where she and little Resaic live; and Mr. Carnegie is as good to Bessie as the stopmother has been. These worthy people have a large family, chiefly of sturdy boys, and Bessie is naturally, but not unkindly, made into a kind of nurse to the little people. Hence her education is not remarkable for its seathetic refinement; and though she has is not remarkable for its mathetic refinement; and though she has learnt to speak the truth, to be considerate and kind, also to ride without fear, she has learnt nothing also considered indispensable

Mr. Pairfex-senior, the old squire of Abbotsmend in Woldshire, if a hard unrelenting man, was surely somewhat tried by his sons and their queer marriages. He has three, whereof the eldest marries a mad woman, the second a Xantippe, and the third, Bessie's father, a couple of unnoted young ladies without family or money. The first two marriages are childless; of the third Bessie is the only result. When the wife of the eldest brother Frederick has been pronounced incurably insone, and Laurence's Kantippo mercifully departs this life, leaving behind her in her husband's mind so much distaste to conjugal felicity that he "would no more the old Squire remembers Bessie, now about fifteen years of age, and sends a lawyer's letter to the Carnegies to demand her n them. As there is no help for it, Bessie is delivered to her grandfather, sent to school at Case for three years, then taken home to Abbotsmead in Woldshire as the young heiress apparent to whom ultimately the whole estate will belong. Blee is destined, in her grandfather's mind, to marry a certain Mr. Cecil Burleigh, a young man of good hirth, pussable brains, and stinted means, a great favourite with old Mr. Fairfax, who thinks it an excellent the mount of the programment of fortune her civing him. Hearing way to make the young man's fortune by giving him Bessie and her lapful of gold. Of course Bessie has left behind her at Beschkurst the well-known boy-love of inferior birth and superior abilities. She therefore remains constant to Harry Musgrave and refuses Cecil Barleigh. On which or grandfather alters his will, makes over to Cecil all the fortune ahe was to have had, leaves her only a paltry five thousand pounds, and Bessie receives the news without emotion, though the blushed, put up her eyebrows, and smiled as she said, 'Then I am a poor young woman again?' She saw at once what was absurd, pathetic, vexatious, in the descent from the dignity of riches; but pathetic, vexations, in the descent from the dignity of riches; but also was not angry." After which she goes back to the I orest, where the Caracques live, marries Harry Musgrave, and pities Lady Latinser, an old lady who moves through the pages handling the threads of the story every now and then in a perfunctory way, but having no vital influence or action therein. Indeed this may be said of every person and every svent outside the skeleton we have drawn. We have seldom read a book with the skeleton we have drawn. We have seldom read a book with less sense of growth in it. The real story is told with only very little more amplification than we have given it, and all the rest is more more assummention than we have given it, and all the rest is fringe and padding. The last scene of all, that which closes the book, may be given as an example of the strangely unsatisfactory treatment of the whole. Bessie has been lamenting to her knahand the necessary loneliness of her friend Lady Latiner. Harry asswers sensibly enough:—

"My dear child, all the world is lonely more or less—she more, we less. But doing all the good she can—and so much good—she must have many laters of pure and high artisfaction. I am giad we have uset."

And Ressie was glad. These chance meetings so far away gave her sweet intervals of reverse about friends at house. He kept her tender heart them, but had never a regret that she had left thom all for Il arry languave's sake. She sat musing with lovely pensive face. Harry looked up from his work again. The sky was heavenly serend, there was a cool arr stirring, and slow moving shallows of slood were upon the lake.
"I am thred diffusersange just now," said Harry, rising and stepping over to the window where his wise ast. "This is a day to find out something new—int us go down the garden to the landing, and take a bout. We will ask for a roll or two of based and some wine, and we can stay as late as we gleene."

Bessie came out of her dream, sail-did his hidding with a grace. And hat was the day's diversion.

We think it would be hard to find a book where the story ran more completely into sand than this, or one where the ending was more tamely conceived or more vaguely touched. This indeed is the great demerit of the whole performance; it is dull and vague. The plot is nothing, the characters have no work to do, the incidents are hable, the dialogues without point or consequence; the writing, to Suchle, the dialogues without point or consequence; the writing, to be sure, is sometimes ament, but more often odd, and the attention falls eather story flags. We have such sentences as, "Hemie was not to wait for when the hour came"; "Young Mangrave and the young Turnegies called cousins," instead of called each other cousins, a planse repeated again if not offener; she "smiled superior"; and, if we might venture to add without seeming hypercritical, "little tents." A little tent in all more wall when women att thinks If we might venture to add without seeming hypercritical, "little trots is all very well when women are talking frailierly of children, but it looks silly in print; and to emile minerior, and to call continu, are phrases open to grave question. But there is a curious ring of affected provincialism in this book; and the cyle is no quest, shrupt, and entity all

through that we seem to be reading by jurks. Take this so

"Wait for me, Miss. Sairfax," said Margaret as she Alementiad. "Come to my rusen." And Bessle went without a word, though her lips were laughing. The was laughing at herself, at her herenyeconsees, at her trivial mortifications. Margaret would set her at her easy and Bessle learns that she had a rere charm in her heir, both from its colour and the meanure of its growth. It was levely, Margaret sold her, and present its crap shining abundance with her hand delicately.

"That is a constant in adverse circumstances," said Bessle with a light in her eyes. Then they ran downstairs to find the maraling-room deserted, and all the company gone in to lumboon.

Elsewhere we read of the little girls, "at a side table, sociable and happy in under tones"; and Miss Buff panting up the hill "with fat tears running down her checks." "She had barely time for a word, Mr. Carnegie always cut short leave-takings." En this acene—it is the parting seens where Ressie leaves the Forest and her old home for school at Caen—we read further that "Bessie's nose was pink with tears, and her eyes glittered, but she was in good heart. She looked behind her as long as she could see her mether, and Jack and Willy course after the chairs with dama neglect-headleschiefs a flutter [sic] and as she could see her mether, and Jack and Willy coursing after the chaise with damp pocket-handkerchiefs a fluttor [sic], and then she turned her face the way shewas going, and said with a shudder, 'It is a beautiful sunny morning, but for all that, it is cold!'"

Among the few incidents in this novel, the fact that Mr. Laurence Fairfax, the old equire's favourite son, and the one who wowed he would have no more conjugal felicity when his special Xantippe died, marries secretly a little lady in blue, has two big boys, and tells no one of his deed, is one of the most unnecessarily complicated and obscure. His wife is the niece of the local milliner, "a large-featured woman of a married with counterpart of the counterpart of the local milliner, "a large-featured woman of a grave and wise countenance," discourses in this wise :---

Miss Josund took off her glasses, and gave Ressle a dalberate, discorning look-over. "Very happy, malam, kulect. Blue, of course?" she said. Hessis arquitesed. "Any tests, any style?" the million further

Yes. Give me always simplicity, and no imitations,"

"Yes. Give me always simplicity, and no imitations," was the unlessitating, soncies reply.

"Mes Fastax and I enderstand one another. Anything more to-day,
ladica?" Bosde and Mrs. Stokes considered for a moment, and then said
they would not detain Miss Joeund any manger from her newspaper. "Ah I
ladics, who can exist altogether on chiffons?" rejoined the million of
spolegetically. "I do love my Tonse—I call it myst gentleman." I comnot live without my gentleman. Yes, ladies, he does small of telescop.
That is because he spends a day and night in the ter-parious of the
Shakespeare Tavern before he visits me. So do svil communications
corrupt good manners. The door, Miss Lawsun—Good afternion, ladies."

She was the daughter of a physician who desays and died in

She was the daughter of a physician who drank, and died in debt, and she was a clever and well-read woman; but why, whom debt, and she was a clever and well-read woman; but why, when she has to tell Lady Angleby the story of Mr. Laurence Fairfax and her own nicee Rosy, does she use such expressions as—"I recken, your ladyship, that Dan Cupid is no more open in his tactice them over he was"; "it suited all parties to keep it a secret at first; but a secret is like a birth—when its time is full, forth it must come"; "Two little boys, with Fairfax writ large on their faces, are had to hide"; "and that is the whole story, an' it please your ladyship"; "I warrant it did not please her ladyship at all," answers Mr. Laurence leairfax in the same key. Her Holmo-Lee been undergoing a course of Mr. Henry Kingsley? We are sorry to see her give way to such missemble affectation, and gravely set down conversations which are atterly impossible among sane people, and which therefore give a false and artificial air to the whole work. air to the whole work.

The prevailing characteristics of the Vicinitades of Bessie Pairfar being vagueness, feebleness, and addity in style and story altie, we being vagueness, feebleness, and oddity in style and story alties, we can scarcely expect the dramatis persons to have much individuality. Nor have they. Herein benealf is a nice, bright, healthy kind of girl, but beyond a certain good common-semantich, makes her take things in the main quietly, and a certain quietless of temper which disposes her to give sharp answers and "scorny" looks, we cannot make out anything very decisive. She is an affectionate little nurse and a murry brown gipsy in the opening chapters; but she reconciles herealf to the londinus and want of freedom at her school with admirable self-command. Always inclined to simplicity and fond of family life, of bissing little boys, hard report in the construction of the longer of the longer hard report in the longer of the lo freedom at her school with admirable sou-communa. According inclined to simplicity and fond of family life, of bissing little boys hard round cheeks, she yet contrives to make berself happy enough in the dull grandeur of Abbotsmead, wisce she has neither duties nor pleasures. But she is not sold. She blaskes furiously enough in the dull grandeur of Abbotamend, where the has neither duties nor pleasures. But she is not cold. She blashes funiously on the smallest provocation, and as soon secovers from any temporary embarrasement into which she may have been east. Thus she unites the contradictory qualities of extreme succeptibility with extreme self-centrel, and the most admirable wisdom of action with the most impotuous contempt for formal rules. She somehow wants a sentral characteristic round which these contradictory qualities might have crystallized in a more harmonious manner than at present; and all the other persons want more defimanner than at present; and all the other persons want more defi-nite drawing everywhere. It seems to us that the book shows municipalities signs of fatigue in the writer. These is a total absence of freshuses and vigour; and addity is last a had substitute for those qualities. Helme Loudses done good work in her day, but she has been gradually sinking into the "securibling" stage, of witch Bessie Emirjue is the communicating example. We are sorry to have this to vary, but with all our respect for past excellence, we are forced to condemn present failure; and Molne Lou has un-desidedly failed in her present noval.

WRENCH LITERATURE.

FRENCH LITERATURE.

THE study of the beginnings of Franch literature is still vigorously presecuted by our neighbours on the other side of the Chamel, and one of its most recent and noteworthy results is a translation of Frederick Dietz's Grammar of the Romance Lunguage.* It is certainly surprising that so calebrated a work should never before have appeared in a French dress, as it is the best authofity on an important branch of comparative philology.

MM. Auguste Brachet and Gaston Paris have undertaken the task of introducing M. Dietz to their fellow-countrymen, and no scholars were more thoroughly qualified to do so. The grammar is advertised to appear in three volumes, each embracing two instalments; the whole of the first volume is now before us, and the entire work will be completed in the course of next year. Besides a French translation of the German text, MM. Brachet and Paris purpose issuing a supplement containing—(1) A detailed introduction discussing the history of Romance languages and of Romance philology; (2) important additions and corrections; (3) an analytical index. So far as we can judge from the two factorist we have received, the version is very well done, and the external appearance of the work deserves unqualified praise. The plan of printing separately the additions to the original work seems to us far preferable to a system of foot-notes, because it secures both fulness and consecutiveness.

If the study of philology taken as a whole is one of the

secures both fulness and consecutiveness.

If the study of philology taken as a whole is one of the most interesting that can occupy us, it is no less essential to inquire separately into certain problems connected with the alterations of letters, and with phonetic changes; special monographs are of course capable of developments from which authors graphs are of course capable of developments from which authors are precluded whose researches cover a wide ground, and problems which in a general grammar must be compressed into a paragraph or two may profitably afford materials for several hundred pages. Such is the case with the valuable publication of M. Joret,†, which treats of the power of the letter c in the Romance languages. The revolutions through which the vulgar Latin has passed in order to issue in the Italian, Spanish, Portuguese, Provençal, and French languages were very numerous and various. Still they can be reduced to rules; and if we take a single letter as an instance, we can form some idea of the rest. M. Joret has done this winch success. After an introduction in which he examines successively all the Latin gutturals he discusses in detail the numerous

we can form some idea of the rest. M. Joret has done this with much success. After an introduction in which he examines successively all the Latin gutturals, he discusses in detail the numerous transformations of the consonant c, some of which had never been dealt with before. The examples he gives and the principles he lays down, throw much light upon the formation of the leading French dialects, and will prove of considerable use in determining the true reading of controverted Norman texts.

The third edition of M. Taine's essays I has been revised by the author, and centains several pieces which did not form part of the previous ones. Amongst others we would notice the preface to M. Mérimée's Lettres à une inconnus. We do not wish to renew now the discussion which was carried on so warmly about the posthumons correspondence of the author of Colomba with his anonymous friend; but we must say that M. Taine's estimate of M. Mérimée appears to us far too favourable. The impression derived from an attentive perusal of the famous Lettres leads us rather to incline to the judgment passed by M. Cuvillier Fleury in the Journal des Lebats. Singularly devoid, not only of enthusicam, but even of moral feeling, M. Mérimée was essentially an Epicurean; enjoyment was his great object, and he entertained a contempt for manking which necessarily led him to admire despotism unprarvedly. If manking consists mainly of rogues and wild beautif the safety of the few dulettants who know it appears for market error.

and wild beasth the safety of the few dilettants who know stages for easer folice requires that these rogues and wild beasts should be kept in constant terror.

If Jules Van Praes has just published the second volume of a world which deserves to be extensively read, and which is undoubtedly a valuable contribution to the history of political science. Not that the author, includes in theories or deals with abstract questions; but lessons of practical wisdom naturally follow from the biography of the personages whose portraits he sketches, and suggest themselves at once to the reader. The subjects examined in the present occave are the politics of Louis XIV. during the latter part of his reign, and the situation of Europe from the beginning of the eightseath century to the Revolution. Louis XIV. seemed to have closed an era characterized by features peculiarly its own; treaties, wars, diplomacy, the whole animus of the Regency moved in a new groove, and had nothing in common with the traditions of the grand stells. M. Van Pract appears to us eminently happy in unravelling the mysteries of international politics and in describing their general bearings.

We have to thank Madame Lenormant for a curious little volume on Chateaubriand ; it consists of three parts, which must be noticed separately. In the first place, we should remember that the autobiography published under the title of Les mémoires d'eutre-tombe had been begun as early as 1800; it was then called Mémoires de ma vie. The author kept unetions; but lessons of practical wisdom naturally follow from

ceasingly correcting his MS.; not only particular expressions but entire paragraphs were modified, and sacrifices were made to the spirit of the times. The original dust of the work had for-tunately been preserved; it is now published, and will interest readers who are curious about questions of style. By comparing the present volume with the introductory books of the Mémoires d'autre-tombe we see that Chateaubriand's original production was induitely present volume with the introductory books of the Mémoires d'sufre-tombe we see that Chateaubriand's original production was infinitely superior to the autobiography as we now have it; as timb went on, neologisms and quasi-slang took the place of simplicity, and the author exaggerated, as if on purpose, all the faults of his style. Next to the Mémoires de ma vie, we find an admirable essay by M. Charles Lenormant himself on his illustrious friends, and, the volume terminates with a series of letters addressed by Chateau-briand to Madame Récamier.

The volume of M. Geston Feugère on Ersamus was prepared

The volume of M. Gaston Feugère on Erasmus was prepared as an exercise for the degree of dectour ès lettres; it is a well-written essay, and describes in an interesting manner the many-sided character of the illustrious scholar. The author remarks that the common characteristic of the Renaissance little actual is universally the common characteristic of the Renaissance little actual a sality; they apply their intellectual energy to every branch of composition. Hence the difficulty of duly appreciating them; hence also the diversity of opinions pronounced upon them. Some staunch Roman Catholics have considered Erasmus an arch-Father Reynaud accused him of Manicheism, and traced heretic. Father Reynaud accused him of manichessin, and waced to his dangerous influence all the heretical teaching of the sixteenth century. On the other hand, we find him raised by M. de la Bizardière to the dignity of a Father of the Church, and Marsollier compared his Apologies with St. Paul's epistles. Finally, Guy Patin, Cardinal de Retz, and many others admire in Ersamus a sceptic who saw both the errors of the Church and the want of logic of the Reformers, who was careful not to excite the suspicion of temporal rulers by too onen a manifestation of freeof logic of the Reformers, who was careful not to excite the sapplicion of temporal rulers by too open a manifestation of free-thinking, but at the same time was enlightened enough to estimate at their own value the pretensions of the Papacy. M. Faugère does not think that Erasmus should be classed amongst the adherents of any distinct school or coterie; essentially independent in his mode of thought, he may be considered as the truest embodiment of the Renaissance.

When we come to study the majestic forum of Pope

embodiment of the Renaissance.

When we come to study the majestic figure of Pope Gregory VII.†, we find ourselves in the presence of a man respecting whom no hesitation is possible. Never were the principles of absolutism more completely set forth than by that remarkable priest, and his history is one of the most striking chapters in the annals of the Christian Church. M. Langeron has discussed it in an interesting volume. The life of Gregory VII. was so eventful that it must always offer plenty of materials for a writer foud of dramatic episodes; but it is also important from the fact that the political and ecclesiastical questions mooted then were those which even now antate modern society. The religious world. the political and eccleanastical questions mooted then were those which even now agitate modern society. The religious world, says M. Langeron, has not changed since the Crusades, and the Syllabus of Pius IX. only re-echoes the Dictatus of Hildebrand. The prejudices, the struggles, the opposition are exactly the same; and if the Ultramontanist doctrines invented by Gregory VII. and endorsed by his successors have remained sweed letter in the nineteenth century, we must ascribe this result not to an imaginary conversion of the Court of Rome, but to the progress of civilization and to the rapid development of the principles on which modern society rests. From these few words ciples on which modern society rests. From these few words it will be seen in what spirit M. Langeron's book is written. It has the fault of being too sketchy, and composed too much in the

has the fault of being too sketchy, and composed too much in the style of a pamphlet.

If M. Langeron treats history as a controversialist, and makes the life of Gregory VII. the basis for a general bill of indictment against the Papal system, M. Paul Dupuy endeavours to show \$\frac{1}{2}\$, on his side, that Protestantism represents a political as well as a religious theory. The Reformation, he says in his preface, speedily developed a strongly marked political doctrine entirely independent of its dogmatic bias, and sometimes even unconsciously apposed to it. This doctrine, closely allied to the Presbyterian form of Church government, was embodied in the metaphysical teaching first of Locke, afterwards of Kant, and its practical exponents were the founders of the United States of America. M. Dupuy considers that the French Revolution was a development of the Reformation, and he carefully distinguishes between the theological spirit of Protestantism and its general views on freedom of conscience. The volume itself is a series of essays written from the revolutionary point of view, but with this remarkshable feature, that M. Dupuy, instead of upholding Rouseeau, Voltaire, and Montesquieu, as the chiefs of the liberal school, transfers that honour to the leaders of the Reformation. Hubert Languet, Duplessis-Mornay, and Luther stood up for man's indigidual rights, and therefore they must, says M. Dupuy, be identified with the philosophera whose political axiom is the sovereignty of the people.

identified with the philosophers waves possession of the sovereignty of the people.

The love of books of travel has decidedly taken possession of the French mind, if we may judge from current popular literature. M. Théodore Duret takes us as far as China; his aim is to give us trustworthy information respecting topics left unmyticed by the common run of travellers; and as his sketches are taken from

scenes hitherto unvisited, he claims to interest us without having secourse to fiction. M. de Varigny's clever book on the Sandwich Islands , besides giving a geographical description of the country, selects the wonderful changes which it has witnessed during the last century. Fourteen years spent by the author in that with sample means of information, and it is interesting to see how the questions of universal suffrage, state religion, public education, and finance have been treated by the islanders of the Pacific Ocean. The two writers whom we shall next mention, instead of merely describing the places they have visited, aim at a style of composition which seminds us of Alexandre Dumas. M. Albert Eynaud, in particular, excels in portraying some of a tragic character, and

particular, excels in portraying scenes of a tragic character, and a three sketches grouped together under the title Science de la visiontale; are very much above the average of modern French velettes. M. Charles Monselet wishes us to believe that he is treading in Sterne's footsteps; a dangerous ambition which can only be justified by extraordinary humour combined with brilliancy on style. M. Monselet's amusing but rather insignificant chapters are more faultators dashed off without much trouble, introducing anecdotes which are rather commonplace, and persons of provincial origin who might as well have been left to their primitive

origin who might as well have been left to their primitive obscurity.?

M. l'abbé Pioger's purpose in publishing his new book is twofold. In the first place he wishes to reconcile science with religion; in the next he attempts to show that the doctrine of the plurality of inhabited worlds is by no means contrary to the teachings of revealed truth. The philosophers of the last century attacked Christianity in the name of nature; the Positivists of our own day appeal to science; but, as M. Pioger romarks \$, we must not forget that D'Holbach and his friends were as sure of the infallibility of their own doctrines as M. Littro's disciples, and yet what is the result? There is scarcely a single point in the whole range of physical science on which our self-confident forefathers have not been found desperate blunderers by the equally dogmatic philosophers of the present day. Give us a body of dogmatic philosophers of the present day. Give us a body of propositions demonstrated beyond the possibility of a doubt, and we will gladly accept it at once; but when the weapon with which our opponents are armed is nothing but a bundle of hypotheses and sophisms, we may be excused for despising it. Such, in a few words, is the substance of M. Pioger's introductory chapter; the book itself shows an extensive acquaintance with the facts and problems of astronomical science.

We have received two valuable and important works by M. Le Sellyer, a distinguished barrister, formerly lecturer at the Paris Faculté de Droit. In the first of these treatises || the author Paris Faculté de Droit. In the first of these treatises || the author goes through the various details of criminal law, viewed in its principles and its applications. What, he asks, is the character of criminality? What are the acts from which it results, and the conditions which constitute it? Such is the subject of the first chapter. The second enters minutely into the details of panality, and enumerates the rules to be applied in every case where panishment of any kind should be inflicted. In another chapter M. Le Sellyer discusses the persons against whom proceedings are to be instituted in case of damages caused by misdemeanor or crime of any kind. If the action is a public one, what should the penalty be? if it is private, what the componsation? ahould the penalty be? if it is private, what the compensation?

This last chapter will be interesting to students of international law; it explains how and when foreigners in general, and political agents in particular, may be ambiable to the cruminal legislation of France, and to the penalties which that legislation enforces. The work is copiously illustrated with footnotes and completed by an excellent index. It is not sufficient, however, to explain the causes and effects of criminality; we require also to know what persons are qualified to prosecute the guilty; what are the means of repression at the disposal of the various tribunals; under what of repression at the disposal of the various tribunals; under what circumstances the right of appeal exists, and what forms are to be followed in exercising that right; how far prescription is allowed, &c. &c. M. Le Sellyer has treated these topics in a second work which forms a sequel to the one we have just noticed; it is abundantly elucidated by references to cases, and accompanied by every needful help in the way of tables, indices, and accompanied.

and summaries.

The elevanth volume of the new edition of Saint-Simon's Memoirs, which has just been published ", contain incidents of the most interesting description. The downfall of Madame des Ursins, the intrigues of the Duchess du Maine to obtain the regency for her husband, the gloomy state of France, and the death of Louis XIV. are subjects worthy of an artist's pencil, and the wonderful brulliancy of the Duke's talent has treated them to perfection. When we read the history of those times, we cannot help being astonished at Saint-Simon's partiality for the Duke of Orleans, a man who with many eminent qualities combined the grossest vices. We do not

mean to say that the Memoine systematically whiteward the Report's character, but still it is singular to find a sweet expense, attacked our for high principles and beauting of inclease themes when the most religious persons at Court, being on familiar terms with a man whose everyday conduct was notorism by its profligacy. The affairs of Spain contribute several interesting episodes to this volume, and Saint-Simon gives us details about the colorated Comercia major for the further elucidation of which we can now refer to the works of MM. Geffroy and Combes.

A few months ago the French Government, itsued the first volume of Cardinal Masarin's diplomatic correspondence as part of the Collection de documents médits. We have now to notice in the same series a handsome quarto of a different character, though equally important; it is a collection of miscellaneous pieces relating to various epochs in the history of France, and bearing upon subjects connected with ecclesiastical affairs, politics, and literature. Amongst the contents of this book are two hundred letters by the celebrated John de Witt, extending from 1653 to 1671, which throw considerable light upon European diplomacy during the reign of Louis XIV. The, letters of Balasc; which follow immediately after, are of a more purely Merarry description; they contain a number of excellent criticisms on French and foreign authors, besides aneodotes completing the information given by Madame de Motteville, Callemant des Réaux, and other memoir-writers of the beginning of the sevententith century.

M. E. Feydeau's reminiscences of Théophile Gautier I con-

and other memoir-writers of the beginning of the seventeened century.

M. E. Feydeau's reminiscences of Théophile Gautier I contain a few details which may be useful to future historians; but the biographer occupies a much larger space in the volume than his friend, and he gives us more about Friend, than about Le capatains Fracasse. The great fault of the volume, however, is the absurd tone of panegyric prevailing from beginning to end, and the senseless denunciations of the unhappy mortals who paralet in thinking that Mademoiselle de Maspin is a scandalously bad book. M. Feydeau says that there is no possible reason why authors should be condemned for, doing either in prose of in poetry what Rubens and Correggio have done with their brush. This is a point of resthetics which might perhaps be profitably discussed; at any rate we persist in thinking that were is no excuss for immorality.

The two volumes recently published of M. Emile Deschamp's Eurres complètes § are devoted to his dramatic works. At the time when Romanticism first broke out in France every literary aspirant thought himself bound to try his hand on Shakspeare. Shakspeare was the God of the new generation, and many a youthful poet who could not understand a word of English took up Letourneur's translation of Macbeth and Hamlet, reduced it to the proportions of the French stage, and put it into rhymed Alexandrines. Thus M. Frédéric Soulié arranged Ronco and Juliet, M. Jules Lacroix applied himself to Macbeth, and M. Alfred de Vigny adapted Othello to the self to Macbeth, and M. Alfred de Vigny adapted Othello to the latitude of Paris. M. Emile, Deschamps undertook to give as faithful a version as he could (for dramatic purposes) both of Macbeth and of Romeo and Julset. Moreover, he cut out of King Lear the materials for a kind of popers which was performed at Versailles in 1853. The last-named work deserves to be mentioned as a curious instance of the extraordinary uses to which a work of genius can be put. The two former transdiss, on the contrary, seem to us superior to all other French renderings of Shakspeare with which we are acquainted. The remaining dramatic productions of M. Emile Deschamps are a libretto for the opera of Stradella, compused by Niedermeyer, an arrangement of Don Giovanns, two comedies, and a versified adaptation of Molière's amusing plays, Le médecia malgré lui and Georges Danden. The necessity of taking liberties with the works of the author of Tartuffe is not very apparent to us, unless it be as a more literary exercise.

M. André Theuriet's Mademosselle Gisignon || is a nery melancholy story, but we can recommend it as a good specimen of

M. André Theuriet's Mademoiselle Gisignon || is a very melancholy story, but we can recommend it as a good specimen of modern French novels. If M. Edouard Caddi wrete in a least sketchy way, and took the trouble of describing with some numuteness the characters he introduces, we should have no fault to find in his Madaine Elisas M. Hensi de la Madaine carries us to the South of France **, introducing us to manners, scenes, and personages which have quite a stamp of originality; his volume comprises three tales, the first two of which are excellent, whilst the third reminds us too much of M. Prosper Mérimée's inimitable style.

LORD RUSSELL ON FOREIGN POLICY.

ORD RUSSELL'S characteristic question on foreign policy, and Lord Derry's not less characteristic Continent then at home. At first sight it might have been thought almost as useful to inquire whether, in the opinion of the Government, ten days of cold East winds and frosty nights have injuriously affected the prospects of the coming harvest. A similar raply might have been given, to the effect that the mischievous tendency of a low spring temperature could not be disputed, but that the Ministers were inclined to hope for the best, and that in all events they would to the best of their power discharge their duty.

Lord Russell clearly showed that, as all moderately wellinformed politicians are aware, the war of 1870 has left behind it the probability of future contests. It is difficult to judge how far the resentment which is undoubtedly felt by the French nation is likely, within any calculable time, to lead to a rupture of the peace for the express purpose of recovering Alsace and Lorraine. On the other hand, the German Government makes no secret of its belief that it is necessary to take ample and constant precautions egainst an undeniable danger. It is to be regretted that the opposition poised in the German Parliament to the demands of the Government for a permanent military establishment should have given occasion to the delivery of Count Moran's supposited speech. Although the famous Marshal is neither impulsive nor loquacious, he not unnaturally urged in this strengest language the arguments which seemed to him best calculated to effect his immediate purpose. It was, as he contended, necessary to be on the watch for fifty years against the consequences of a victorious war of six months. The French not unreasonably received the declaration as a challenge; for a nation can scarcely profess an indifference to territorial losses when, in the opinion of the conqueror, it must be inevitably bent on repairing them. If angry and provoking words necessarily led to corresponding acts, Lord Russell's gloomy anticipations would be fully justified; but fortunately the preparations of the German Government are calculated to discourage practical expressions of the irritation which they perhaps tend to

A piece of political gossip which has apparently been produced at Paris may have seemed to furnish a corroboration of Lord Russell's statements and apprehensions. According to an odd narrative of the Paris Correspondent of the Times, Prince Bismarck communicated to the King of Italy during his visit to Berlin expressions of regret that he had concluded peace with France in 1871 on injudiciously lenient terms. It would have been, says the story, better, according to the Prince's present judgment, to have overrun every French department, for the purpose of bringing home to the inhabitants of all parts of the country a wholesome impression of the evils of war, and of the superiority of the German forces. It was also a mistake to be content with the moderate sum of 200,000,000l., when the payment of twice or thrice this smount would have crippled for a long time the financial resources of France. Finally Prince Rismarck is supposed to have suggested that the King of Trair might reclaim Savoy and Nice as the reward of an alliance with Germany. It occurred even to the reporter of the apocryphal conversation that the German Chancellon must have had some practical regions. The disclosing to a recent and doubtful ally his times removes and his hypothetical severity. It

therefore became necessary to conjecture that, while he professedly spoke of the past, Prince Birmarce really intended to sound the King as to his probable conduct in a future war. The insinuated offer of Savoy and Nice was accordingly intended to secure the aid of Italy in a projected attack upon France. It is added that Vicrok Emmanuel received the overture coldly, and that consequently no further negotiation was attempted. If the account is authentic, it may fairly be inferred that a renewal of the war by Germany is possible and perhaps imminent. It would be interesting to ascertain how the details or the substance of the conversation transpired. It seems strange that statesmen and kings, after exchanging with one another the revelation of dangerous accrete, should proceed to impart their complete or abortive plots to confidents who at once publish the whole transaction in newspapers. It is well known that Prince Birmana is by temperament, and perhaps on calculation, unusually candid, but it is scarcely credible that he should threaten and bluster even if he is meditating any design against France. It is in the highest degree improbable that either the German Emperor or his Minister should desire the renewal of the war which they may perhaps expect. The German nation, which at present gives its full confidence to the Government, would almost unanimously disapprove of an unnecessary and aggressive war. It is not at the height of fortune that the winners of the last game are eager to double their stake with the risk of losing all that has been gained. Although Germany is more than a match for France, it is in the highest degree improbable that the marvellous successes of the last war should be hereafter repeated.

Lord Derry's officially conventional answer to Lord RUSSELL seems to have misled and to have puzzled foreign politicians. As Foreign Minister he could not but admit that there were elements of future trouble in Europe; and it would have been discourteous to remark on the inutility of announcing facts which are generally notorious. It has been naturally assumed on the Continent that Lord DEEDY referred to some special circumstances which had come to his knowledge since his accession to office. Students of Parliamentary language and of Ministerial replies will rather conjecture that Lord Derny was silent because he had no information to communicate to the House. He added, perhaps unnecessarily, that England was bound by treaty obligations which would be fully discharged if the occasion arose. It would seem that he, must have pointed to the treaties which guarantee the independence of Belgium, but at present neither Germany nor France can be supposed to cherish designs against Belgian independence. It is not necessary to comment on Lord Russkil's boasting belief that the influence of England is extraordinarily great in Europe. A statesman bred in the traditions of a former generation may well be excused for still indulging in the gratifying belief which was in his younger days universally entertained. Cananad would CANNING would have answered a similar question in nearly the same terms with Lord DERSY; but he would have announced his determination to enforce the covenants of treaties in a tone and with a confidence which have been out of place since the Russian Government tors up the Treaty of 1856. England is far richer and more populous than in the days of Lord Russell's youth; but the national strength is no longer organized for the purpose of controlling the policy of the Continent.

Lord Russell judiciously withdrew, in deference to the advice of briends, another question or motion involving a

merican negotiations which ended in the Even if the whole subject had not been nsent deliberately remitted, as far as possible, It would be idle and useless to deplore in public the miscarriages of English Cabinets and the triumph of an overbearing adversary. Lord Russell pays the constituencies of the kingdom too high a compliment when, judging of their sentiments from his own, he attributes the defeat of the Government at the general election to disapproval of the Washington Treaty. Not one elector in ten knew that American exigency had been rewarded by submission, and not one in a thousand desired to pass a vote of censure on the Ministers who were responsi-ble for the proceeding. The 25th Clause and the early closing of public-houses seem to English constituencies more interesting than the international transactions which trouble Lord Russell's repose. It is not inconvenient that veterans with habits of thought long since immutably fixed should from time to time remind a newer generation of the traditions of English policy. Hereafter it may perhaps be necessary or expedient to abandon on some great occasion the established system of non-intervention. In the meantime Lord Russem's speech may serve to connect the possible enterprises of a future time with the history of the post. It would be difficult for his the history of the past. It would be difficult for his warmest admirers to discover any more practical advantage which could result from his speech. It is odd that the same eminent personage who lately congratulated the German EMPEROR on his ecclesiastical policy should now call attention to the dangers which are o be apprehended from German armaments. Lord Russell, has perhaps searcely mastered the complicated tonnexions of political and religious movements in the present day. French statesmen hope to profit by the quarred between the German Government and the Roman Jatholic hierarchy; and they regret that the hostility beween the Pore and the Italian Kingdom may possibly drive anatural ally into the arms of Germany. Ford Russell agained Popery from the point of view of 1688, while his hearing of foreign policy date from the time of Fox and IRENVILLE.

JUDICATURE AND APPEAL.

THE LORD CHANCELLOR has supplemented the Bill of last L year by two measures, which immediately received the earty support of Lord Selborne. The late Chancellor, ideed, seems in this and many other legal matters to reard the present Chancellor as the exponent of his own ishes. He would like to have done what Lord Cairns oes, only the late Government were not strong enough, and o Lord Selborne was obliged to keep matters for months nder consideration which Lord Caurs can settle in five ninutes. It is notorious that the late Government wished o revise the Irish judicial system, to limit its numbers, nd increase its efficiency; and they kept an Irish judge-hip for a long time open in the hope that they might be trong enough to begin their reforms by not filling it up. But sinking politicians cannot dispose as they propose, and they were obliged at last to think more of the claims of a supporter than of the interests of Ireland. Lord DAIRNS can do exactly as he pleases, and he has not had he slightest hesitation in reducing the Irish patronage of he Government. Throughout his new measures he has worked, so far as possible, on the lines of the measure of ast Session, which Lord Stineaus must have been glad o hear him pronounce to be destined to rank among the reatest and most important legislative measures. The reatest and most important legislative measures. The rish judicial system is to be assimilated to the English. there, as here, there will be one Supreme Court, with livisions, and with the old names retained. But Ireland is o be relieved from the expense of two Common Law indges, the circuits being reduced from six to five, and he Judge of the Landed Estates Court is to take his work s that of a branch of the Court of Chancery. The Irish re to have their own Court of Appeal, and to strengthen t a new Lord Justice of Appeal is to be created. The mlarics of the puisne Judges are also to be slightly augmented, and thus the pecuniary gain derived from the suppression of two puisne judgeships would be more than counterbulanced, were it not that Lord Careas proposes that, as vacancies occur, two useless and expensive offices thall be suppressed. He thus calculates that the country will neve £4,000l. a year by his proposals; but, as he wisely hidely him thinks very little of a trilling gain of that sort.

The real gain is in the suppression of offices aseless to the country, and only maintained for the sake of the patronage to which they give rise. It is in the appointment to such places as those which will now be suppressed that jobbery finds its true home, while public and professional opinion forces every Government to keep within the very limited circle from which a Lord Justice of Appeal can be drawn. The Scotch system is to be left unchanged. It is so good, Lord Cairos says, that it wants no change; and works so well that suitors have not to complain of delay or expense. Certainly, the Scotch are always turning out to be, in one way or another, the best off of any people on earth. On the other side of the Border a complicated case of entail was actually, as the Changellos informed the House of Lords. The Scotch accordingly are perfectly satisfied with their judicial system, and have every right to be so.

Both Ireland and Scotland, besides having their own intermediate Court of Appeal, are to have a further appeal to an Imperial tribunal. The Judges and the Bar in both countries would prefer having the appeal to the House of Lords continued. They know how the tribunal works to which for many years their appeals have been sent, and they do not know what a new tribunal would do for them. But the Irish Judges at least are unanimous in holding that, if the appellate jurisdiction of the House of Lords is abolished for England, it is not desirable that it should be continued for Iroland. All that they ask is that there should be one satisfactory Imperial tribunal. Lord Penzance and some other peers have thought that even at the last moment the old jurisdiction of the House of Lords might be retained. But Lord Carens has no intention of receding from the position which he took last year rilen Lord Skirokne's Bill was ander discussion. The jurisdiction of the House of Lords could, even according to the views of Lord PENZANCE, only be retained by nothing more than the name being preserved. He proposed that not only no laymen should be allowed to take part in the proceedings, but that some of the Judges should attend, and instead of merely advising the Lords, as at present, should aid on equal terms in giving the decision, and further, that this tribunal should sit during the whole legal year, without reference to the sitting of Parliament. This is not to retain the jurisdiction of the House of Lords, but to invent a new tribunal, and to call this new tribunal the House of Lords; and if a new tribunal is to be invented, the great thing to decide is, not what it shall be called, but how it may be best composed. And in deciding this it is necessary to determine a point in which Ireland and Scotland are greatly interested, and which has naturally given rise to great differences of opinion. This point is whether Ircland and Scotland should be directly represented on the Imperial Tribunal of Appeal by one of the Irish and one of the Scotch Judges being ex officio a member. Lord Moncreur urged very strongly the necessity of such a provision being made, and Lord O'Hagan agreed with him. Scotch law is very different from English law; it is based to a large extent on different principles; it is expressed in its own most peculiar language, and it is full of technicalities unknown to English lawyers. The Imperial Court of Appeal must, Lord Moncriers argued, have a Scotch member available to teach Scotch law to his brother Judges, and to see that they do not do injustice through sheer ignorance. It is true that for a century and a half the House of Lords has adjudged Scotch appeals to the entire satisfaction of Scotland, without having a Scotch lawyer to help them. But then, as Lord Moncrieff said, the real decision has been in the hands of a few very able, very conscientions, and wide minded men, who have grappled honestly with the difficulties of Scotch law, and whose intellects were capable of rapidly appreciating its peculiarities. It does not follow that a majority of a new Appellate Tribunal would possess equal qualifications. If Scotland is specially represented, it follows that Ireland must be specially represented too, or there would be a cry of injustice to Ireland. Lord Consess, with the entire approval of Lord Selborns, has defided the other way. He allows the Government to select the ordinary Judges of the Court of Appeal from the Bar or Bench of Scotland or Ireland as well as from the Bar or Bench of England; but he thinks it would be movied to oblige those who have an appointment to make to look evolunively

to Scotland or to Ireland for it. There might be no fit man who could be appointed, and to make an Irish or Scotch Judge an ex officio mamber would be to take him from a sphere of work where he will already have enough to de. This argument seems conclusive against the proposal to have an ex officio Irish or Scotch Judge; and the argument that the fittest man ought to be chosen that can be found at the time in any of the three of attries is so strong that Irishmen and Scotchmen will probably acquiesce cheerfully in the Government being free to choose, and not bound to appoint, a certain proportion of the ordinary Judges from each of the two countries.

The most important change made by Lord Caiens is that of remodelling the Court of Appeal itself. He makes a new Imperial tribunal consisting of eight members. Three, the Lord Chancellor, the Master of the Rolls, and the Chief Justice of the Queen's Bench, are to be the ex officio Judges; three more are to be appointed for three years out of the ordinary Judges of the whole Appeal Court; and two more are to be appointed also for three yours out of those Judges of the whole Appeal Court whose work is voluntary, that is, Judges who have been Lord Chancellor in England or Ireland, Lord Justice Clerk in Scotland, or a Chief Justice in India, and who, if willing, may be authorized to sit. Of this tribunal of eight, five must be present to make a quorum, and no one can doubt that five out of eight such men would constitute a very strong tri-To this tribunal would be referred all appeals from Ireland or Scotland, all ecclesiastical appeals, all appeals from colonies involving points of constitutional law, and all colonial appeals in which both parties agree that the case should be referred directly to this supreme tribunal. For England there is still to be only one appeal, except when there is a division of opinion among the three Judges who, according to the provisions of the Act of last year, will hear the appeal. In case of such a division of opinion, there will be a further appeal to the tribunal of the eight Judges. In this way there need be no apprehension, such as was excited by the Act of 1873, lest discordant decisions should be pronounced by the different divisions into which the Supreme Court of Appeal was marked off, and Ireland, Scotland, and the colonies will be sure that their appeals will always be decided by the very best and most eminent Judges that are to be found. The object of limiting the appointment of five of the eight Judges to a term of three years is to avoid as much as possible the appearance of drawing a line between the members of the higher and lower divisions of the Appeal Court. These five Judges will be on an equality with the rest of the Judges of the whole Court of Appeal, but will be told off for a definite time to do particular work; and of course the members of the First Division, as it is to be called, will discharge their duties as time may permit, either as Judges of First Instance, or as ordinary Judges of Appeal. No scheme can be quite perfect, and them are one or two obvious objections to Lord Cairns's scheme. At the end of the three years the five Judges, whose time as Judges of the First Division will then have expired, must either be reappointed or not. If they have been carefully selected in the first instance, they will probably be better men than the rest of those from among whom they have been chosen, and as they will have had three years' experience of special work, the advantage of their natural superiority will be thus increased by a peculiar and beneficial training. Not to reappoint them would be often to put out of the First Division those best fitted to sit in it, and to put in men less fit, and they would greatly impair the prestige of the tribunal. If, as a general rule, they were reappointed, it would be a slur on one of them not to be reappointed, and this is the sort of slur which Governments are very reluctant to cast on any man of eminerica, and which they would be especially reluctant to cast if the Judge in question happened to have been in old days a Law Officer of the party in power. It is therefore difficult to see how anything like equality between the Divisions of the Court of Appeal can be practically preserved. Then, again, if the best men are taken to sit in the First Division, an English suitor who has his appeal decided against him by Judges who, not being members of the First Division, are looked upon as equally strong with the members of that division, will be apt to think that he has only one Tribunal of Appeal in case the three Judges again, while the Irish and Scotch have a double appeal, and are sure of getting in the last resert to a tribunal

which is perfectly satisfactory. It is there
that the tendency of the new system
the tribunal of eight Judges superior in imgeneral Court of Appeal, and that Judges one
sit on it would stay there. This sconer or later would
lead to a double appeal being given to Englishmen as well
as to Irishmen and Scotchmen, and the inhabitants of
colonies and dependencies. But Lord Carris, even if he
foresees this, may be very prudent in keeping for the present as near to the Act of last year as he can, and leaving
time to show what are the further changes that must flow
from the scheme he now proposes.

THE CARLIST DEFEAT.

THE decisive victory which has ended in the relief of Bilbao appears to have been fully deserved. The Government had at first greatly underrated the difficulty of the task. Moriones attacked the lines of Bomorrostro with a force which must have been entirely insufficient for the enterprise, and SERRANO himself, with a much larger army, was unable to produce any serious impression on the Carlist lines. After the check which he suffered in the last week of March, the Commander-in-Chief devoted all his energies to the accumulation of a force strong enough to turn the enemy's position while it was attacked or threatened in front. His selection of Marshal Concha as his chief assistant has been justified by the result, though the employment of a general of eighty years of age excited some surprise. It is probable that the plan of operations which ultimately succeeded was adopted by the two generals in concert; and the more prominent share in the movement was allotted to Marshal Concha. Serrano began an advance against San Pedro de Abanto which was probably intended as a feint, while Marshal Concha, after encountering a slight resistance, moved on the flank and rear of the Carlists, who were ultimately compelled to evacuate their strong position. The relief of Bilbao was practically accomplished as soon as the Government troops occupied Portugalete, at the mouth of the river Nervion. On the 2nd of May Marshal Concua was, by the courtesy of Serrano, allowed to be the first to enter Bilbuo, to which he had already forwarded supplies by the river. The garrison and inhabitants of the town deserve a share of the credit which belongs to the victors, on account of their obstinate resist-After the repulse of Moriones and the check of SERMANO'S advance, the town might without disgrace have surrendered to the besiegers. For the second time the relief of Bilbao will probably have been decisive of the fate of the Carlist party. The largest army which has in the present war followed the banner of the Pretender has been utterly defeated, though it has not been disgraced. Experience has once more shown the hopelessness of a contest with superior numbers, and the inability of one or two provinces to maintain a contest with the rest of Spain. It is unlikely that the circumstances which favoured the last insurrection will hereafter rocur. For some months the Government of Madrid was compelled to devote its chief efforts to the reduction of Carthagena; and at the commencement of the war in the North the army had been reduced by the Republicans to the lowest condition in efficiency and numbers. If the Carlists were unable during the autumn and winter to penetrate the central provinces, they can scarcely hope again to assume the offensive. Even Carlist leaders must be weary of a hopeless and useless struggle, and the funds which the Pretender has derived from some unknown source cannot be inexhaustible. If the chiefs of the party tender their submission, Sergano will probably not impose excessively harsh conditions. He was much blamed for his leniency when he effected a temporary close of the contest during the reign of King Amango; but he carned a title to the confidence of the defeated party. The continuance of a desultery and hopoless war in the mountains would be not so much unjustifiable as criminal. The districts which have so resolutely supported the cause of Don Carlos deserve to be relieved from the further prosecution of the struggle.

It may possibly be found that the Carlists have involuntarily contributed to the establishment of a strong and regular Government in Madrid. The laurels of Serrano had partially faded when he became for the second time Chief of the Executive Government. Only a few months before his accession to power he had been compelled to

escape from the capital in disguise; and he was made Chief Minister after the fall of Castelar by no effort of his own, but on the nomination of General Pavia. From the fall of Isabella to the establishment of the Republic, Seerano was almost uninterruptedly at the head of affairs, and even when he was out of office he was a principal person in the State. It had been his good fortune to defeat the Queen's sole army at Alcolea, and now he has associated his name with the relief of Bilbao, and probably with the successful termination of the war. Until his supremacy is challenged by some military rival, he may easily maintain his position. The numerous partisans of Don Alfonso have no reason for precipitating an appeal to the country in his favour; for under the nominal reign of a boy the chief of the army would practically enjoy supreme power. It was supposed that Marshal Concha would have proclaimed the Prince if Serhano had been defeated. Victory will have enabled Seerano to exercise his own discretion.

The late campaign will have restored to the army its self-spect, and its habitual sense of superiority. Whoever respect, and its habitual sense of superiority. can command the obedience of the officers and soldiers will for a long time to come be master of Spain. Nothing in Serrano's history leads to the suspicion that he will use his power in a violent or tyrannical manner; but, on the other hand, he can scarcely be expected to abdicate in favour of a nominally constitutional Government. When the Spaniards first commenced their long succession of revolutions, they little thought that the government of a successful soldier would be nearly the best result which all the efforts of politicians would finally attain. When the latest of the periodical changes occasionally tended in a democratic direction, the apparently logical consistency of Spanish institutions has not only produced cuthusiasm at home, but has excited the envy and admiration of foreign partisans of equality. When the Cortes which was summoned to ratify the expulsion of the QUEEN published a new edition of the Constitution of 1812, the leader of the Hyde Park rioters, then or recently a popular demagogue, publicly expressed his regret that the institutions of England were far less perfect than those of Spain. Only a year ago hasty journalists of the class which always sympathizes abroad with systems which it would repudiate at home were lost in admiration because the Republic had not within a few days of its establishment produced universal anarchy and spoliation. More prudent and more thoughtful observers understood that the only genuine Republicans were enemies of society, and they knew that the army which ought to have defended order had for the time been demoralized by factious intrigues. The prospect is now more hopeful only because the army can be trusted to prevent a repetition of the wild experiments of PI Y MARGALL and SALMERON.

In the midst of the exciting events of the past week the purveyors of Madrid news have thought it worth their while to announce the conversion of the eloquent and obsolete Castelar from his lifelong heresy of Federalism. The eminent orator has, it seems, become a Republican of the Unitarian species, at the moment when the Republic itself has become a fiction which will perhaps shortly disappear. It may be conjectured that the abandonment of Federalism was suggested, not by recent reflection, but by the experience which was acquired when CASTELAR was himself the chief of the Government. He then learned for the first time in his life that men must be governed, and not merely amused with fine phrases; and the Carthagena insurrection furnished an instructive illustration of the true meaning of Federalism. The party seemed to itself, like Nero, worthy of empire, until it had exercised imperial power for a month. The climax of folly and dishonesty was attained when a Republican and Federalist Minister declared to the Cortes that he would not use force against members of his own faction, even if they were engaged in open rebellion against the Government. Castelae, who was with reason supposed to be honest, and who was, unlike some of his immediate predecessors, neither a fool nor a traitor, began his official career by dismissing the Cortes, before he undertook the difficult task of suppressing the experiment of Federalism which had been tried by Contrers and his accomplices in the Canton of Murcia by CONTRERAS and his accomplices in the Canton of Murcia. If the Republic is for the present nominally maintained, it will only imply the postponement of dynastic projects of restoration. Public opinion, if not universal suffrage, will justify the exercise of supreme power by the chief of the army. The intermission of conspiracies during the absence of Sarrano in the North may perhaps indicate a revival of

the patriotism which had been superseded by factious passion. The country has really cause to be grateful to the General who has inflicted a probably fatal blow on the Carlist cause. If Marshal Concha and the other leaders of the army support the present Government, it has nothing to fear from Republicans or from rebels. Mutineers, such as Contreras, are not likely to stir when rebellion would be sternly repressed and summarily punished. With even a temporary restoration of peace and order, agricultural and commercial prosperity will resume the steady advance which has been interrupted by political agitation and civil war. When Prince Alfonse attains his majority, he may not improbably be recalled, unless a vicious education has disqualified him from reigning. Since the disaster which has befallen the army of Don Carlos, his cousin is apparently the only possible candidate for the throne. The peace of the world will not again, as in 1870, be disturbed by the candidature of any foreign prince. Whether the tedious cycle of military and democratic revolutions is to recommence experience alone can show. There is reason to hope that the Republic has been rendered impossible during the existence of the present generation, and consequently that the supremacy of the rabble will not be embodied in the scheme of any future Constitution.

PRINCE BISMARCK'S PROJECTS.

DIPLOMATIC revelations are the order of the day. Some one is always publishing letters damaging to some one else, or relating the substance of mysterious interviews with Kings and statesmen, or revealing the secrets confided to him when he held a position of trust. A series of letters written by Count Arnin from Rome while the Vatican Council was holding its sittings have recently been brought to light at Vienna. These letters showed that Count Armin appreciated with singular clearness the consequences of the declaration of Papal infallibility on the relations of Rome with lay Powers, and especially with Germany; and the clique of Prince BISMARCK'S admirers suggest that Count Arnim, although pretending to be in no way responsible for the publication of these letters, really managed to have them published in order that it may be seen that he is a much superior politician to Princo BISMARCK, and saw further in 1870 into the future than the Chancellor. Count Arnim's friends in reply suggest that it was the Prince who got the letters published, because he saw that their publication would lead to a correspondence in which Count ARIM would be guilty of some indiscretion, and then Prince BISMARCK would find some opportunity of getting rid of him. Those who like to listen to ingenious gossip may do so, but the end of the matter is that Count Arim, who suffered himself to get irritated, and to write with a very unofficial latitude of expression, has had to resign; and thus the publication of letters written three years ago, and meant to be entirely confidential, has led to the loss of the services of a competent and even eminent official. The practice of publishing such documents in order to get up a momentary sensation is most pernicious, and it is much to be regretted that both Prince BISMARCK and Count ARNIM did not at once refuse to take any notice of documents which were not meant for publication, and which, when printed apart from any state-ment of the circumstances under which they were written, or of other documents connected with them, may easily raise a very false impression. Scarcely is the controversy between the supporters of Prince BISMARCK and those of Count Arnim brought to something like a close by the Count's resignation, when a circumstantial narrative is sent over from Paris of an attempt alleged to have been made last year by Prince BISMAECK to persuade VICTOR EMMANUEL, when paying his visit at Berlin, to get up a new war with France by a movement for the recovery of Nice and Savoy. Prince BISMAECK, as the story runs, was longing to deal France another blow before she had had time to recover herself, but could not think of a pretext. It occurred to him that VICTOR EMMANUEL might be conveniently used to take the chestnuts out of the fire. Havey and Nice are just enough dissatisfied with their new lot to be promising fields for a little well-directed agitation. VICTOR EMMANUEL might listen to their cry for help, and then Germany might support its traity ally, Italy. Thus the curning Parion conceived that the way are burning sent over from Paris of an attempt alleged to have been

to see might be made a certainty without any great blame being imputable to Germany, which would have had the air of having been forced into the war against its will. VICTOR EMMANUEL, however, as we all know, did not go to war last year for the recovery of Nice and Savoy. He is accordingly reported to have answered Prince BISMARCE by saying that Italy could not afford to make any rash experiments, they she had a supply neither of troops nor of money adequate to a great war, and that, however satisfactory and glorious the war might have been to Germany, it meant for Italy probably another Custozza, and certainly national bankruptcy. The devices of Prince BISMARCK were thus foiled by the wariness of Victor Em-MANUEL, and the peace of Europe was preserved.

Very little reliance is to be placed on these reports of conversations. The report in this case comes from Paris, where a ready car is turned to every piece of gossip that seems likely to damage Prince BISMARCK, and where there is a profound belief that he is a sort of ogro ready to swallow up France directly he gets a chance. Any one might safely guess that VICTOR EMMANUEL and Prince BISMARCK would be likely to discuss the chances of another war breaking out soon, and Savoy and Nice might come into the conversation. But there is a long way from this to a definite statement that the Prince suggested that Nice and Savoy might do for a pretext for Italy going to war at once. The reporter of this conversation imagines hunself to know that Prince Biswarck much regrets that he did not punish France much more severely when in 1871 he had the power to do so. The five milliards asked for turn out to have not been nearly enough. France has paid them with great ease, and is financially flourishing. If the CHANCELLOR had but had the sense to insist on ten milliards being paid, he might have crippled France for years. Nor is thus all. The larger part of France, including the whole of the fervent and wealthy South, never felt the pressure of the war at all. To the population of those untouched districts battle-fields and plundered homes and burnt villages were distant calamities with which it had no personal con-cern. Those districts have not been taught by painful experience how very disastrons a thing war really is What Prince BISMARCK now thinks he ought to have done is to have sent a strong force down to Toulouse, Marseilles, and Bordeaux, which would have encountered no opposition worth speaking of, and which might have harried the defenceless departments of the South, and have burnt, destroyed, and plundered right and left until the whole of France felt like a whipped dog; and then he could have had a really easy conscience, and been sure that he had done his duty to Germany. The reporter says that these are the views of Prince BISMARCK now that he has had plenty of leisure to reflect on, and repent of, his errors. The reporter may be right, for who except a correspondent at Paris can pretend to know the workings of Prince BISMARCK'S mind? But antecedently it would not have seemed very probable that Prince BISMARCK should have ever thought or said anything of the kind. From first to last, in every negotiation attempted or concluded since the outbreak of the war, Prince BISMARCE has always stuck to one text, that it is to the advantage of Germany to have a regular Government in France to deal with. France in a wholly chaotic state is by no means a pleasant neighbour; and it may be very seriously doubted whether the financial burden laid on France was not as great as could be borne, if an orderly Government possessed of power sufficient to keep down turbulent spirits and to direct the thoughts of the nation towards peace was to be created and maintained. France has paid the indemnity with wonderful ease and punctuality; but the burden of taxation is very heavy, and even now the Budget is not balanced. To have prolonged the war merely to worry and descripted the South of Krance would have been an act of devastate the South of France would have been an act of climinal wickedness which would have disgusted Germany itself before long, and the rest of Europe at onco. Nor must it be forgotten that the Germans had very strong reasons of their own for wishing the war to end. Their efforts had begun to tell severely on them, and the enormous number of troops required had drained the military strength of the country. Almost all the regiments that fought against BOURBAKI before MANTEUVEL came up were drawn from the Landwehr, and every one who knows what this means must question whether the strain could have been endured much longer if the object of renewed efforts had been, not the defence of Fatherland, but what this means must question whether the strain could have been endured much longer if the object of renewed existing system gave a special emphasis to the recent efforts had been, not the defence of Fatherland, but action of the Synod. The weakness which they find in the arms of brigandage against a conquered people.

The reporter further knows' from his own internal sources, and not as part of the conversation so minutely reproduced for his benefit, that Prince BISMAROK is always trying to get France to go to war prematurely—always playing the part of the wolf and finding fault with the lumb, however innocently the lamb may behave. Nothing indeed but the extraordinarily lamblike behaviour of the French Foreign Office has staved off a war to this moment. No doubt this view of things is entertained very widely at Paris. There every one is sure that Prince BISMARCK wants to bully and irritate France by a constant series of petty insults and voxations demands until the vossel of French wrath will boil over, and a new war will be undertaken without any proper preparation having been made for it. Nothing will get their fixed belief that this is the pet project of Krinco BISMARCK out of the heads of Parisians and Paris Correspondents; and Fronchmen may well be pardened for entertaining alarmist views, and for an exaggerated susceptibility as to all that Germany does and that German statesmen say, as the position of humiliation and inferiority in which they find themselves is so new to them. But they would find it hard to fix on any definite acts by which it has appeared that Prince BISMARCK has a malicious purpose and is bent on driving France to war. He did much to facilitate the operations of the There Government. He acceded to the proposals for shortening the period of the occupation. He gave up Belfort much sooner than he need have done. Of course he got his money at an earlier date, and did not make concessions without an equivalent; but he know that, by with-drawing the army of occupation from France, he was strengthening the hands of the French Government, and hastening the time when the nation might freely choose under what institutions it would live if it was capable of a choice. If he had not withdrawn the German army, he would have got his money sooner or later, and he would have powerfully contributed to keep France in that position of nritated dependence which it is supposed to be his great object to perpetuate. Last autumn be did no doubt interfere in French affairs. It seemed as if the French nation was going to be tricked into placing itself under the guidance of a party which made no secret of its intention to undo the work of the war, carry disorder into Italy, and make Germany tremble for its conquests. Bishops openly set themselves to foment the antiputhies of their countrymen to Germany, and to help the domestic enemies of the German Givernment. Prince Bismarck remonstrated, and he remonstrated successfully The French Government was afraid of its own clerical supporters, and was not sorry of an opportunity to show that its aims and views were not altogether those of the Ultramontane party. Prince Bisharck interfered in French affairs, but he only did so when he was challenged by a faction which professed that the time was come when all France was ready to lay itself at their feet. It is, however, idle to hope that Paris will ever judge Prince Bismarck with anything like fairness. But it is cheering to find that the reporter, although hving in the thick of Paris gossip, candully owns that a needless war wantonly provoked with l'rance would be exceeding distasticful to Germans generally. If Frenchmon get as far as this, they may accustom themselves to those peaceful feelings which their common sense bids them cherish; and if they like to find a vent for their unavoidable irritation in inventing or listening to revelations of the diabolical schemes of Prince BISMARCK, no great harm perhaps will be done by their providing themselves with an hour's amusement.

THE COLLAPSE OF THE ARCHBISHOPS.

THE greatness of the mistake which the Archbishops, and, as controlled by them, the entire English Episcopate, have committed has been far more speedily and completely proved than any one could have anticipated. A unanimous condemnation by the Lower House of the Convocation of Canterbury of a Bill ostensibly promoted by the whole Right Reverend Bench is a rebuff which cannot be salved over by sage lucubrations upon the composition of a body which, as all know, broadly and approximately reflects the more educated feeling of the general clergy, of whom it is the constitutional representative. In fact, the owing to the great preponderance of numbers which its exofficio members, who owe their seats to the grace of Minister or prelate, possess over the elected representatives of the parochial clergy. Yet it is this bishop- and Crown-ridden body which has without one dissentient voice expressed itself unable to accept the provisions of a Bill which the united Episcopate endorsed, and which the Government has not yet formally repudiated.

Indeed the complicated ingenuity in blundering which the archiepiscopal party have shown since the first moment that they rushed into the *Times* with their crude and preposterous scheme for a Court of Churchwardens is only conceivable on the supposition that they were riding for a full. Con-fidence in the Episcopate might even then have been restored if the more independent Bishops had publicly repudiated the officious communiqué; but it was parafully apparent that the Lords Spiritual—whose constitutional position in the Church is that of an Upper House in either Convocation, as theirs in the State is that of a number of independent peers --had allowed themselves to be managed out of their legitimate rights, when they consented to sit as the unwieldly and phantom Cabinet of a two-headed archiepiscopate, with no better reward for their abdication than the burden of an enforced silence. The Convocation of Canterbury was about to meet (as would that of York but for reasons which the Northern Primate probably thinks sufficient), and all men knew that it ought and would have to say a great deal about a Bill which vitally effected every moreher of the help and which vitally affected every member of the body, and every clergyman whose representative the Lower House Yot the Archbishop was so wanting in tact as to refuse a little delay in the Second Reading of his Bill in favour of Convocation when asked for by so weighty representative of moderate Churchmanship as the Duke of MARLBOROUGH, only to have to give an ungracious consent a few minutes later because the LORD CHANCELLOR told him he must. The popular House of Convocation accordingly met in the reasonable belief that the English clergy must take care of themselves, as they had few friends upstairs to look after their safety, when the expected missive came from Lambeth. Even at this latest hour a full and confidential reference of the whole question to a body which, at the lowest estimate of its status, was a practically sufficient caucus of able and learned clergymen, might have tended to restore cordiality. But, instead of any such message, a schedule of questions from the ArchBISHOP was produced, intended to tie Convocation to some general principles as to the reform of Church courts which it had passed some years before with intentions obviously the reverse of those actuating the archi-episcopal clique, and so to inveigle them blindfold into accepting the obnoxious measure. Happily, Convocation kept its temper, and avoided the snare. It reaffirmed its own conclusions in its own sense, condemned the Bill, and prayed to be allowed to name a Committee to consider the whole question of ecclesisstical procedure, with a sufficient time given for so grave a matter. Here was the last chance of a cordial reconciliation, and, as before, the superior authority rejected it by insisting on separating the specific issue of the darling Bill from the general question, and by giving to the Committee, which it dared not refuse, the miserable allowance of three days in which to consider the archiepiscopal coup d'état.

As might have been anticipated, the Committee, which was large, varied, and representative, has reported vital alterations in every clause of the Bill, and wound up with expressing deep regret that, even with the amendments suggested, they are unable to recommend legislation in the manner proposed, while there would be little difficulty, if the Clergy Discipline Act were repealed, and the existing Consistory Courts were reformed, of dealing expeditiously with the contemplated cases. The Lower House has also passed the Report of its Committee, and the Upper House has had perforce to accept its leek with a hope that the document will be generally read in the newspapers. Meanwhile the Record and its party, which is not wont to gather its inspiration from Convocation, has been thundering against the unfortunate measure. A cry of distress has been sent up in a public appeal through the columns of a daily paper for petitions in favour of the Bill, to be addressed to the care of the Archershop's Secretary at Lambeth; while the Bishop of Liegon, the very type of those steady old Anglican Churchmen whom the Archershop called to the rescue in his appeals, has characterized it as "penal, stringent, and

Such are the conditions under which the PREMATE of All England will move the second reading of his measure on Monday. We have a regard—selfish it may be, but very sincere—for the Church of England as an eminently useful public institution, wholly apart from the acts or words of any Archbishop; so we are very sorry when we see a Primate deliberately determine on that which every by stunder perceives can only weaken the coherence, if not split up the framework, of that Church. We are hardly less sorry because the question, irrespectively of the turn of Monday's debate, must lie between putting the Bill shortly and sharply out of its misery, and the more conventional and feeble policy of "doing something" by leaving a "whoreas" at the beginning and a short title clause as "the state of the state the end, and filling up the intermediate gap with some new provisions, warranted harmless and inane. We may say, in passing, that we are slow to appreciate the advantage of keeping a Bill alive in a state of toothless imbecility merely because the country has shown that it would not stand it so long as it boiled over with active mischief. The consideration which moves us is the sacrifice of moral influence and true dignity which the Bishops have made at a crisis when it most behoved them to have kept their heads cool. They have chosen the moment when the Church as a composite whole was enjoying a rare turn of political good fortune at the hands of the constituencies, to allow themselves to be scared by a factitious cry against Ritualism of which they might have gauged the depth by considering that pro- or anti-Ritualism was a curiously wanting element in the results of the English elections. Thus, in obedience to their own fears or the machinations of their prompters, they have embarked upon a design which must tear the whole Church of England up in order to oppress a very small knot of enthusiasts, who will make themselves troublesome in proportion as they are martyred. They have not even gained the favour of those whose service they are performing, for Rock and Record combine to gird at their plan, while Mr. Holl rises in the Honse of Commons with a Bill calculated to gratify the most remorseless aspirations of the Church Association, and the Liberation Society chuckles over the sudden revelation of a divided Church, and launches its new policy of disestablishment without compensation.

Common sense and statesmanship, if no higher metive, might have taught the controllers of episcopal action that the use to make of the Church's improved public position was to avoid giving a triumph to or inflicting a mortification on either of the great parties on whose cordial acquiescence in the existing settlement the permanence of the Church Establishment really reposes. They preferred to grasp at powers which the High Church and the Low Church equally sees may be used to its destruction in the hands of partisan prelates. We can only revert to the position which we took up when we first discussed the Arcu-BISHOF'S Bill, and which has since been urged with much force by the Bishop of Lincoln, that the danger does not consist in the variations of usage adopted by different parties, but in the narrow bigotry which refuses to recognise, and in recognising to keep the peace between, and moderate, those variations. Our appeal lies to men who think the Establishment worth maintaining, and our argument is that they can only succeed in their object by giving equal fair play to the tastes and the practices of the Iligh and the Low Church parties. Archbishop Laur, with all his force of will and all the influence of a Government in which STRAFFORD was Minister and "thorough" the watchword, only pulled down Church and Crown in the attempt to resettle both on an exclusive We do not anticipate better luck for Bishops who certainly do not possess Laud's advantages, and which can hardly claim his characteristic qualifications, for any similar attempt in the opposite direction. A liberal concordat is now the best hope both for the Church at large and for the imperilled but not yet forfeited influence of the Episcopats.

MARSHAL MACMAHON'S PROGRESS.

MARSHAL MACMAHON has paid a nort of State. Visit to Tours and Saumur. He has been present at public banquets, has held reviews, has hid foundationstones, and has been enthusiantically received allegeons the line of his journey. This last feeture of his geogram is probably less a matter of course them such manifestations.

commonly are. It is true, no doubt, that a disapproving growd would soon have made proof of the wisdom of keeping its disapprobation to itself, and even if it had been imprudent in this respect the newspapers would have known better than to mention the fact. But though the enemies of the Government might have been silent both in speech of the Government might have been silent both in speech and in price, there is no ground for supposing that the applause of the bystanders was not freely and honestly given. It is some years since the Loire cities have seen their ruler in the flesh, and the most Republican communities may occasionally hunger for a little pageantry. As yet, too, Marshal MacMahon seems to have escaped the unpopularity which has fallen upon his Administration. The little that has been told or conjectured of what goes on at Cabinet Councils represents the jectured of what goes on at Cabinet Councils represents the Marshal as less obstinately anti-Republican than his First Minister. Perhaps a natural sense of his own importance may have helped to raise his estimate of the exceptional position which he holds. He consented to become President in the first instance from a sense that, if he refused, the Conservative party in the Assembly would have very great difficulty in replacing M. THIERS; and at that time he probably looked forward to resigning office in favour of a King as soon as the Royalists should have settled who the King was to be. But now that he has agreed to remain President for seven years, it is only reasonable that he should regard the Royalist schemes in a different light. To play the the Royalist schemes in a different light. To play the part of a stopgap of your own free will is one thing; to have the part imposed upon you is another. From the 24th of May to the 19th of November Marshal MacManos was in the former position. His friends in the Assembly thought that they saw their way to effecting a Restoration if they had some one to keep order for them while their plan was hatching. Marshal MacManos was willing to help them in this way, and for the whole summer and autumn he took care that they should not be interfered with. When the idea of a Restoration came to interfered with. When the idea of a Restoration came to nothing, the Conservatives had recourse to Marshal MacManon a second time. Their prayer was no longer that he would fell the King's place. The attempt to turn the Court of Chargen into a constitute of the model. Count of CHAMBORD into a sovereign of the modern type had altogether failed, and the only way of keeping the Radicals from regaining the control of affairs was to confirm Marshal MacManon's power for a fixed term. The Marshal assented to this prayer and became President of the Republic for seven years. There are now signs that the Royalists wish to repudiate their agreement with him.

The extreme depression of six months back has passed away. By what means or under what conditions the partisans of the Count of Chamborn hope to seat him on the throne is not evident, but there is a section of them at all events which looks forward to finding an opportunity in the course of the debates on the Constitutional laws. In their opinion the law of the 20th of November has made no change in the Marshal's duty. The prolongation of his powers for seven years is only a formula, of which indeed it may be open to him to take a mean advantage, but which does not in the least prevent the Conservative majority from proclaiming the Count of CHAMBORD King. It is doubtful how far Marshal Mac-Manow accepts this reading of his position. The commonsonse view of the law of the 20th of November is that it was intended to put an end for seven years to all uncertainty as to the form of government. Whatever might *happen afterwards, the Republic, with Marshal MacMation as President, was established till 1880. If the Marshal adopts this theory, he has to all appearance ample means of reducing it to practice. The Conservative party in the Assembly is, as a whole, far too timid to quarrel with him. A few extreme Legitimists may be prepared to push matters to all lengths, but the majority even of the Royalists may be trusted to keep on good terms with a man who is virtually Commander of the Army as well as President of the Republic. The Moderate Left is quite as ready to support him in any reasonable assertion of his own powers as the Moderate Right. The fact that he is President, and that the existence of a President involves the statence of a Republic, would weigh with the former, as the fact that he is Object of the Executive and can make the rule of the Executive respected weighs with the latter.

Marshal MacManon's visit to the Loire may have some

were meditating any immediate retirement in favour of the Count of CHAMBORD he would hardly have cared to do this. The strongest argument that could be used in favour of a Restoration would be the impossibility of giving France a settled Government by any other means. But when the President of the Republic makes a semi-royal progress through two important French cities, and plays the sovereign's part in the pageantry by which such progresses are naturally accompanied, it becomes very much harder to convince people that this is true. They see the Marshal invested with much of the pomp which they are accustomed to associate with royalty, and they hear of his performing all the functions which constitute the outward and visible symbols of Government; and the Royalist lament that the country is without a head and without a protector, and that there is no refuge from certain anarchy except at the feet of Henry V., becomes to them a cry of little meaning. They like to be assured in the possession of their lives and goods, to know that fanatics who wish to confiscate private property will be kept in check, to see trade encouraged by the reappearance of something in the nature of a Court—to feel, in short, that the world is going on in its regular course, and that there is no danger of that course being upset by the occurrence of political or social catastrophes. But it does not need a legitimate King to give them all these advantages. A substitute for a King will do just as well, provided that he has the requisite personal qualifications. Marshal MacManon quite answers to this description. He is strong enough to give France all the solid advantages of a Restoration without attracting anothing like an agent assertion. tion, without attracting anything like an equal amount of hostility, or having to peril the substance of power in the effort to preserve the shadow. If he chooses to follow up his visit to Tours and Saumur by a corresponding display of authority at Versailles, he will find the Assembly ready to prostrate thomselves at his feet. He has only to send a message giving to the conduct of the ultra-Royalists the censure which it so well deserves, and, though the composition of the majority would be changed, its numbers would probably be greater than ever. For every deserter from the Right there would come a new recruit from the Left or the Left Centre, and, what is of still more importance, the majority as then composed would be much less antagonistic to the majority in the electoral body.

These speculations as to Marshal MacManon's intentions

are qualified by the uncertainty which there is as to his relations with the Duke of Buoute. Left to himself, it is probable that the Marshal would take some means of letting the Assembly know that he does not mean to allow his power to be questioned, or the form under which he exercises it changed, during the term for which he has been declared President. But such a communication would involve a consequence which the Duke of Brooms: is hardly prepared to face. It would be tantamount to a declaration that the Republic is to be the recognized Government of the country for the full term of soven years. A declaration of this kind would provoke a schism between the Government and the Extreme Right, and so compel the Cabinet to seek support on the opposite side of the Chamber. That support would be readily given, but it would be given on condition that the process of organizing the Government and providing the country with settled political institutions should go on without interruption. But if this process goes on under the control of a majority which is willing to accept a Republic, the result will probably be to give Republican institutions so firm a hold on the nation that there will be no chance of displacing them when the seven years are over. For Marshal Mac-Manon this prospect has probably no terrors; but the Duke of BROGLE, judging by his acts during the time he has been Minister, is resolutely opposed to any such settlement of affairs. Whether the Marshal or the Minister will have his way must be determined before the end of the Bession. Hitherto the Duke of Brootte has succeeded in making himself indispensable; but that disbelief in his identification of himself with the Conservative cause which probably exists within the Cabinet may in time communicate itself to the Chief of the State.

A PAIR OF IRISH GRIEVANCES.

A LITTLE debate and an unexposed division ought and of last week on bounties to Irish fishermen ought LATTLE debate and an intexpected division at the manufacture with these political speculations. He has been to be instructive to the Secretary of the Lord Lieutenant, stemming with him, the de facto ruler of France. If he and to the Parliamentary Secretary of the Treasury.

Although Lord Harringron supported his successor in opposing the suggested grant, the Irish members succeeded in carrying Mr. Synan's motion by a majority of two. The Conservative party has often been commended by its opponents for the strictness of its discipline; and it is not desirable that the vigilance of its managers should be relaxed when they have to defend the public interests, rather than to cultivate their own chances of attaining office. Mr. SYNAN may boast of having carried the first amateur resolution in the new Parliament. More plausible proposals have been summarily defeated by the Government with the cordial approval of the House. Sir MICHAEL BEACH to some extent conceded the principle of Mr. SYNAN'S demand by his offer to advance a sum from a STNAN'S demand by his offer to advance a sum from a forgotten fund originally raised long ago by subscription. If Irish fishermen must be helped by the Government, it matters comparatively little from what source the trifling subsidy is derived. The Government might have granted or refused the request without risk of serious disapproval. Having determined to adhere to the sounder theory of non-interference, they ought to have secured the necessary majority. On questions of small importance in themselves which involve grants of public money Parliament is willingly guided by a responsible Minister, and non-official members ought not to have opportunities of snatching a division. The country will probably have to pay for the carelessness of the Ministerial adjutant. It was not to be expected that the supporters of the Government would, if they were left to their own discretion, sit through a dull debate for the purpose of giving a vote which would to a certain extent purpose of giving a vote which would to a certain extent be unpopular in Ireland. The opponents of the grant would have been still fewer if it had not happened that the Scotch members were auxious to defend the fishermen of their own country from the imputation of having been unduly favoured in the distribution of bounties. To the House in general the discussion was utterly uninteresting.

Another Irish grievance which was discussed on the same evening deserved more serious treatment. The LORD LIMUTENANT has thought fit to address a warning, in ac-cordance with the provisions of the existing law, to one of the most seditious and mischievous of Irish journals. The description of the QUEEN as "the foreign lady who rules "over us against our will" might perhaps have been safely passed over without notice if it had stood alone, instead of being one of a series of incitements to rebellion. Of all the provisions of Coercion Acts, none are more unobjectionable than those which confer the power of checking the violence of writers who incossantly cultivate the disaffection of the populace. The liberty of the press is so fully established in Ircland, as well as in England, that there is no reason to be scrupulous in dealing with the license of seditious writers. The cant of extreme jealousy for the freedom of the press may perhaps be a respectable Parliamentary tradition, but it dates from times when it was really necessary to protect the utterance of public opinion. The demagogues and adventurers who lately affected sympathy with the Ashantees merely because they were engaged in war with England fully deserve the penalties which are nevertheless soldom imposed. The passages which were quoted in the debate entirely justified the exercise of the discretion which is entrusted by law to the Irish Government. One member professed to regret that the warning should have been published on the very day on which the Duke of ABERCORN arrived in Dublin; but a step preliminary to the abatement of a nuisance seems not to be inconsistent with the celebration of a splendid ceremony. The Home Rule members who allege that they are loyal to the Crown probably regard with but faint disapprobation measures which tend to restrain the inconvenient candour of their Fenian allies; but it was to be expected that they would deliver conventional protests against any measure which might tend to the maintenance of order.

The system of warnings which is borrowed from the legislation of France under the Empire offers facilities both for indigment eloquence and for solemn official apologies. Sir M. Brach, in the tone usually adopted by Irish Ministers, expressed the deepest regret for the necessity of ostensibly violating constitutional principles; and, after all, as he plausibly contended, a warning is not an excessive punishment, but, as the word itself purports, a friendly intimation

Irish journalism, and that there would have been rea to suspect an oversight if the editor or his contributors had at any time deviated into loyalty and moderation. To the argument of leniency Irish patriots replied that the warning was the commencement of a process arbitrary confiscation. Having given legal notice, the LORD LIEUTENANT may at any time suppress the deliniquent journal on a repetition of the offends; and it is of course deemed intolerable that the property of newspaper awards about the held at the mercy of the paper-owners should be held at the mercy of the Government. They might have added that, if the journalist deferred to the Ministerial warning by discontinuing his incitements to discord, the value of his property, consisting in the goodwill of a mart of sedition, might probably be diminished; but, except in the House of Commons, a vested interest in treason ought not perhaps to be regarded with extreme delicacy. The partial suspension of constitutional privileges in Ireland is a cause of regret, not as an evil it itself, but on account of the state of society which unfits a part of the population for the exercise of freedom. When Irish members truly assert that crime has greatly decreased since the enactment of the last Coercion Bill, they supply the most complete defence of a measure which has produced so beneficial an effect. The discouragement of assassination and of exhortations to violence is the first duty of the Legis. lature and the Government. Liberty, or the power of every one to do what he likes, must be contingent on his disposition to like a peaceable and reasonable mode of life. In the conduct of business, and especially in Parliamentary debate, prudent men generally conform to established fictions; but they at the same time remember that political realities are not accurately represented by customary phrases.

The Government appears to have arrived at the sound conclusion that Ireland requires for the present no further legislative innovations. With the exception of the Irish ATTORNEY-GENERAL, who spoke on the newspaper question, no member of the Government except Sir M. BEACH has taken part in any of the Irish debates which have occurred during the Session. Mr. DISRAELI had probably determined to abstain from Irish legislation when he appointed an untried colleague, not of Cabinet rank, to the office of Irish Secretary. Since the failure of his own former attempts to conciliate the priests, he has finally abandoned the project of a Roman Catholic alliance. The majority which he commands has given him the advantage, enjoyed by none of his predecessors for many years, of being entirely independent of the support or hostility of the party which has lately adopted the doctrine of Home Rule. Although Mr. DISRAELI in one of his election speeches taunted Mr. GLADSTONE with the severty of the executional large property. of the exceptional laws now prevailing in Ireland, it is highly improbable that he will for the present relax existing restraints. To a question founded on his language at Aylesbury he judiciously replied that it was inexpedient to discuss an important branch of policy in a fragmentary manner, and on an incidental occasion. As far as the abolition of the Irish Church and the Irish Land Act tend to satisfy the population, the present Ministers will reap the benefit of Mr. GLADSTONE'S sweeping measures, while they are not responsible for total or partial failure. They have already declined to reform the municipal franchise, to purchase the railways, and to abolish the restraints on newspaper violence. The defeat on the petty question of subsidies to Irish fisheries possesses little importance. Mr. Burr and his allies have only taken one opportunity of urging their inadmissible demands on the attention of the House of Commons. Circumstances are not at present favourable to a renewal of the discussion.

MR. MUNDELLA'S BILL.

MR. MUNDELLA'S Bill for imposing restrictions on the employment of children, young persons, and women in factories has been set aside for the present on the understanding that the Government shall bring in a general measure dealing with the subject. It is obvious that the question which has thus been raised is one not of principle, but of expediency; and it has been justly observed that many of the arguments of the opponents of the Bill ment, but, as the word itself purports, a friendly intimation to a negligent editor that objectionable paragraphs, admitted perhaps into his journal by inadvertence, may as well be excluded for the future. It was not necessary to add that seditions language was the staple of malcontent personal contract is objectionable in itself; but no ressort

able person will venture to say that absolute freedom of contract must be maintained at all hazards, and under every conceivable set of circumstances. The choice lies between two evils. It is bad that the State should have to interfere in order to prevent any one from voluntarily accepting a particular kind of employment, but it is worse that the health and moral condition of a large body of helpless persons should be deteriorated by their having to labour under injurious conditions. This principle has been embodied in a number of Acts of Parliament which nobody proposes to repeal, and it must now be regarded as definitely established. It is evident that the State has just as much right to fix the number of hours during which certain classes of persons shall work in factories as the hours during which public-houses shall remain open for the sale of liquor. The only question is as to the degree of necessity for restrictions, and each case must be considered on its own merits. It is easy to see how the principle might be abused. "Steeple-Jack" follows a perilous trade, but vanes and lightning-conductors must be fixed, and the advantage to the community of getting these things done may be balanced against an occasional accident to the man who does them. It may be assumed that, after every imaginable precaution has been taken, underground mining will inevitably be attended with considerable injury to health and loss of life, but here again the loss on this side must be weighed against the gain on the other. All that can reasonably be required is that such precautions shall be enforced as may reduce the danger and injury of the occupation to a minimum. In the debate of Wednesday Mr. MUNDELLA fell into the same error as some of his opponents in using an argument too large for his purpose. Ho remarked that during the cotton famino the death-rate of Lancashire fell enormously, and that when the people were fully employed it again rose. Even Mr. MUNDELLA, however, would hardly propose that the mills should be permanently closed in order to improve the health of the people. The fact is that people do not come into the world merely to live, and enjoy good health, but to do something, and in the doing of it they must expect to get more or less rapidly worn out. All that the State can be asked to do is see that the wearing out shall not be wanton and extravagant.

Mr. Mundella's proposal was that a young person or woman should not, except in recovering lost time, be employed in any factory for more than fifty-four hours in any week, or more than nine hours and a half in any day; that no child under ton years of age should be employed at all; that a child's work should be limited to five hours and a half a day, or therty-three hours a week; and that up to fourteen a young person should be treated as a child unless he had reached the third standard of education. He also proposed that no child, young person, or woman, should go to work before seven o'clock in the morning. Medical evidence was adduced to show that the present system of employment was extremely hurtful to women and children, and produced exhaustion and disease, and though this evidence is probably to some extent prejudiced and exaggerated, there can be very little doubt that the hours now in force must tell very severely on some women and on most children. It is impossible for a mother to go through this amount of work in a mill and at the same time to bestow proper attention on her children, and the appalling returns of infant mortality in some of the manufacturing districts may be partially attributed to this neglect. The Home Secretary truly remarked that there could not be a stronger case for interference, as far as actual injury to the woman herself and her child was concerned, than work at the mill two or three days after her confinement. Humanity apart, this is clearly sheer waste. The woman's health is broken, her children either die off or grow up feeble and sickly; and this is a loss to the industrial force of the country. It is not worth while to run the risk of losing several lives for the sake of getting a little more work out of a woman at a time when she is necessarily weak and suffering. Nobody would suggest that a woman should be at liberty to starve er infant or knock its head against the wall; and yet to desert it at such a time for the mill is pretty much the same thing, while, in addition, it is a form of suicide for herself. At the same time, it is not quite so clear that able-bedied women are seriously injured at ordinary times under the existing hours, although no doubt the families of those who are married suffer from their absence. There is no reason why a woman should not be free to take the

same chance as a man of being used up by her work, except consideration for other lives depending on her. Home Secretary, however, touched a weak point in the system when he said that the wives and children of men who are employed at the factories are expected to work there too; and have practically no choice in the matter. The offer of the Government is, on the whole, a reasonable compromise, which may be accepted without difficulty. It is intended that the law should be as elastic as possible, so that both employers and workpeople may suit their own convenience. The work of women and young persons is not to begin earlier than six in the morning, nor to continue later than seven in the evening, nor to exceed fifty-six hours a week. Moreover, the strain of continuous labour is to be limited to four and a-half hours at a time. Two hours are to be allowed for meals on five days of the week, and on Saturday there will practically be only six hours' work, with perhaps an extra half-hour for cleaning up the machines. Mr. Cross also suggested a plan by which the work of half-timers might be confined to less than thirty-three hours a week. Till the end of next year, nine will be the age at which children may work in a factory; in 1876 the age will be advanced to ten. On these terms the Government has undertaken to consolidate the existing Acts, and to consider how far they should be extended to any trades which are as yet exempt from their operation.

Too much was said in the debate about the possible injury to trade through restrictions on infantile and female labour. In its social and industrial conditions England is far ahead of every other country in the world. The troubles through which we are passing will seen evertake other countries, and it is only because these other countries are behindhand that they enjoy a momentary advantage. In any case the prosperity of a nation should be reckened not by its cash balances, but by the health and morality of the people. Even on mere economical grounds, nothing can be more irrational than the reckless waste of women and children who might, if properly cared for, afterwards multiply the industrial power of the country. The case of the publicans shows that the State has a right to regulate the business of particular trades in the interest of the community at large; and no nation can prosper when a part of it thrives at the expense of the whole. At the same time it is impossible to shut our eyes to the motives of the agitation which has obtained Mr. MUNDELLA as its mouth-piece. There can be no doubt that it is promoted by the Trade Unionists as part of a general campaign which has for its aim to reduce the hours of labour for both men and women, in order to diminish the supply of labour and to raise its price in the market. Any restriction on the employment of women and children promotes the attainment of the monopoly which the Unionists covet, since it excludes a large amount of competition, and at the same time compels the factories to keep shorter hours. A mill cannot be carried on by men alone without the aid of women and children, and the hours of the latter are practically the measure of the labour of the mill. It is well that the object at which the Unionists are aiming should be kept in view, in order that a stand may be made against it; but this does not furnish a ground for opposing measures which are proved to be necessary for the protection of women and children on broad grounds of public policy. On the contrary, reasonable and timely concessions are the most effectual bulwark against outrageons demands.

EDUCATION AND THE GOVERNMENT.

THE Government is beginning to learn the lesson that measures which most substantially promote the efficiency of general education are not those which most approve themselves to the parochial mind. The Education debate of Tuesday was admirably calculated to raise the drooping spirits of the Ignorantine party. It showed the nature of the pressure to which Ministers are subjected, and it showed also how little able they are to resist that pressure. The Education Act of last year provided that children of out-door paupers should attend school until they were thirteen years old, unless they had passed the Fifth Standard in the Education Code. It thus made compulsion universal in all cases where parents are in receipt of outdoor relief. The State was made in effect to say to these persons, You shall not be relieved

unless you consent that your children shall be brought up in such a way as to give them a chance of not becoming panpers in their turn. The policy of such a provision was questioned by no one. It is obvious that the child of a pauper has every inducement, if left to itself, to follow in its father's steps. It is being brought up among pauper surroundings, pauper traditions, pauper habits of thinking. Its carliest associations are with the parish. Its conception of Providence is drawn from the relieving-officer. Its idea of citizonship is the right to receive half-a-crown a week from the rates. Its notion of home, when other resources fail, is the workhouse. It is being trained up in the way of pauperism, and there is every reason for confidence that, when it is old, it will not depart from it. thing that can be done for a child in this miserable condition -- short of taking it away from its parents altogether - is to give it the education of a different class. At the best it will be hard enough to counteract the teachings of home; but if it is kept at school till thirteen, or, at all events, not taken away from school until it has received a fair elementary education, it will start in life with some chance of doing better than its parents, and so of sparing the community the cost of maintaining it afterwards. was as much to the interest of the ratepayers as of the purpor children that such a law should be passed, for unless the standard of education among the poor can be raised, parperism must be a constant sore. Exceptional prosperity may lighten the pressure for the moment, but it will be as burdensome as ever as soon as things fall back into their usual course. There are other things, no doubt, besides reading and writing which go to make education, and occasionally men are to be met with who are quite unlettered and yet very far from being quite uneducated. But such cases are like the cases of travellers of exceptional energy who make their way through a country without understanding a word of the language. The ordinary rule still is that some acquaintance with it is necessary to getting on at all.

A year ago all this was generally admitted. But as Mr. Disease has said, a good deal has happened since then, and among the things which have changed in consequenco is the view taken of education by a large and powerful class. The Education Department has published a Minute substituting the Third for the Fifth Standard as the point at which the education of the children of ontdoor paupers is to end. This Minute was attacked on Tuesday by Mr. Kay-Shuttersworth, and the debate which followed was remarkable for the line taken by the independent supporters of the Government. Lord Sannen did his best to make out a practical case for the change, and to avoid committing himself to any definite assertion of principle. But we have to look to the independent leaders for a logical exposition of parochial misgivings. The whole fabric of State education really rests on one principle—that children are not to be sacrificed to the necessities of their parents. Experience shows that wherever this is done each successive generation is no botter off than the generations which have gone before. The poorer and the more wretched the parent is, the more certain it is that the child will be equally poor and wretched. And this sacrifice of the children does not in the long run do any real good to the parents. On the contrary, it postpones their ultimate interest to their momentary wants. If the child receives a good education, and is thereby enabled to get on in life, he can support his parents when they are old; whereas if he is sent to work without education, he will have enough to do by and by to support himself. Thus the parents lose what might have been of gennine service to them bereafter, and all that they get in consideration for this surrender is the shilling or two which make up the child's wages while he is under their control. Guardians' friends have another story to tell. The first duty of children, they say, is to contribute to the necessities of their parents, and the business of the Guardians is to see that children perform this duty. But if the education of children is to go on until they are thirteen, or until they have passed the Fifth Standard, several years of their lives, during which they might have been continuing to the necessities of their parents, will be at school; and all because a tyrannical Education at and their duty. The stands between them and their duty. The a shild ought to be kept at school

to carn money, unless its parents

are rich enough to be able to dispense with their children's wages. If it is a duty to contribute to your parents' necessities rather than learn to read and write well, it must be equally a duty to contribute to them rather than learn to read and write at all. But in truth, to stop at the Third Standard is tantamount to not learning to read and write at all. A little learning ceases to be dangerous when it is so little that it is forgotten as soon as learnt, and by the common consent of all competent authorities this is the case with learning which goes no further than the Third Standard.

It will be difficult for the action of the Government to be confined to the children of persons in receipt of outdoor relief. If pauper parents have a claim to have their necessities considered, parents who have with difficulty least the process off the period have at least an expedicion kept themselves off the parish have at least an equal claim to the same benefit. The man who by hard work and incessant thrift just makes both ends meet is a more interesting object than the man who falls back upon the community and is content to be supported as a burden on the rates. As soon as ever children are able to go to work, and in some parts of the country they can earn a few pence while they are little more than babics, they are able, and consequently bound, to contribute to the necessities of their parents. Yet if they happen to live under a School Board which has adopted a bylaw for making attendance at school compulsory, they will probably be kept from work until they have passed the Fifth Standard; in other words, they will be subjected to the same intolerable and immoral hardship from which the Education Department has just relieved the children of paupers. It is not possible that this invidious distinction should be maintained. Lord Synpon, if he cannot persuade the School Boards in question to anticipate him by altering their bylaws, may be obliged to bring in a Bill substituting the Third for the Fifth Standard as the universal limit of compulsory education. When this has been done, the compulsory education. When this has been done, the Elementury Education Act will, for all practical purposes, have been repealed, and Guardians may with reason propose that a machinery which has ceased to be operative shall not be permitted to encumber the Statute-book.

A compromise of the Fourth Standard might have been defended, but we fear that the Secularists will make capital out of the adoption of this "miserable Third Standard" the approved limit of elementary education. We have again and again insisted that the difference between Denominationalists and Secularists is not that Denominationalists care less for education, but simply that they wish to make full use of the means for giving education which are already in being. Both parties, we have maintained, propose the same standard of secular instruction, and both are auxious that the attainment of this standard shall be, as far as possible, made compulsory. The point at which they part company is whether this standard shall be taught in the existing schools or in new schools to be built everywhere at the cost of the ratepayers. This view will now be far less easy of proof, as we shall hear that the Denominationalists, baving an overwhelming majority in the new House of Commons, their first educational deliverance is to declare by 265 votes to 203 that the standard of secular instruction shall be dangerously lowered. They had the Act of 1870 to deal with -an Act which, while they were in a minority, they accepted as the substantial expression of their educational views -and they now think themselves driven to cripple its most salutary provisions. Mr. Mousev and the Education League may plausibly contend that their predictions have been fulfilled, and that the party which has so constantly boasted of its educa-tional zeal has shown itself weak at the first note of invitation in resisting the sacrifice of education to a paltry and short-sighted economy. If the victory of parochialism means that the most ignorant and prejudiced section of the rutepayers is to fix the standard of secular instruction for the whole country, a reaction in favour of Secularism becomes simply a question of time.

SEX IN EDUCATION.

THE discussion opened by Dr. Mandaley in the Phiencelle, a lady who is cortainly wall qualified to represent an explain apon plan subject. We do not desire to discuss this physiological qualifies in the the manual property of the physiological and the physiological property of the physiological property of the physiological physiologica

perience; and probably Dr. Mandaley and Mrs. Anderson would both admit that we are so yet scarcely in possession of the information necessary for a trustworthy decision. Meanwhile, however, we may venture to make some remarks upon the general tendency of the discussion; and especially we would point out that, after all, there seems to be much less difference between the disputants than might for first sight be supposed; and therefore very little reason, except the irritating nature of all disputes about women's rights, for the importation of any hostile spirit into the matter. Mrs. Anderson, though she writes temperately and sensibly, seems to disapprove of Dr. Mandaley for giving what, even on her showing, appears to be a seasonable warning, and one which might very well be accepted by all parties without any display of sensibility. A good deal is admitted on all hands. The dispute was originated by certain American observers who thought, rightly or wrongly, that some part of the delicacy of American women was attributable to the system of female education. Mrs. Anderson remarks upon this that, assuming the facts, many other causes may be alleged. If American women are more delicate than. Europeans, which scarcely seems to be disputed, much must be set down to habits of life, to the want of out-of-door exercise, to the worries of housekeeping in a country where good servants are an extinct luxury, and to the general state of nervous excitement in which American men, not less than American women, are accustomed to live. All this is true and indeed obvious. It would be an absurd exaggeration to set down all the evils which afflict American women is not a conclusive argument, as Mrs. Anderson seems to assume, against some part of the men suffering equally with the women is not a conclusive argument, as Mrs. Anderson seems to assume, against some part of the will being attributable to the alleged cause. Men have nothers, and a woman with ruined nerves is likely to have sickly sons. We quite agree, however, with he

On another point we entirely agree, and we do not see why Dr. Maudsley should not agree, with Mrs. Anderson. It is highly desirable that women should receive the best education possible. The evils of the present superficial and often most foolish system of education, if it deserves the name, are manifold and grievous it is perfectly true that young women's minds are often so imperfectly developed that they are incapable of taking a rational interest in intellectual work; and that they frequently find refuge in mere frivolities, or in unhealthy sources of excitament. The same remarks indeed apply in a considerable degree to the education of men; but, in spite of the evils produced by an exaggerated athleticism and by the degradation of study due to excessive competition, a certain number of men do in fact receive a more solid trouning of their faculties than can often fall to the lot of women. Women ought to learn more, and to learn more systematically. Nor, we may add, is there any part of a man's education from which a woman should be deburred. Women may or may not be the equals of men in originating power; but at least they are capable of acquiring all the knowledge which is supposed to be imparted at our Universities. And therefore, when Mrs. Anderson argues for making the course of feminine studies wider and more thorough, we entirely agree with her, and at all only refrain from expressing our views more fully because we are not aware that anybody would seriously dispute them.

What, then, is the point really at issue? Dr. Maudsley asserts

What, then, is the point really at issue? Dr. Maudsley ascerts that sanitary considerations are too much neglected because the reformers of feminine education are apt to lay down the same course for men and for women; and he holds that the severs competition which may have no injurious effect upon male students may be prejudicial to their sisters. To this statement Mrs. Anderson seems to oppose two replies. She tells us that these reformers have, in fact, attended to sanitary considerations. The schoolinistresses, she says, who asked for the admission of their pupils to the University examinations also introduced gymnaetics, boths, and various hygienic appliances. We are very plad to hear it, and we hope that they will carry out the system as thoroughly as possible. We suspect indeed that, whatever has been done, a mate deal more remains to do; and that the physical needs of facilities schoolgirls by no means receive the amount of attention which they deserve. That, however, is a question of fact. If the profession is already made for all the wants to which Dr. Mandally spirit, instead of being regarded at measurably indicating a hearth, spirits. But there is no more to be said. If it is hardly spirit, instead of being regarded at measurably indicating a hearth, spirits as beyond girls have different physical attention, there is no more to be said. If it is a failed to said have different encountered in a failed to said have different encountered in the said and the said and

modest one, and Mrs. Anderson's attempts to meet it are, to our thinking, the weakest part of her case. Her chief argument, indeed, contains a palpable begging of the question. "It the course of study," she says, ". . be one as likely to strengthen the best powers of the mind as good food is to strengthen the best powers of the mind as good food is to strengthen the body, if it tend to develop habits as valuable to women as to men, and if the pace is moderate, there would seem to be no good reason why the special physiological functions of women should prevent them from running it any more than these same functions prevent them from esting beef and bread with as much benefit as men." If Mrs. Anderson merely means to say that experience must decide in both cases, we agree with her. But she says herself that young girls are frequently encouraged by ignorant parents to indulge in exercises (she specially mentions riding) which are injurious to them, though they would be healthy for boys. If this be so, it is plain that a purely physical system of training would have to be modified according as it was intended for boys or for girls; and there is at least a presumption that a similar difference would be required in the case of intellectual training. Boys and girls should both eat beet and bread, and should both learn classics and mathematics. Nolvely disputes either proposition. The only question is whether they should both eat the same food in the same quantities and at the same times, and should both go through the same course of study independently of any consideration of their differences of constitutions. Experience may possibly show that the differences of constitution are not of such a nature as to require a corresponding difference in habits of life; we can only say that the presumption appears to us to be the other way; and that the tendency of feminine reformers is generally to overland thus obvious and very important feet.

overlook this obvious and very important fact. Mrs. Anderson indeed disavows any such tendency, and declares that only "injudicious advocates" have made remarks capable of being interpreted as expressing a wish to assimilate the female to the male mind. We are atraid that her cause has a good many injudicious advocates, and it is precisely against them that Dr. Mandsley's remarks are valuable. She incident ally suggests a pertinent analogy. She contemptuously dis-misses some of Dr. Maudsley's arguments on the ground that they have already been advanced in regard to negroes and agricultural labourers. Does the fact that they have been unged and dissecurded prove that they were valueless? People objected very rightly to negro slavery on the ground that a system was a bad one which deprived certain human beings, espidia of better things, of rights to property, to their wives, and to education, and which allowed other men to flog them as much as they pleased. In short, it was said that slavery was a bad thing, because it tended to lower a negro to the state of a brute. But then other people, not content with these very forcible arguments, proceeded to assert that, because a negro was a man, he was in all respects as good as another man. They resolved was in all respects as good as another man. They resolved entirely to overlook all physiological and intellectual differences, and to treat the emancipated shave exactly as if he were a white man. Their motives were excellent, in a their arguments had the we done s of neglecting the true facts of the co.e. The result of acting upon them may be seen by anybody who will examine into the present condition of South Carolina. Because the intercerity of the negro 1800 had been turned to account for purpose of tyrongs, it was denied that the interiority existed; and no reasonable abolitionist will done that very gravo evils to both races have been the result. To apply the parallel, we will adont that women have hitherto been treated, if Mrs. Anderson pleases, as shaves. Then inferiority in physical, we may not say in intellectual, strength has fed to their being prievously oppressed by our social and legislative arrangements. This is the explanation, indeed the and legislative arrangements. This is the explanation, indeed the only explanation, of their grievances given by Mr. Mill and other advocates of female rights. Now, however, women are to be emancipated, and we are immediately told that women are no nearly equal to men that we need pay no attention at all in educational matters to the difference of physical constitution. Women have been bulled and ill treated through all the ages of history simply because they were weaker than mon; but, now that we are to cose to take advantage of our superior strength, we are middenly to assume that it does not exist, or at least that it is a matter not worth taking into serious account. Womust say that, to our thinking, the organization should be inverted. If the weaker vessels are to be devoted by should be inverted. If the weaker vessels are to be obvisted by bein, exposed to open competition with the strong, surely the ment, exposed to open competition with the scrong, surely must obvious conclusion would be that some precautious should be taken to neutralize the inequality which has hitherts been so directions. Women shelld be allowed to join in the struggle on such terms as to relieve them from the strain to which the stronger race is recklessly exposed.

Indeed, without dweling upon this argument, we cannot but think that, in spite of Mrs. Anderson's disavowals, the warning is one which may well be taken by the more ardent supporters of woman's cause. The tendency is, if not to assimilate the female to the male mind, at least to expose women as much as possible to the same conditions of education. Their teachers have been very enzious for permission to send in their pupils to the same aminations as those which their brothers undergo. As animations as those which their brothers are animations as the animation

sex; and Mrs. Anderson makes admissions which at least go very far to support his case. If so, we do not see what cause any one has to object to the modest conclusion that great care should be taken by the advocates of an improved system of feminine education when they are seeking to introduce an element which has already produced questionable results upon men, and which is costainly not likely to be less injurious to the more docile and less vigorous sex. Experience undoubtedly must be the ultimate test; but we should try experiments on such precious material with every possible care, and should guard against the danger—not an imaginary danger, whatever Mrs. Anderson may think—of being carried away by abstract theories about human equality. It is a pity that warnings should cause resentment when they might more properly be taken in a friendly spirit by those who have the success of female education most at heart.

PRESENTED AT COURT.

THE disorderly scene at the recent Drawing Room, which has been so pathetically described by several correspondents of the Times, is only another illustration of the consequences of the social crush which is causing inconvenience in various ways to so many classes of society. The arrangements of the Court are based on the assumption that the attendance at a Drawing Room is as select and limited as it used to be, and the accommodation which is provided is correspondingly narrow. The result of attempting to treat a vast crowd as if it were a small party must necessarily be embarrassing and if it were a small party must necessarily be embarrassing and unpleasant to everybody concerned. It is difficult to imagine a more scandalous spectacle in a Royal Palace than that of Tuesday. The Queen was to enter the Throne Room soon after three o'clock, but in order to be in good time most of the company had to leave home about noon. Then followed an hour or two of o'clock, but in order to be in good time most of the company had to leave home about noon. Then followed an hour or two of weary waiting in the Mall, subject to the searching scrutiny and candid criticisms of a London mob, staring into the carriage-windows; and after this another hour passed in a dense and struggling crowd in the ante-rooms of the Palace. A member of Parliament has calculated that he went through the first crush-room, with about two thousand other loyal fellow-subjects of Her Majesty, at the exact rate of six feet in every ten minutes. At the end of an hour and ten minutes he had succeeded, by careful and enterprising tactics, in bringing his charges to the door of the first ante-room. Here the imagination of the Lord Chamberlain appears to have conthe imagination of the Lord Chamberlain appears to have contrived, as an interesting diversion, some of the incidents of a steeple-chase. A series of chairs fastened together in rows stopped the way, and had to be crept through or climbed over in a fashion which must have reminded any Ashantee warriors who happened to be present of their recent experiences in the bush. After two long was at length reached, and, M. P. says, "wo were hurried through a narrow vista, with Court officials on one side, and the Royal Family on the other, the great object apparently being to do the thing as quickly and as unceremoniously as possible." It was something to have got so far, and it may be conceived that a good many of the competitors broke down on the way, but it was even more difficult to get away again. "Owing to the entire want of management and the absurd want of exit room, we were detained in the corridor for another two hours and three-quarters, the ladies sitting on the stone steps in the coldest current of English East wind."

According to the experience of this party, it took five hours and three-quarters to drive from Eaton Square to Buckingham Palace, bow to Majesty, and reach home again. This however was probably a stroke of luck, for others seem to have been detained till as late as seven o'clock at night. And it must be remembered that during the greater part of this time the unfortunate ladies and gentlemen were struggling in a dense mob, that there were no rofreshments of any kind to be obtained, and that, as there were no seats, a rest could only be procured by sitting on the stone steps or on the floor. It is scarcely necessary for "A Chaperon" to eal to medical authority in support of the opinion that a forced abstinence from food from twelve o'clock in the day till past seven at night is not conducive to good health. It is also obvious that the sort of semi-nudity which is known as full dress is not exactly the condition in which any one not tired of life would care to be exposed for some hours to the keen blast of an East wind. The Government has been engaged in considering the condition The Government has been engaged in considering the condition of women employed in factories; but it would appear that the treatment of ladies who go to Court is, on grounds of humanity, equally deserving of attention. After all, loyalty is not a crime, and it can hardly be said that delicate ladies ought to be punished for paying their respects to their Sovereign by having to run the risk of being made ill, and perhaps killed, through exposure and exhaustion. The consideration which is due to the Sovereign should in itself be sufficient to prevent the possibility of such a cruel and disgraceful scene as that at the latest Drawing Room. It is not consistent with respect for the Queen that people should have to fight for access to her presence, and that those who succeed in getting so far should have to appear before her flushed, breathless, and disordered from the struggle in which they have been succeed. If it is worth while to have a Drawing Room.

It was expected beforehand that there would be a crush, unle precautions were taken, and there is therefore no excuse for their having been neglected. The overcrowding reached a climax on Tuesday, but it has been increasing for some time, and it was certain that some day, if nothing was done, it would produce scandalous results scandalous results.

certain that some day, if nothing was done, it would produce scandalous results.

It is strange that the Lord Chamberlain should be unable to perceive the symptoms of the social revolution which is getting him into trouble. Formerly, a Drawing Room was attended only by persons who had really a sort of personal acquaintance with the Sovereign; but the circle has gradually been enlarging, until now there is scarcely anybody, who, on some pretext or other, cannot claim the right of presentation. The Civil Service is continually expanding and every little deputy sub-secretary must go to Court. Members of Parliament are expected to open the way for their constituents. The wealth of the country has enormously increased, and wealth affords little satisfaction unless accompanied by some degree of social ostentation. There is a squash at the Palace for just the same reason that there is a block in the Park, and that is that the progress of democracy is leading everybody to covet aristocratic distinctions. At this season of the year the hotels of London are packed with people from all parts of the country, who have come up in order to make a show, if only for a week or two, and who are desperate in their eagerness to obtain some sort of badge of social position. It is the mania of the period:

Those go to Court who never went before,

Those go to Court who never went before, And those who went before now go the more.

On Tuesday there were four hundred presentations, and some three thousand people were squeezed and hustled through the narrow accommodation, which, if decorum is to be considered, is only sufficient for a third of the number. There can be no difficulty in devising a remedy for this state of things, and respect for the Queen, as well as consideration for those of her subjects who have to attend Drawing Rooms, renders it imperative that one should to attend Drawing Rooms, renders it imperative that one should be found. Something might perhaps be done to extend the present accommodation, but it is clear that three thousand people at Court or anywhere else can be nothing but a mob, and that the number of admissions should be strictly limited with reference to the amount of space and to those conditions of dignified ceremonial which ought not to be ignored in the presence of the Sovereign. To prevent disappointment, it may be necessary that there should be more frequent Drawing Rooms, and if this is too fatiguing for the Queen, the duty may be discharged by deputy. As "A Chaperon" observes, there are plenty of princesses. It is possible that it may also be found desirable to recognize different are to recognize the conditions of admission. groups at Court, and to revise the conditions of admission.

THE COMPLETION OF ST. PAUL'S.

MR. BURGES has done well in sending his models for the internal completion and decoration of St. Paul's to the Royal Academy, for he has in this way most effectually disposed of the unjustifiable cry—raised in face of the most positive assertions of those who had the right to claim belief when they asserted facts within their own competence—that his appointment as architect to the Cathedral implied some subtle intention of gothicising the structure. He has also acted wisely in refusing to palm off drawings, whether measured or perspective, upon his employers and the public as sufficient indications, not only of what he means to do, but of the effects which must grow out of his intentions. An ingenious man may do anything with drawings, but a model has a stubborn matter-of-fact nature which refuses to lend itself to tricky manipulation. It is, in fact, the actual thing upon a reduced scale, and reveals not merely form and colour, but light and shade, and all the accidents of good or bad proportion. Two models have been completed, that which was earliest pro-Two models have been completed, that which was earliest produced being of one side of a bay of the nave, with its corresponding aisle, and the nearly entire nave-roof appertaining to it. The other model gives the east end in all its breadth, including appearant aisles, and a sufficient sample of the choir proper. Wren's design for the nave and choir (exclusive of the apse) is identical; so it follows that the decoration of the two must be treated on similar principles, but Mr. Burges has judiciously put out a greater richness of detail in his choir than in his nave. To some extent we may say that he is thereby competing with himself, as either or both portions of the church are capable of either treatment. But in a tentative model this elasticity of scheme is helpful, while the designer does not scruple to say that he considers one scale of ornament suitable for the nave and the other for the choir. The treatment of the dome is left for future consideration, and, excepting that the stalls will be retained where they are, the ritual arrangements have not as yet been matured.

Before he could lay a stroke of colour upon his model the artist Before he could lay a stroke of colour upon his model the artist had to make his choice between two systems of ornamentation. One is that of merely tinting and touching up the structure, with here and there, it might be, a specific decoration inserted, while the Portland stone of which the Cathedral is constructed would still be left to contribute the leading tone. The other was the adoption of full, entire, and decisive colour, applied by various processes and in different degrees, from more material the to figure art, under such elastic conditions as the special design of every portion dictates. The question was, in short, whether the tall was to complement or to supplement Wash's constructional work Coursesoully, that is certain, and wisely too, as we contend, Mr Burges took the second and the bolder course. The critics who manipulate well-used phrases about delicate gradations, half tints, sciral effects, and so forth, conveniently forget the condition to which the atmosphere of the heart of the Dity has really and unhappily been reduced, and how slightly Wren by his provisions for windows had provided for anevil which, in his own day, was but in its infancy. The essential condition is that the decoration should not overlay and blur the distinctive features which together make up the crehites design. The obvious mode of avoiding such a mistake would be to resolve the building into its component parts, and then, while holding to the entire harmony of the structure as the ruling idea, to treat each part according to its own character the ruling idea, to treat each part according to its own character—mouldings as mouldings, soffits as soffits, domes and conches as curves, panels and spandrels as plain surfaces, windows as windows. If this is conscientiously done, the building must come together again, truly still the architect's conception, and with no

together again, truly still the architect's conception, and with no greater loss of identity than any lady suffers who puts on her pearls and sparkling train for the service of the drawing-room. We claim the credit of this method of procedure for Mr. Burges, who attaches peculiar importance to the use of decorative processes which shall offer the greatest resistance to the deleterious atmosphere of London, and also be most easily cleaned. Glass mosaics take the first place; then come marble mosaics and ceramic plaques, while bronze reliefs are locally employed, and marble veneers and more painting and cidding are only employed. marble veneers and mere painting and gilding are only employed under conditions so simple as to make their restoration or cleaning a under conditions so simple as to make their restoration or cleaning a work of mechanical safety. The whole style of the decorative work shown on the model (in which, as the Academy Catalogue tells us, Mr. Burges has been seconded by Mr. Lonsdale) is conscientiously Italian. In this respect it loyally carries out the intention of completing the great work of the architect whose purpose of richly ornamenting the Cathedral stands recorded in the pages of the Parentalia. The forms are, we conjecture, more pure than those with which Wren would have been contented; for, as he had no pretence to be a painter, his reliance was to have been upon Italian artists, and Church art in Italy was rapidly degenerating into the rocco extravagances of the "Jesuit" school. If Mr. Burges's design is, however, to be rejected in order that St. Paul's may become on a much larger scale the duplicate of the gaudy fancs which Loyola's ubiquitous Society produced in the earlier fanes which Loyola's ubiquitous Society produced in the earlier years of the last century, we had much rather that it had been left in its nakedness and squalor.

Up to the necking of the tops of the small pilasters the architect proposes to coat the walls both of the nave and of the choir with a veneer of white Sicilian marble, following of course the exact lines of Wren's actual stonework. For this use of marble there is ample precedent in Italian churches of the period, while the advantages of the proceeding are found not only in a greater richness of tone, but in the practical change from a material which is porous enough to be continually absorbing dirt into one which readily reflects light, and is so closely grained as to make its cleansing very easy. The most fastidious purist could hardly raise the cry of sham against this proceeding when the substance offered to the eye would be a real material used in accordance with its legitimate nature. While, however, the large pilasters of the nave will be translated into white marble, their flutings will be of black and red murble, those of the choir being of red marble fluted with black, and the capitals in both cases being gilt. Marble mesaic of various hues, either in geometric patterns or in the richer forms of tarsia-work, will form the decoration of the various panels of the lower story of piers and aisles, with a moderate use of bronze panels in relief round the ground story of the apse and in places where space is to be reserved for special monu-ments. As to the spandrels of the arches, Mr. Burges proposes to enrich their present plain surfaces by an ornamentation partly sunk and partly in relief, comprising heads in circular panels. Another slight modification of the structure consists in carving certain raised surfaces which occur in the soffits of the arches, which were undoubtedly left by Wren, to be sculptured. A few other additions of a similarly restrained character can be discovered, to which we only refer as showing how religiously the new architect has respected the *ensemble* of his famous predecessor's church. One of the cleverest of Mr. Burges's proposals is that of the curichment which he intends to apply to the "attic story" between the pier arches and the clerestory window, of which the main feature is a series of oblong panels corresponding with the triforium of a mediaval cathedral. These panels are to be filled with groups of standing figures in company of the Theory of the panels are to be filled. of standing figures in ceramic ware. Those of the nave are represented as white upon a blue ground, reminding us on a vast scale of Wedgwood ware, while Mr. Burges proposes, for the sake of greater richness, to introduce varied colour into the choir panels. We believe that the architect found much difficulty in coming to a conclusion as to the treatment of the very awkwardly shaped cheeks into which, two for each bay, the insertion of the windows, with their flanking stone elbows of scrollwork, has cast the wall space of the clerestory. He has happily hit upon a series of sitting figures with a subdued background. Very stately standing angels are introduced into the spandrels of the vaulting, and the flat Byzantinesque domes with which the successive bays are capped signantinesque domes with which the successive bays are capped are divided into geometrical panels by shallow plaster-work, and carefully enriched with gold and colours. The windows must not only be a hopeless blot, but a disturbing element in the whole treatment so long as the heavy Munich glass with which the larger number of those in the apec have unfortunately been filled is suffered to remain. Mr. Burges accordingly proposes to sweep them sway, and to glass all St. Paul's with glass in which

colour is not eschewed, though the predominance of white gians is well secured. The pevement, geometrical in the nave, is rich with varied designs towards the east end. The treatment of the samidome or conch which surmounts the space and is the crowning points of the entire vista, was not only a consideration of primary importance, but, as it happens, one of the most ambarrassing problems which the artist had to solve in the whole work. The difficulty chiefly arises from Wren having divided the space into three quasi-triangular panels, by ribs starting between the windows and converging at the apex. Even a scrappilous man might have been tempted to sweep away these accessories in hopes of a great result; but Mr. Hurges has found it possible to grapple successfully with the situation. It was indispensable to lend brightness and splendour to this most important, conspicuous and (ritually speaking) sacred, but least satisfactorily lighted part of the interior, and so it is proposed that the ground should be of gold mosaic. In the central panel is introduced a majestic sitting figure of our Lord in the attitude of blessing, after the precedent of the Basilices, but drawn in conformity with modern art, and in the two side panels groups of standing angels. The whole treatment is conscientiously Italian, while the effect is happily very different from that which the artists of the Josuit school sought to produce with their voluptnous and sprawling figures.

to produce with their voluptuous and sprawling figures.

Critics may very probably argue that Mr. Burges's design is not perfect, but this is morely to say that its author is human. Improvements and modifications will be certain to suggest themselves provements and modifications will be certain to suggest themselves to him sconer than to any one else as the work grows under his hands. The question immediately to be answered is whether the suggestions which he has proposed offer a satisfactory basis on which to carry out the decoration. We have no hesitation in very decidedly saying that we believe they do so. We go a step further, and contend that hesitation in accepting them in favour of any vague proposal would be almost wilfully to sacrifice all hopes of seeing some notable portion of the decoration of Str Paul's accomplished within the time of the living generation. After vexations and obstacles which we do not care to recall, those who are responsible for this great enterprise have succeeded in obtaining are responsible for this great enterprise have succeeded in obtaining a noble suggestion from a distinguished artist. If now they allow themselves to be leguiled by any fastidious discontent into rejecting the design, they will find the task of recommencement not difficult, but impossible.

THE TEACHING OF THE THEATRES.

LECTURING seems to be the fushion in Paris just now, MM. Laboulaye and Legouvé are at present engaged in a series of lectures upon the rather incongruous subjects of Franklin, Sir Thomas More, Henri Quatre, and La Fontaine. What the con-necting link between these lectures may be it is difficult to imagine; it is more easy to see why M. Paul Feval thought it expedient not long ago to deliver a discourse, as we learn from Paris journals, "sur un sujet très-intéressant; le theâtre moral." There is cer-"sur un sujet tree-intéressant; le theatre moral. There is co-tainly a fine field open for a lecturer on this subject. Lovers of the drama in its highest and best forms have marked with growing disgust the downward tendency of the most important plays lately produced in Paris. The corruption which has always been present in some form or another on the French stage - now in the indecency of a Palais Royal farce or the suggestions in an operatta at the Bouffes, now in the insidious mischief of an eminently moral and instructive drama from the pen of Dumas fils-has at last spread its evil growth to the one spot which has for so long been sacred to the best interests of dramatic art. The time-honoured tradi-tions of the Théatre Français have been outraged, and its stage has been degraded, by the introduction of a distinguished member of the demi-monde in a play by two celebrated authors. This incident, which occurred in Jean de Thommeray, was the climax of the mischief which no doubt began in the popularity of such plays as Paul Forrestier and Julie, wherein the mainspring of interest lay in the breach of the seventh commandment. Now this interest has become the very bulwark of playwriters in France; without it their occupation would be gone. The fact that the evil did work its way slowly by gradual means is a strong argument in favour of the Lord Chamberlain's refusal to license the particular plays which we have named and others of their kind for performance on the Feelin state. which we have named and others of their into for performance on the English stage. From the indignation which was expressed by many people at this refusal one would have thought that it involved the destruction of the drama as an art. This outery against a monstrous act of tyranny, a senselessly prudish exercise of an arbitrary power, as it was called, was raised probably by those who took no interest in the drama as an art. They had never thought of watching the progress of events upon the French stage, and were bent only upon the means of their own amusement, regard-less of the effect which those means might have upon the repute and estimation of the theatre. Some excuse was to be found for the indiscriminate protest against the refusal of doubtful pieces in the fact that there was for a long time an unnecessary amount of pradery in certain matters observed upon the English stage. Perhaps it is the reaction from this which has caused a somewhat alarming tendency in the opposite direction. There is good sense in the old adage about callings spade a spade; but there is little to be said for the practice which has lately become prevalent of representing a spade, dressing it up with all sorts of unpatural and impossible adjuncts, and pointing out what an exquisitely beautiful thing it is. This new practice, it may be urged in our defence, has been, like so many plays, adapted from the French, a nation extelled as models.

for authors and actors. It is, however, an unpleasantly significant

for authors and actors. It is, however, an unpleasantly significant fact that we in England have only begun to take example from that nation in the period of its decadence.

It is not only in point of morality that the Théâtre Français has fallen lately. M. Octave Feuillet's Sphinx, the present success there, is a play full of strong situations and good writing, but disfigured by the representation of an agonizing death by poison upon the stage, which we cannot but think with Horace to be a great offence against art. It is an offence because the physical pain is made paramount in this instance, the mental emotion almost disappearing under its influence. Otherwise it would be unious to essign to under its influence. Otherwise it would be unjust to assign to Madlle, Croizette, who plays the Sphinx at the Français, the credit or discredit of marking in a death-scene the distinct effect of poison. This was done by Macready in King John, by Rachel in 'Adrienne Lecouvreur, and by M. Delaunay in Hernani. But in these instances the artists were careful, while they indicated the physical anguish, to show the mental still predominant. Herein lies the distinction between nelodrama and poetic tragedy. It is the multi-particle actor's wivilege to represent the reservoir in the property of the control of the contro the melodramatic actor's privilege to represent the more material realities of life, surrounded with a halo of romance. It is for him to depict the heroic leap or daring grapple which comes just in time to stem the stream of adverse fortune. His part may be played with a certain degree of violence, and accompanied with the roll of drums and the rattle of musketry. Or, if he would be the roll of drums and the rattle of musketry. Or, if he would be impressive and pathetic, then soft tremulous music may be allowed to help him out and indicate to the nudience what his intention is. The tragedian's mission is higher. His province is by the power of his art to carry the feelings and sympathies of his audience away into regions higher than these of daily life; to interpret to them the subtle and varying shades of mental emotion. His skill supplies upon the stage the deficiencies of real life; he gives utterance in voice and pesture to thoughts which are not spoken or expressed in the actual world, but lie hidden until the poet disinters them, and the actor lends them life. In the exercise of disinters them, and the actor lends them life. In the exercise of this function the tragedian disdains to employ merely physical means. And it is an offence when even the melodramatic actor resorts to the employment of writhings and contortions which resorts to the employment of writings and confortions which would be found more fifty in the circus-ring than on the stage. There is consolation to be found in the condemnation of this offence as it occurs in the Sphinx by the most highly reputed organ of French criticism. M. Buloz speaks of it in the Revue des Daux Mondes in no measured terms. "Que vient faire là," he asks, "cette scène d'hôpital, jonée avec une si prodigieuse vérité?" One cannot comprehend indeed what pood end can be served by the contouplation of response chich ere againly confined. served by the contemplation of scenes which are usually continued to a hospital or a closed room, reproduced with accurate detail and finish upon the stage. It is hard to guess what pleasure such a spectacle can afford, unless it be the same kind, if not the same degree, of excitement which the Roman crowd found in the death-struggles of gladiators. If it is to minister to this sort of excite-ment, to gratify a sickly curiosity, to fan and stir the cruel instincts which exist wherever men are assembled together, that the resources of the greatest theatre in Europe are to be employed, then the author's and actor's arts have indeed fullen low.

It is a notoworthy fact that while this is going on in Paris the It is a notoworthy fact that while this is going on in Paris the powers of a celebrated actor in London are exercised in the accurate portrayal of a death agony. Such mistakes as these not only mar both the artistic beauty and the moral effect of the plays in which they occur, but extend a baneful influence in another direction, and give an excellent handle to the class of scople who decry plays and players as things in themselves aboundable. "See what this stage is," they may say, "which you advocate as a means of education! Would you have your children brought up in the creed which play-writers profess? Would you have them think that the life upon which they will enter is such a tangle of deceit and intrigue as dramatic authors would lead us to believe? Would you teach young men that no men and few women live out Would you teach young men that no men and few women live out their lives without falling sooner or later into the snares of illicit love? Would you teach them to palliate, even to glorify, vices which every other part of their education leads them to detest?" And to such an appeal as this there can be given indeed little answer, except that the stage is not what it ought to be. We would not, as Schiller proposed in a famous pamphlet, convert the stage into a severe school, instituted for the purpose merely of religious and moral education. That pamphlet, written in the poet's youth, was marked by a good deal of eleverness, and also by a good deal of absurdity. According to his project, each of the plays presented by a national theatre to an appreciative audience would have embedded either some particular class of crime and its appropriate punishment, or some virtue and its reward. One cannot help thinking that he had his own Robbers in view when he contemplated a style of performance which would have resembled a series of acted tracts more nearly than anything else. It is unadvisable, as much because it is impossible as Would you teach young men that no men and few women live out would have resembled a series of acted tracts more nearly than anything else. It is unadvisable, as much because it is impossible as for any other reason, to crant moral instruction down the throat of the public. It ought, however, to be quite as easy to write plays of good as of bad tone. The play-writers of course shift all the blame upon the public, and say that in the absence of a subsidized theatre they cannot afford to write for the sake of art alone. If work of an inferior tone pays well, it is not their fault; the fact that they produce such work must be laid to the public's charge. Experience, however, has shown that wherever good plays and good soling have been found together, there the public have been found together, there the public have been found together, there the public have the been found. It was so in the days of Mecready, who set the days of Mecready, who set the days of Charles Lean, who followed

in his track, and it may be so again in these tays at one thetter at least out of the many with which London abounds. But the very number of these theatres goes to counteract the good effect which may be produced by one or two. It is hardly too such to say that at this moment there are not more than two plays being performed in London from the contemplation of which any conceivable good, moral or educational, could be derived. To such a capital as London this is little short of a disgree. The worst, however, is the tendency to deteriorate from what was not really good to start with. The fascination of "dangerous" subjects have not been treated in a way to make their attraction matter of rejoicing. As women reproduce in England the most extravagant Paris fashions in dress, so writers are beginning to transfer the rejoicing. As women reproduce in England the most extravagant Paris fashions in dress, so writers are beginning to transfer the worst tricks of Paris authors to the English stage, where there seems a fair prospect of the introduction of all the vices of French plays without any of the virtues of French players.

CIVILIZATION IN FIJI.

I T appears that the King and Chiefs of Fiji made an offer of cession to England, and afterwards withdrew it. The Fiji Times in case of non-annexation fears for the future of the island. "We are now without any Government." It had been announced by Commodore Goodenough that in case of war in the islands no British subjects would be allowed to take part on either side. These words, says the editor, point significantly to disturbance if the islands be left in possession of the natives. He hopes that the question of annexation will be decided in the affirmative, as it involves the making or ruin of many of the settlers. A the islands be left in possession of the natives. He hopes that the question of annexation will be decided in the affirmative, as it involves the making or ruin of many of the settlers. A correspondent of the same paper describes the King and his Ministers as having "humbagged the British Lion," a feat which appears more extraordinary to him than it does to us, who are near enough to that noble beast to know his habits and character, and to be aware how easy it is to "humbug him." That men possessing the ability and pluck to do this really lived, like the writer, on yams and pork, and breathed the same air as he did, seems to him very surprising. It appears that the Chief Secretary wrote by the authority of King Cacobau, and asked the English Government whether they would amex the islands, provided the people wished it. Hereupon a Commission was appointed to ascertain the wish of the people, and then the King told the Commissioners that he and his fellow-Fijiats did not want any other rule than their own, and that they were quite competent to govern themselves and the white men living in their midst. The British Lion has so much to do all over the world, that perhaps he would as soon leave Fiji to itself as take the government of it, and therefore he seems to have undergone this "humbagging" with considerable equanimity. Another correspondent imputes to Cacobau's English Ministers that they have influenced him adversely to annexation. This correspondent urges the immediate deportation of these Ministers, and thinks that, if these hold had scheming men were out of the correspondent urges the immediate deportation of these Ministers, and thinks that if these hold bid scheming men were out of the way, the sun of annexation would shine and shed its benignant rays on every inhabitant of these lovely islands and bring to each security and prosperity. The same paper contains a warning that the Fijian Treasury is empty and the Government in debt to the amount of \$7,000l. This debt has been incurred by King Cacobau's Ministers in three years.

Ministers in three years.

Au advertisement in the Fiji Times states that the market price of beef and mutton is eightpence halfpenny per pound, for English gold and silver, and prices are as usual for approved paper currency. All joints are to be taken in rotation. The next advertisement in the paper states that beautiful hair can be obtained by the use of Rowlands' Macassar Oil. After mentioning in usual terms the Kalydor and the Odonto, it is added that all three articles have been used and justly appreciated by the Sovereigns and Courts of Europe, the Pope of Rome, and the aristocracy of the world, and they are sold throughout India, the Colonies, and South America. A few local advertisements follow, and there we read that Lea and Perrin's Worsestershire Sauco is declared by connoisseurs to be the only good sauce. Then come advertisements by a tailor at Sydney and Woreestershire Sauce is declared by connoisseurs to be the only good sauce. Then come advertisements by a tailor at Sydney and a biscuit-baker at Auckland. Holloway's Pills and Ointment are advertised at portentous length, and a doctor practising at Molbourne announces that he was the pupil in England of "the colebrated Dr. Culverwell," and goes into details respecting his line of practice in which we shall certainly not attempt to follow him. There had been a crickot-match between an Eleven from H.B.M.S. France and the Lander Club. and the Levuka Club. A former match had been won easily by the townsmen, probably because sailors do not get much practice on a cruise, but in this match the Peurls won easily. The difficulties of cricket in Levuka seem to be only less than those of government. The ground is very bad. On one side of the field is a steep ment. The ground is very bad. On one side of the field is a steep hill, and when the ball is hit well up this hill it generally rolls down again. On the other side is the sen. Scattered over the ground are several trees, a few mud holes, and a well. The reporter noticed a scout apparently fumbling the ball whilst rans were being got, but really he was fielding in a well. Another ran to catch a "skyer," and just as he was grasping the ball fell into a ditch. All the dogs of the place, and some of the pigs, were collected between and near the wickets. After this experience we do not see why the Pearls should not play oricket on their own quarteral performance by the A. D. O. of the Pearl, and seem a theatrical performance by the A. D. O. of the Pearl, and seem a theatrical performance by the A. D. O. of the Pearl, and seems the tree.

sek before ended, just as in England, with "God but this, we think, was hardly handsome to mve the Queen," King Cacobau.

A writer in an earlier number of the same paper thinks it strange that England should be spending millions of mensy and sacrificing valuable lives in Africa, while she natures to enter into peaceful possession of the "jewel of the South Pacific." The proposal to establish a line of mail steamers between Sydney or Auckhard and San Francisco renders it more than ever desirable that Fiji should have the standard of the South Pacific and the South Pacific be under Imperial control. It is difficult, says this writer, to overrate be under Imperial control. It is difficult, says this writer, to overrate
the importance of these islands on account of their position as a
naval station, and their extraordinary fertility. Cotton, sugar,
rice, tobacco, tropical fruits, and spices of every kind grow there
most luxuriantly. For nine months in the year the climate is delightful. Nothing but a stable Government is needed to "inaugurate
an era" of great prosperity. Labour and capital would then flow
and its into the group. In proof of this general statement, we find readily into the group. In proof of this general statement, we find that a cotton-planter in Fiji desires to turn to sugar, for which his land is well adapted, but before he can do this he must find a capitalist in Auckland who will undertake to erect a crushingestate, and this is not likely to be done while the rule of King Cacobau is the only rule that prevails in Fiji.

The resolution of the King and Chiefs against the annexation which they were supposed to have desired is ascribed to the contrivance of the King's Ministers, and particularly of the Chief Secretary, Mr. Thurston. It is rather difficult to see what would be likely to happen if annexation did not take place. The assembled Chiefs did not seem greatly disturbed by the existing public debt, and probably, whatever professions they might make, they would not attempt to pay it. Among other blessings of civilization which have been purchased with borrowed money is a Government Gazatte, to which of course the Fig. Times is fiercely opposed. The prevailing idea among the European settlers at this moment appears to be that Fiji should be made a Crown colony. moment appears to be that Fiji should be made a Crown colony. They are supposed to desire "something approaching the simple form of government formerly administered in the colonies before representative government was grunted to them." A correspondent thinks that a Governor and a responsible nominee Council could govern Fiji, and this form of government could be maintained by an annual sum, which the colony could afford to pay. We may be quite sure, however, that if this form of government were established, agitation would before long commence for representative institutions. Either the before long commence for representative institutions. Either the Times or some other newspaper would invest largely in patriotism, and it would be asked why Fiji should be thought unworthy of that liberty which is enjoyed by the neighbouring colonies of Australia. The settlers evidently have at this moment a clear and strong perception of their true interest. A stable Government will produce prosperity, in which they will all share. This, indeed, is so clear that even the Chiefs could not fail to see

the Commissioners answered that England would expect them to the the price of annexation it was in the hope of getting something out of the Commissioners as the price of consent. One of thom asked whether, in case of annexation, England would pay their debt, and it is quite possible that this question might appear much less absurd to them than it does to us. The Commissioners answered that England would expect them to pay their own debt, but " with a colonial Government so much more mey and foreigners would come into the country that the interest of the debt would be easily paid by revenue alone." Doubtless revenue would increase, but experience teaches that probably expenditure would increase also. There would be demands for public works, and there would probably be a patriotic party prepared to grumble in any case either at the apathy which declined or the recklessness which undertook such works. The decined or the rocklessness which undertook such works. The answer given by the King on March 6 to the Commissioners was that he desired to carry on the government himself, and that Fiji and its people would be ruled by their own Chiefs. He thought they would be able to do this, and if they received the support of other nations all would be well. The King then handed in a written withdrawal of the offer of annexation. The Commissioners answered that if the King and Chiefs wished to keep the government of the country in their own hands it was well, and England would only require that they should govern wisely and rightly would only require that they should govern wisely and England would only require that they should govern wisely and rightly with equal justice to both whites and natives. It is obvious to remark that, if a British man-of-war is to superintend the administration of equal justice, it would be simpler for this country to do directly that which it would be doing indirectly. The first impulse of the English residents in Levuka, when they heard that annexation had been rejected, was to invite the English Consul to assume magisterial jurisdiction over them. This, however, he for the time declined. The Commissioners went on to speak to the King on time declined. The Commissioners went on to speak to the King as to the way in which the government should be carried on in the future. The Government which then existed was brought about by white men resident in Fiji. It was for white men laws were made; for white men debt was contracted; and as white men pay most of the taxes, they would want to know how their taxes were spent. It is therefore right, said the Commissioners, that the whites for the future should be taken into Council by the King, and consulted in the formation of his Government. Before anything else should in the formation of his Government. Before anything else should be done, they strongly advised and requested the King to reform his Cabinet. Thus speaks the Chief Commissioner, who is also Commander-in-Chief of the Queen's ships on that station. Notwithsfinding Mr. Ward Hunt's dismal speech, the British may is still by far the greatest power in the Pacific, and this fact manage others renders the question of summing Fiji ungust. When the treatest of twenty legions "advises and requests" his amounts to

adopt a particular course, we can calculate protty nearly what will happen, and if it pleases him to subinit his proposal to popular vota, the result is not likely to be appreciably affected. "No computation, only you must." This is the effect of the Commissioner's address to King Cacobau. The phrase "manifest destiny" is applicable to more than one civilized and colonizing powers. Capital will be invested and will protect itself in Fiji, and without prejudice to the free deliberations of King Cacobau and his Chiefs, and of the British theyerment and Parliament, causes will produce effects. The Chief Commissioner finally urped the King to reduce his civil and military establishments. The present machinery of Government was too great. With a The present machinery of Government was too great. With a happy mixture of the ideas of the politician and the sailor, he added, "It is like a small cause with an immense sail." The Commissioner concluded with an inquiry as to the dobt, and was told by the interpreter that the Chiefs had taken upon themselves "an official responsibility" in respect of it. The Commissioner did not know what that meant, nor do we. But we can guess what it would practically come to.

SPRING IN ITALY.

THE Times' Italian Correspondent entered a very sensible protest the other day against the common practice of English travel-lers in Italy. They swarm to the South in the beginning of winter and burry home again on the approach of spring. It is impossible of course to settle plans for other people, and to say how those who are blessed with health, leisure, and fortune can turn these blessings to the best account. Property has its duties as well as its privileges; most men and women have a plurality of tastes; and the very laziest of mortals has generally more than one iron in the fire. Many a man after an absouce of several months from home finds his conscience begin to smart and worry blue with the sense of accumulating responsibilities and ongagements. Then there is the accumulating responsibilities and engagements. London season with the Parliamentary Session; the salmon are coming up the Scottish rivers, and even English landscapes may be beginning to brighten up again. Still there must be many people who have few urgent claims upon their time, whatever may be the revolution of the seasons, and it is strange that so few of these should stay behind in the South when the multitude of their countrymen take to the wing. It is only another illustration of the universal despetism of fashion and custom. As a rule, the most crowded winter resorts in Italy are very far from being most sligible winter residences in the country. There is Rome, for instance. The Roman winters are often simply abominable. The streets have been built with an eye to the heats of summer, but in winter the warm sun is a comparatively rare visitor. While your friends are sunning themselves on the slopes of the Cornics, from Hyeres by Nico and Mentone to San Remo; while there is generally a bright promenade in Florence along the broad esplanade of the Lango d'Arno; while even in lagon-girdled Venice you may often bask without a greatcoat before the cheery cases in the Piazza of St. Mark—the English in Rome are haddled into the close, many-storied lanes in the low-lying quarter of the Piazza d'Espagna. Within doors they have seldom either Italian Piazza d'Espagna. Within doors they have seldom either Italian splendour or English comfort. The rooms are meither spacious nor snug; the windows admit the wind but not the sunbsums; the passages and vestibules are cramped and confined; the common staircases are gloomy and filthy. All this might be endured if long days and bright weather invited you to live out of doors. But the days are short, the skies are grey, and the weather inclement; often you may get up of a merning to shiver at the sight of hour frost on the window-panes and snow on the housetops. that there are good counterbalancing reasons for going to Rome to spend the winter. You find plenty of congenial society there -no light consideration where the natives, for one cause or snother, always keep the foreigners at arm's length. If you mean to labour vigorously at art, archieology, or even the environs, cold is more endurable than heat. If you have strong limbs and sound lungs you may defy the deadly chill of the bleak picture-galleries in the you may defy the deadly chill of the bleak peture-galleries in the old palaces, or of those interminable vaults in the Vatican which contain the treasures of classical statuary. Above all, you may go about your pleasures with small fear of the malaria, while in the summer it settles down even upon the breezy heights of the beautiful Daria Pamphili gardens, and besets your path like a deadly phentom as you jog home of an evening from your long rides in the Campagna. But during a winter in Home you rarely experience caything of that innocent intoxication which comes of an exchanting landscape seem in perfect weather, and you might have it alread to settlets. in perfect weather, and you might have it almost to satisfy were you to delay your departure a little longer. All over Italy there is a delightful month or two during the time of transition from the winter to the scorching summer. The noons even then may occasionally be somewhat hot; but the long mornings and the pleasant nights come as near to paradise as anything in this world. We have no more delightful recollections than those iated with early spring rides in the Roman Campagna. Only the last time you were out there, everything around you was brown and barren. There was nothing but dull neutral tints on the sties, the distant Alban hills, the rolling hillocks and hollows in the forethe distant Alban hins, the rolling indocks and nonows in the lore-ground, with the long grey lines of crambling aqueducts, and the isolated form-baildings overshadowed by their sombre stone pines. Of a sudden all has changed as if by magic. There is a blush of violate over the broken plain. Each tangled patch of bramble is blooming with gay columned creepers. The freels air that comes

sweeping down from the hills is laden with the fragrance of the thyme and scented herbs among which the hards of sheepsand goats are luxuristing. You may revel in a similar change if you have been wintering at Naples. Hitherto it has been fully ten to one that you were caught in a biting wind from the mountains the moment you turned the sheltered corner of the Chiaja. The muddy roads to the Lago d'Agnano and the Bay of Bairs were almost as damp and dismal as the interior of the grotto of Posilippo. Your marrow was chilled when you mounted the airy heights of the Camaldoli. There were wild effects of cloud and rain, and very little else to admire when you looked over the bay to rain, and very little else to admire when you looked over the bay to Iachia and Capri. Even on the Piano of Sorrento there was Ischia and Capri. Even on the Piano of Sorrento there was nothing to relieve the dull foliage on the stone-pines and still and balmy, the shrubs and trees in the gardens of the Villa Reale burst out in full flower; and yet these gardens are scarcely so brilliant as the glens and glades on the Piano, or even the banks by the side of the dusty high roads. And it is just at this moment that the hotels are emptied of travellers crowding to the railway stations, and the flying legions actually encumber the decks of the steamers with their shakedowns in their extreme anxiety to get well away in the rush.

As to the more secluded Italian country, it is never visited at all, except by some eccentric adventurer, or some enthusiastic artist doing his best to educate himself in his brief holiday. Since artist doing his best to educate himself in his brief holiday. Since the introduction of railways people see even less than they used to do. In the good old times of posting and vetturin there was a great deal of quiet travel on the fashionable highroads, although too early in the year for the thorough appreciation of their structions. Then you might spend three or four days on the road between Rome and Naples, although you rattled over the whole of the ground almost as rapidly as you cleared the ill-famed Pontine Marshes. You might probably about the form to have to whole of the ground almost as rapidly as you cleared the ill-famed Pontine Marshes. You might probably choose to go from Rome to Florence by Nami and the Falls of Terni, the classic Clitumnus and the Thrasymene, and the hanging city of Assisi, instead of taking the shorter cut by Siena. Travelling with the same horses, the driver was compelled to bait, and you had no help for it but to kill the time while he was baiting. You climbed the arbutus-grown hill behind Terracina, whence you could sweep the long amphitheatre of sea from the Ponza Islands southwards to Pæstum. You went and looked at the bridge of Nami at Velino, "cleaving the wave-worn precipice," and all the rest of times itself these. He sticks to the railway which cuts the corners and ties like those. He sticks to the railway which cuts the corners and tunnels the hills. He draws down the sun-blinds to shut out the intolerable glare, and the landscape with its classical peaks and historical cities. He has but a single absorbing thought—to secure a carriage in the scramble at the terminus, and to be among the first in the race for rooms at the hotel which he knows will be

Even scurries by rail and steamboat must have left on the tourist's mind some dim ideas of the beauty of the scenery between Naples and Florence, and by simple induction he may have come to the conclusion that much of it would improve upon closer acquaintance. But the roads between the three great cities possess no accidental superiority in their views over hundreds of others that are seldom or never travelled on. On the contrary, as you ascend among the spurs of the Northern or Central Apennines, or as you penetrate to the southwards into the wilder regions of Calabria and Apulia, the landscapes become grander and infinitely more avage. Mr. Davies, in his charming Pilgrimage of the Tiber, pointed out the attractions of those most unfamiliar districts which his within a formaccial driver of the Application of the structure of t pointed out the attractions of those most unfamiliar districts which lie within a forencen's drive of the tourist thoroughfares. But at the same time he did not blink the chief drawback which may deter many people from following in his footsteps, and in common fairness we must call attention to it in singing the praises of Italian spring tours. There is a painful dearth of decent accommodation, and Italian travel becomes everywhere more or less a question of roughing it, especially when the weather gets warm. Some of the remoter districts are so seldom visited by strangers that you have to trust yourself to the hoswearner gets warm. Some of the remoter districts are so seldom visited by strangers that you have to trust yourself to the hospitality or cupidity of the natives almost as absolutely as in the furthest countries of the East. Many towns of historic celebrity, and still with no inconsiderable population, have been mouldering away unvisited during successive centuries. If you chance to find yourself in one of these without an introduction, you may have to historic in some filthy convergence in whom you have to find find yourself in one of these without an introduction, you may have to bivouse in some filthy caravanserai, where you have to find your own provisions, if indeed you have not to fall back upon the streets. Even on the more frequented routes the inns are far from being all that could be desired. Sanitary improvement is generally a dream of the future, and you may be sure that there are open drains simmering and stagnating in the sun under your windows. The ventilation within doors is as bad as the drainage, as your nose very soon tells you. There is quite sure to be a plague of insects, which, so far as those that are winged are concerned, is more or less incidental to the climate or latitude; but the sheets are not so anowy-white as they might be, and there is a very general scarcity of linen. The food that goes down pretty well in the appetizing cold of winter becomes decidedly more distasteful now that the weather is warm. It is borne in upon you that the mutton is stringy and the bent hard: the bread is coarse the best hard: weather is warm. It is borne in upon you that the mutton is stringy and the beef hard; the bread is coarse, the butter rancid; and as for the mouldy old vegetables, they appear to have been gathered among ruing with the idea of serving as ingredients in a witch's cauldron. Above all, when your throat is parched and you have a genial labest upon you, you find the wines as a rule most repugnant to passed. The aparkling Asti of the North is refreshing;

Orvieto in good seasons is nearly equal to second-rate-cider; and Locryma Ohristi is pleasant drinking when you fad it fairly unadulterated, anywhere about the skirts of the vines unadulterated, anywhere about the skirts of Vesuvius. But the wines generally are poor and sour, and smack literally of the soil. For all which seasons we admit that Italy must be at a disadvantage with the Sybarite who contemplates a prolonged sojourn through the spring, especially when he diverges from beaten tracks. He cannot take his ease in his inn as he might in Germany or Switzerland, getting up something of a homelike feeling for the place in spine of defects which he is ready to grumble at even there. But then, on the other hand, he must remember that in Italy he is much less dependent on his inn and its accommodation. He is seldom weather-bound; he can his inn and its accommodation. He is seldom weather-bound; he can live through the daylight in the open air, taking his mid-day siests under some spreading tree, and he can cultivate the practice of languid contemplation, which gains like opium upon those who indulge in it. The exhilarating atmosphere and the perpetual sun-shine should enable him to bear up against troubles and hardships that would oppress his spirits in a duller and damper climate; and if he lives for anything beyond the day, he will find endless objects to interest and enliven him. It is no doubt very much a question of individual tastes, but we are sure that many persons would enjoy a spring in Italy who have never dreamed of staying to try it; always supposing that they have provided thomselves beforehand with some pleasant hobby that suits their fancy.

FRIENDLY SOCIETIES.

T appears from an interesting Report which has just been issued by the Friendly Societies' Commission that for many years the Government has been issuing certificates which are supposed to be guarantees of the soundness of Societies a large number of be guarantees of the soundness of Societies a large number of which are, in point of fact, utterly rotten and insolvent. A working-man is always much impressed by the royal coat of arms, and when the rules of his club bear this stamp, and are further attested by the signature of a Government official, he takes it for granted that the Government is watching over his interests, and that he can go on paying his subscriptions with an easy mind. It may have a property and in a great many cases it does have not that the can go on paying his subscriptions with an easy mind. It may happen, however, and in a great many cases it does happen, that the institution thus certified is little better than a trap for ignorant and unwary men. The soundness of a Benefit Blub is not a matter of opinion; it is a question of fact. Given the scale of premiums, the conditions of membership, and the advantages offered, and an actuary can ascertain at once whether it is possible that it can pay its way. When this test is applied to a large number of existing Friendly Societies, it is found that their insolvency is inevitable, for the simple reason that they have undertaken to make navments for the simple reason that they have undertaken to make payments far in advance of their funds, and that steadily year by year their liabilities are increasing and their power of meeting them diminishing. There is a melancholy list of Societies which have collapsed, ing. There is a melancholy list of Societies which have conapsed, and the exhaustion of others is only a question of time. When it is considered how many Friendly Societies there are, and who are the class who compose them, it will be seen that this is a very serious matter. The members are mostly poor working-men who have to make a sacrifice in order to keep up their subscriptions, and who are absolutely dependent on the relief which they imagine that they will thereby secure in sickness, and whose families have nothing to look to but the allowance on their death. It is calculated that there are thirty-two thousand Societies, registered and unregistered, with over four millions of members, and with funds to the amount of more than eleven millions sterling. The "Manchester Unity" comprises within itself (in England and Wales) about one-tenth of the whole number of members and onewates) about one-tenth of the whole number of members and one-ninth of the Societies; its average income during the last five years has been 560,000l., and its average sickness and death pay-ments have annually amounted during the same period to nearly 400,000l. The Manchester Unity of Odd Fellows is not only the largest organization of this kind, but comprises many of the best managed Societies. Yet an actuarial comparison of its assets and liabilities shows a deficiency of 1,343,446l., or, ex-cluding all ledges with a surplus an average deficiency of assets and liabilities shows a deficiency of 1,343,4461, or, excluding all lodges with a surplus, an average deficiency of 3l. 12s. 3d. per member. Of the total number (3,168) of lodges valued, 813, or nearly twenty-six per cent., appear to have a surplus; the rest can show only a deficiency. If the contributions are insufficient, the larger the lodge the more certainly insolvency follows. The cause of the deficiency has been clearly explained by the Directors of the Unity. The contributions of the explained by the Directors of the Unity. The contributions of the older lodges have been fixed at a haphazard rate, and much too low for the benefits promised, "and have been kept too low on account of competition with other Societies, which admit members at low contributions, and promise benefits which they cannot guarantee, and fail to give when the members have most pressing need for the promised assistance." The Commissioners state that there is no reason whatever to suppose that any other of the affiliated bodies, with probably one exception, would show results in any respect so favourable as those of the Manchestes Unity. The Commissioners commend the courage and frankness of the latter in facing the unpleasant reality of its position, and remark that "it may be said to have taken every step towards security except the final one of enforcing means to meet an accertained deficiency." It will occur to most persons that here it is the last and not the first step which is essential.

It is obvious that in issuing misleading certificates the dipersument has been doing grievous injury to a large body of the population which on every ground is entitled to append protection. The system which has been followed has been this. It is optional

with Societies whether they will register themselves. If they register they obtain the following advantages:—They can hold property in the name of trustees, can sue and be such in representative names, can proceed against their officers in case of fraud or misconduct, can recover property from their estates in certain case, can make provision for the settlement of disputes among their members by arbitration, can invest their funds with the Commissioners for the reduction of the National Debt, are exempt within certain limits from stamp duties, and can be dissolved on cheap and easy terms when occasion arises. On the other hand, a Society, before registration, sion arises. On the other hand, a Society, before registration, must obtain from the Registrar a certificate that its rules are in conformity with the law, must make periodical returns of its condition, and cannot alter its rules without a fresh certificate. Al that the Registrar really cortifies on behalf of the Government is that the registrar really cortines on benari of the Government is that the rules of a Society are in conformity with the law; and the law does not require that a Society shall be established in accordance with sound actuarial calculations as to the relation between subscriptions and promised advantages. Unfortunately the extremely limited nature of the Registrar's certification. tificate has not been brought home to the public mind, and much misapprehension has been caused by the authority given to the Registrar to advise with "the officers of a Society for the purpose of ascertaining whether the rules are calculated to carry into effect the intentions and objects of the persons who desire to form such Society." The Registrar may advise with anybody who is willing to take his advice, but those who do not care to ask his advice are to take his advice, but those who do not care to ask his advice are perfectly independent of him, and he has no authority to compel even those who consult him to adopt his views. On the face of it, the Government certificate does not guarantee financial soundness, but ignorant working-men, with a great faith in paternal government, do not understand that rules can be in conformity with the law which provide for more or less rapid insolvency and ruin. There can be no difference of opinion as to the existing system being irrational and mischievous. It encourages the members of Friendly Societies to trust to the Hovernment to see that their investments are safe, while it pro-Clovernment to see that their investments are safe, while it provides absolutely no security whatever for their safety. It is obvious that the Government should either give a trustworthy guarantee or leave the matter alone. It is, as the Commissioners remark, "inconvenient" that the Registrar should be supposed to possess greater powers than are actually entrusted to him, and that it should be thought that his certificates convey an assurance which it is impossible for him to give. Only "inconvenient" is rather a mild word for the disastrous consequences of a delusive certificate.

The Commissioners have agreed to recommend that registration should continue; that it should, on the one hand, be made more easy for the Societies in various ways, while, on the other, the requirements of the law should be more strictly enforced, by penalties or otherwise, than they have been hitherto; and that the certificate of registration should testify only to the fact of compliance with statutory requirements. It is proposed that a competent actuarial staff should be attached to the Registrar's office; and that the Registrar should, at his discretion, give advice to the promoters and managers of Friendly Societies, but without having power to compel them to adopt it. Four of the Commissioners, power to compel them to adopt it. Four of the Commissioners, Sir M. Beach, Mr. Richards, Mr. Bircham, and Mr. W. P. Pattison, go further, and suggest that more ought to be done for securing and enforcing sound tables of premiums and benefits. There can be no doubt that it would be a great advantage if the State could undertake the supervision of provident funds for the benefit of the working classes; but the difficulty of course is to determine whether this should be done directly or indirectly; and there is a further difficulty in interfering for the pro-tection of people against their will. The subject clearly deserves the most careful consideration of the Government.

The investigations of the Commissioners and Assistant-Commissioners have brought to light a great deal of curious information with regard to the organization of Friendly Societies. Their tendency to eccentricity is shown in their names. There are not only Odd Fellows and Foresters, but Druids, Rechabites, Ancient Romans, Comical Follows, Shepherds, and Prussian Hermits. The Romans, Comical Fellows, Shepherds, and Prussian Hermits. The Order of Cemented Bricks is confined to officers of the Royal Navy, and has for its object to create "good fellowship among British naval officers, and distribute discriminating charity." The Royal Antediluvian Order of Buffaloes appears to be wholly a convivial body. The Good Templars may perhaps be described as wholly an anti-convivial body. They are not exactly a Benefit Club, though the members engagement of "fidelity" and "charity" is understood to amount to an undertaking that no brother or interestability has allowed to become dependent on poor raise. is understood to amount to an undertaking that no brother or aister shall be allowed to become dependent on poor relief. The branches of the Manchester Unity are called lodges, but the Rechabites have "tents," and the Ancient Romans "senates." The Foresters are governed by a high chief ranger, the Shephends by a chief shepherd, and the Sons of Temperance by a patriarch. There are, it seems, some three hundred Friendly Societies composed of women; and in the list we find Odd Females, Odd Sisters, Ancient Shepherdesses, Royal Women, Comforting Sisters, Female Druids, Female Foresters. Many of the lodges of Skepherdesses and Odd Sisters, it is stated, are got up by the Sindledies of public-houses, and are conducted in their interest; in other cases the female Societies meet in chapals. Some Friendly Societies, known as "sharing-out clubs," make a practice of dividing their funds from time to time among their members, leaving a certain sum in the box to go on with. In cases of pro-

entiopieted death benefit, and the member is then entireled. This is solded. "burying alive."

Some of the more terrible abuses of the Burial Clubs a have been checked; but their general condition is far efactory. One of the Assistant-Commissioners remarks satisfactory. One of the Assistant-Commissioners temarks that the money invested in the insurance of a child's life in most cases exceeds the expense of the funeral, and consequently represents a form of gambling. The access received over and above the cost of burial is too often squandered upon the funeral feast. There is among the poor a strong feeling of reabove the cost of burial is too often squandered upon the funeral feast. There is among the poor a strong feeling of repugnance to being buried by the parish, and even the most necessitous strungle to provide for a private funeral. The travelling collector, who usually carries an insurance card in one hand, and clothes or some other cheap goods in the other, is the pivot of the Burial Club. Collectors are paid by a commission on their returns, and some idea of the extent of their emoluments may be carthand from the fact that a collector's book has been said for the gathered from the fact that a collector's book has been sold for 6751., and that in another instance as much as 1,000L is said to have been given for one. The class with which these collectors have to deal is the most ignorant in the community; many of the subscribers cannot read or write, and are altogether at the mercy of the collector. It is mentioned as a significant circumstance that the collector is chiefly interested in procuring new members, who bring him entrance fees, rather than in retaining old members. There is thus little or no check upon an unscrupulous collector who, for the sake of the greater gains derivable from new members, may devote himself mainly to making and dropping them, and there are ten chances to one against the insurer over gotting anything for his money. The Commissioners cannot look without grave suspicion on the heavy infant mortality in connexion with Burial Societies. In one Club at Blackburn, of 2,012 children under 10 years of age, 1,080 died. In another nearly 40 per cent. of the deaths occur under two years of age, and in a third case more than half of the whole mortality is under four years. One of the evils of the Friendly Society system is the habit of transacting business in public-houses. The interest of the publican, we are told, in whose house the branch is to meet is too often the only reason for its foundation. The managers say, "It we do not open branches for the publicans, they go to other orders who will." On the whole, the picture of these Provident Societies which is here presented is so far entisfactory that it shows the strong desire even of the poorest and most ignorant classes to try to exercise some degree of thrift and foresight; but it is melancholy to reflect on the extent to which these classes are deluded and plundered.

REFORM IN FUNERALS.

SOMETHING has been done in recent years to check the expensive absurdity of funerals. But a person who dies in London must be buried in a suburban cemetery, and a journey over sourced in a suburban cenatery, and a journey over several miles of road can searcely be performed without some employment of hired mourners, who will not be able to be properly sorry without beer. The prospectus of a Company for "Reformed Funerals" offers new and improved hearness and carriages, and grey instead of black horses, but the idea under which it was composed was evidently that of the tradesmanlike undertaker who has so long dominated society. The Directors of this Company endeavoured to supply a want which had long been felt by the provision of hearses and carriages of elegant construction and appropriateness. with such symbolical adornments as tion and appropriateness, with such symbolical adornments as were calculated to deprive the surroundings of death of their ghastly and repulsive features, and to assist in the inspiration of bright hopes and elevating thoughts of the future. We can only hope that the Directors succeeded in this laudable but rather difficult undertaking. The prospectus from which we have quoted is three years old, and we do not know whether the Company which issued it is still in existence. This, however, is immaterial; for if one Company of this kind dies another is born, and the same prospectus is equally suitable to all of them. The artist who designed the symbolical adornments which robbed the grave of victory and took the sting from death is still perhaps prepared to inspire bright hopes and elevating thoughts of the future, not only of departed souls, but of newly-created Companies.

Turning to the detailed estimates which accompany the pros-Turning to the detailed estimates which accompany the prospectus, we find that in 1871 a "nobleman's funeral" might have been had for 53l. 10s. If an ungrateful public has allowed this Company to languish for want of adequate support, the opportunity of being buried as "a nobleman" at any of the metropolitan cometeries is perhaps irrevocably lost. Why did we not know in 1871 that, if we chose to die then, we might be buried magnificently for 53l. 10s. P Such an opportunity may never occur again. The new and improved hearse had been manufactured for the Company from a novel and artistic design and had been very Company from a novel and artistic design, and had been unicarried to the grave in this superfine structure. The dome roof of the hearse was surmounted by a silver-chased celestial crown. Although one might desire to be buried as a nobleman, one might Although one might desire to be buried as a nobleman, one might hesitate as to ordaring 'an earl's or duke's coronet to be put upon one's coffin, but the title to a celestial crown could be questioned in no earthly court. The sides of the hearse would be ornemented with a triumphal garland, "for which a cross may be substituted, if preferred," You pay your money and you take your choice. For \$33, 30s, you can be buried as a nobleman either of Christian belief or otherwise, "in a plain yet elegant and effective style," and you can be drawn to the grave by four or six handsogns; dark

grey horres "in their new and costly harness." You would be for grey horses "in their new and costly harness." You would be followed by two "very superior mourning-coaches," with crown and garland or cross complete, and presenting an appearance of "singular appropriateness and beauty." The use of the best Genoa velvet State pall, with every substantial and necessary requisite, is included in the proprinteness and beauty." The use of the best Genoa velvet State pall, with every substantial and necessary requisite, is included in the price named; and by some reduction in the splendour of the "interior funeral arrangements," or, in other words, of the coffin and its lining, the whole may be done "in the above style" for 45l. In the next class the price is 30l., and by diminishing the cost of the "cases and fittings," it may be reduced to 35l. 10s. The new and elegant hearse, drawn by four handsome dark grey horses, and the use of the "best silk velvet pall," will be available for those who are content with splendour one degree below that appropriated to nobility. It seems a pity that the Directors did not offer to colliers and others, who invariably drink champagne and ride first-class while they are alive, a still higher class—say of "royal"—funeral, of which the price might be perhaps 100l. There is no reason why Mr. Smith or Mr. Jones should not be buried as a prince if his family like to pay for it, and if he is entitled to the "celestial crown" at all, he is not less entitled to it than the Queen herself. There are eight more classes through which the price gradually descends to 6l. 6s., but we have no idea, and, if we had, we should offer no suggestion, what that rank in society may be which is eight steps lower than nobility. Even in the lowest class the corpse will be carried to the grave by "the above cortége," which on reference we find consists of the new and elegant hearse drawn by two handsome dark grey horses, and a very superior mourning-carriage drawn by two hondsome dark grey horses, and a very superior mourning-carriage drawn by two hondsome dark grey horses, and a very superior mourning-carriage drawn by two grey horses, and a very superior mourning-carriage drawn by two beautiful grey horses. If we descend more than nine degrees below nobility we may still have an "ordinary "funeral, "respectbelow nobility we may still have an "ordinary "Inneral, "respectably" conducted, for 3l. 15s.; and special arrangements, "combining respectability with economy," may be made even for 2l. 15s. It may be hoped that noblemen, now that they know how far they are placed above respectability, will behave as such, and we shall not inquire whether Heaven so far resembles Hyde Park that a costermonger who comes all complete with his celestial crown upon his carriage and "four pairs of cherub handles" to his coffin will certainly be permitted to pass the gate. If we desired to appreciate the difference between reform and revolution, we could do no better than study the prospectus of this Company. They rely greatly upon the authority of Dichens, but we hardly think that when he protested against the "revolting absuidity" of modern funerals, he would have been satisfied with an attempt to maintain in death the lifelong struggle of snobbasin to give itself anstocratic airs. would have been satisfied with an attempt to maintain in death the lifelong struggle of snobbsen to give itself aristocratic airs. If indeed the Company proposed to work "a complete reformation of existing funeral customs," we must allow that, like a leader-writer in the Daily Telegraph, it began at a long distance from the point which it designed ultimately to attain. By dispensing with mutes, volvet horse-cloths, estrich feathers, and "all such more theatrical display," while retaining, at least for those who are therefore to taste, the "clerub handles," and "the best Genoa velvet State pall," the Company does not revolutionize and hardly does it reform; but, if we may borrow a phrase from the addresses of Conservative candidates at elections, it seeks the amelioration of existing institutions. the amelioration of existing institutions.

The subject of funeral reform might, we think, be usefully taken up as a branch of International Exhibitions. There is ample space at South Kensington to display novel and artistic designs in hearses and mourning-coaches, and arrangements might be made so that for an extra sixpence you might try the effect of lying like a nobleman in your own coffin in the improved hearse with colestial crown, mountings and panels relieved with violet, and triumphal garland, or cross if preferred. To make it more real and pleasant, the "interior funeral arrangements" might be completed by making temporary use of the "patent closing screws," and the occupant of the coffin would thus be able to ascertain by actual experiment whether "every needful requirement of the very best description" had been provided. Mr. Cole C.B. would, we feel assured, give his best assistance in developing this idea of an exhibition of the funerals of all nations, and he can doubtless lay his hand upon a literary genius capable of compiling the descriptive catalogue that would be necessary. The references which Funeral Companies make in their prospectues to supposed canons of art and taste convince us that the whole subject ought to be handed over to Mr. Cole for examination and report. The museum that he could form and the descriptive catalogue that he could make of it would be alike illimitable, and in connexion with the subject of cremation he would be entitled to expatiate on all ancient as well as modern applications of art to funerals.

If it be true that the suburban cameteries are already over-full, funerals must in future be performed at greater distances from London, and a system of carriage by rail will become established in which seither tasteful bearses nor handsome horses will have any place. The Necropolis Company at Woking are as much convinced as all other Companies that were ever started that they have been "established to supply a want" which lapse of these will make society precave more clearly. They, like all the other Companies that have to do with funerals, large, ar prespective which has evidently been composed regardless of the presented by the finest writer that could be presented by make the finest writer that could be presented by make the finest writer that could be presented by make the finest writer that could be presented by make the finest writer that could be presented by make the finest writer that could be presented by the finest writer that could be presented by the finest writer that could be presented.

and dotted here and there with pictures the state of an analysis of sight, to the left of the line beyond working state of the the third beyond working as the case of the state of the third that it differs from cometeries in general in not be sing yet become a distinctly unpleasant object, as perhaps in many short it is as full of varied monstrostics as the centefories nearer, had not the "rural peace and placidity" of their site Theft soil is close day; and gravelly, and they offer the opportunity of largely disputsing with the "puraphernalia of the undertaker," his nutes, closues, coaches, and planies. If, indeed, people cling with an "ill-advised and traditional conservatism" to "ridiculous forms and permontes," the Necropolis Company is propared to gratify them. Its business extends to all that pertains to the bursh of the dead, and it undertakes the conduct of funerals with precision and substantial docorum at moderate charges. With a deep impression of the nothingness of man and the vastness of eternity they combine a clear eye for business, and for the class to which a rival Company offers a "nobleman's" funeral they offer to provide a funeral which they designate as "occlesissicial." We do not understand that funerals otherwise described are without religious service. But an "ecclesiastical" funeral comprises, according to the prospectus, "mediaval coffins, with quatre foil armiture, Calvary crosses, violet and white palls," &c. This Company is even prepared to compete with other Companies in statuary and neson's work, and we should not be surprised to hear that it keeps a poet for inscriptions. Happily, however, funereal art at Woking will for a long time to come he subdued by nature. The dead who lie there have, as the prospectus says, a clear sky over their heads, and "a sweet fresh air rustles among the leaves that sigh above their resti

THE ROYAL ACADEMY.

11

THE least setisfactory works are, as usual, the most ambitious; our linglish school scarcely cares to be historic, if it could; it soldom takes a retrospective view of past ages, but prefers instead to realize present times. And this realistic spirit of our art maturally determines the character of the pictures devoted to historic personages. The few painters who now deal with past times do not allow themselves as heretofore to rely on imagination for their facts; on the contrary, they go to the National Portrait Gallery for their characters, and to the British Museum or South Kensington for archaeological accessories and chronological costumes. This mode of study comes as an all but inevitable sequence to the more searching inquiries of historians, and to the more accurate investigations of men of science. In short, they whole of our modern art, as exemplified within the Academy and elsewhere, bears the sign of being in accord with the time in which we live. From historic acts to domestic incidents, from genre to landscape, we everywhere see facts in place of fancy, realism as a substitute for romance; thus historic compositions become archaeological records, and landscape studies might serve to show geological strata. These tendencies determine at once the strength and the shortcomings of the present Exhibition in common with its immediate predecessors.

common with its immediate predecessors.

Mr. F. M. Ward, R.A., is one of the very few of our living artists who have through a number of years built up deliberately an historic style, and the mode of his procedure exemplifies what we have seen to be the prevailing principles of the present period. He is studions of likeness, furniture, drapery, and costume, and yet somehow his pictures look modern; they are not painted by a contemporary who moved himself among the characters, but by a man of our own day who sees from a distance darkly. And yet seldom has this vicorous painter thrown so much daylight upon the shadowy past as in the scene where Lady Rachel Russell on her knees implores Charles II. to grant "a short reprieve for her condemned Lord" (252). "The stony-hearted" King, caressing his lapdogs and arrayed in the gay trappings of royalty, stands stern and repellent; he evidently does not mean to relent. The story is told with point and emphasis; the heads and the hands, the fitting feed of expression, are scarcely overpowered by accessories; in fact, the composition is sufficiently concentrated to escape being scattered. Naturally enough Mrs. E. M. Ward in a claver picture, "The Defence of Latham House" (445), falls into a similar style; the concentration is helliant yet teme; the colour, though inchined to be over-florid, is not mattempered by green, though inchined to be over-florid, is not mattempered by green. The center of the composition is femily held by the cumely Counters of Derby, assisted with her two little damping room, and the latham all of a uniform and class that the company unburs.

A validate old attacking, whose Might contrasts well with the edintion of the Barbert, and he children, harves a sword, and to do battle
section that the edinting months. This touch of the comic enlivers the
scene without consecting from its dignity. The Academy is fortumate in the possession of an important picture by Sir John Gilbert,
A Bar. The Field of the Cloth of Gold" (620). The composition, as might be anticipated, is crowded; indeed confusion is almost
inevitable unless the figures were more detached. The probability
is that any extist who might have happened to be present on the
spot would have felt the scene to his beyond the compass of art;
yet Raffiselle in his fresco of Attila and in his drawing for the
lattle between Constantine and Maxentius educed order out of
confusion, harmony out of discord. But English art compared
with Italian is more picturesque and less Academic.

Of late years, however, a reaction has commenced; in place of the picturesque comes the statuesque; instead of heavy draperies we have light gossumer fabrics, half revealing the beauties of the figure, and in lieu of realistic studies we find ideal forms and symmetric limes. The Lecture-room wherein students are accustomed to be made acquainted with the divers systems of historic schools is now as heretofore deemed a fit arens for experimentalists of all sorts. Here meet on common ground severe and decorative pictures, classic, romantic, and Oriental styles. Mr. Armitage, R.A., following in the footsteps of M. Delaroche and M. Fiandrin, indulges in "A Dream of Fair Women of Ancient Greeco" (1929). This frieze-like composition, evidently designed for mural decoration, comprises Pandom with her box. Cleopatra with the asp, also Holen, Sappho, Aspasia, and others. The style, as a matter of course, inclines to the classic and statuesque; the arrangement relies on proportion and defined interval, principles of composition which Greek artists are said to have derived from Pythagoras. Yet these principles, which are supposed to lie at the root of beauty, are not here supreme; in other words, this company of fair women are scarcely fair enough. Yet it is difficult to do justice to an obviously monumental composition on so small a scale; we shall hope to see the idea carried out in the decoration of some one of our many public buildings.

many public buildings.

Also in the Lecture-room, in a central place upon the line, hangs Mr. Leighton's massive and majestic figure—"Clytenmestra from the battlements of Argos watches for the beacon-irres which are to announce the return of Agamemnon" (981). The pose is immobile and statuesque. Clytenmestra stands firm and erect as a column, stern is her mien and calm her eye, and from her shoulders fall, in graceful lines, draperies which clothe the figure fully as in the ancient statues of Minerva and Pudicitis. The light within the picture is spectral; indeed the figure is so cold that we might almost 'imagine flesh had been changed into stone. The art of Mr. Leighton is learned, it is recondite, and lies removed from the beaten track; perhaps its greatest charm is in its exquisite subtlety, as seen especially in the "Antique Juggling Girl" (348).

Mr. W. B. Richmond is yet another of our painters who takes a retrospective view; indeed "Prometheus Bound" (687)

Mr. W. B. Richmond is yet another of our painters who takes a retrospective view; indeed "Promethens Bound" (687) carries us back to the forsaken region of high art, to the time when colossal scale, deep tones, and dark sindes were decimed essential to grandeur. Here on an isolated rock which rears its summit from the sea beneath to the sky above is bound the giant form. The moon has risen in a stormy sky. Prometheus writhes as Samson when he broke the fetters, no vulture hovers in the air, only a flock of sea-birds have been startled from their covert in the caves. The conception is imposing, though necessarily not very novel; indeed in the figure we seem to see under diaguise the torso of Horcules in the Vatican. The mighty spirit, too, of the "Lazarus" in our National Gallery may have been present with the artist in his studio. Not that we here encounter plaguirism or even positive compilation; we only recognize in this noble effort a mind which holds converse with historic master-works, and composes from like points of view. The aspirations of Mr. Richmond have thus much in common with the creations of Mr. Watts; and, by a coincidence which seems to be more than an accident, Mr. Richmond's "Prometheus" now occupies in Gallery VII, the place which two years are was allotted to Mr. Watts's "Cain and Abel."

by a coincidence which seems to be more than an accident, Mr. Richmond's "Prometheus" now occupies in Gallery VII. the place which two years ago was allotted to Mr. Watte's "Cain and Abel."

We find yet another phase of what we have designated retrospective art in that remarkable resuscitation of Roman times, the "Picture Gallery" (157), by Mr. Alma Tadema. Yet it is a startling anomaly that, instead of a company of old Romans, we meet the familiar faces of a quendam London picture-dealer and his family. But the substitution of a classic toga for a modern cont and inexpressibles secures sufficient disguise, so true is it that the tailor makes the man. Yet the artist might have found among the descendants of the old Romans in the Trastevere, who still live on the borders of the Tiber, a physique more strictly historic, though acarcely an eye so professional for a picture. We would also venture to ask in what shop in modern London or in ancient Rome the casel and the panel here before us were made; though, after all, it is possible that studies and picture-galleries among the Romans were not so different from our own as is generally supposed. At all events we can recall a comic sketch found at Pompaii of the "Studio of a Painter of Antiquity," wherein the artist, with a polette by his side and a brush in his hand, is at work upon a portrait resting on an easel. Mr. Tadema's picture is at once a conically and a stroke of genius; no picture in the Exhibition is no provocative of criticism. Among other signs of the times are a councily and a stroke of genius; no picture in the Exhibition is no provocative of criticism. Among other signs of the times are a council of large simple figures hung as companions, the one "Shelle" (1554), by Mr. Armstrong. The style and the technique

times. The handling is sketchy as a fasce, the chalky colour is pitched in a light key, the lines are stadious of concords, the draperies are disphanous, revealing the figure as in classic sculpture. We thank these pointers for adding to the elever curiosities of the Exhibition; we can ill afford to lose works painted for the sake of an idea.

Religious art is commonly said to be extinct, but it would appear as if Mr. Horsley, R.A., and Mr. Thorburn, A.R.A., still stick to the forlorn hope of its possible revival. "Are They not all Ministering Spirits?" (564) seks Mr. Thorburn. We beg leave to reply that it is to be hoped that such angel visits are few and far between. As for Mr. Horsley's "Healing Mercies of Christ" (128), the world will scarcely accord to it even faint praise. But there appears a Mr. Cotman, who kindly comes to the rescue of sacred art; his theme is the head of "Noah" thrust out of a window to welcome the returning dove (264). The studies of this painter have apparently been made from the Noah's arks known to children in nurseries. Almost the only effort in the way of religious art worthy of serious consideration is the "Adoration of the Magi" (308), by Mr. Herbert, R.A. The scene is laid in the cave of the rock over which now stands the Church of the Nativity. Beneath stretch the hills and the olive-clad valleys of Bethlehem. The moon is still up, yet it is not night, for the dawn approaches, and silver light illumines the cavern where the three kings present their gifts to the Infant and the Mother. The artist in his treatment tries to effect a compromise between old and new schools, between traditional art and actual nature. The success of the attempt is not quite assured; nature would be nearer to reality, and tradition would retain more of the halo of sanctity. The treatment would have been greatly improved had the artist infused over the scene the lastrous yet selemn tones of Perugino or of Palma Vecchio.

Some persons prophesy the impending decay of our English school. They see in the preponderance of costume over character, in the preference given to accidents rather than to essentials, in the love of decorative allurement instead of clovated motive, signs of that luxury and intoxication which have ever proved fatal to art. And certainly it were easy to adduce from the Academy evidence in support of this discouraging view; artists are found on every side to play superficially with their subjects; thus Mr. Frith, R.A., quoting the lines of James Montgonery, "prayer is the burden of a sigh," "the upward glancing of an eye," is content with a sentiment skin-deep only (1331). The lady here chosen to pensouity "Prayer" might adorn a balcony at a carnival or a wondow at a boat-race. The head, which is cleanly and smoothly printed, is soulless. Guido and the degenerate artists of the decadence were never so vapid; so mistaken a work not only shows how for modernism is removed from modievulism, but proves that religious art has become all but an impossibility. As a further sign of degeneracy may be quoted "The Grape-Gatherer" (193) and "The Butterfly" (1421), severally by Mr. Poole, R.A. We will not stop to point to bands which are as formless as molluscous extremities, for Mr. Pools never cased to make himself a draftsman; but we quote these meretricious figures to show how, under the deteriorating influence of the times, a great artist, always to be held in reverence for such noble creations as the "Pracching of Solomon Engles," may sink into the commonest campound of mere flesh and blood. We do not say that these and other works, seen usually in greater plenty among "British Artists" in Suffolk Street than in the Academy, are morally open to objection; the whole class is nothing worse than low in intellectual aim and our painters are equally to blame; the masses applied most loudly what they can appreciate with least thought, and the artist, wise in his generation and true to the spirit of a commercial age, paints d

REVIEWS.

COX'S HISTORY OF GREECE.

MIR. COX'S reputation for sound acholership and critical acumen, well established as our readers are aware by his previous works, will be signally enhanced by the volumes of the Ilistory of Greece before us. Whatever judgment may be ultimately formed as to his possession of other qualities equally indispensable for the arduous task which he has undertaken, there can be no doubt concerning his sure-footedness as a classical scholar. He springs from a school of which the late Sir G. C. Lewis, with whom he has more than one intellectual feature in common, is one of the most adequate representatives; he holds his knowledge with something of the certainty of hand which distinguished the lamented author of the Credibility of Early Roman History, and which distinguishes the author of the History of Federal Government; and though his reading is less wide than theirs, he has it equally under control and at command. In one field of research however, as is well known, Mr. Cox is confessedly the devotes of a particular theory, first revealed to him by Sir. Max Müller, though developed with great zeal and shility by himself. Thus, while his moral point of view commends itself by its healthy simplicity to general assent, he cannot be described

^{*} A Nistery of Graces. By Q. W. Cox, M.A. Vols, I. and II. London: Longmans, Green, & Co. 2874.

as wholly free from intellectual bias when he approaches subjects connected with his favourite department of inquiry; and, as Porson said of Gibbon that his humanity never alumbers except when Christians are persecuted, so it may be averred of Mr. Cok that his coolness of judgment is rarely at fault except when he has an opportunity of enforcing the comprehensive theory of solar myths.

myths.

We are not about to waste any words on the question whether a new History of Greece was called for at the present moment. On such a subject it is not merely unlikely, but impossible, that much will not remain to be said worth attention even after Mr. Cox's work shall have been followed by its next successor; and if that successor is able to show cause for a reconsideration, if not a reversal, of views previously held on so many points of importance as are freshly discussed in these volumes, he too will not have written in vain. Mr. Cox's History makes its appearance shortly after the temporary cessation of the work of Professor Curtius in the same field; and it would probably be difficult to point to two books in so many respects dissimilar from one another. This dissimilarity does not indeed, as Mr. Cox seems to think, extend to the absence from the work of Dr. Curtius of references to his authorities, though the German author is certainly less liberal than the English in references to his own previous labours, and has not thought it necessary to furnish comments in such abundance as Mr. Grote. Indeed, especially of course in the second volume of the present History, Mr. Grote stands to Mr. Cox in the relation (hardly sufficiently acknowledged by critics) in which Schwegler's exhaustive volumes stand to the earlier part of Dr. Ihne's History of Rome. But though it may be doubted whether under these circumstances it was necessary for Mr. Cox to narrate at such length the history of the Peluponnesian War, he has here, as elsewhere, found frequent occasion for the exercise of an independent judgment; nor would it be just, with reference to his treatment of his great English predocessors, not to acknowledge that he tempers the exercise of his right of free criticism with due respect for their acknowledged authority. The labours of Curtius, on the other hand, with one or two exceptions, and indeed those of recent German scholarship in general, he prefers to ignore. Quite apart from those subjects on which h

A History of Greece like the present suggests so many questions calling for notice that we may content ourselves with a passing reference to its most prominent features of manner and style. Mr. Cox writes almost invariably with clearness and vigour, though perhaps he is too much given to overlaying his discourse with that usually unsatisfactory species of historical parallels, with that usually unsatisfactory species of historical parallels. Those parallels are moreover not in the present case taken from a very extensive range; and it seems as if we were never to hear the last of the Norman William, of Warren Hastings, of the rule of the English in India, and of the brutality of Joffreys and Scroggs. Mr. Cox's bétes-noires (and perhaps we should also say his bétes-blanches, for our old friend the "pickled sow" of Lavinium reappears at least twice in these volumes) will, we hope, be less persistently introduced in future portions of his History. The vehemence of his moral indignation at times hurries him into vituperation the reverse of dignified. His observations on Alcibiades may perhaps be justified by the view—in our opinion, as we shall take occasion to show, doubtful—which he has formed of Alcibiades's whole character and carver; but we regret to find Brasidas accused of a "flat lie," and stigmatized as a "ready liar," on the authority of Thucydides, who, after all, merely says (iv. 108) that on one occasion he used blandishments instead of stating facts (ov rd ovra hipovroc, and a comparison with Thue, iv. 70 seegs, will show that what Brasidas was really guilty of historical writing which we hope is not yet to be reckoned among the things of the past, against Mr. Cox occasional lapses into a species of humorous or would-be humorous illustration hardly appropriate to a work conceived, and in general executed, in so serious a spirit. The inconsistency of Spartan policy with the representations of the Spartan envoys might have been made clear without the epigram that "Mephistopholes in trouble is an excelle

The most interesting part of Mr. Cox's first volume see is to begin with the opening of the Second Book—s circumstance which will explain itself from a rapid survey of the method adopted by Mr. Cox in his sarlier pages. After a rather trite chapter on the Physical Geography of continental Hellas, containing a not very necessary warning against the danger of indulgible in speculations on the influence of soil and climate upon the character of tribes and nations (for which influence it is quite possible to make due allowance without falling into the fatalism of Mr. Buckle's disciples), we find in the second chapter what may be described as the keynote of Mr. Cox's conception of Greek history. It is hardly necessary to say that this is sought in the tendencies derived by the Greeks from their Aryan descent. Again and again in the course of his History Mr. Cox reverts to his view that the in the course of his History Mr. Cox reverts to his view that the conditions of Greek life were in reality nothing but a development of those of primitive Aryan life; and that the rock on which the effort of Athens split was her inability to overcome the tendencies in question. In other words, the isolation of the family under the absolute control of its head was the source of the "wretched centrifugal" tendency which prevented the Greeks from ever becoming a nation; and the endeavour of Athens to bring about an opposite result by means of her maritime empire, though legitimate in itself, and carried on without any unreasonable encroachments upon the real interests of her allies, was doomed to failure. The only exception to be taken to this view is the danger of attaching too exclusive a force allies, was doomed to failure. The only exception to be taken to this view is the danger of attaching too exclusive a force to the causation which it suggests. On the one hand, it will be questioned whether the conditions of life ascribed to the primitive Aryans are not, in part at least, common to other primitive races, and whether there is any difference between the source of Abraham's paternal power over Isauc and the relations indicated in the radical affinity of the words πατήρ and δισπότης. Indeed, in speaking of the principles which made up the moral atmosphere of the Greeks, Mr. Cox says very truly (i. 22) that "they may be traced in every Aryan land, and if they still retain their full power over a large proportion of the human race, no room is left for doubt that they once exercised an absolute despotism over all mankind." Now it cannot for a moment be denied that we find the Greeks even in historic times clinging with remarkable tenacity to institutions, as well as to conceptions of life, distinctly traceable in their beginnings to an age when society beyond the limits of a family was unknown. What then is the cause of the tenacity? It is precisely here that, as it seems to us, the task of an historian of Greece begins, and that it behoves him to show how it came to ass that with the combination of families into clans, and of tribes roached its ultimate development, which the endeavours of Athens sought in vain to advance a step further. It would probably be difficult to find any cause so signally contributing to this result as affinite to find any cause so signally contributing to this result as the physical configuration of continental Hellas. For this reason it is perhaps to be regretted that Mr. Cox should have thought himself obliged to treat this part of his subject so cursorily. For inquiries into the origin of the Hellenic tribes he, in the absence of satisfactory evidence, manifests what is little short of contempt. His interesting chapter on the Mythology and Tribal Legends of the Greeks takes him to familiar ground; but the title of the book of which it makes part the "Formation of Hellas" can hardly be said. Greeks takes him to familiar ground; but the title of the book of which it makes part, the "Formation of Hellas," can hardly be said to be adequately answered by its contents. On the general principles pervading Mr. Cox's treatment of Greek mythology it is quite unnecessary on this occasion to enlarge; his position is well known; it has been explained with great clearness and fulness by him in his Mythology of the Aryan Nations, and will survive even the discoveries of Dr. Schliemann. The vulnerable point in his method of conducting his argument—the heel of Achilles, the pregnable place in Sardes wall (see Note 498)—is his apparent unwillingness to allow for the operation of that transmutation of history into myths to which he has himself in his Muthology history into myths to which he has himself in his Mythology (i. 59) made reference. One need not be guilty of "modern Euemerism" in modestly asking for so much as this. But, as we have no exception to take to his conclusions as to the history of the Homeric poems, we pass by this part of Mr. Cox's remarks. His view as to the essential distinction to be drawn between Hellenic religion, or morality, on the one hand, and Hellenic mythology on the other, is thoroughly sound, and is stated with considerable force. Neither the wisdom that was Greece, nor the virtue that was Rome, was based on the popular theology of oither.

without dispute the substantial identity, as to one main source at all events, of the legends of the several Greek tribes, allowing without dispute the etymological agreement in meaning among the names of "Athenians, Arkadians, Argives, Lykians, Delians, Ionians" (i. 148), it is still a long leap to the conclusion that it is practically futile to seek for the signs of historical currents in the mythical traditions of the tables. "History," sternly says Mr. Cox, "is not a legitimate field for speculation." Yet certain kinds of evidence, that of language, e.g. which can do so much for comparative mythology—a science which justly avails itself of that gift essential to the historical inquirer, the power of combining at leading ideas, if not definite conclusions, concerning the movements of preshistoric times. Perhaps Mr. Cox, like Professor Mummen in the case of the first volume of his History of Rome, may find occasion to reconsider the method which laws part of the first volume so very blank a page. Meanwelf it is a large tribular and the case of Greek who is not a mean of Greek and his first volume of Greek and his first volume and the first volume of the first volume

dialect divisions as exhibiting indefinite shades of difference of a number measurable by that of the autonomous communities of Helias (Vol. i. Appendix E), whose ingenuity in the matter of the so-called Borian migration is mainly confined to finding analogies for the Argive toad in the myth of the Frog-sun and the German story of the Frog-prince, and who obviously regards the question of the louisn migration as fattle, can hardly be said to have contributed more than a cup of cold water to the stream of recent research on this part of his subject. It may be well that the student should suspend his judgment—in particular where modifications are adopted in the course of controversy by advocates of particular views—on such a subject as the Ionian migracates of particular views—on such a subject as the Ionian migra-tion; but he will prefer to turn to such an essay as that of the late Professor Hadley for information on what has been written about the matter, rather than virtually ignore it with Mr. Cox. So, again, while we have no doubt as to the general correctness of Mr. Cox view concerning the early institutions of Sparta—

which, with Grote, he sees no reason for regarding as typically Doric—it mugt be observed that this History adds little or nothing to the considerations to which the subject leads. The strange institution of the double kingship, e.g. he has not attempted to explain; he speaks of the Kings as "both Hendleids," and thus syoids all speculation as to the possible native origin of either one or the other line. His survey of the general transition in Hellas from kingship to oligarchies, and the frequent lapse of oligarchies into Tyrannies, is, however, as lucid as it is brief. The intense selfishness of early Aryan traditions of life, together with the circumstances rendering interpolitical combination difficult, explains the tenacity with which the dominant houses everywhere—Gamoroi or Eupatridai—clung to the exclusive possession of power. Hellenic Kingship, Mr. Cox, we think justly, regards as rather like the Tyrannies themselves, a comparatively late and transitory phase. "When, therefore, an Hellenic dynasty was set aside and an oligarchy set up in its place, this was strictly nothing more than a return to the earlier form of government. The observation is a very acute one, and might be illustrated from early Roman as well as early Germanic history. The impulse given by the Tyrants to democracy is a phenomenon which has been more commonly noted. The downfall of the great Tyrannical dynasties is briefly treated as still within the domain of legend, the tradition of Kypselos's coffin being inevitably assigned its place among "the thousand forms in which the tale of the Babes in the Wood has come down to us." Mr. Cox remarks that, "apart from their share in the expulsion of the Pisistratidai from Athens," no other instances can be established of the interference of the partans for putting down Tyrannical dynasties throughout Hellas. A brief chapter on "the Intellectual Education of the Greeks

helps to explain the slowness of the progress of Hellenic political life. For Hellenic science Mr. Cox yindicates an essentially native origin, and his remarks on the difference between Exyptian and Greek science strike us as admirable. He discriminates in this chapter

with great justice between Panhellenic and national sentiment;

with great justice between Paintelleme and national sentiment; and points out how inoperative were the influences of art, and those other general influences which culminated in the great festivals, in producing the latter with the former. Those who desire to enforce a clear view of the progress of Greek society are under a special obligation to Mr. Cox for his observations on this topic; for much confusion is produced in the popular view of Greek history by treating Panhellenic and national Hellenic feeling as convertible terms; and beginners are to this day impressed with the wholly fictitious notion that the religious festivals and games of the Greeka inspired in them what they never possessed, a desire of the Greeks inspired in them what they never possessed, a desire for a real national unity. It is in the bringing out of such truths as this, and again in that distinction adverted to above between mythological beliefs and a vital system of social and individual morality, that the value of the introductory part of this History seems to us above all to lie. The chapter "Hellas Sporadike" is, on the other hand, extremely disappointing; and there is something almost worse than disappointing in the way in which the question as to the colonization of Asia Minor is dismissed (i. 142-3). annost worse than disappointing in the way in which the question as to the colonization of Asia Minor is dismissed (i. 142-3). There is, e.g. as we venture to think, a great deal "to instruct and interest us" in the inquiry into the early history of such a committy as Ephesus, without which its later history and much of history of the Ionic Revolt must remain obscure. But we have no space to enter into other topics suggested by this chapter. It is thus at no very advanced point of this work that we arrive, with that instinctive accession of interest which it is impossible not to feel on reading the name of Athens, at Mr. Cox's chapter on the early history of the City of the Violet Crown. We are of course prepared to expect little patience on the part of Mr. Cox with the traditions of Athenian history before Solón; and even with regard to Solon he reminds us, in the spirit of Sir George Lewis, that "between his age and that of the first writer who can really claim the title of a contemporary historian, three generations at least have passed away." But in dealing even with the prehistoric traditions of Athens Mr. Cox is in sympathy with his theme; and he can at least incidentally discuss the statements of authorities whom he is willing to criticize closely and in detail, and from this point hawards combine with critical references to the views of Grote and Thirlwall a vigilant examination of the statements of point howards combine with critical references to the views of Grote and Thirlwall a vigilant examination of the statements of Herodotus and Thucydides. In his observations on the earlier of these writers, as we hope to show, will be found the most interesting of Mr. Clax's contributions to the question of the aredibility of Greek history. In his account of the early constitutional history of Athens he has, in the absence of historical resords of a direct

kind, shown little respect for indirect evidence, such as that which the study of local names in particular supplies. Attic topography is general suggests considerations of far greater value in discussing the problems of prachistoric times of Attic life than Mr. Cox seems to assume. He hastens over the doubtful ground intervening between the certainties of primitive Arvan life and the facts historically on record. The story of the Thesean settlement, as related by tradition, he considers "as plausible as that of Robinson Crusso," and as standing "on precisely the level of the legend of Jack and the Beanstalk, if we leave out all about Jack the grant, and and the Beaustalk, if we leave out all about Jack, the giant, and the beau." The humour of the comparison escapes us. While the democratic ordinances ascribed to Theseus. are doubtless inventions of the age of Pericles, and his democratic sentiments a Euripidean fancy, the character of the traditions connecting him with the Synocism establishes the by no means insignificant hiswith the Syncecism establishes the by no means insignificant historical substratum which may be justly described as the beginning of Athenian history proper. With regard to the legislation of Draco, Mr. Cox perhaps insufficiently insists on the primary point with reference to the concession on the part of the Eupatrids—to which he shows in a note that Mr. Grote was fully alive—vix. that a written legislation was granted at all. On the subject of the Solonian Scisachtheia Mr. Cox differs essentially from Mr. Grote; and though we have here merely a question of counceting conjectures. and though we have here merely a question of competing conjectures, we should certainly incline with Schoemann and other authorities to the more thorough view adopted in this History. His runarks on the Solonian legislation, as well as on that of Olisthenes, are satisthe Soionian legislation, as well as on that of Olisthenes, are satisfactory and just, without containing any fresh illustration of the several points at issue; indeed, in discussing the question of the election of magistrates by lot, the whole of the evidence which has been arged against Mr. Cirote's view is not reviewed.

In his Second Book Mr. Cox at last enters "the borderground between history and more mythical tradition"—for it is under this against that he research the second to be the second to the the second to the last enter the second to the se

aspect that he regards the accounts which have come down to us of the causes and results of the Persiur wars. In other words, the view which he takes of the credibility of Herodotus as an historian determines the whole tenor of his remarks in this portion of his work. The significance of these remarks is therefore considerable; they seem to us upon the whole both forcible and true, and it will therefore be worth while to return to them on a future occasion, as probably the best recent exposition of the subject, and to add one or two comments on Mr. Cox's view of the Thucydidean

period of Greek history.

(To be continued.)

ROSS NEIL'S PLAYS.

THE three plays which are contained in this volume are marked by the same qualities of vigorous simplicity and artistic finish which distinguished Mr. Ross Neil's carlier efforts. The versification is remarkable for its unaffected gracefulness and dignity; the delineation of the various characters is at once delicate and distinct; and the plot is in each case conducted with sustained draunatic movement. The smoothness of style may perhaps at first eight in some degree disguise the force of the current, which is rather felt than perceived. This quiet strength of treatment is one of the artistic merits of the plays, and will be found to be quite consistent with dramatic vividness. There is an idea among a certain class of playwriters that it is necessary to concentrate attention on one or two striking situations, which are worked up as if each was in itself the climax of the piece; but Mr. Neil disdains to sacrifice artistic continuity and completeness for the sake of isolated effects. It is not stated whether any of his pieces are intended for representation on the stage, but some of them would appear to be well adapted for the purpose. There have of late been some hopeful signs of a reviving teste for the poetical drams, and it can hardly be doubted that there is a sufficient number of cultivated people in London to supply audiences for at least one theatre which made a feature of producing plays of a refined and intellectual cast, managers who take a low view of the public taste can understand the attractiveness of variety, and almost anything might be welcomed as a change from the mechanical repetitions of journeymen playwrights. The severe historical simplicity of Lady Jane tirey would, with capable performers, he extremely impressive on the stage; but possibly such a piece as The Cid, which contains strong situations and is full of variety and movement, would be more certain of commanding immediate favour.

Mr. Ross Neil's Cd has nothing in common with that of Corneille except the story on which it is based. In incident and treatment it is a perfectly, original work. The controversy as to the propriety of the marriage of Chimene with the man who killed her father has perhaps scarcely yet been exhausted; but even M. de Scudéri would probably admit that the modern dramatist not failed to respect the bienstances which he thought so hardly not failed to respect the biensances which he thought so hardly used by his contemporary. It can scarcely be denied that there is, especially to an English reader, a good deal of abourdity in the great French tragi-comedy; but this is mainly due to the fantastic restrictions as to the unity of time and place which prevailed at the time when it was written. Don Diego and the Count quarrel in the morning; the duel between the Count and Rodrigo immediately follows; in the afternoon Rodrigo and his six hundred friends beat off the Moors; then Rodrigo fights another duel; and his marriage with Chimène is arranged before the day

" Plays.—The Cld. The King and the Angel. Duke for a Day; or, the Taller of Brunels. By Ross Neil, Author of "Lady Jane (1717," and "Inex; or, the Bride of Partugal." Landon: Lills & White. 1374.

In the intervals of fighting Rodrigo and Chimène have various interviews while her father's body is presumably still lying in the next room. The French Academy, in their carefully balanced judgment on the piece, condemned the plot as contrary to nature; and in actual life such a union as that of the hero nature; and in actual life such a union as that of the hero and heroine would of course be revolting and unnatural. A daughter might retain her affection for her lover after he had killed her father in what, according to the ideas of the period, was honourable combat; but the character of the affection would be changed, and both she and her lover would feel that a gulf had opened between them which could never be passed. This, however, is rather a narrow view of the subject. It is not as a picture of actual life, but as a poetical study of passionate and conflicting emotions, that this story of the Cid should be regarded. The opponents of Corneillo insisted that the only way to move an audience was to Corneille insisted that the only way to move an audience was to adhere to the *vraisembluble*, but the answer was too obvious to be passed over by the Academy. Whether or not the play contravened the rules of art, there could at least be no doubt that it moved audiences deeply, and it continues to do so to this day. We should think that an audience could not fail to be touched also by Mr. Ross Neil's play, which presents a more romantic, picturesque, and animated series of incidents than the familiar classic. It is written in flowing and vigorous verse; it contains some descriptive passages of much spirit and beauty, and the noble and elevated tone of the dialogue is well sustained. The play opens with Don Diego and the Count each pressing upon the King his claim to be greatered to his some The december is deferred, and with Don Diego and the Count each pressing upon the King his claim to be governor to his son. The decesion is deferred, and Sancho, who is jealous of Rodrigo, does his best to poison the mind of Ximema's father against his rival's house, and in return obtains the promise of her hand. A scene in the garden of the palace discloses the bent of Ximema's feelings, and the King and Queen undertake to secure the happiness of the lovers. Rodrigo has just received this assurance when the quarrel breaks out between his father and the Count. He endeavours to calm them, and even a taunt of personal coverdice. and even a taunt of personal cowardice-

> What I set not to so. After so loud a roar is't now to find. The old lion's teeth are drawn, the cub's not come? What ! is't not to be? You are wise-most wise.

does not stir him until his father receives from the Count a blow ith the flat of his sword. The duel takes place off the stage with the flat of his sword. The duel takes place off the stage—which in representation would perhaps disappoint the audience—and Rodrigo returns to announce the fatal result. In the French play, it will be remembered, Rodrigo in a long soliloquy explains the reasons which compol him to average the insult to his father, and afterwards argues the matter with the Count, who compliments him on his high sense of honour, and tries to dissuade him from fighting. Ximena's appeal to the King to punish her lover is at once simple and impassioned, and may be quoted as an example of the dramatic force and colour which characterize the piece:—

QUEEN.

I had not thought
Thou couldst be thus ungentle.

XIMENA.

To love a father shaughtered? O poor father,
Because thou hast no son to take thy part
Shalt lie in the earth forgot? because thy name
Lives but in me, a weak unweaponed maid,
Shall none dare speak for thee? shall I, thy child,
Smile tamely on thy grave? Not so—not so—
I am my father's son and daughter too,
Both to avenge and weep. King, hast thou heard?

As thou wouldst have high Heav'n befriend thy need,
Do me now justice.

Dignored.

As thou woulded have high Heav'n betriend thy need Do me now justice.

Dixio. Pardon, pardon, sire!

If you would have Heav'n's mercy for yourself, Show mercy to my son; he is young yet,
Show mercy to my son; he is young yet,
But trust me he shall serve you well one day,
And make you bless your pity.

AIMENA.

With what a how shall do who near you Mayor.

XIMENA. Hark, he bribes you With what a boy shall do who ne'er saw Moors, Save captives in a show; I bid you look On your long streets, and heav'n-aspiring towers, And churches dim with pomp, and then beyond On your broad fields that sun their billowy wealth With none to threaten but the bird of the air From the blue camp on high, and think that these My noble father's arm full many a time Kept safe for you and yours. My father's arm Lies in the dust, my father's lips are mute, But shall his service therafore be forgot, And his blood cry in vain—his blood, that ne'er the grudged Castile or you?

Rodrigo is banished, but it is made clear that Ximena has not cast him out of her heart. His return in triumph, after having by a sudden onset scattered the Moors who were threatening Burgos, a sudden onset scattered the Moore who were threatening Burgos, revives her sense of duty to her father's memory, and she demands that the Cid should be again sent into exile. The King rebukes her pittless persistence, and it is then that she listens to Sancho's insidious offer to avenge her loss. She imagines that there is to be a duct, and the struggle between her desire to accomplish what she thinks due to her father and her passion for Rodrigo is touchingly portrayed. The wily Sancho, however, half a Moor by parentage, prefers to attack his rival by an ambuscade secretly arranged with the enemy. Under the shock of the report that the Cid has been hilled, Kimena acknowledges her love; and when the report proves the and the Cid respects, it is too late for her to retract her are well. The architecture of the sudience.

The King and the Angel is a dramatic rendering of the old The King and the Angal is a dramatic rendering of the old legend of a prince who was published for his arrayance and blasphanry by being changed into a peasant, while an angal filled the throne until his moral reformation was completed. The story is variously told with different names, but here the despot is a certain King Robert of Sicily, whose natural good qualities have been corrupted by the adulation of his courtiers and by the selfish exercise of unlimited power. He looks down upon his people as so much dust beneath his feet, and his scorn of men is equalled by his contempt for Heaven. His subjects are ground down with heavy taxes, and nothing is allowed to stand in the way of the gratification of his passions and caprices. One of his freak has been to break up the farms and destroy the homes of a great many churls in order to make way for a magnificent new hunting lodge, so that so that

now the fawn comes fearless down to drink Where late the mill-wheel clicked,

Another of his misdeads is the cruel coldness with which he treats his affianced bride, the daughter of the King of Aquitaine. father has died, and she is helpless in King Robert's hands. Her dower has been squandered in riot and extravagance; but the marriage is indefinitely postponed, and the poor Princess lives in melancholy seclusion, neglected and unvisited, while the King hunts, and revels, and surrenders himself to the fascinations a light, intriguing Countess. One day the King, returning weary from the chase, falls asteep under the upbraidings of a faithful old councillor, Count Raymond. The monks in the adjoining monastery had just been singing the chant, "He hath put down the mighty from their seats, and hath raised up the humble"; and the King had boasted, with mocking defiance, that he at any rate was beyond the reach of such menaces. The monks now cross the stage in a solemn procession, and when they have passed "the King is discovered still sleeping, in the same place, and in the same attitude, but changed from his former likeness, and in a mean and ragged attire." His rage and horror as he gradually realizes the transforfather has died, and she is helpless in King Robert's hands. attire." His rage and horror as he gradually realizes the transformation which has taken place are effectively depicted. His royal commands are received with ridicule. When confronted with the angel who has appropriated his figure and authority, his first impulse is to spring on him, but his arms hang powerless by his side. As he insists that he is King he is treated as a madman, and locked up in one of the dangeous of the eastle. In the adjoining cell is a poor peasant whom he has himself imprisoned for having dared to present a petition setting forth the distress of the unhappy people whose houses had been pulled down over their heads. The two captives talk together, and the King is shocked to learn how he is execrated by his subjects, and that a plot has been formed to take exertified by the subjects, and that a plot has been formed to take his life. On reflection, however, it occurs to him that it will be his representative who will be killed; so he encourages the design, and pledges his companion by an oath to stab him on the first opportunity. The scheme is baffled by the elemency of the angel, who not only releases the peasant, but gives him money, and promises compensation to all who, like him, have been made homeless. The angel also orders the Princess Blauche's dower to be restored to her, with a safe-conduct to go where she chooses, and then sues for the love which King Robert had scorned. King Robert's eyes have now been opened. He has discovered the hollow servility of his former favourites, and also his own selfishness and cracky; his kinship with the commonest of humanity has been brought home to him, and he has learned humility and consideration for others. to him, and he has learned humility and consideration for others. He has also been touched by the beauty and tenderness of the Princess, and would now be content to spend his life as her meanest servent. He is allowed to become himself again, and marries Blanche. There is scope for good acting in the transformation of the King and his conflicting emotions, and the incidents are skilfully handled. A Fool of the Shakspearian type, in quaint motley, enlivens the scene with his quips and snatches of song. In this play, as in the others, we get the impression of clevated artistic feeling and reserved power.

The third piece, founded on a traditional story about Philip

The third piece, founded on a traditional story about Philip the Good, is a comedy in three acts, which is interesting as an example of the writer's faculty of imparting a certain nobility of treatment to a common subject. The tailor of Brussels is of treatment to a common subject. The tailor of Brussels is a ranting demagogue who, like Christopher Sly, is conveyed when drunk to the palace, and made to believe that he is the Duke. The height of Sly's ambition was a pot of small ale, but Peter Schenck is anxious to show that he could give a lesson to dukes if he had only the chance; and he is represented as a good fellow at bottom, for he in the end surrenders himself in order to save his confederates. His scheme of a successful Ordering the people insurrection is exquisite in its simplicity. to follow him, he will ride to the town hall:

there—all the guards being fled
At noise of our approach—fall straight to work
Upon the locks of the armoury, make them yield,
Arm the whole following people, name ourselves
The government of Brabant, and proclaim
All taxes done away with.

The confusion of mind of the vulgar democrat, who usually covets what he affects to denounce, is happily hit off in the following

Sit, gentlemen, and share the best we have; Not spleed unwholeseme viands such as lead The tables of the great—though, were high to They should be seemson food for all usershind.

The late Mr. J. S. Mill, in a letter to Fortilar extain politicism who are "Hadicale bootuse

lords," and the creed of this class is summed up in Peter's com-

Who redome dukes as good as other men.

Who redome dukes as good as other men.

Blasphemes the law of human brotherhood.

Of course, when a tailor becomes a duke, he changes his views, and discovers that there is a great deal to be said in favour of taxes and wholefone severity of government. The "foo of tyrants and of tyranny" is discovered to be the foe of law and government. The sham Duke orders Peter Schonck into custody, "but not to be much hurt." Altogether the humour of the subject is to be much hurt.". Altogether the humour of the subject is

The plays in this volume fully support the reputation which Mr. Ross Neil has already acquired, and will be read with pleasure by all who can appreciate tender and elevated poetry, as well as by those who relish the vividness of dramatic recital. We should, however, be glad to make the acquaintance of some of his works on the scene on which they are, if not intended, at least well fitted

to be produced.

RITES AND CUSTOMS OF THE RUSSIAN CHURCH.

IN a short introduction prefixed to this interesting volume Miss Yonge remarks on the almost entire ignorance of the Eastern Church which till lately prevailed in our own country. Englishmen, as a rule, seemed unaware of its very existence, and were apt to divide Christendom roughly into Protestants and Catholics, of whom all the former were right and all the latter in deadly error. We remember hearing an elaborate discourse on the number of the saved, in which the preacher arrived at his final calculation by first eliminating all the heathen, then dividing the nominally Christian remnant into two classes, and summarily putting saide the Roman Catholics—of the Greek Church he had evidently never heard—till he came at last to discuss the moral qualifications of the Protestant minority, from whom alone, as his hearers were distinctly given to understand, the ranks of the blessed would be hereafter recruited. We have advanced a little beyond that point new, though for most of us the Greek Church has still a very shadowy existence. In a novel which had a considerable run two or three years ago, the heroine, on learning that a friend of hers conor three years ago, the heroine, on learning that a friend of here contemplates marrying a Russian, observes to her husband, "Oh! how shocking; why they are hardly Christians, are they!" to which he replies, after a few minutes' reflection, "Well, they don't believe in the Holy Ghost." It is true, indeed, that a warm sympathy for the Orthodox Church—not very warmly reciprocated witness for primitive truth as distinguished from Romish corporations, and the state of the company and the ruptions; and we believe there has for some years past been a Society, calling itself the Eastern Church Association, established among us, with the view of effecting a closer union between the English and Eastern Churches. Still to the general public the rites and doctrines of the most ancient and inflavible of Circiatian bodies are at best a region of mystery, as was some-what amusingly illustrated the other day in the case of the auspicious event which is likely to do more than anything else to bring about a fuller knowledge and more intelligent interest in the subject. If the Times' Correspondent, who professed to be describing from personal observation the Royal marriage at St. Petersburg, had even glanced at such a popular sketch as that now before us, he would have been saved from some very strange ocular illusions. That the Russian Church, the rigid, upholder of traditional orthodoxy, would admit Protestants as such to communion was on the face of it sufficiently improbable; but there was a sublime absurdity in the account of the Duke and Duchess of Edinburgh three times sclemnly marching round the alter, and each time "receiving the Sacrament" afresh; the fact being that neither of them went near the alter or received communion at all. The ceremony thus travestied by the lively imagination of the Times Correspondent is described very clearly, together with the whole marriage rite and its attendant circumstances, in the fourth chapter of Madame Romanoff's book, to which our readers may be referred. The Russian Church, as Miss Yonge reminds us, is a child of the Greek, Russia having been converted in the us, is a civil of the Greek, Russia having been converted in the tenth century by missionaries from Constantinople. But it is, it not filis pulchrior, certainly filia major: for of the eighty million adherents of Orthodoxy nearly sixty millions are Russians, so that practically and politically the chief interest centres in the Russian Church, though it is much the youngest of the Orthodox communities, and is now entirely independent both in form and in fact of all the four ancient Patriarchates. There was formerly a Descinate of Moreover, carabitahed with the sengtion of the four of all the four ancient Patriarchates. There was formerly a Patriarchate of Moscow, established with the sanction of the four (Ecumenical Patriarcha, but Poter the Great, by a ukase of January 25, 1721, abolished it, and aubstituted the Most Holy Governing Synod as the supreme authority in the Russian Church under himself. The Bishops who are members of this Synod take an eath of uncenditional obedience to the Czer, who is in fact the acting Patriarch of the Russian Church, and is supreme in fact the acting Patriarch of the Russian Church, and is supreme in the canone of the smearest Councils; and he is officially styled fliesd of the Church. The four Patriarchs under the Turkish himpire are not because much better off, as they are appointed, and liable to be deposed, by the Sultan. It was not necessary for the writer of a work on the Rites and Gustoms of the Rasso-Greek Church to notice these facts, which must however be been in mind in to notice these facts, which must however be borne in mind in

* Shetches of the Rites and Customs of the Green-Russian Church. By E. C. Barnesel. Second Edition. London: Rivingtons.

forming an estimate of the ecclesissical position of the Eastern Churches. But her readers might be tempted to forget, without a word of caution, that she is dealing with one side only of Russian Church life, and that she has evidently been led to view it under the most farourable aspects.

Madamo Romanoff is an English lady, married to a Russian officer; and, if not actually a momber of the Church of her sulopted country, she must at least be in the habit of frequenting its serand cultivating the acquaintance of the Russian clergy to whom she professes her "deep obligations" for the help they have given. She must therefore be presumed to speak with their authority, and to give what they would themselves desire to be accepted as a correct account of matters ecclesiastical. We have already said, that it is on the whole a favourable view; but her descriptions—except in the case of ceremonies, which are very minutely explained-are often so sketchy as to stimulate rather than to explained—are often so secreny as to stimulate rather than to satisfy a desire for fuller information. The book is thrown into the convenient shape of a series of short tales illustrating the seven Sacraments and other principal rites of the Church, which has the advantage of rendering it more attractive to the general reader, but also, of course—and that is not an unmixed benefit-of enabling the writer to make the structure of the narrative subservient to her own view of the facts. Let us take as a specimen the opening story of "Roman the Reader," which is the longest and altogether the most interesting in the book. It includes a detailed account of the Sacraments of Buptism and "Buptismal Unction"—or, as we should say, Confirmation—which is administered in the Eastern Church to infants immediately after they are baptized, and of the Consecration of Charebes. But its main interest to an ordinary reader will lie in the sketch, sight as it is, of clerical life and education as exemplified in the hero's career from childhood till his early death by a stroke of lightning. One hears a good deal usually about the draukenness and ignorance of the mass of the Russian clerky. Our author does "not pretend to dispute that many are ignorant, given to much wine, and lovers of lucre," but she considers that these failines are greatly exaggerated, and that Englishmen have formed their estimate from onesided stories of travellers much as Russians love generalized their conception of English schoolmusters from Dickens's Squeers, We greatly desiderate a fuller and more explicit account of the training of youths destined for the ministry; but the impression left on our mind by the experiences of Roman—who is represented as somewhat exceptional, both in character and attainments—is of a system quite as narrowly exclusive as the Roman Catholic in the separation of the young seminarist from early boyhood, but with separation of the young seminarist from early boyhood, but with less care for moral sateguards. Lying and other schoolbov vices appear to be very prevalent among these neophytes, who are also said to be greatly addicted to "maling-ring." And the plan of making the priesthood hereditary, "like the Levites, you know," as Roman expresses it, is not likely to act satisfactorily. "We grow up," he says, "with the conviction that Priests, Deacons, or Renders we must be. Our friends do not approve of our becoming laymen; many will not give their blessing to such some as feel an insurmountable exercise to the Church stancy that!" The intense renganage of many of these youths for their that!" The intense repugnance of many of these youths for their that!" The intense repugnance of many or these yearns considered career, often attested by running away from the seminary, does not look a hopeful sign. Nor are matters at all improved by the still more objectionable application of the same principle in the female line, through the commercial arrangement of priestly marriages, which appears, however, to have been forbidden by a recent Imperial ukase. We will let Roman explain it:-

And what do you mean by marrying for a place? "

"And what do you mean by marrying for a place?"

"Do not you know? Oh, that is one of our systems, one of our ways of getting our maidens provided for. For instance, a Pilest, with an unmarried daughter, dies. Well, she may be a nice anishle grit that any one might be glad to have for a wife; she may be elderly or nely; worse still if she be ill-tempered or in bad health. The Consistory knows every brids in the discess; besides, the mothers send petitions to the Vholika, begging that a bridegroom may be found for her daughter. The condition for the place is informed that if he chooses to take the glil, the place is his; a married man gets a refusal at once—though, to be sure, if he knows that there is a bride there, he does not think of asking for it."

"Good God I' cried Michael, "what an abuse! Go on brother!"

"The candidate thinks, 'Who knows, perhaps the gui may please me,' and off he sets, perhaps some hundreds of versts, to look at het. There are cases on record that candidates with mothers and orbina brothers and sisters on their hands have not been able to make up their minds to such conditions. And the position of the poor girl—what must be her feelings? Other candidates, just for the sake of 'daily bread,' as I say, marry cross old frights, for whom nobedy and during the lifetime of the father; and I leave you to imagine the domestic happaness that is to be expected. It is a fact."

"Is it possible?" murmured Michael, shaking his head.

fact."
"Is it possible?" murmured Michael, shaking his head.

The practical working of the system is illustrated a few pages further on by the example of Roman's schoolboy friend, Appolon:-

The ceremonies of Baptism and Duction-or Confirmation-we must leave our readers to study in Madanie Romanoff's pages; they may feel thankful that immersion is no longer enforced in the West, when they learn that some priests are so maskiful in discharging their office that "little innocents have been known to be drowned at the very moment they were made Christians." It is fair to add that such accidents are said to be of rare occurren

fair to add that such accidents are said to be of rare occurrence.

We should gather from the chapter on "Confession and Communion" that here, as in almost every other point, there is no difference of doctrine between the Greek and Latin Churches, but that there is just the variety of practice that might be expected from the stationary and inelastic character of Eastern Christianity. The custom which became prevalent in an early, though not the earliest, age of frequenting the Sacraments only once a year, still prevails in Russia, and even the most devout never think of confessing and communicating oftener than twice. Children, from their baptism till the age of seven, when they make their first confession, communicate twice a year, with the chalice only... There has been nothing in the East corresponding to the Franciscan and Jesuit revivals. And indeed much of the life of Oriental Christianity looks like a petrifaction of primitive faith and worship. Christianity looks like a petrifaction of primitive faith and worship, touching and venerable in its fidelity to the ancient type, but wanting in that power of adaptation to the changing needs and circumstances of the day which, even in its darkest periods, has marked the religious and ritual developments of the Latin Church. Whether we contrast the rival communions, so like at once and so unlike in their liturative moments or repulser existence. whether we contrast the rival communions, so like at once and so unlike, in their liturgical, monastic, or popular religious systems, we are met with the same characteristic of rigid immobility in the East. And the distinction holds good equally in the domain of theology. The intense speculative energy, of which not Rome but Constantinople was the centre, which gave birth to the heresies and the Councils of the first eight centuries, has lain dormant for above a thousand years. John of Damascus in the eighth century was the last theologian of note in the Orthodox Church, and the iconoclastic policy of her rulers about the same period marks her suicidal rejection of the services of Christian art. These tendencies to a merely sterile conservatism have inevitably been strengthened by successive ages of religious and political isolation. A correspondence between the German Old Catholics and a Russian religious society which has lately been published in the newspapers illustrates very curiously that ingrained in-capacity to distinguish form from substance which has become almost a second nature in the Orthodox Eastern mind. But we almost a second nature in the Orthodox Eastern mind. But we may seem to be wandering from Madame Romanoff's volume, though not from the thoughts which its perusal naturally suggests. One of the most interesting chapters is that on "Adoption," for which a peculiar and very beautiful rite, or "moloben," is provided in the Russian service-books, but is apparently so seldom used that many of the clergy are oblivious of its very existence. A bereaved couple had however resolved to replace their lost children by adopting the son of a friend, a boy of seven years old, and desired to consecrate the new relationship by the ordinance of the Church. We must find room for the leading incidents of a ceremony which has no parallel, so far as we are aware, in any Western ritual. Mass has been celebrated and "infant Communion "administered to Max with the chalice, and the ceremony then proceeds:

Western ritual. Mass has been celebrated and "infant Communion" administered to Max with the chalice, and the ceremony then proceeds:—

And now the closed royal gates were opened, and Father Platon, with his Testament and cross, issued therefrom. Contrary to custom, Michael Emilianovitch and his son ascended the steps of the amyon, and with lighted candles in their hands, made an obelsance to the ground, and crossed themselves three times as the Priest chanted "Blessed he our God, now, henceforth, and for ever." After a few short prayers and kondake, the following prayer was read, with the distinct enunciation that has lately become, happily, so common, but which then was quite a new thing:—

"O Lord our God! who through Thy beloved Son, our Lord Jesus Christ, hast called us to be the children of God by Adoption, and the grace of Thy Holy Spirit; saying, 'I will be a Father to him, and he shall be to Me a son i' O mercibul Father and King, look down from heaven, Thy dwelling-place, on these Thy servants; and their natures (strangers to each other in the flesh) do Thou units in the bonds of relationship as father and son, by Thy Holy Spirit; confirm them in Thy love, bind them with Thy favour, bless them with Thy glory, strengthen them in Thy faith, preserve them for swa, and grant that an unseemly word may never pass their lips; and be Thou the Recorder of their vow, that even to the end of their lives their love be not broken, that they never fail in their duty to Thee, in whom all things living have life; and make them heirs of Thy Kingdom. To Thee is due all honour, glory, and worship, to the Father, and to the Son, and to the Holy Ghost, now, henceforth, and for ever. Amen."

The Priest then turns his face towards the congregation, and says, "Peace be to you all !"

And the Reader answers, for the congregation, "And to thy spirit."

Priest. "Bow your heads before the Lord." (The congregation stand with bent heads while he reads this praver.)

"O Almighty Father I the Creator of all things created, who in th

The murber of English works conveying information about the

Russian Church is extremely limited, and there are still fewer likely to attract the notice of any but professed theologians. We can honestly recommend Madama Romanoff's unpretending and very readable volume to the larger class who may, especially at this time, desire to learn something in an informal way of the religion of the new member of our Royal family. But they must remember that it is the work of a reverential admirer, if not of a convert, whose opportunities of personal observation as well as her sympathies have probably disposed her to dwell chiefly on the brighter side of things. But a little exaggeration in that direction is at all events preferable to the vulgar bigotry of mere ignorant contempt. It is quite time that Voltaire's famous sneer at our insular religion should be proved to be obsolete.

LADY ANNA.*

MR. TROLLOPE must have had an object very superior in his eyes to popularity, or even to general approval, when he indited a novel making Lady Anna, the daughter and wealthy heiress of an earl, marry a journeyman tailor (and, lest the reader should ever forget himself into the delusion that it is a master with the content of the conte tailor, the full title is seldom spared him), carrying along with her, moreover, the author's sympathies in so doing. And he is a tailor who is nothing else than a tailor—not a prince in disguise, not a hero, not a poet, not even a demagogue, but a man who goes steadily to his work, coming home from it with hands hard and black with behour and carning him thirty-five shillings a weaks and without and several card with a several card without and several card with a several card without and se labour, and earning his thirty-five shillings a week; and withal an ill-conditioned tailor, with a "coarse mouth" and a very uncivil tongue in it, selfish, surly, ill-tempered, and dangerous, whom the heroine (we use the term conventionally) fears at least as much as she fancies. This is a sort of thing the reading public will never stand, except in a period of political storm and ferment. There are Radicals in the abstract, but a man must be embittered by some violent present exasperation who can like such diaruptions of some violent present exapperation who can like such disruptions of social order as this. Not all the cleverness and admirable portrait-painting shown in Felix Holt could make that story popular, or overcome its unpalatable plot, which Lady Anna follows in too many points to allow us to regard the similarity as entirely accidental. And yet Felix Holt, as compared with our tailor, is Hyperion to a satyr, and Esther has nobody to please but herself. In the interest both of male and female novel-readers we protest against Lady Anna's match; for their sensibility's sake we expose at once the main feature of the story, that they may not be betrayed unawares into reading what will probably leave a disagreeable impression. Fiction at least as much as poetry should be the art of instructing by pleasing. The most tragic catastrophe art of instructing by pleasing. The most tragic catastrophe pleases something in us when human nature performs its part with credit; but who can be pleased here? Not middle-class readers midway between earls and artisans, determined at least to hold their own; not earls and countesses, unless they are disloyal to their order; not tailors, if they are wise men, for what sensible man wants a wife who is ashamed of him? and Mr. Trolloge knows his art too well to pretend that his tailor can talk or look or behave himself on any occasion at all like a gentleman. He has indeed shirked, which we think a little cowardly, showing us his hero in the posture and surrounding circumstances of his calling, but we see him distinctly, though the words are not written, sitting at the wedding-breakfast ill at ease on the edge of his chair, embarrassed in his new clothes, awkward and sullen.

We have heard it suggested that the plot of this story is the carrying out of a bet. Without accepting this solution, it is clear that for some reason or other Mr. Trollope before he concerned himself with the how. The plot must have been an after consideration. He trusted his ingenuity to find the means. It was obvious that, if the young lady was to carry with her the reader's sympathy, she must be placed in exceptional circumstances to start with, and her extravagant views of constancy easily accomplished all the rest. It is a rule with some directors of conscience not to aim at universal perfection or at an equality of excellence, but to choose a particular virtue, and to exercise all the energies upon it; to hold it perpetually before the mind's eye. It is thus that Mr. Trollope has in this instance directed the conscience of his genius. Constancy to a lover is the one virtue which is to supersede all others; a promise once made, under whatever circumstances, is to override every other consideration. Once, then, get the young lady to promise, and the thing is done. The reader, however, is accustomed to consider that all our relations with our fellow-creatures imply tacit promises. Are there no bonds but spoken ones? Because a girl does not say in so many words to the Countess her mother, I promise not to marry a tailor, does she really break no understood long-standing promise when the wedding comes off? If not, then not only must the present framework of society be changed, which the line of the story would seem indeed to suggest, but the moral obligations of parents their children are reduced to a minimum—a mere parish allowance as it were. But there is a recognition of such an unsmoken promise ever circumstances, is to override every other consideration. Once, as it were. But there is a recognition of such an unspoken promise in all concerned, whether author or lovers. Mr. Trollope cannot construct his story without the aid of falsehood and trighterous concealment. The young girl, at the bidding of her lover, keeps the engagement a profound secret from her mother, not scrupling to tell lies when his are necessary to keep in the deception.

The plot is just such an impossible one as would grow out of

Long Anne. By Anthony Builtons, London: Chapman & Hall, 1874.

the original design; people all behave in the story as nobody would behave in real life. Ledy Lovel, on whom Ledy Anna's méallièmes comes as a Nemesis for her own ambitious marriage, was daughter of Captain Murray, a thorough gentleman of good family, "one of the right Murrays," living in a pretty cottage near Keswick. Here she was found by Lord Lovel, a conventional wicked pear, who persuades the beautiful girl to marry him, though she is told he is a bad man. Very bad he proves to be; for six months after he has led her a bride out of Applethwaite Church, he tells her the marriage was not valid, as he had a wife already in Sicily. She told her father, and one of the Murrays fought a duel for her; but shortly afterwards the father dies, the Murrays become suspicious of her claims (without any reason as it seems), and we soon find her so reduced in circumstances and so desolate that an old master tailor who takes up her cause because he hates the aristocracy is her only friend. He spends all his savings, some six thousand pounds, in a prosecution for bigamy, which ends in the absent Earl being acquitted and the Countess being legally acknowledged to be Lady Lovel. It might be supposed that under these circumstances old Mr. Thwaite would not be her only friend; but so it is, and her little girl is brought up in his house, hearing a great deal of her rank, and called Lady Anna, but still living dependent on her old friend; who perseveres in the lady's cause, which indeed is so good a one that we never quite understand how nobody believes in her but the tailor.

The poor unsuspicious Countess, training her daughter in the high hopes which fill her own bosom, is little aware that an engagement has been formed between the young girl and Daniel Thwaits, the tailor's son. So utterly unconscious indeed is she (and what depths of duplicity does this imply!) that she allows Daniel, who has come up from Keswick to London to work with a tailor in Wigmore Street, to take lodgings for her and her daughter in the ame house, of which he has a room on the top floor. Let who would question Lady Lovel's claims, he and his father had maintained them, and as a boy he had fought many battles at Keswick maintaining Lady Anna's right to her title. He was a reader and "no dolt," and yet it does not seem to be thought dishonourable in him that he should get the girl's secret promise to marry him. His contempt for the aristocracy is assumed to clear him from such reproaches. Here in these lodgings it occurs to Lady Lovel that her daughter ought not to be calling the tailor Daniel. Lady that her daughter ought not to be calling the tailor Daniel. Lady Anna blushes, and argues how good he had always been to them. Lady Lovel is quite willing to acknowledge her obligations. She is grateful; but still insists upon "Mr. Thwaite"; and just gives a hint to old Thwaite, with which the old man is offended. Now here, again, the tailors—father and son—strike us as pushing the view of gratitude strangely far. If the old man advanced his money to prove her a countess, the mere fact of success ought to have told him that equality between them was impossible. And where is the generosity, if, believing her a countess and her daughter an heiress, Daniel thinks his father's services justify him in securing the daughter as his own prize! In the meanwhile a beyv of London lawvers are busy with the justify him in securing the daughter as his own prize! In the meanwhile a bovy of London lawyers are busy with the trial which brings Lady Lovel from her retirement. Her hustrial which brings Lady Lovel from her retirement. Her husband, the wicked Earl, is dead, and the title goes to a distant heir, but not the fortune amassed in various securities. The dying Farl had left his money to a mistress, but he was proved to be mad at the time, so the will was set aside; but the young Earl has a more formidable antagonist in Lady Anna, whose legitimacy it is his policy to dispute. He is an honourable young fellow, with no wish to deprive anybody of their rights; but an earldom cannot be maintained with credit on a thousand a year, which is all that comes to him unless, as he takes for granted, the Countess can have been proved to be no wife. Sir William Patterson, Solicitordescribed in Mr. Trollope's manner, and play their several parts—which are very honest parts, for he is a sympathizer and friend of lawyers of every branch. The perspicacious and bland Sir William soon discovers that his client has not a leg to stand upon, and suggests, as the best thing for all parties, that a marriage should be arranged between the young people new opposition. soon discovers that his client has not a leg to stand upon, and suggests, as the best thing for all parties, that a marriage should be arranged between the young people now opposed to one another. A great deal of sounding goes on on both sides. The young Earl's friends recoil at first, not believing in the girl's rights, and having heard rumours (rife in Keswick, though unheard by the Countess) that she was in love with the tailor. Sir William, who has heard the rumours also, and backs the Earl against him, replies, "I am told that she is very lovely, and that pains have been taken with her education," and he carries his point so far that the young Earl consents to call on the Countess and her daughter. On her part Lady Lovel is more than willing for such a compromise. She has a preliminary meeting at the attorney's chambers with the young man, and then amounces the proposal to her daughter, who can only say "It is impossible." Still the mother only takes this for maiden reluctance and her natural objection to be merely woosed for her money; and the young Earl calls, and conducts himself very pleasantly, claiming the young lady as his undoubted cousin, and impressing her with the charm of his appearance and manner. After this it is arranged that she shall pay a visit to the Earl's uncle, a Yorkshire rector, who is nest reluctant to receive such a visitor, but persuaded into it by the hours of the estate. She has time to get acquainted and to

win favour with the family before the Earl arrives upon the scene. In manner, diction, and all the etceteres of young ladyhood she takes equal rank with all Mr. Trollope's heroines. It is intended that the young Earl should find interest and inclination agreed. He really likes her, and she seems to like him. If it were not that we know Mr. Trollope of old, it would seem possible that she might find her liking for the tailor an illusion, but it's know there is no help for her.

The best part of the book is the young Earl's courtship, which stands, as far as words and manners go, in very favourable contrast with his rival's; and she likes it too. He really has every reason to think himself in the way of success; but when the actual proposal comes she starts to her feet and tells him she is engaged to Daniel Thwaite the tailor, though not without some shame and some regret.

And thus the terrible paper have her mother who hereses. And thus the terrible news bursts upon her mother, who, however, cannot at first believe her own powerlessness. Hitherto her daughter has seemed submissive and obedient; now, following blind instinct or higher duty—we are not told which—she transfers all submission and obedience to Daniel. The mother entransfers at submission and obelience to Painel. The mother entreats and storms, kneels and raves by turns, but as her fury grows so does her daughter's obstinacy. The more everybody argues the more she is resolved. At length, with a view to robbing the wretched mother of even the reader's sympathy, Mr. Trollope puts into her hands the inevitable pistol with which he cuts short so many complications. She shoots at Daniel, and lodges a ball in his shoulder. Such magnanimity as is shown in not delivering over to the police the mother of his future wife and the woman he has driven mad, he shows. The Countess is panic-struck and hors de combat through her own deed. Daniel gives Lady Anna to understand that her mother has wounded him, and she walks off straightway to his lodgings to nurse him, for by this time the Countess, restored to fortune, has removed from the roof which Countess, restored to fortune, has removed from the roof which once covered them both. An arrangement is made of the property, by which a fair share is allowed to the Earl, who is assured by his lawyers that it is fit and fair that he should take it. The Countess has already repaid Daniel principal and interest of the mones borrowed from his father; he has thrown up work, and, as far as nine thousand pounds and an idle life can make him such, is a gentleman. The Earl considers himself bound in values for Tale man. The Farl considers himself bound, in return for Anna's liberality towards himself in money matters, to be civil to Anna's necreatry towards numbell in money matters, to be civil to his rival, and asks him to call upon him to receive the renunciation of the lady's hand; and moreover persuades his reluctant uncle to allow the marriage to take place from his house, and to give the bride away. The Solicitor-General expects that Daniel will some day get into l'arliament; awkward particulars will soon be forgotten; and the world will call it a happy marriage. Young ladies are found glad to be bridesmaids; "things arrange themselves"; the only one who stands out in the unwascouble mother selves"; the only one who stands out is the unreasonable mother, who refuses the sanction of her presence. This does not, however, much affect the bride, who is seronely happy in her choice. The poor Countess asks the Earl who ought to have been her son-in-law to rent to her the gloomy mansion where the miseries of her life began. Lady Anna and her husband go off to Australia, and so we take leave of them; but not a final leave, for the concluding words contain a promise which possibly throws some light on the purpose of the present volumes:—" Of the further doings of Mr. Daniel Thwaite and his wife, Lady Anna-of how they travelled and saw many things; and how he became perhaps a wiser man—the present writer may, he hopes, live to tell." Through their means then we are to learn more than Mr. Trollope's published observa-tions have hitherto told us of social life at the Antipodes.

ARNOLD ON PRUSSIAN ECCLESIASTICAL LEGISLATION.*

In republishing the German part of his Schools and Universities on the Continent Mr. Matthew Arnold has taken occasion to compare the Prussian ecclesiastical legislation, so far as it bears on the relation between religion and the higher education, with the attempts at legislating on the same subject which have from time to time been made in Ireland. We entirely agree with Mr. Arnold that Englishmen, more perhaps than almost any other civilized nation, need the criticism of "a disinterested literary class—a class of non-political writers, having no organized and embodied set of supporters to please, simply setting themselves to observe and report faithfully, and looking for favour to those isolated persons only scattered through all the communities whom such an attempt may interest." The reason why Englishmen need this so especially is that the statesmen by whom their laws are for the most part made are not really free to act. The measures they introduce are not those which they think the best; they are those which they think good enough to be worth passing, and not too good to have a fair chance of passing. In order to slip into a Bill as much of what they think right and expedient as they can, they have to coax and humour the prejudices of their followers as regards matters which they have designedly left out of it. For a similar reason Englishmen rarely hear the truth about the practice of foreign nations upon points on which it is opposed to their own, politicians and newspapers always trying to exhibit this practice "by a side which may make their own followers feel proud and comfortable rather than humiliated and uneasy." Mr. Arnold finds examples of this temper in Exeter Hall and in the Times. The one praises Prince Bismarck because, "like England at its best moments, he sternly restrains Romanism." The other congratulates its fellow-country-

^{*} Higher Schools and Universities in Germany. By Matthew Arnold, D.C.L. London: Macmillan & Co. 1874.

en that they are strong enough to leave Ultramontanes to the contact of free discussion, instead of being compelled, like Prince Bismarck, to have recourse to measures of repression. Even the journals which are most opposed to Prince Bismarck over-praise England by implication, because they argue as though parallel legislation in England would consist in compelling Roman Catho-lic priests to take degrees at Oxford or Cambridge, thereby implying that Prince Bismarck has been guilty of an act of tyranny which, in his own country, every Englishman would repudiate. According to Mr. Arnold, the real difference between Prince Bismarck's policy towards the Prussian Roman Catholics and the policy of successive English Governments towards Irish Roman Catholics is this, that Prussia, before compelling Roman Catholic candidates for orders to attend Universities, gave them Roman Catholic Universities to go to, while England, though leaving Roman Catholic candidates for orders free to attend Universities. versities or not, steadily refuses to give them Roman Catholic Universities to go to. Herein he thinks Prince Biamarck shows himself a statesman, while English Governments show themselves the slaves of a current and irrational prejudice. The one values culture, and insists that men who are to exercise important public functions shall have undergone the discipline which ordinarily brings culture. The other despises culture, and does not care whether men who are to exercise important public functions have it or go without it. The one interferes with the freedom of the Roman Catholic clergy, but only so far as to ensure that their teaching shall be the best and most intelligent which their Church can supply; the other refuses to Roman Catholic clergy the means of making their teaching intelligent even up to the level allowed by their Church. "Prince Bismark's principle is, that a man who exercises an important public function in dealing with men's minds should exercise it with the light, help, and discipline of the best culture which the nation has to give."
The principle of the ligglish Government is, "that for the future we must not in Ireland endow religion in any way whatever."
The success of the two policies will depend in the long run on the

comparative truth and worth of these two principles.

The first inquiry which suggests itself is whether Mr. Arnold's account of Prince Bismarck's principle fairly represents it. As against the would-be complimentary nonsense often talked in this country about the Prussian ecclesiastical legislation, it certainly does. The popular English identification of Prince Bismarck's policy with the policy of Henry VIII, and Elizabeth would be comic if it were not discreditable. For a generation and a half English Liberals have been accustomed to boast that we have got zid of the last shreds of Tudor legislation, but they seem to think that to get into our cast-off clothes is a real advance for Prussia. What a blessing it would be if an English journalist would think for a moment what sort of opinion (fermans are likely to form of a nation whose public writers gravely congratulate them that they are not more than three centuries behind England! But as against reasonable criticism of Prince Bismarck's policy Mr. Arnold's position is not quite so unassailable:—

To interpose [he says] somewhere between the private seminary and the public cure of souls the studies and examinations of the University.

In reasonable. It is true the Roman Catholics have the right to certain guarantees in the matter. They have a right to demand that the University shall not be made an engine of Protestant or of anti-religious propagandism, that the seminarist shall not be put in the hands of the enemies of his faith, that his University therefore shall be a Roman Catholic University, and his professors for theology, philosophy, and history Roman Catholics. This being guaranteed, I think the State may reasonably impose University studies as a preliminary to orders, and that it may fairly hope to obtain, with time, the approbation of its Roman Catholic members themselves to its doing so. The reasonable ones will be brought to approve first, but the mass will come in time.

It is true that the law of the 11th of May, 1873, requires that every priest appointed to an ecclesiastical function shall have passed the final examination at the end of a gymnasium course, have gone through a three years' course of divinity at a German State University possessing a Catholic theological faculty, and at the close of this latter course have passed an examination in general throughed a confidence of the course of the latter course have purely and the confidence of the latter course have purely and the confidence of the latter o knowledge conducted by State Commissioners. But in the dioceses where there is no University answering to this description a course of study at the diocesan seminary, provided it he approved by the Minister of Public Worship, is accepted as a substitute. In Prussia, Breslau and Boun are the only Universities which possess a Catholic faculty of theology, so that, except in those dioceses, the studies of a University are not interposed between the private seminary and the public cure of souls. On the contrary, the training of the private seminary is accepted as suffibetween the private seminary and the public cure of scale. On an contrary, the training of the private seminary is accepted as sufficient over the larger part of the kingdom. And since the studies at those seminaries cannot by any action of the Government be premaueutly raised to the University level, Prince Bismarch's scheme deserves less credit for enlightenment and love of culture than the Arnold is disposed to accord to it. Even where the priest Mr. Arnold is disposed to accord to it. Even where the priest does go to a University, he is only bound to attend the theological lectures, so that the amount of general culture which he acquires need not be very much more than qualifies for matriculation at the University of London.

University of London.

If University studies were really interposed between the private seminary and the public cure of souls, the tenderness to the reasonable requirements of Roman Catholics which Mr. Arnold attributes to Prince Biamarck would still exist only in theory. Probably if the condition with the Ultramontanes had been fought hadone the Vatican Council, or if the Vatican decrees had been minumally accepted by Roman Catholics, such praise would have been more than just. Prince Biamarck has certain ands in

view, and so far as tenderness to the reasonable or ever the reasonable requirements of Roman Catholics is consistent with the attainment of these ends he is perfectly willing to show it. Het one of these ends happens to be the extension of a certain amount of of these ends happene to be the extension of a certain amount of protection to that section of Roman Catholics which rejects the Vatican decrees, and this section is strongly represented in the professorial class. In theory, therefore, Prince Biamarek concades that the seminarist must not be put into the hands of the enemies of his faith; that his University shall be a Roman Satholic University; and his professors for theology, philosophy, and history Roman Catholics. But the Old Catholice claim to be Roman Catholics equally with, or even more strictly than, the Flussian Covernment is not prepared to reject this pretension, excommunicated professors are allowed to reject this pretension, excommunicated professors are allowed to retain their chairs both at Boun and at Breslau. The ecclesito retain their chairs both at Boun and at Breslau. The ecclesiastical authorities may therefore plead that their seminarists, in spite of Prince Bismarck's protestations, are put into the hands of the enemies of their faith. In this way the Pressian Government is placed in a dilemma. To admit the plea is to admit by implication that the ecclesiastical authorities have a right to depose and excommunicate Old Catholic professors. To reject it is to insist upon the ecclesiastical authorities recognising as Roman Catholics men whom they consider as much enemies of their faith as Protestants themselves. If Ultramontane or Vaticantheir faith as Protestants themselves. If Ultramontane or Vaticanist were substituted for Roman Catholic as the description of the University to be interposed between the private seminary and the public cure of souls, Mr. Arnold would probably be right in his view that the State may fairly hope to obtain, with time, the approbation of its Roman Catholic members in making University studies a preliminary to orders. As it is, the case is different. If Mr. Gladstone, having the right of appointing Catholic professors in Mr. Gladstone, having the right of appointing Catholic Professors in a Catholic University, had refused to dismiss a professor who had conformed to the Church of England, on the ground that, the Church of England being a branch of the Catholic Church, tha professor in question had not ceased to be a Catholic, a good deal would have been said about his incurable love of casuistry, and much ingenuity would have been displayed in tracing it to the ecclesiastical influences under which he was brought up. What would be casuistry in Mr. Gladstone is in Prince Bismarck only a robust indifference to moral subtleties. No one imagines that his conscience can ever act except in harmony with the best secular lights of the time.

It is not necessary to go very far in Mr. Arnold's preface to dis cover that Prince Bismarck is chiefly dear to him as a new stick with which to beat his old enemies, the Dissenters. The principle that the State should have nothing to do with religion depends, he says, on further propositions advanced respectively by Secularists and Nonconformists. The Secularist wants to sever all connexion of the State with religion, because "religion as it exists is merely another page for characteristics." another name for obscurantism and superstition." conformist wants the State to have nothing to do with religion, because he holds all religious except his own to be false, and any complicity on his part with the endowment of them to be wicked. Mr. Arnold's answer to the Secularists will not meet with much criticism in this country, for here Secularists in the Continental sense of the term are but a small minority. It is a mistake, he says, to treat religion as a disease which will die out if it be not fostered. It is a natural human need which will satisfy itself, and the more it is dissociated from the public life of a country the stronger what is faulty and mischievous in it tends to become. His answer to the Dissenters embodies a conclusion the recognition of which would have gone far to save the Liberal party from

its recent disaster :-

After all one must sak, where the public action is concerned in what a man's conscience commands or forbids, whether the conscience commands or forbids reuseably. . . . To profess an opinion or adopt a practice for eneself can reasonably be said to engage one's conscience; to pay a tax laid by the majority for an institution which the opinion or practice of the majority leads them to adopt can engage the conscience only if what is instituted is plainly flagitious. Violent men easily allege, no doubt, that all opinion or practice at variance with their own is flagitious and pernicious. But here the public at large is the judge, and more and more assumes the right of judging, whether this right is sustainable.

As regards the objection of Dissenters to pay a school rate hich may indirectly support the Church of England, we agree with Mr. Arnold that the public are more and more coming to perceive that it "is not reasonable": and that "the proper answer to perceive that it "is not reasonable": and that "the proper answer to it, instead of turning up one's eyes and saying 'How very grievous!' is 'Then you ought not to feel your conscience violated by it.'" The reason of this is that the great majority of the people of England do not believe the Church of England to be 'plainly flagitious," and that the majority even of the Dissenters do not believe it either. But as regards the Roman Catholic Church we do not feel so sure. The ordinary English Protestant must be greatly enlightened and humanized before he will believe with Mr. Arnold that Roman Catholicism is, "like Protestantism itself, an essay in religion, an approximation." So long as he regards it as a "heathenish superstition," University education in Irakand will a "heathenish superstition," University education in Ireland will continue a difficulty for English statesmen. One section of politicians resents the doctrine that Ireland must be governed accordance with Irish ideas; snother and larger section insists on so narrowing Imperial ideas as to make them purely and exclusively English. Between these two first what one a Government do but sit still and hold up Mr. Arnold's hands while he serves to make Dissenters national instead of sectarion.

KINGSLEY ON HEALTH AND EDUCATION.

EXECUTE and Education is the title given by Canon Kingaley to a collection of articles and popular lectures taking a rather wider range of subjects than is implied in the name. Some of the chapters, at least, can hardly be described as directly educational or sanitary without using those words in a rather loose sense. But one must not look at titles too closely; and we may admit that the book has a certain unity dependent rather upon the affrit than upon the substance. Mr. Kingaley's teaching differs in certain points from that of former times; he has become perhaps a little tamer than he was in his earlier moods, and is disposed to take a rather more cheerful view of things in general. Whether he has lost in force what he has gained in discretion is a question which we need not discuss. Amidst various changes we have no difficulty in recognizing the same tendencies. The arch leader of the sect of Muscular Christians has allowed some of his characteristic tenets to drop a little into the shade. some of his characteristic teneta to drop a little into the shade. There is, indeed, a time of life, from which we fear that Mr. Kingsley cannot be far removed, at which the merits of violent bodily exercise become rather less palpable than of old. Few men can be undergraduates in spirit for more than twenty years or so, and a man who has fairly taken his degree in mind as well as in the flesh recognizes the fact that, even for sanitary purposes, all the lessons of life are not summed up in the code of athletic training. Mr. Kingsley, however, has rather widened his teaching than abandoned its principles. If his disciples learnt in former days the vital importance of rowing, running, hunting, and flahing, they are now invited to study in a more scientific spirit the ome of his characteristic tenets to drop a little into the shade. they are now invited to study in a more scientific spirit the general conditions of physical health. The habit of taking exercise, it need hardly be said, is only one of those conditions, and there are others more important in themselves and much more deserving the attention of the great bulk of the population. It is difficult indeed to overrate the importance of sound teaching upon such points. Political economists may preach to us of the "inexorable laws of supply and demand," and enforce the Malthusian doctrine of population. Politicians may settle the best forms of constitutions of the population. tion and show how to regenerate mankind by the help of ballotboxes. Nay, theologians may confute heretics and extirpate infidelity. All the lessons inculcated by such reformers may be very good in their way; and if our teachers were a little better agreed amongst themselves, they might doubtless succeed in doing us a great deal of good. But it implies no disrespect if we add that all their teaching is pretty sure to be thrown away if it is bestowed upon a physically degenerating race. People will not grow wiserand betterifthey are becoming more sickly, nervous, and stunted. Vigorous vitality is a more important condition of the success of a race in the great struggle for existence than even the most admirable assortment of theoretical principles. The Tocquevilles and other political observers are very apt to overlook this tolerably obvious fact. They are so absorbed in indicate fact. They are so absorbed in judicious speculations upon the effect of enlarging the suffrage that they forget to inquire whether men's chests are increasing in girth and their digection acting more healthily. And yet the last line of inquiry may surely be the most important. It has been said, for example, that the native Americans have worse constitutions than their forefathers; and that they are even dying out, instead of multiplying, like the early colonists. If so they are noting a very heavy price for the bleasings colonists. If so, they are paying a very heavy price for the blessings of a Republican Constitution. Nor can we afford to look on with of a Republican Constitution. Nor can we afford to look on with indifference. Englishmen are being daily congregated more closely into towns; and many observers have told us, and have supported their statements by formidable statistics, that the town population is lamentably inferior in stamina to the beef-cating Briton of

Mr. Kingsley dilates upon such topics with great emphasis, and they well deserve all the emphasis which he can give them. He does not share the gloomy views of Mr. Ruskin, who seems to think does not share the gloomy views of Mr. Ruskin, who seems to think that our manufactories and coal-mines, and other abominations, are taking us straight to perdition. Mr. Kingsley rather holds that, on the whole, though with many drawbacks, we are really an improvement upon our forefathers. But the drawbacks are decidedly heavy. He tells us, for example, in a paper called "Nausicaa in London," how he took a walk through the streets after visiting the marbles of the Pritish Museum. Admiring the marvellous perfections of the decided (freely have a hard that the control of the latter. fection of the old Greek type, he seems to have become for the moment a muscular Pagun rather than a muscular Christian. And it must be granted that the drop from the ideal beauty of an ancient statue to the concrete upliness of modern Londoners is a rather severe one. Here and there he might meet one of the healthy English girls whose slightly exuberant beauty excites the ridicule and the envy of Parisians. But these girls, he thinks, were country-bred; and it was painful to eyes accustomed to stalwart peasant women "to remark the exceedingly small size of the sverage young woman." There was a want of the large frames which can support healthy brains as well as large muscles. Then he was a stall and third health and the stall are the stall as the stall and the stall are stall as the stall as groaned, as he well might groan, over high heels, and chignons, and tight stays, and compared the victims of those atrocities to the passing gipsy with stately elastic step and swinging hip. And he goes on to meditate upon the effects of drinking too much tea and goes on to menuate upon the energy of drinking too much tea and reading too many flimay novels, and general craving for false excitement and unhealthy stimulants; and asks, not very hopefully, whether our young women brought up in such fash drilled into their under the name of higher education. He takes some com-

fort from the fact that the Ladies' College near Cambridge has sait up a swimming-bath; but we fear that girls in all classes have still very few opportunities of receiving a physical education suited to their annual content of the to their sex.

Mr. Kingsley, however, would certainly agree that, even if yo ladies could be taught football, cricket, and boxing as well as swimming, there would still remain much to be done. The question, in fact, is most urgent for the classes to whom such mod development are not very easily attainable. Mr. Kingday therefore insists, amongst other suggestions, upon the propriety of erecting a "school of health" in every great town. There ought to be lectures, he tells us, about tissues, respiration, digration, absorption, secretion, and the structure of the nervous system. There should, moreover; be lectures on the mode in which discuse is generated and diffused; on the advantages of pure air, water, good drainage, and ventilation. To one obvious objection he replies that we ought to have female lecturers upon all these subjects. That, however, is a matter of detail. No-body, we presume, would deny that the population night be body, we presume, and if manufactured the course or arditions of much better off if people understood the general conditions of health in any tolerable degree, and were propared to act upon their knowledge. This last clause, we feat, suggests a considerable difficulty. After all, we may doubt whother the existence of lecture on physiology in every town and village in the kingdom would necessarily make much difference to the general health. Talk about tissues and secretions may be amusing as long as it is novel; but it goes but a very little way to encourage cleanliness and sobriety. There are some laws of health which are so obvious that even the dullest are acquainted with them; but the lesson, however impressive, seems to produce the smallest possible effect. There is not a ragged good-for-nothing lounging about in London gin-palaces who does not know perfectly well that drunkenness is a bad thing for his health, and that gin in large does is simply a above poison. If all the physiologists in England were to exhibit the pathology of intoxication in the most striking colours, it would not make his conviction clearer, and therefore, it may be presumed, it would not prevent him from taking a single glass of gin. It may be very pleasant to hear a philosopher proving in a lecture-room that breathing pure air is a matter of some importance to room that breathing pure air is a matter of some importance to the human frame; but he will hardly induce a miserable hearer to screw out another penny a night that he may occupy a better room in a lodging-house. The arguments of misery said vice are so terribly strong that it is to be feared that scientific lecturing will prove but a feather in the balance. Unhealthy practices are undoubtedly fostered by ignorance; but it is ignorance of a kind which can hardly be removed by this charmingly easy remedy. We have to make men prudent, temperate, cleanly, and that, we fear, will be rather a long business. We do not indeed suppose that Mr. Kingsley would differ from us upon this point. He has been a professor and a preacher, and can estimate the efficacy of sermon and lectures. In another way, it is true, a spread of some knowledge of physiology may be useful; and upon this Mr. Kingsley has much to say. Legislators may be impressed if the people are sluggish, and to improve the conditions under which our poorer neighbours live is to give them a greater chance of moral, as well neighbours live is to give them a greater chance of moral, as well as sanitary, reformation. The importance of securing good water and good air is coming to be better understood, and we have been told that an ora of sanitary legislation is about to open. If so, Mr. Kingsley will have much to say that is worth hearing as to legitimate ends and means.

We have not, however, space to follow him, and will only add that perhaps the most interesting part of this volume for other than sanitary reformers is the conclusion. These interesting chapters are devoted to the lives of George Buchanan, Rondelet, the French naturalist, and Vesalin, the anatomist. They are lively accounts of remarkable men.

HONE'S CALENDARS.

IN the later half of the nineteenth century the enormous multi-plication of books has tended to dull the gratitude which was felt towards such collectors and compilers as Hone in the first half of it. Modern readers dipping into the portly and solid volumes which Mr. Tegg has put forth anew continually find that a reference to an obsolete custom, a quaint epigram, or an old character, is mot by some elder of the age of the century with the remark that it is an old story—"You might have found it in Hone." There can be no doubt that Hone's calendars of sports, customs, pastimes, manuers, and ceremonies made a deep impression on his contempomanners, and ceremonics made a deep impression on his contemporaries, whose general reading was extremely limited. In our own days, however, they have till now been little more than a name, except to a few persons in bood with old traditions, or shrewd enough to know the profit of digiting in such a quarry. Although there is to some extent a difference in aim and purpose, it is impossible not to detect a kindred form and fashion in our modern Notes and Queries, and more especially in the mouthly publication entitled Long Aye, now in the second year of its existence. There is, however, a still closer second year of its existence. There is, however, a still closer resemblance between Hone's books and the two volumes of the Book of Days compiled and published by the brothers Chambers. There must be some secret of perennial attraction in a kind of work which has such a tendency to repeat itself successfully; and

Health and Education. By the Rev. Charles Kingsley. London:

^{*} The Everyday Book, the Table Book, and the Year Book of Daily Respection and Information. By W. Hone. New Edition. 4 vols. Landon: William Tegg. 1873.

the recent republication of the original models will at least afford an opportunity of discovering this secret, if it does not, as is possible, instal the resuscitated Hones in a more honourable place

sible, instal the resuscitated Hones in a more honourable place among books of reference in our libraries.

Perhaps in his own day the daring publisher, who was prosecuted by the Government for his irreverent and profane parodies, may have set more store on the political works which opened the way to martyrdom for his opinions than on the pleasant and instructive contributions to literature which Mr. Tegg has republished. The parodies, however, are forgotten except by the few who collect samples of a type of literature which never ranked particularly high, while the calendars, which in their time were praised by Southey as doing "good service in an important department," and not less handsomely commended by Charles Lamb, appear to be entering on a new lease of popularity. According to Hone's stateentering on a new lease of popularity. According to Hone's statement the Everyday Book was begun on New Year's Day in 1825, and finished in the last week of 1826. The Table Book followed quickly, and was designed, according to its projector, to furnish a volume of agreeable reading which should always be out of the bookcase, always so welcome and in request that it might, "if the good old window-seats had not gone out of fashion, be called a parlour-window book." In keeping with this programme, it contains more stories and poetry than its predecessor, although still preserving the calendar arrangement, and moulding itself to the convenience of our national feasts and holidays. Table Book seems to have been finished at the close of 1828; and the Year Book, which was the last of the series, like its fellows and yet with a difference, was published in 1832, a year or two before William Hone and his family became members of a Christian congregation, and abjured the irreligion with which his tastes and sympathies seem so ill-assorted. These dates will of course suggest the old-fashioned flavour of the volumes. We catch glimpses in the Year Hook of a pro-Victorian England, when the waybill of the Norwich coaches in January was a most satisfactory and trustworthy bill of fare of the season with regard to poultry and game; when philanthropy was so little out of its infancy that, apropos of Sir John Hawkine's traffic in negro slaves in 1563, the editor informs his readers that "vigorous efforts are in progress to redeem our country from the nation-sinking sin of a trade in human beings"; and when toll-houses, now either defunct or else cheap and mean to a degree, were thought worthy, as that at Stanmore, engraved in p. 86 of the Table Book, of a frontage ornamented by Grecian pillars, and a superincumbent cupola, illuminated in dark nights as a guiding star to drivers. It is possible that herein may consist for many the attraction of those volumes, which, indeed, up to the time of their publication, would form a trustworthy authority as to manners, customs, and national as well as local features.

Hat it is heart to say in what kind of information within their the Year Book, which was the last of the series, like its fellows well as local features.

But it is hard to say in what kind of information within their scope and range these volumes are deficient. We tested the merits scope and range these volumes are deficient. We tested the merits and the fulness of information of the Everyday Book not very long ago, in connexion with a recent Handbook of Weather Folk-Lore. But in a hundred other paths of observation and curiosity, help, illustration, and corroboration may be gathered from the calendars before us. To take one or two comprehensive subjects of more or less interest, what do they yield us on such topics as dendrology and centenarianism? Mr. Hone's pedestrian topographers seem to have had a commission to report fully any phenomena in tree-crowth presenting themselves in their rambles, and to have done growth presenting themselves in their rambles, and to have done their duty con amore. In the Year-Book we find an engraving and full particulars of the old oak growing in the ruined wall of the ancient Abbey of Boxley, near the town of Maidstone (pp. 120-1); a record of the very ancient yew-tree, said to have been planted in the time of William the Conqueror, and to have seen the rise a record of the very ancient yew-tree, said to have been planted in the time of William the Conqueror, and to have seen the rise and fall of three successive churches beside it at Windlesham, in Surrey (p. 369). It is not, of course, anything more, to judge by the engraving, than the literal "body of a dismal yew," but, as such, its girth is twelve feet at a yard from the ground. Two ancient fig-trees, said to have been planted in Lambeth Palace gardens by Cardinal Pole in 1558, or thereabouts, find full commonoration in pp. 459-60; and if these gardens have not since Hone's day suffered from the London smoke to any very serious extent, there should still be seen there, besides the ancient fig-trees, of the white-fig kind, remarkable specimens of the occidental plane, the Carolina sumach, the three-thorned acacia, and the Catalpa syringsofolia. The engraving and description (at pp. 216-7, Year Book) of the curious twin trunks of an alder growing near Loose in Kent, which, springing from the same root, have either by fissure or accident taken independent growth, and seemingly coalesced again at a certain point of contact, may be compared with a young ash-tree (p. 647) on Shirley Heath in the parish of Solihull, near Birmingham, through a fissure in which a boy named Thomas Rowe had been drawn as the custom was, to cure him of rickets. In the Beryday Book will be found ample data to illustrate the engraving of the Blasted Oak at Nannau, near Dolgelly, and some interesting particulars about the oak planted by Sir Philip Sidney at Penshurst, commemorated by Ben Jonson, and felled by a mistake of a blundering woodman, according to the author of Silvan Sketches, since the time of Martyn, the translator of the Georgics.

Whether the cases of centenarianism adduced by Hone would lator of the Georgics.

Whether the cases of centenarianism adduced by Hone would stand the scrutiny and testing of Mr. Thoms we are not prepared to say, and would rather leave the onus of proof or disproof with that experienced doubter. One case that of Robert Howman of Inthington, near Carliale, alleged to have been haptized at Hayton in 1705, and to have died in 1823, at the age of 118 (see Few

Book, p. 362), gave rise to a controversy between Mr. Thoms and Canon Harcourt of Carlisle. This is one of those cases where, rather Canon Harcourt of Carlisle. This is one of those cases where, rather than accept the ultra-centenarianism involved in any age above one hundred and six years at the utmost, the former with reason doubts the identity of the person whose birth is attested in the haptismal certificate with the person of the same name who died in 1823; and, as might be expected, the dispute is still subjudies, as it is likely to be until a keep nearch in the registers of Northumberland, where Rowman spect his casely were and as Mr. Thoma arones. where Bowman spent his early years, and, as Mr. Thoms argues, may have been baptized, shall result in the discover of a Robert Bowman whose years at his death were not so patriarchal. Other examples adduced by Hone are Phone Hessell, said to have died at 100 years of age, and Cardinal de Salis, who lived till 110. The latter, as a noble and an ecclesiastic of rank, belonged to a class in which duration of life is usually greater than in any other, the former to a sex which even doubters admit to number most authenticated instances of ultra-centenarianism. Phoebe Hessell Table Hook (p. 521) is cited a case of a Highlander who lived to the age of 107 years with every faculty unimpaired; and in the Everyday Book we meet, as we should expect, the more dubious case of Henry Jenkins.

But it is not only on these larger questions that Hone's books exhibit a research and observation in advance of their age; there is hardly a custom or superstition one can name that is not examined, illustrated, and traced to its likeliest origin. The ring-linger, the fourth of the woman's left hand, is surmised to have been chosen because used less than the others, and mised to have been chosen because used less than the others, and therefore less likely to expose the ring to bruising; a more plausible reason than the crotchet of a connecting artery between the finger and the heart, which one Levinus Lemnius, a physician, so fully believed, that he fancied he could recover his lady patients from a swoon by pinching the fourth-finger's joint and rubbing the ring with a little saftron. The belief, discredited by Sir T. Browne, about the tenth wave and the tenth egg exceeding the nine before them in size, is examined and qualified by the light of experience (Fan Book, p. 222). The custom of by the light of experience (Year Book, p. 222). The custom of nailing up a horse-shoe to keep off witches and evil spirits, which has been very recently discussed in Notes and Queries, and shown to be not unknown even to episcopal palaces, is anticipated in p. 447 of the same volume of Hone. Indeed there is scarcely an odd or obsolescent usage in regard to which Hone has not been before us with curious observation. The divination by Hible before us with curious observation. The divination by Bible and Key, which crops up just now in an amusing story in the Corshill, is described in the Year Book. The superstition of the "sin-eater," a poor half-starved wretch, bribed by a dole of bread, beer, and a sixpence, to attend at a funeral, and by accepting such a tender to take upon him the sins of the defunct, is noticed in the a tender to take upon him the sins of the defunct, is noticed in the same volume, and referred to certain counties in North and South Wales, where we have reason to believe it still lingers. In the Table Book an anecdotic article, headed "the right Lord Lovat," curiously supports a claim well known and believed in the neighbourhood of Mona and Parys mines, near Andwch in Anglesea, of the lineal descendant of Simon Lovat, sole brother and next of kin to the rebel lord, who was attainted and executed, to the title, benous, and estates of the Lovats, which were created by the kin to the rebel lord, who was attainted and executed, to the title, honours, and estates of the Lovats, which were granted by the Crown to a collateral branch. The claimant is a miner of intelligence, and, like his father and grandfather, enjoys the prestige of a traditional claim amongst his fellow-miners. In the Year Book by anticipation is propounded, at p. 244, the right of any man to change his surname at pleasure, and without the royal licence or an Act of Parliament. During the last ten years or so, custom has affirmed this right, and the fees of the Herald's College have, we suspect, been sensibly diminished. In time, perhaps, the sceptic will doubt whether it was ever otherwise, unless he happens to discover in his archives a document with the Sovereign's sign manual, or a receipt from the Herald's College.

Of a once imposing ceremonial, the cavalcade of javelin-men and

Of a once imposing ceremonial, the cavalcade of javelin-men and trumpeters with which the high-sheriff met the judges of trumpeters with which the high-sheriff met the judges of assize, all that now remains is the bannered trumpets. It was not so when Hono extracted from Anbrey the explanation (see Table Book, 197) "that upon occasions of bustling in old days great lords sounded their trumpets, and summoned those that held under them. Old Sir Walter Long of Draycott kept a trumpeter, and rode with thirty servants and retainers. Hence the sheriff's trumpets at this day." There is a curious article in the Table Book on Hound Starte for public (m. 241-2). in the Table Book on Hour-Glasses for pulpits (pp. 241-3). These were in use formerly at Abingdon, Dunstable, Bibury, and elsewhere; and the story is told that at the last-named place the squire was wont to withdraw after the vicar's text was given out, smoke his pipe at his leisure, and eventually return to get a share of the blessing. This is partly accounted for when we learn that the vicar's custom was to turn the hour-glass twice in the delivery of his discourse. Space fails us for more than a bare mention of the specimens of the "Garrick Plays" and other contributions of Charles Lamb to the Table Book.

JOHNNY LUDLOW.

A FTER the prolonged story of the ordinary novel in three volumes, where the interest of the reader, when once roused, is kept in a state of excitement for nearly thrice three hundred pages, it is an agreeable change to come upon a book like Johnny Laudon,

in which there are given more than a score of stories, each with its own plot, yet all strung together in a certain connexion. We have often thought, as we have been hurried along in an express train that stops only once in every eighty miles or so, that after all we were less fatigued when the journey by frequent stoppages used to be broken up into smaller fragments. Both in reading and in travelling there comes a certain strain upon the mind when it is kept in a state of prolonged restlessness. So little indeed can some people bear the suspense in which those novelists in whom they delight so artfully involve them, that as soon as they come to the mystery in the first volume they at once solve it by turning to the mystery in the first volume they at once solve it by turning to the last chapter of the third volume. It would seem a pity, however, last chapter of the third volume. It would seem a pity, however, that the novelist should have been at such infinite pains to construct his plot and arrange his mystery if the reader is at once by a hop, skip, and a jump to arrive at the solution. For such readers as these a book written on the plan of Johnny Ludlow is very well fitted, where the interest that is aroused is considerable, and the suspense is brief. It has this advantage too over a mere collection of short stories, that, though the point of interest constantly varies in every one of the tales—so much indeed that each has a plot of its own—vet there is not an equal variety of characters. A certain own—yet there is not an equal variety of characters. A certain set of characters is found in every story, so that the reader feels as he enters upon a fresh plot that he knows at all events a good many of the people who are introduced. He is not overwhelmed, therefore, by the feeling that before he can derive any pleasure from his reading he must first make the effort of fixing in his mind the names, the characteristics, and the mutual connexions of some dozen persons. Whatever fresh people are brought in in every story, he is pleasantly and conveniently introduced to them by characters with whom he is already familiar. He thus quite easily falls into each tale, and is not taken aback like a shy man who, when invited to dinner, on entering the drawing-room finds it full of strangers. The stories are told by Johnny Ludlaw himwho, when invited to dinner, on entering the drawing-room finds it full of strangers. The stories are told by Johnny Ludlow himself, who, though not the hero of any one story, yet fills a considerable part in most of them. As the author calls himself Johnny, we must assume that the book is written by a man, though we should not be surprised to learn—to use the language of the countryman whose girl was accidentally christened Thomas—that "He's a her," after all.

"He's a her," after all.

Of whatever sex the author may be, there is considerable merit in the stories. There is a certain freshness of description in the scenes of country life and country people which is an agreeable change after the ordinary sensational novel with its tawdriness of incident and language. The stories vary as might be expected, a goo'd deal in interest and power, and in the third volume unfortunately the author drags in the supernatural, greatly to the injury of the book. "The mind," as Johnson remarks in his Life of Savage, "which naturally loves truth, is always most offended with the violations of those truths of which we are most certain." Now of no truths is a sensible person more cartain than that in all the chance incidents of our everyday life warnings are not given of losses that are threatening us. Addison, in one of the best papers of the Spectator, points out the mischief that is done and the suffering that is caused by this idle belief, and says, "Were I a father, I should take a particular care to preserve my children from these little horrors and imaginations, which they are apt to contract when they are young, and are not which they are apt to contract when they are young, and are not able to shake off when they are in years." He goes on to urge us "to pull the old woman out of our hearts, and extinguish those impertinent notions which we imbibed at a time that we were not able to judge of their absurdity." It is many a year since Addison wrote, and many an age since Persius wrote before him; but as fast as we try to pull the old woman out, so fast do our writers try to push her back. Not many months ago it was our fortune to hear a silly fellow in the pulpit scare the children of his parish by saying that, though the sounds heard in a church-sardon a stormy night might be the wind yet who could tall that yard on a stormy night might be the wind, yet who could tell that they were not the howls of the souls of the damned? Our author they were not the howls of the souls of the damned? Our author then we hold greatly to blame in the story called "David Garth's Night-watch" for dragging in supernatural warnings and borrors. David's mother, in her widowhood, had married a bailiff named Hill, who shortly after their marriage proposed to move into a house "that had a lonely lock, and was lonely." When she had got a few articles in her arms, the first trifles they had begun to move, down she fell on going out of the door. "To me," she said, "it seems nothing but a warning that we ought not to move into Willow Cottage." In the Spectator, when the salt was spilt, it was only the pigeon-house that fell that same afternoon. But nowadays a higger accrifice is called for, and that very night poor David was to die. There were yet other signs, för his mother said that when first "I put my foot over the threshold to enter, a kind of tremor took me all over," while David talked that same day of tremor took me all over," while David talked that same day about angels and going to heaven, in such a way that the author has to state that he has "fear people might think I invented it." By the cruelty of his stepfather, David is made to pass the night all alone in the house, but here our author shall tell the story in

David was found dead. We shall be long in pulling the old woman out of our hearts if writers who have as much ability as the author of Johnny Ludlow are not ashamed to trade on superstitions beliefs and lears.

Most of the stories

stitions beliefs and fears.

Most of the atories happily are free from this sort of non-sense, and yet even by the reader who finds his sad pleasure in getting frightened out of his wits will be read with interest. Johnny Ludlow's character is very well drawn—the quiet, gentle lad who "was always reading people's faces, and taking likes and dislikes accordingly." No less well drawn is his fail-brother, Joseph Todhetley, or his stepfather, Squire Todhetley, with all the strong projudices and the kindliness of an English squire. One of the stories is of a poor overworked pointsman who, worn out with a long day's duty, and having a most wenderfully contrived set of points under his charge, caused a collision, and the death of three or four people. The railway directors, by the way, would not do ill if they were some summer's day to invite the novelists in a body to the inspection of a set of points, with a good luncheon to follow, to put them tion of a set of points, with a good luncheon to follow, to put them in good humour. Railway accidents are coming to play such an important part in the modern novel that it would be just as well if the writers understood a little how they are caused. No one was more indignant with the pointsman than Squire Todhetley, whose children had been in the train. He would hear of no excuse, and was eager to have the man punished to the full. The inquest was adjourned more than once, till at last the poor fellow, worn out with remorse and anxiety, was too ill to attend. He was committed to the county prison for manufacultier, but the Squire remarked to to the county prison for manslaughter, but the Squire remarked to the doctor, "I am not sure but it ought to have been returned Wilful Murder":-

"It might make no difference, one way or the other," answered Mr.

"It might make no difference, one way or the other," answered Mr. Cole.

"Make no difference! What d'ye mean? Murder and manslaughter are two opposite crimes, Cole, and punished accordingly. You see, Johnny, what your friend Lease has come to!"

"What I meant, Squire, was this: that I don't much think Lease will live to be tried at all."

"Not live!"

"I fancy not. Unless I am much mistaken, his life will have been claimed by its Giver long before March."

The Squire stopped and looked at Cole. "What's the matter with him? This inflammation—that you went and testified to?"

"That will be the cause of death, as returned to the registrar."

"Why, you speak just as if the man were dying now, Cole!"

"And I think he is. Lease has been very low in frame for a long while," added Mr. Cole; "half clad, and not a quarter fed. But it is not that, Squire: the heart and spirit are alike broken: and when this cold caught him, he had no stamina to withstand it; and so it has laid hold of a vital part."

"Do you mean to tell me to my face that he will die of it?" cried the Squire, holding on by the middle button of old Cole's great cont. "Non-sense, man! you must cure him. We—we did not want him to die, you

· Ilis life or his death, as it may be, are in the hands of One higher than

I, Squire."
"I think I'll go in and see him," said the Squire, meekly.

He finds poor Lease dying, and knowing that he is dying. "This won't do, you know, Lease," said the Squire. "We don't want you to die," and he was as ready to pour in port wine, beef-tea, jelly and blankets, as he had been ready to pour in abuse.

The first story in the book, called "Losing Lona," is one of the prettiest. Joseph and Johnny, to give trouble to the nurse, had hidden away their little sister Lena and hidden her only too well. For in the same hiding-place was a tramp who, when the boys were gone, carried her off and robbed her of her clothing. Joe, a boy of high spirit, full of remorse, sets off in pursuit of a poor fellow whom he suspects of being the kidnapper, and makes Johnny come with him. He catches up to the man and linds the ginsy tent in which he him. He catches up to the man and finds the gipsy tent in which he lived, but only to find that he is overwhelmed in deeper grief than they themselves. Their sister is soon recovered, but his little girl has that same day died of want and exposure. He it was indeed who rescued Lens and brought her back home, but unhappily, before the Squire could reward him as he wished, all traces of him for a time were When he was found again it was too late, as want had worn him out also. But the whole story is very prettily told, and should be read, not analysed.

The author falls into one or two errors when he (or she) writes about what is unfamiliar. What is "shunting" at football? and whatdoes the author mean when he says that "Herbert had passed shiningly in mods and divinity and all the rest of it"? If we might give a short hint to a young writer, we would advise him first of all only to describe those modes of life with which he is himself quite familiar, and in the next place, if he must at times venture beyond his own knowledge, never to make use of slang expressions. In the use of the word "mods" there is an affectation of familiarity with the University of Oxford which he the of tremor took me all over," while David talked that same day about angels and going to heaven, in such a way that the author has to state that he has "fearpeople might think I invented it." By the cruelty of his stepfathery David is made to pass the night all alone in the house, but here our author shall tell the story in his own words:—

But now, a singular thing happened that night. Mrs. Hill was in a sound alsep, when a load, agonized cry of "Mother" aroused har from it. She started up, wide awake instantly, and in terror so great that the persuitant began to pour off her face. In that moment the call was repeated again. The voice was David's voice; it had appeared to be in the recompliance. They she persuit has the persuitant here into every observe in vain. They also cause or other, had come home from Willow Brock, and ment morning of course.

Just then the clock struck twelve, and next morning of course of its name, will know that it would require a good pair of syes to of its name, will know that it would require a good pair of syes to of its name, will know that it would require a good pair of syes to of its name, will know that it would require a good pair of syes to

HINDUSTANI MADE EASY.

THIS work is another addition to the many which have been THIS work is another addition to the many which have been written with the object of facilitating and spreading a knowledge of the Hindustani language. It can hardly be said that the work was needed, nor is it likely that the book will do much towards imparting a sound knowledge of the language. For although it has been compiled with care and ability, the object it has in view is a very restricted one—that of "enabling the student to acquire, in as short a time and as easily as possible, a colloquial knowledge of the Hindustani tongue." A colloquial knowledge of a foreign language is certainly a useful accomplishment, and if the language be that of a savage unlettered race, no more can be desired. But, if the language has a literature, and is not only spoken but written and read, books of instruction ought to help the learner not only to speak but to rend and write it also. This book is printed in the Roman character, and although some provision has been made by an afterthought for imparting a knowvision has been made by an afterthought for imparting a know-ledge of the alphabet used by the natives of India, it is insufficient for the purpose. The book will certainly not enable a man to read or write the language, it is possible that it may enable him to make himself understood upon common subjects, but even this is

make himself understood upon common subjects, but even this is not so certain as it may appear.

This is not the place for saying anything for or against the adoption of the Roman alphabet by the people of India. It does not affect the question before us. The people who speak Hindustani use their ewn alphabet, and Englishmen who wish to make themselves useful and to obtain power among them must not be content with a mere "colloquial knowledge of the language," but must be hard a rest and on account the subject of the language, but must be able to read, and on occasion to write, the character which the natives themselves employ. The work is based upon the Ollendorff system, and consists of a succession of "lessons" upon particular words; but it does not adopt that tedious reiteration which the founder of that system deemed of especial utility. These lessons are followed by a "Concise Grammar," occupying just twenty pages, by a series of exercises for translation into the language, and these have been carefully and intelligently prepared; but as the book only helps a student to compose the exercises in a character unintelligible to the natives, the writing of them cannot prove of much benefit to him. For practical purposes the work can only be regarded as a good book of Dialogues, useful in its way, but insufficient for imparting sound knowledge. Short reads and golden ways for the acquisition of knowledge are among the characteristics of the present age; and the Hamiltonian system, the Ollendorffian system, and many others of less repute, have been devised for extenditing the acquisition of languages. Most of these have in them subject which meets the powers and requirements of different minds. subject which meets the powers and requirements of different minds. But the best of them are but helps, and very limited ones. The only means of acquiring a sound knowledge of a foreign language is a diligent study of good authors with the help of a good grammar; and if the language is written in a character of its own, the sooner that character is mastered the better for the learner; the greater will be his securacy, the more practical his knowledge. Our schools do not attempt to teach Greek in the Roman character, and surely their experience is not to be cast aside as worthless. If it be objected that the Greek character is easy to learn, it may be answered that comparative children have to acquire it, and that the acquisition of a more difficult character by young men in the prime of intellectual activity ought to be, and really is, an equally easy matter. For too much has been made of the supposed difficulty and intricacy of the native character. Its acquisition certainly requires some application; but when diligently attacked, it is soon mastered, and its difficulties, like difficulties in general, quickly vanish before resolution and perseverance.

Excellence in a foreign language is of two kinds. accomplishment of an accurate and extensive knowledge, and there is the accomplishment of a good promunciation, what in imitation of our neighbours over the Channel we now often and incorrectly hall "accont." There is nothing to prevent the acquisition of both these accomplishments; but if requently happens that an excellent scholar has a very indifferent pronunciation. This may be attributed to his having alligently studied books and learned the language printipally by the eye. Others who have no pretensions to learning frequently have an excellent pronunciation and good practical colloquial powers from having acquired their knowledge through the ear in intercourse with the people. The student carries to his books preconceived notions of the powers of leaters which it is difficult for him to make the while the other terms at the wond of complete synds without made to the leaters of the powers of leaters which it is difficult for him to make the wind to the leaters of the powers of leaters which it is difficult for him to make the while the difficult for him to make the state of the position. ecomplishment of an accurate and extensive knowledge, and there

spoke to her be congratulated her upon having made an acquaintage and asked how he spoke French. "Très-bien; micux que monsieux was the answer. So the great scholar was held inferior as speaker to a man who was uneducated and unable to read or was level to make wish to discourage the use of books of instration, for very few mest have the opportunity of learning to speal language without them. But the book before us is especially like to produce a vicious pronunciation. It is a book which is learn must keep for his own use. Very few native teachers will be able understand it, still fewer will consent to use it; so learners have no one to correct them will be very likely to acquire a failly munciation, and thus fail in the most important feature of the "colloquial knowledge" which it is the object of this book facilitate. facilitate.

facilitate.

Another disadvantage of books composed upon the "progressilesson" system is that rules of general application are often a plained as having only a special bearing such some particular wor construction which turns up in the isseen. Thus in page the phrase "he is eleven years old" is correctly radiored us his a spiarah baras ki hai; but to this is appended a note that "he word does not generally receive the plural tempination." I (year) does not generally receive the glural termination." I truth, however, is that there is nothing peculiar about the baras. Numerals when combined with nouns are field to show the combined with no combin baras. Numerals when combined with nouns are field to show a phirality without putting the nouns in the plural; and if the no is put in the plural form, it receives a definite and specific means such as we impart by using the definite article, and asying "I seven years' war" instead of "seven years war." Again, page 40, it is said that "aulid, though really an Araffo phural, trdu takes the verb in the singular." Perfectly true, but yet in leading; because what is thus said about the word sudds apply with equal force to all similar words, and they are numerous, other examples of this tendency to narrow the application of general rul are not wanting. And the converse process of generalizing t specific is also to be found. In fact, the explanatory notes a about the worst part of the book. Not that they are entire wrong, but that they often convey a false impression. But this an almost inevitable result of the plan of the book. Some few the notes show an inaccurate and confused appreciation, page 63 there is a difficulty made about the use of the plupers tense where there is no difficulty. This tense is more frequent and more accurately used in Hindustani than it is in English, a nothing is more easy of comprehension that the law which require it to be used when speaking of an anterior action. Again, it to be used when speaking of an anterior action. Again, p. 95, "some of the most esteemed writers" are charged wi "inconsistencies" in the use of the intimitive. This only about the danger of foreigness criticizing native writers. What are sa to be inconsistencies are so only in the critic's magination. T infinitive is used both as an infinitive and as a verbal noun; with 1 inimitive is used both as an inimitive and as a versal from; what is informed by the combined and made to agree with nou in forming compounds, like kitab-parlent, & book-spading." It is equally allowable, though not so usual, to may kitab parlent to read a book," and to make this the nominative case as in the familiar latin example "ingenues didicisee." &c. So the expression of the combined of t milinat uthana, which is declared to be an error, is quite correct but the form of its expression is "to take trouble," not "takin

The passive verb is brought into somewhat unusual prominen in this book. The existence of the passive in Hindustani has be stromously denied by some native writers, and in truth it is almost unnecessary, for the language so abounds with neuter verbs that unnecessary, for the language so abounds with neuter verts that is rarely necessary to employ the passive. It was very sparing used by the earlier writers, but it seems to be growing into asship and this is probably attributable in some degree to English influence. The literary language may indeed be said to have be formed under English supervision. Most of the early works in printed under the direct superintendence of Englishman. It is own language there is a strong tendency to neglect the neuter. favour of the passive, and it is curious to eeg that the same oper tion is at work in that language which may be called, in India: at least, our adopted child.

tion is at work in that language which may be called, in India at least, our adopted child.

Another point observable in the grammar is the rejection of a final n, which in all previous grammar, has been appended to a feminine plural of the future tense. This letter is very slight enunciated and is quite unnecessary, for the number and gond are clearly shown without it. The newspapers of Dehli at Lucknow have rejected it, and there can be no doubt that it we eventually disappear like all such uncless expressioners. This we were that he was been compiled with the absistance of two learned natives. Dehli, and so it may be understood that, so air as that part of a country is concerned, the recognized termination of the future now of instead of size.

There is one clear of persons who may study this book with advit tage—namely, such as have mastered the leading points of grammis and have acquired a fair pronunciation. The English statements and have acquired a fair pronunciation. The English statements and have acquired a fair pronunciation. The English statements and idicinally forms of appreciacy. The language many reat and idicinally forms of appreciacy. The language many read a fair produced the higher standard—the language used by aductived Makohiselans, which shounds in Arabita at many a word. It is have to be challed in the tides. It is nearly the leaves of the language in the statement of the language in the statement of the language in the statement of the language in the language in the language in the statement of the language in the

THE CZAR'S VISIT. ORE of the first objects in life to the ruler of a great country who happens to possess an active and intelligent mind must be to gather a wide and varied experience. Even the Emperor of Russia must recognize that his knowledge of life would not be quite complete without his personally ascertaining how royalty is received in England. He could not picture to himself, unless by coming and observing the minute interest and affectionate m England. He could not picture to himself, unless by coming and observing, the minute interest and affectionate admiration which every detail of his visit awakens in our national bosom. Of course he knows what going to foreign capitals means as a general rule. He has been to Berlin, for example, more than once lately; but then everything is done there so differently. At Berlin it would have been thought enough to say that the CZAR arrived, and was met by his daughter. We do not like this bald, unimpassioned way of doing things. The CZAR if he has unimpassioned way of doing things. The CZAR, if he has had a moment's leisure to look at the English papers, will find our style of announcement about him much fuller and richer. He will read a record of every movement of his body and every twinkle of his eye from the time his yacht first came in sight at Dover. He will have the gratification of learning that he was closely have the gratification of learning that he was closely gratified, and that the case and adroitness with which, as the ressel neared the pier, he performed the double task of bowing courteously to the mob and intimating his fatherly delight at the sight of his daughter, was considered eminantly satisfactory by the most competent judges. Hemay even gather a little as to, what happened before his arrival, and he may read with fatherly pride that his daughter, as the train nessed Dover, was noticed to be sitting in her carriage so as to command a view of the sea, thus adroitly evolding the natural inistake of staring straight into the Dover cliffs in the hope of seeing the Imperial yacht in that direction. The CZAR, too, is known to be a most amiable Sovereign. Prince BISMARCK says he is amiable—and a Sovereign whom Prince BISMARCK thinks amiable must be very amiable indeed—and he cannot help feeling a little pity for the poor disappointed people of Gravesend; and especially for the Mayor, who got indeed a telegram of especially for the Mayor, who got indeed a telegram of concentrate, and yet was not more than a very little comforted for the absence of the Czar. Perhaps, however, it will not be accomplished for a foreign Prince newly arrived here, however naturally gifted he may be, to understand all that if conveyed to the minds of Englishmen by the conception of a Mayon who got a telegram from the Prince of Walls, and yet in the midst of his joy had room in his mind for other and sadder feelings. Thus, though he may not quite appreciate all that we feel for him, we may be sure that the Czar will enfoy the heartiness and may not quite appreciate all that we feel for him, we may be sure that the Czar will enjoy the heartiness and warmth of the reception that will be given him. He cannot fail to see that we wish to give him plenty of occupation and amusement, and will honestly do our best to save him the tedium of a moment's leisure. He will go to Wool-wish and the Crystal Palace, and see our public buildings and our troops, and as much as Mr. Ward Hum will own to be visible of a phantom navy. The streets will be decreated profinely, and he will at least have one advantage over most of his English admirers, for he will be able to understant what the Russian theoritique, mean which the spread of informational learning has begun already to sprinkle so freely on banners and fight. The City, the, will more more show the resources of its gorgous hospitality. The the resources of its gorgous hospitality. The the resources of its gorgous hospitality. The the resources of the Loan Maron, who will be placed to do his very less, not perhaps without a sweet special for the life he does the particle has many may be placed on the middle incommittee to the particle has many may be placed on the middle incommittee to the land market has the placed on the land market has the land market has the placed on the land market has the placed on the land market has the land market has the placed on the land market has the land market

of baronets next after that of Sir John Kelk. Indeed the Czar's visit may be pronounced a success almost before it has really begun.

There is, however, a drop of bitterness even in the most There is, however, a drop of bitterness even in the most honied cup, and it may occur to the Czar—or, if such trifles are beneath the screne notice of royalty, to some of his suite—that, however handsomely we treat him, there is not the same gratifying amount of popular madness about him that there was last year about such a very small potentate as the Shah. But this mays be easily explained, if the Russians will but condescent to examine and admit our explanations. We were the a very peculiar state of mind just then; we were dead sick of the Gladstone Government, worn out with great measures. GLADSTONE Government, worn out with great measures, fluttered by Mr. Lows and Mr. Ayrron, and longing for a good, silly, schoolboy holiday. Such states of mind are accidental in the history of a nation, and a reasonable amount of indulgence must be extended to them. the Shah was not really like other Sovereigns. His peculiar charm lay in its being totally uncertain what he would do next, and in no fable as to his manners and habits being too wild for credulity to accept. There was always a chance that he had just been cutting off the head of a Vizier in a back drawing-room; and a Sovereign who wears the principal wealth of his kingdom outside him is unavoidably more stared at than an Emperor who merely in the quietest way gives a very handsome fortune to his daughter. allowance, too, must be made for our deep political designs, and for our persuasion that, if we did but give the Shall enough to cat and drink and look at, he would somehow make Persia a bulwark in our behalf against the aggressive tendencies of Russia. Besides, there is always more fun in making much of a small thing thun in rondering a respectful tribute of admiration to a great thing. There was a sort of humour in treating the Shan as if he were a person in the Arabian Nights, suddenly raised by the Caliph from the dust and ordered to be mounted on a white horse, and paraded about the streets as the new favourite and the intended bridegroom of the Caliph's "daughter." We had our fun and enjoyed it, but we also made a little fun of our quaint guest. The Russfans would not wish the great CZAR to be treated in this way. England recognizes in Russia an equal; and it is only disclosing a secret known to all the world when it is said that Russia and the United States are the only Powers of which England is in any degree afraid. Not that some other Powers are not. in their way, very powerful, but these are the only two l'owers that can do us much harm, and can get at us or our possessions. We cannot make a joke, even in the most good-humoured way, of the ruler of Russia. Serious thoughts unavoidably growd on our minds even while we give him our best in the way of entertainments and show. He may get be the man, or he may be the father of the man, who will some day make a dash for the great prize of Constantinople, or menace India through Afghanistan. There is little present distrust of Russia, and over-anxiety about the future is always a mistake. The CZAE can therefore be received with hencet coordiality; but there must necessarily be something sobre and grave in our manual of acceiving him.

An ardent French Commission has Jately written h. Life of the young Prince Labellant, and suffice replaced incidents are not very numerous in the history of a had of cighteen, the author is shipped to make a proof of such answeries as necessary of its supply. He is afterestingly seem migrate is histories as a designmental space of limitations.

then he visited Paris in 1867. Did author indignantly asks, even when was killing and burning and pillaging rance, think of the caresses he had intera that sweet and promising child? No one can say, although to guess is not difficult; but at any rate these agreeable recollections did not exercise the smallest influence on the Kine's conduct. Royal visits and the amenities of Royal hospitality cannot be expected to affect very profoundly the policy of great nations. All we can say is that they tend to establish those relations of friendli-*ness which are so far an obstacle to war that it costs an additional pang to break them. Nor is it a matter of slight importance that in England the reception of the CZAR is the affair, not only of the QUEEN and her family, but of the nation, or, at least, of the capital. A great many persons of all ranks will be better disposed towards Russia at the end of the Czar's visit than at the beginning, and although this may be an evanescent feeling, it is of somewhat greater political importance than caresses bestowed in the seclusion of a palace on a child. The Czas will perhaps do us the justice to recognize that no nation was ever less disposed to bear grudges than the English. He is the only Sovereign living who has subjected England to indisputable humiliation. Whether we were forced to give way ignominiously in the case of the Alabama Arbitration may be a matter for fair argument; but no one can doubt that when Russia took advantage of the French war to declare abrogated a provision of the Treaty of Paris which we had lavished our blood and treasure to obtain, it gave England a slap in the face, which we did not resent simply because we did not know how to show our resentment effectually. More recently we have been disquieted by the discrepancy between the promises and the performances of the Czar in regard to the treatment of Khiva. Here, again, we did not see our way to do more than remark that Russia always gets advantages in one mode or another. But as peace has been preserved, and as Englishmen see that, so far as anything has as yet gone, it may be honourably preserved, there is no sulking or antipathy, and the nation wishes to show that it can forget what it has been obliged to forgive. Fortunately the task of bearing this burden of charity has been lightened to us lately by the union of the Royal families; but nothing perhaps tends to make it so easy to bear in the presence of the Czar as the remembrance of his high personal qualities, and of the benefits which his enlightenment and his sympathy with the suffering multitude have enabled him to confer on his subjects.

HOUSEHOLD SUFFRAGE IN COUNTIES.

MR. TREVELYAN can scarcely have been disappointed by the rejection of his Bill for establishing household suffrage in the counties; and he had every reason to be gratified by the tone of the debate. From the mover to the PRIME MINISTER, almost every speaker discussed the question with unconscious or deliberate indifference to the practical results of a further extension of the franchise. Mr. Newdegate unfortunately provoked ridicule by his alarms on the subject of Popery; but he may claim the credit of having almost alone discussed the probable consequences of handing over the counties to the labourers. The triumph of the Conservative party at the late election has greatly diminished the impediments to the success of Mr. TREVELYAN'S agitation. The unexpected operation of household suffrage in the boroughs, combined with secret voting, has weakened the just dread of the sovereignty of numbers which had been previously entertained. Mr. DISRAELI himself has discovered that Mr. TREVELYAN is justified as a member of the Opposition in promoting a Bill which it would, according to the same authority, have been culpable to introduce when he was a supporter of the Ministry. Mr. Gladstone's restless activity in disturbing existing institutions had united a large part of the community in distant to any proposal of his Government which might tend to constitutional change. It seems now to be thought that, because Mr. Disparable has for once succeeded in lighting on his fact there is no large. for once succeeded in lighting on his feet, there is no longer any risk in a succession of leaps in the dark. Mr. Terveltan and other democratic politicians probably listened with contemptuous amusement to the admission of their adversaries that the extension of household suffrage to the counties was only a question of time. Mr. Diseasti pro-ferend confidence that ratepayers in the country would be

as trustworthy as in towns; nor was it easy to learn from his elaborate phrases whether he entertained any serious objection to the division of the country into equal electoral districts. Mr. Newdegate's blunt, and probably exag-gerated, prophecy that the change would lead to a republic or a despotism, approached more nearly to statesmanship than Mr. Diseasen's far-fetched excuses. It would indeed be a grave, if not a ruinous, innovation to about the representation of boroughs, and to disfranchise political minorities by the creation of equal and uniform districts.

The newfungled doctrine that the franchise has by the legislation of 1867 been converted from a trust into a personal property is due to Mr. GLADSTONE'S extemporaneous ingenuity. It would be more correct to assert that, neous ingenuity. It would be more correct to assert that, before and after the last Reform Bill, the suffrage was not so much a trust or a property as an instrument for promoting good government. That a man on one side of a brook or a wall should have a vote while his equally meritorious neighbour on the other side has none, is not an anomaly except on the assumption that the possession of the franchise is a privilege. Experience shows that con-stituencies may be too large or too small; and it is for. practical legislators to secure as far as possible the conditions which are most favourable to the election of competent members. If household suffrage is made universal on the ground of the injustice of arbitrary distinctions, the claim of those who are not householders will be logically strengthened. Mr. TREVELTAN and those who share his opinions are perfectly consistent in their endeavour to obtain a concession which will render their further aims more easy of accomplishment; but it is a melancholy spectacle to watch the complicity of Conservative politicians with the schemes of their most formidable opponents. No speaker in the debate recognized the truism that, since the whole amount of political power is a constant quantity, the electoral influence which is given to a new class of votors must be taken from some portion of the existing body. It is natural that the working people of the towns should desire the reinforcement of their own ranks by a large addition to the number of electors living on weekly wages. Those who hold that property would oqually secure after the transfer of the county representation to the labourers will do well to notice Mr. FORSTER'S hint that land tenure, among other questions, will be most advantageously considered in a Parliament elected by uniform household suffrage. The silent members, and especially the representatives of the farmers, were probably influenced by entirely different reasons from those which were advanced by the PRIME MINISTER and by other professed exponents of their opinions. It is a rash experiment to confer absolute political supremacy on the class which possesses no realized property. It has been often remarked that popular suffrage in England is more democratic, and may be more revolutionary, than in any other civilised country. English artisans are far richer than Continental peasants; but on a superficial view it may seem to them that they have less to lose than petty freeholders. Mr. DISRAELI, who in some parts of his speech might have been mistaken for one of Mr. TRE VELYAN'S supporters, asserted, and forgot to prove, that the majority of new household voters in counties would not consist of agricultural labourers. As all the small farmers and village shopkeepers already possess the franchise, it is difficult to conjecture the qualification of the householders to whom Mr. DISRAELI refers.

The defeat of the Bill by 114 votes, nearly doubling the estimated Ministerial majority, is so far satisfactory that it disposes of the question during the continuance of the present Parliament. It would seem that Mr. DISRAELI still hankers after the opportunity of forcing his reluctant followers into another constitutional experiment; but it also appears that the bulk of, his party will have nothing to do with Mr. TREVELTAN'S proposal, and of the late Ministry only Mr. FORSTER and Mr. STANSFELD voted for the Bill. No profound sagacity is needed for the reflection that the Conservative party owes its present prosperity to an accidental combination of circumstances. Four of five years hence the Government may have become unpopular; some opponent may have devised a plausible pretext for agitation; and, above all, the voters who were enfranchised in 1867 may, under the guidance of skilful managers and elequent demagagers. present Parliament. It would seem that Mr. DISRABLI still of skilful managers and eloquent demagognes, have discovered the accret of their strength. The counties have may be safely reckoused on by the Conservative marty, as long as the franchise is retained at the present moderne limit. If

all the landowners and all the farmers are practically disfranchised by becoming a minority, it is impossible to fore-see the character of a new Parliament. The boroughs of moderate size also have reason to fear that they may be approved into equal electoral districts. Whether a revolu-tion of the House of Commons would immediately lead to subversive legislation is a question which would probably depend on the wider or narrower prevalence of feelings of discontent; but demagogues and agitators make no secret of their ulterior designs. The House of Lords, the Established Church, the tenure of land, and the law of inheritance would all be at the mercy of the equalized constituencies in which Mr. DIERARLI hypothetically reposes perfect confidence. Democratic institutions in a prosperous country where social equality deprives envy of its natural sustenance, produce, as is shown by the example of the United States, nothing worse than political indifference, party intrigue, and political corruption. Large and uniform constituencies with no passion or strong interest to stir them to activity are inevitably manipulated by professional politicians, themselves among the least estimable of mankind. General BUTLER is the consummate flower and typical representative of democracy under favourable conditions. The Americans are not proud of their most complenous politician; but they may boast that he and the class to which he belongs are powerless to interfere with their freedom or seriously to interrupt their prosperity. England, with its narrow space, with its historical inequalities, and its broad social and economical differences, is not in the same enviable condition of stable equilibrium. It is only from weakness and carelessness that the upper and middle classes can incline to subject themselves to the absolute control of the numerical majority which maintains itself by wages. In the present House of Commons it would seem that scarcely a single member has the courage to avow the opinions which nevertheless determined the rejection of Mr. TREVELYAN'S Bill. The debate was extremely damaging to the party of re-sistance, not through the force of the arguments used by Mr. TREVELYAN and Mr. FORSTER, but because Mr. Dis-BAELI and other opponents of the measure admitted the principle which they declined to apply. If the country would be better governed by uniform or universal suffrage, the franchise ought at once to be extended. It is frivolous to pretend that the refusal of the vote to agricultural labourers is founded on belief in their fitness to use it well.

SIR GEORGE CAMPBELL ON THE FAMINE.

SIR GEORGE CAMPBELL'S Minute on his visit to Tirhoot is now more than six weeks old, but it is still the most interesting and suggestive document which has been published about the Indian famine. It shows how great have been the difficulties which the Government have had to meet, how immense has been the energy displayed in inceting them, and how grave are the problems arising out of the fact that they have been met. The district in which the famine has been most severe is inhabited by a poor and quiet race, who ordinarily give little trouble, and so call for little of the machinery of government. One young man has had the whole charge of a subdivision, with a population perhaps of not much less than a million. Consequently when the famine threw a great part of this population on the hands of the Government, there was hardly any one to take the charge of it. The Governments both of Bengal and of India have done their best to supply this deficiency. In Bengal the districts not threatened with famine were almost stripped of their staff, and by this means 181 officers were sent to Behar for relief work. The Government sent 260 officers more, including many soldiers and others specially engaged. Still this supplementary agency was not, and could not be, uniformly efficient. The new staff was energetic and painstaking, but it lacked that intimate knowledge of the people and of agrarian affairs which only fabiliarity with the country can give. Sir George Camperal is of opinion that in this state of things more use ought to have been made of indigenous and voluntary agency, but he admits that in digenous agency of the best kind was especially hard to find in Behar, from the absence of a middle class, and from the fisinclination of many of the assumption to de their the Lisinclination of many of the nomindars to do their duty. On the other hand, the village organization in Behar is more complete than in Bengal. The late census was almost entirely taken by the head man of the villages, of the villages,

and Sir Groupe Camprell looks to f the preparation of a census of the pow in each village, and for the administra by which their wants are to be relieved. organization of some kind must be introduced into the relief operations. The three main forms of Government relief, public works, charitable allowances, and advances to cultivators, all demand an amount of detailed and individual knowledge of the persons relieved which cannot be attained without it. Whou first a rush is made to the works it is as much as the officials can do to get all the labourers relieved. But though Sir George Campull. thinks that these sudden rushes indicate real want and rapidly approaching famine, he points out that when the merest pretence of work is paid for, the mode of life irresistible attractions for an indolent race, and presents the number of labourers is in danger of becoming absolutely overwhelming. To prevent this the multitude must be sifted ont according to their families, villages, and tracts of country, and those who can and will work must be separated from those who are not able to work or who wish to go home. The former class must be employed under Public Works officers, and full wages be paid to them in return for real work. The latter class should be employed as far as possible in the neighbourhood of their homes.

The aim of all this organization is thus described by Sir Gronde Campbell: - When the arrangements we " are now making in the most distressed districts are "complete, I trust that we shall be able to lay our hand on each person requiring relief according to his residence and circumstances. We shall be able to say in each village, Here are so many persons found to be fit objects for charitable relief; so many are doing " work of some sort; so many are receiving a charitable "allowance of food; so many have received or will receive "advances to enable them to continue their cultivation; "so many residents of this village are absent working on such a public work. On the public works again 1 hope we shall be able to say, Here is a gang from such a " perguinah and a gang from such another perguinah; so "many (name by name) from such a village, and so many "from such another." The distribution of charitable relief is to be left as much as possible to the local relief committees, each member of which ought to undertake to look after a certain area or number of houses or families, so as to ensure that no one shall die for want of the food which the Government is ready and waiting to supply. Cooked food is to be given at once to all starying persons. After their immediate wants have been relieved, either uncooked food or the money wherewith to buy it is to be given to those who are found to really require it. advantage of cooked food is that it constitutes a rough test of destitution. "It is clear that the people of Behar will "not accept this form of relief in any number till they "are very much straitened"—their refusal, however, being apparently due, not to easte scruples, but simply to a timid dislike of doing anything which they are not accustomed to do. The very poor who depend entirely on accustomed to do. public charity are to receive one part of palses and other nitrogenous grain with every three parts of rice; but as regards those above actual pauperson, Sir George Camputal hopes that they will be able to find this nitrogenous element for themselves, the famine being mainly a rice famine, and the bazoars containing an abundance of other grains. This expectation has not proved true, at all events not universally, for a letter from the Correspondent of the Daily News mentions that at Bettinh, in the district of Chumparun, there is no longer any bazaar for food, and that the people ask eagerly at the Government store for grain other than rice-a demand which at the date of his letter there was no mode of supplying.

By these means Sir GEORGE CAMPBELL hopes to carry the people over the dry season. When the rains begin, a new set of difficulties will present themselves. It will be no longer possible to go on with public works on a large scale, and, even if it were possible, the labourers would be wanted for agricultural operations. In former famines, when the Government has given relief on a moderate scale, and guarded it by severe tests, the able-bodied labourers have been glad enough to go home as soon as there was any work waiting for them when they got them. But in the present famine relief is being given on a far more liberal scale and less hedged in by strict tests, and Sir George Campants evidently fears that the effect of feeding a large past of the population in return for little more than

nominal labour may be to indispose them for harder work, and consequently to make it difficult to get rid of them even when they are really wanted elsewhere. It is partly with a view of meeting this difficulty that he lays so much stress on the system of village organization. "If we knew "who our labourers are, where they reside, and where they "who our labourers are, where they roside, and where they
"work, we may be able to say to a poor man when
"the rains commence, We now know that you are
"no impostor, but a person willing to work for your
"bread; we can't employ you longer, it would ruin
"the country if we could; here is a couple of months'
"supply of food; we give you that; take it home; but now
"you must support yourself, we have done with you."
Ryots employed on the public works should be dealt with
in the same way, except that in their case wages may be in the same way, except that in their case wages may be advanced at an earlier period so as to enable them to go home and start their cultivation as soon as it is possible for them to do so. In North Behar there are many ryots of a higher class who have not been employed on the public works, but who yot are too poor to carry on the work of another season and pay their labourers without some assistance from the Government. In dealing with this class it will be expedient, Sir George Campbell thinks, to draw a line between those who may fairly be expected to repay advances and can give sufficient security and those to whom an advance will really be, not a loan, but a gift. It is of great importance not to shake the credit system of the country, and therefore, wherever there is not a good prospect of repayment, it will be best to make the advance a gift in name as well as in fact. As regards those ryots who can give good security, Sir George Campbell thinks that the necessary advances had best be made, not through the Government, which has no machinery for the purpose, but through Zemindars, where they have the means or the will to give assistance, and through native money-lenders, where the agency of the Zemindar cannot for any reason be employed.

The very completeness of these arrangements furnishes matter for grave anxiety. If to deal with a famine requires so vast a system of organization, and famines recur as frequently as heretofore, the strain on the Government of India must be immense. It is bad enough to have to rule a country in which the population is dense and the means of subsistence small, but the difficulty is immensurably increased when a great part of this dense population may any year be reduced to starvation by an unusually dry season. Former famines were not very postly, because the preparations made against them were few. But if every famine is to be encountered with the Tew. But if every famine is to be encountered with the thoroughness which has characterized the action of all the Governments concerned in dealing with the present one, the whole subject of Indian finance will have to be reconsidered. If the cost of feeding the people during a famine is to be borne by the Government, the reasons against entering upon a very large outlay on public works necessarily cease to hold good. It may be cheaper—though even that is doubtful—to spend no money in warding off famine, provided that famine when it comes saddles the Government with no very large additional burden. But it does not follow that it is cheaper to spend no money in warding off famine, if a famine when it comes means many millions, or the interest on many millions, out of the pocket of the Government. It is exceedingly important, of course, that India should be self-supporting, that she should borrow money on her own credit and pay the interest and repay the principal out of her own revenues. But the question by whom the cost of preventing famines is to be borne need not influence the determination to prevent them. If that can be done, it must be a cheaper policy in the end, and whether the cost ultimately falls upon the Government of India or upon the Home Government it will be desirable that it always to be the cost upon th Home Government, it will be desirable that it should be as small as possible. Where calamities come in such proportions as the Bengal famine, a mere hand to mouth policy can never conduct to donomy.

ENGLISH POLICY IN AFGHANISTAN.

ORD DERBY gave the only possible answer to Lord
NAPIEE and ETTRICE'S recent question; and if his
guarded language produces an uncomfortable impression, the
result of the conversation was perhaps unavoidable. It would
be unreasonable to blame Lord Derby for not possessing the
natural air of frankness and candour which always enabled
Lord Parameters at the same time to baffle unseasonable

curiosity and to give general satisfaction. The present head of the Foreign Office sometimes provokes uneasy snapicions by exhibiting in his language and manner even more scrupulous caution than that which he is bound to exercise in his conduct. The open countenance and close thoughts recommended in the Italian proverb are thoughts of the Italian grower of Paris and Berlin were lately occupied for some days in the task of divining the secret which they erroneously thought to be contained in Lord Derby's conventional answer to Lord Russell. The relations of the Indian Government with Afghanistan are more practically important than mere speculations on the future policy of Germany and France, and consequently they are less convenient subjects of Parliamentary discussion. Lord Derby was perfectly right in refusing to define the responsibility which may arise from the understanding of last year between England and Russia. Lord Napier, indeed, observed with perfect truth that the diplomatic demarcation of a boundary must be a political fact, and not merely a geographical proposition. Prince Gortchakoff's acceptance of the limits assigned by Lord Granville to the territory of Afghanistan involved a pledge that the provinces to the south of the frontier should be exempt from Russian interference. It may also be contended that the English Government undertook some kind of obligation with respect to the Afghan dominions. Prince Gortchakoff closed the correspondence with an intimation that he understood England to have assumed the protectorate of Afghanistan. In future controversies on the subject the Russian Government will refer, as may best suit its immediate purpose, either to Lord Granville's tacit acquiescence or to Mr. Gladstone's injudicious protest.

It is not surprising that Lord NAPIER, who was lately Governor of an Indian Presidency, should have disapproved of Mr. Gladstone's impotuous timidity; and his criticism on a speech delivered about the same time by Lord Derby was in itself not unjust. A politician of high rank who has held the office of Foreign Minister retains a portion of official responsibility. It was unnecessary for Lord Derby in 1873 to express a hope that Mr. Gladstone's Government would not be tempted into an extension of the English dominions to the North of India. No Cabinet has been less inclined to embark in daring and ambitious enterprises. The Russian Government is probably well aware that the policy of Lord Granville has descended to Lord DERBY, and that both Ministers have been equally disinclined to encounter unnecessary risks. It is unlucky that those who represent the most peaceable of ancient and modern communities should incessantly proclaim their aversion to any policy which may possibly lead to war. The Indian Government, which, possessing an army, has also a definite policy, understands that peace is secured by careful precaution, and not by an ostentatiously inoffensive demeanour. As Lord NAPIER said, the Viceroys have for several years been engaged in efforts to secure the alliance of the Afghan ruler; and apparent repudiation of that policy naturally causes embarrassment and weakness. Mr. GLADSTONE and Lord DERBY were led into rashness by excessive caution; but the mischief which may have been effected by their speeches is done; and there is little use in reviving the discussion after an interval in which their language may have been partially forgotten. Mr. GLAD-STONE'S declaration that no material interference with the Afghan Government would in any event be attempted will certainly not prevent either English Ministers or Indian Viceroys from discharging a duty which may perhaps be imperative. In certain cases the AMBER must be controlled, and it is easy to imagine contingencies in which he would be entitled to protection. If Lord NAPIER had been a member of a Cabinet confidentially discussing Asiatic affairs, his reasoning would have been appropriate as well as forcible. In the House of Lords, his appeal to the Government inevitably produced a repetition of the language which he disapproved.

Both Lord DERRY and Lord GRANVILLE properly affirmed the inexpediency of asking or of answering hypothetical questions as to occurrences which may perhaps never arise. States and Governments ought always to reserve their full discretion, and to avoid premature pledges. It is unfortunately difficult to deny the existence of an obligation without suggesting the conclusion that the liability will in no contingency be voluntarily undertaken. The Government may perhaps not be bound to support the Ameer of Cabul against oppression; but it might nevertheless be-

come expedient to render assistance which could not be demanded as of right. As Lord Derby observed, every quarrel has two sides and two parties; and until the merits of the controversy and the position of the disputants are known, the expediency of interference can scarcely be defined. An unprovoked invasion of Afghanistan by a bassian army would certainly load to war with England; but there would probably have been some kind of provocation; and the risk could only be averted by the assumption of control over the Government and the country. Lord Derby explained, with almost superfluous clearness, the difficulty of making a statement which would not expose him to misinterpretation. If he told the simple truth that the Government could not tell how it might act in unknown circumstances, he might be as truly told that he had no policy. If he promised to protect Afghanistan, he would have undertaken a serious responsibility; and if he declared that he would not protect it, the Amere would probably be induced to look for allies elsewhere. On the whole, great questions of national policy are seldom proper subjects of public debate. Lord Namer was in the right; but he ought not to have called attention to the ambiguity or the feebleness of official declarations. Lord Derby was in the right in refusing to give a definite answer, but it would have been better that he should not explain in detail his reasons for reserve.

Notwithstanding his laudable repugnance to committing himself, Lord Derby concluded his speech with a declaration which may perhaps have satisfied Lord NAPIER. While he denied that the AMEER had any right to claim moral or material support from England, he intimated that the Government would regard interference with Afghanistan as a grave matter, involving serious danger to the peace of India. "I think," he added, "if such an interference "occurred, to put the matter mildly, it is highly probable "that this country would interpose." In the meantime, as the Russians contended when they annexed Khiva in violation of the pledges given through Count Schouvaloff, a prophecy is not a promise; and it may remain unfulfilled without a breach of faith. Lord Derby's estimate of contingent probability may perhaps be extended to that assumption of control which he earnestly deprecates. If the Afghan AMEER offers any unnecessary offence to the Russians, or to the tribes under their protection, the Indian Government will, in spite of Mr. GLADSTONE'S statement, not fail to enforce on him the necessity of prudence. It would be highly undesirable that the Afghans should believe that their territory is absolutely guaranteed by England; but the AMEER and his advisors are probably acute enough to perceive that the solicitude of the English Government for their independence is not wholly disinterested. Although Lord NAPIER and Lord DERBY spoke of unprovoked aggression, the advances of Russian dominion, and not the motives for aggression, are the real subject of anxiety. Friendly relations with Russia will be most effectually secured by a distinct understanding which ought not to be rendered offensive by the use of threats. Lord DERBY's conjecture that in certain events interposition would become probable is sufficiently definite to be clearly understood. There will be no advantage in renewing the discussion, until some change of circumstances occurs. It is by no means certain that the Russians enter-tain any hostile designs against Afghanistan, or that they propose to tempt a conflict with the superior force which they would encounter on the frontier of India.

THE ARCHBISHOPS' BILL.

THE prominent feature of the debate on the Archeshors' Bill was the unreality of the defence set up for a measure which only obtained a second reading on the preposterous condition that it was at once to be changed into something quite different. There was no mistake about Lord Shafteshur's meaning when he declared, as a Low Churchman, that, if he were sure that all Bishops for half a century would be Low Churchmen, he would still refuse to give them the powers claimed in the Bill; and if the prelates could find consolation in Lord Salisbury's candid criticism, they are very easily pleased gentlemen. On the other hand, the defence rested on an ill-adjusted heap of Sanisandictory and irrelevant positions. The Archesishops devoted themselves to the paternal task of winning back Ritualists by hard scolding. Lord Harrower saw bogies, Lord Harrower was sorely tried by much hymn-singing,

Lord SELBORNE gave the Bill a helping hand by adventuring a competing plan, and the Bishop of Persesonous performed the ingenious feat of defending it as a whole by attacking every provision in detail.

The one fact thrust into unblushing prominence by the Archiepiscopal sponsors and their attendant chorus was that the two-sided intention originally claimed for the measure was a mere pretence. They did not condescend to deal with it in any light except that of a club wherewith to brain Ritualism, always reserving for thomselves the right of defining what was and what was not the accursed thing. Herein resides the peculiar unfairness of the proposal, apart from all constitutional objections to an ecclesiastical revolution made in a way in which in imitation of Mr. Disraell, we may call harum-scarum. Ritualism has undoubtedly succeeded in exciting very strong antiputhies, particularly among persons who never come across it; and it is certain that claims are both advanced and put in practice on the part of some heated enthusiasts for a license in ceremonial wholly incompatible with the good order of a settled community such as the Church of England claims to be. But it is equally patent that this disorder represents the vicious excess of a movement which exists in its wholesome manifestations as a necessary component part of the whole Established Church. Society in England, as everywhere else, is more active as well as more artistic and less commonplace than it was half a century since, and the Church of England has conspicuously shared in the movement. The result of this development is a sharper definition than formerly existed of the parties—termed by Lord Salashury sacramental, emotional, and philosophic—into which Churchmen have distributed themselves; while the burden has fallon upon prolates and ministers of wisely keeping these parties together within an Establishment which is enpable of containing all on the double condition of a defined minimum of restraint and an clastic maximum of teleration. Of these parties the sacramental or High Church is the one which on principle attaches most importance to the externals of worship as types of the unseen and as channels of grace to the worshipper's soul. We are not concerned with the truth or untruth of these principles. It is sufficient that they are held by a body of persons whose learning, abilities, virtues, and varied social position, not to talk of their large and increasing numbers, make their cheerful acquiescence in the status in quo indispensable for the cohesion of the Establishment. The empty charge of unpopularity, so often brought against them in place of argument, can be reasonably met by an appeal to the furore for church building and church restoration characteristic of the present generation, as pulpable evidence of the hold which one portion at all events of their teaching has taken of the public mind. This party, as they acquired strength, found in the Prayer Book an unworked mine of devotional material, and they have elaborated out of it a far more artistic system of worship than the rendering of that book which contented our grandfathers. At the same time the party have advanced reasons, some historical, some based upon the internal construction of the document itself, and others appealing to the personal wants and tastes of mankind, which are at least very weighty, for their being allowed, not to force their own type of worship upon the other parties, but to enjoy it for themselves in unmolested peace. comes in the so-called ritualistic difficulty. Evidence is adduced to show that the process of devotional develop-ment has gone on so far in certain minds as to have landed the innovators in practices neither deducible from the Prayer Book—nor even supplementary, though unknown, to it—but antagonistic to the principles which plainly governed the process under which it was moulded out of the older services of the Church before the Referention. Those who are the most carnest advocates of prompt and decisive action are at the same time-the most vehement in assuring their hearers that the number of these lawless nonconformists is very few. They are so anxious to persuade the world into letting them make their Nasyrr's hammer that they can never sufficiently insist that it will be only used in cracking nuts. Of course such a state of things calls for regulation and restraint; but it does not justify a coup d'élat. We do not imagine that Mr. Dishaell's majority would long hold together if he were to get up and, after appealing to the strikes and the locks-out, were to ask Parliament to repeal the Habeas Corpus Act. Yet this is just what the Archesishors are attempting to do.

More than that, they do not come into court with clean hards as arbitrators in the ritual difficulty. The one body which has made itself conspionous for its estentations re-The one body pudiation of all principles of mutual toleration is the Church Association. This combination of agitators approached the two Archestops last year with a clamorous appeal to them to put down such religious practices as the Association was pleased to disapprove of-namely, the whole system of worship agreeable to the High Church party; and the Primates were so inconceivably weak as to fan the slame by an encouraging answer. How the Archbishop of Canterbury, after such an exhibition of partisonship, following as it did very closely upon the discredited Purchas Judgmont, could have ventured to appeal to High Churchinen to "separate "themselves" and become his accompliers in his crusarie against Ritualism passes understanding. It is not that they approve of violations of the spirit of the Prayer Book on the side of excess any more than he does, while they may without vanity claim that they are rather more jealous of offences caused by defect. But they cannot trust the leadership of men who have already shown themsolves so willing to obey the behests of the Church Association persecutors. They fear that any pledge which they may be coaxed into giving to check the growth of ultra-Ritualism may be appealed to as an honourable obligation on their part to abandon forms which they have at least as much right to enjoy as the Low or the Broad Churchman has to be left free to develop his own peculiarities. The fact which Lord Shaftesbury was neute enough to discover, that the Bill might be made equally efficacious in harnssing Low Churchmen, is no palliation for its violation of natural equity towards the other side, unless it can be shown that two injustices make one justice.

The promoters of the Bill showed considerable adroitness, though not of a very high order, in catching at Lord Sharteshuar's reference to what he considers the alarming growth of a system of compulsory confession in the Church of England analogous to that on which the Church of Rome insists, and which the Church of England at its reformation most wisely abandoned in favour of the absolute liberty to all its members of confessing or of declining to confess, not according to any occlesiastical and external rale, or at the bidding of any other person, but as the soul knows its own bitterness. believe that any system of obligatory confession can ever prevail in England as it now is or is ever likely to become. If it does, then, as Lord SHAFTESBURY truly said, such Bills as this of the Archestops will be wholly useless to population the phonomenon. But certainly the one thing which is supremely ridiculous is the self-complacent fuss with which alloged abuses of the liberty of seeking that pastoral counsel which even Mr. Springer-who would rather be called domon than priest - does not, we suppose, refuse to his flock, are encountered by ordering that there shall be no public confession boxes in any church. Ugly, strange, and unwise as these things may be, they certainly prevent the elergyman and his fair penitents from fluting, as the liberty of meeting in any private room, with which the Archushor does not, because he cannot, interfere, can hardly be said to do. Lord Salisbury and the Bishop of Petersorough, at all events, showed how much more widely than the Metropolitans they could appreciate the real difficulties of the religious question, when they pleaded for recognition and teleration between different Church parties as the only escape; but we cannot help thinking that the Bishop's argument would have been both more forcible and more consistent if he had declined to encumber it with any perfunctory recommenda-tions of a Bill which has died in the act of coming to life.

AFRICA.

OHANGE of Ministry necessarily throws a veil over many transactions which would otherwise have provoked discussion and comment. We shall now never know whether the present (lovernment could, if it had still remained in Opposition, have shown that the Ashantee war, need not, if proper presentions had been taken, have ever happened. If Lord Kimpeller made any mistake, he has made a complete atonement for it by being turned out of office. The consideration of the past being, therefore, withdrawn from its sphere of inquiry, the Ministry has only had to consider whether we should continue to have spattlement on the Gold Coast or not. There are reasons

against our continuing there, of which both Lord CABNARVON and Lord KIMBERLEY recognized on Tuesday night the great force. The climate is deadly, the allies whom we should have been bound to protect deserted us, and the people we have conquered are recognized as infinitely better than the people we have been protecting.

But, however good the reasons for going away from they,

Gold Coast may be, the reasons for staying there are rea one of the kind that make discussion practically superfluors. We should have toown ourselves beaten, and Englishmen do not like to do that. We should have attempted to governmed have failed. We should have set a precedent which might have tempted other harbarons or semi-barbarous nations to believe that, if they only gave trouble enough, we should be sure sooner or later to leave them to their own devices. Lord CARNARYON had really little choice. Ho might argue with himself in favour of abandoning the Gold Coast, but he probably knew all the time that he would end by deciding that the Gold Coast could not be abandoned. He could not, however, bring himself to admit that a resolution to which he felt obliged to come was necessarily an irrevocable one; and, after having proved that we must stay there, he hinted that the happy time might come when we could go away. The area of the British Protectorate is not to be extended until any reason is found for making it larger, and the protected tribes are to be independent so long as they do everything they are bid. In fact, it is settled that we shall stay there and see what happens; and when this is settled, it is easy to find excellent reasons for doing what we have settled to do. We shall put down human sacrifices, discourage slavery, open channels of trade, and make the Ashantees our friends, unless it turns out that we have reduced the Ashantees to the chaos in which Abyssinia was plunged after we had conquered the famous THEODORY. Possibly even we may improve the Fantees, who it appears have, according to Lord CARNARYON, perfectly wonderful powers of learning everything they wish to learn, although otherwise it must be owned that they are about as uscless and intolerable a set of savages as could be found. We shall, it is to be hoped, make the dependency self-supporting, as its revenue has more than quadrupled since 1869, and we may, with good management, kill off comparatively very few Englishmen; and we can do much to make them tolerably happy and contented by giving them plenty of work, much real power, and satisfactory salaries while they contrive to live there, and a good pension when they die.

Lord Carnaryon sketched with an instructive minuteness the general character of the system of administration that he intends to set up, and his scheme deserves commendation, not only because it is a good one in itself, but also because it shows that English statesmen have begun to apply some of the principles of common sense to the government of rude populations. The experience of India has gradually told, and the fancy no longer provails that the best way for Englishmen to govern inferior races is to set up a burlesque of English institutions. The Gold Const is in future to be governed very much on the model of a Non-Regulation Province in India. There is to be a Governor, who is to be, if possible, a really good man, who is to be adequately paid, and who is to have a residence in the hills, so that he may have all the frail chances of health compatible with the climate, who is to have a small Conneil to help him, but who is to do pretty nearly what he pleases. Lagos is to be joined with the Gold Coast, while Gambia and Sierra Leone are separated from it, and three times a year the Governor and his Council are to hold Sessions at Lagos. There is to be a native force officered by a large staff of Englishmen, but neither British nor West India regiments are to the employed. Roads are to be made and kept open by an armed police, and any attempt to interrupt communications or to molest travellers is to be summarily and sterrily punished. The official staff attached to the Governor is cut down to the lowest possible limit, but then all the officials are to be well paid, and to have pensious on the tropical scale. Hitherto, by one of those absard regulations which if they save creen into a service see regulations which, if they suce creep into a service, go on for years unaltered simply because no great man has time to consider their absurdity, the officials of the Gold. Coast have only received pensions on the English scale, as if the Gold Coast were in a healthy part of Morthum Enrope. Now this is to be alfered; but the number of officials is so small that the total extra expanse caused by

the augmentation of salaries and pensions will not, as Lord CARRARYON calculates, exceed 7,000l. a year; and while, as he justly says, Parliament must not expect that such a dependency as the Gold Coast can be governed well if it is governed too cheaply, yet he thinks the increasing evenue of the Gold Coast under a strong and stable Gonment will make the dependency self-supporting. All me nonsense of importing English legal institutions into such a community as that of African savages is to be got rid of. The negroes on the coast have hitherto, it appears, been favoured with the application to them of the English law of bankruptcy, a part of law perhaps more unintelligible than any other to Englishmen themselves, and which has simply had the effect on the blacks of suggesting to them new ways of cheating. Local self-government and juries are also henceforth to be denied to these interesting creatures, who have just perception enough of the institutions offered them to guess how they may be perverted. Still the Governor and his legal staff must have some law to follow and administer, and it would be much more satisfactory if a short and simple set of rules both of criminal and civil law were drawn up and made to take effect, such as Lord LAWRENCE had drawn up when he administered the Punjab, rather than that the English law should nominally prevail, be kept in the back-ground, and replaced by any law which the sort of legal person who takes a judicial appointment at the Gold Coast is able to remember or invent. The whole scheme of government described by Lord Carnarvon is probably as good as could be suggested, and its merit is not diminished by the aunouncement which Lord Carnaryon felt bound to make, that he did not at present see his way to any attempt to put down domestic slavery in the Protectorate. One difficulty appears to be that the slaves have no wish whatever to be liberated, as they foresee the probability of dying by starvation; and under these circumstances our policy of emancipation ought, no doubt, to be cautious and

It is not, however, only on the Western Coast of Africa that we are called on to interfere. We have our duties on the East Coast also, and a meeting under the presidency of Prince Teck has been held this week to recall these duties to the recollection of the Government and the public. is always the case, the discharge of some duties has led us to bear new burdens of duty in Eastern Africa. We wish to stop the slave trade, and we find, as Sir BARTLE FRERE reminded the meeting, that it is partly what we have done and done for the best that has fostered this trade. We invented the Sultan of Zanziban, and it is he who has persisted in sheltering the trade until he was obliged by the sight of armed force to mend his ways. It is we who have cloured the Indian Sea of pirates, and thus relieved the slave vessels from one great obstacle to the prosecution of their enterprise. It is we who govern the country whence the Banian Indians of Zanzibar come to supply the capital for the trade, and who take care that their families and possessions are safe in India while they are making their fortunes. So, as it may be fairly argued, we are bound to take extra pains to put down the slave trade, which, however innocently, we have done much to call into activity. The only question is what we can do at comething like a proportionate cost of men and money, and within reasonable limits. England is not likely to higgle too much in such a matter. Great nations, as Lord CARNARVON said, must do disagreeable duties without caring too much about money or results. But still when we are asked to suppress the East African slave trade, we must press for some definite answer to the question what we are supposed to be going to do. Mr. Foreter said that he was an economist, but that still he would gladly support any proposal for increasing the amount of our naval force on the coast by two or three vessels. If this is all, most Englishmen would be delighted to pay the infinitesimal amount of extra taxation which this increased exercises of the national newer month increased exertion of the national power would involve, and there are plenty of men who would be ready and even eager to be employed on what is not in itself a very inviting service. But Mr. STANLEY, who knows something of the country of which he was speaking, took a zery different view of what was necessary. He did not think it nearly enough to try with a small naval force to prevent cargoes of slaves being shipped at some point of a long line of coast. He was for much more radical measures. He wanted the Sultan of all immand Zanmean to be made to keep a register of all inward-hound caravans, and to allow no one connected with the

slave trade to penetrate into the interior. He wanted a European Court to be set up to try the Banian traders on the spot; he wanted settlements to be provided on Lake Nyassa, and, generally speaking, the lake, rivers, and coast to be patrolled by a naval force, These means might, it is to be hoped, be efficacions, though expensive; and foreigners of all nations seem to be most anxious that efficacions and expensive means should be applied; but it is to be observed that they are unanimous in holding that England should do all the work and find all the money. We cannot hope quite to reach the high standard which intelligent foreigners set before us. Still we may go on in our own humble way, and strive to do the best we can within the limit of our power and our means.

FRANCE.

THE Duke of Brooms and the Right are like an ongaged couple who are always quarrelling and always making up again. Their reconciliation can hardly be called a renowing of love, for by this time they probably detest each other as heartily as persons commonly do who, with quite different ends in view, find it necessary to work together for a time. But the link between them, though it is only one of conveni-ence, is very hard to break. There has been scarcely any important debate in which rumours of a final quarrel have not been flying about, and whenever the Assembly has not been sitting some Legitimist deputy has usually taken occasion to commit his party to some formula which he thinks it impossible that the Duke of Bucuts can accept. But with the decisive division has invariably come reflection. The Duke has not shown himself a rigid stickler for particular phrases, and even when he has seemed to commit himself to a policy in proposing a toast or in replying to a deputation, he has always succeeded in explanning it away in the tribune. Thus the ill-matched pair have gone on with more substantial agreement than is sometimes found between real friends. The truth is that they are very necessary to one another. No majority would, on the whole, suit the Duke of BROGLE's purpose so well as the majority he has hitherto com-manded; and if any other Minister were to come into the Duke of Brootie's place, the existing majority must altogether disappear. There are some even among the Duke's own colleagues who would prefer that the Ministry should lean upon the Centres and leave the Extremes to take their own course. In the eyes of the Duke of BROGLIE this policy has one fatal demerit. It would mean the definitive organization of the Conservative Republic, and the Duke, though he has abandoned a good many convictions, is still faithful to the theory of Constitutional Monarchy. Somewhere in the unknown future he still hopes that there may be a chance for the Count of Paris, and, if the Republic were to be adopted as the acknowledged Government of France, this door might be finally closed. The more Conservative such a Republic was, the more likely it would be to have this effect. There must still be many Frenchmen even in the Left Centre itself who cherish un. spoken misgivings as to the possibility of such a Republic as M. There used to promise them. So long as their doubts are not removed, they are a latent source of strength to the Orleanist party. They have no love for Royalty as personified in the Count of Charson. The Fleur de Lys and the State coach and the white charger are thrown away upon them. But they would like an Orleanist King, if he could be had, not because they had kings to be hedged about with any special divinity, but because they regard them as useful institutions for the hedging about of property. A few years' experience of a successful Republic might modify this view, and when the Count of Pasis offered himself as a candidate for their support, they might answer that the Republic had turned out so much better than expectation that they had no desire to change it. If these profils hat any and the pasing the country of the support of t to change it. If these useful but unromantic supporters are to be kept in tow the Government must be prevented are to be kept in tow the Government must be prevented from taking too definite a shape. That shape cannot at this moment be Monarchical, and it would be most dangerous to allow it to be Republican. So far the Right and the Duke of Brockin are agreed. Where they part company is on the means by which the evil day is to be postponed. The Right wish that everything should be left must that it order that the Count of Change the ship maettled in order that the Count of CHARBORD may be able to take instant advantage of any unforeseen opportunity.

The Duke of Brogles, not being specially interested in the Count of Chambor's fortunes, wishes a provisional organisation, during which the Count would have time to grow old, and to appreciate the blessings of such repose as might be secured by abdication. The Duke wants to get as much provisional organization as is compatible with retaining his majority; the Right want to get as little as is compatible with not displacing the Duke of Brogle. Neither will yield everything to the other, because to do so would be to give up the very things that each thinks most worth fighting for; but both are probably willing to yield a good deal rather than risk the evils which would to all appearance follow upon a rupture.

The immediate questions which divide the Right and the PRIME MINISTER are the provisions for the transfer of the executive power in the event of Marshal MacMahon's place becoming vacant from any cause, and the time at which the new Electoral Law is to be brought forward in the Cham-ber. The provisions for the transfer of the executive power are contained in the Bill creating a Second Chamber. Supposing Marshal MacManon to die or to resign his office, the President of the Grand Council will immediately convoke the two Chambers for the purpose of electing a successor, but this successor need not take the title of President of the Republic, nor need his powers be limited as Marshal MacMahon's are limited. This arrangement does not quite square with the views either of the Royalists or of the Republicans. The Royalists, at least the Legitimist Royalists, dislike the admission that the throne is to remain vacant during the whole of Marshal MacManon's tenure of office. They wish to be able to propose a Restoration whenever it pleases them, without having to wait for Marshal MacManon's death or retirement, and the subsequent convocation of a Constituent Congress by the President of the Grand Council. The Republicans dislike the postponement of the definitive recognition of the Republic, and the distinct acknowledgment that the system which is to succeed the Septennate need not be a Republic at all. But, on the whole, the Bill is calculated to satisfy Royalists rather than Republicans. The Republicans, if the Duke of BROGLIE would let them, could organize the Republic. The Royalists, even if the Duke of BROGLIE gave his consent, could not be a chart a Partontion Consequently the postpongment. bring about a Restoration. Consequently the postponement of a definitive settlement is more in the interest of the Royalists than of the Ropublicans. The latter have to Royalists than of the Republicans. The latter have to resign what is almost within their grasp; the former have to resign what there is not the slightest chance of their at present obtaining. It is probable that this distinction will commend itself to the Right, and that when the Bill for creating the Grand Council and investing its President with the uncertainty of the president with the p its President with the proposed functions is brought forward, they will give it a gradging support. The majority thus kept together are still strong enough to carry any measure through the Chamber, even if the minority were united in opposing it. As a matter of fact, however, the minority will not be united. Cautious Republicans will, on the whole, be thankful that the existence of the Republic is assured for the present, and will look forward to the eventual defeat of the Duke of BROGLIE on some less critical issue, and to his possible replacement by a Minister of less monarchical tendencies.

The question whether the new Electoral Law is to be debated immediately touches the Right more nearly. They are certainly not in love with universal suffrage, and they must be quite aware that successive partial elections under the present law will in the end completely change the character of the Assembly. Against this, however, is to be set their extreme dread of a dissolution, which would entirely scatter their forces; and they fear that, if the Duke of Broglie were better pleased with the composition of the electorate, he might be less unwilling to try the experiment. The Bill for creating a Second Chamber vests the power of dissolution in the President of the Republic, acting with the consent of the Grand Conneil; and as even the Extreme Right can hardly deny that a representative Assembly must sometimes submit itself to the judgment of its constituents, this provision will probably be adopted. In that case the next time that the Right wishes to put a pressure on the Government, the Duke of Broglie might answer that rather than submit to be coerced in the present Chamber, he would try his fortune in a new one. Or, supposing the Duke to want to put a pressure upon the Right, he might remind them that, if he resigned, his successor would at them a tyranny which had been greater than even the

Duke of Beogue could bear. As there is a general agreement on the part of all sections of the majority that a dissolution must not be risked until the constituencies have been properly purged of their Radical elements, or at all events have undergone the weeding process which it is hoped will have this effect, the postponement of the Electoral Law would save the Right from being export to these possible dilemmas. Their wish, therefore is that the new municipal law shall be brought forward first, and as the discussion of this would probably occupy the remainder of the Session, the evil day would be put off till November. It is doubtful, however, whether the Duke of Broque will consent to this; and if he perseveres in placing the Electoral Law at the head of his list of measures, the Right will probably give way. The reasons which lead them to dislike the Bill are not such as can be avowed, except by a few reckless partisans, and it is difficult to oppose a Minister who can hardly be done without upon no assignable grounds. On the whole, therefore, the chances are that the present quarrel between the Duke of Brogue and the Right will, like many previous quarrels, be patched up at the last moment.

LORD REDESDALE'S MOTION.

MOTION of Lord Redesdale's which gave rise some days ago to a short conversation in the House of Lords involved a principle more important than the not inconsiderable interests which it directly affected. The House of Lords wisely declined to pass a resolution relating to the duty of Select Committees which would not even have controlled their proceedings. Lord Redesdale proposed to declare that compulsory powers ought not to be granted to Railway Companies for the construction of lines intended to accommodate private persons. The Duke of RICHMOND properly declared that, as a member of a Committee, he would not consider himself bound by any resolu-tion of the kind. The House of Lords entrusts to Com-mittees the judicial duty of balancing private interests against public wants, and it would be an anomaly to instruct them that any kind of property is to receive special protection, or that a certain kind of public utility may not justify expropriation. It is perhaps to be regretted that the Duke of RICHMOND and several other peers should have expressed their approval of the theory which Lord REDES-DALE proposed to enforce by a general rule. It is scarcely possible that the case to which the resolution referred should actually occur. Railway Companies are not in the habit of projecting branches leading to the doors of private houses for the convenience of owners. Where their object is to afford an outlet to goods or minerals, it is inaccurate to describe their undertaking as tending exclusively to the benefit of private persons. Producers may be few, and any one or more of their number may be invidiously described as private persons; but the railways which accommodate their traffic are at least as useful to the consumers as to the sellers of any commodity. The dairymen who supply London with milk which is conveyed by railway are perhaps private persons, but it would be hard on the population of London if railways leading from the dairy farms were probibited. It can never be the interest of a Railway Company to spend some thousands of pounds on a branch, except for the purpose of bringing a proportionate amount of traffic to the main line. The purchasers and consumers of the articles conveyed are not the only persons to be considered in addition to the producer, who attracts Lord Redesdale's exclusive notice. The whole community is interested in the large-ness of the supply of useful articles of consumption, inasmuch as it tends to the reduction of prices. The exclusion of any single producer from the market by the enforcement of Lord Redesdale's rule is equivalent to the arbitrary establishment of a monopoly in favour of those who are more favourably situated. Compulsory powers furnish the only security for the access of outlying districts furnish the only security for the access of outlying districts to the existing railway system.

Lord Redesdale's object was to protect a small class of private persons in the enjoyment of a right which scarcely descrives extraordinary regard, though it is perhaps, like other kinds of property, entitled to consideration by Parliamentary Committees. His general and argumentative, resolution referred solely to the preservation of wayleaves in mineral districts. The mention of manufactories and other private undertakings had probably no relation to any

case which has occurred in practice. Mines and coalpits are useless and unworkable unless they have access to railways; and it seldom happens that they are traversed, like the Clay Cross colliery in Derbyshire, by a main through line. It therefore becomes necessary to form thanches from the nearest railway; and Lord Redesdale's farmed that the construction of the lines should in many cases be rendered impossible scarcely deserves the favour which it received in the House of Lords. The peers instinctively inclined to the side of the landowner; and they forgot for the moment that coal and other minerals are mituated under the land. The owner of the narrowest strip of land intervening between a pit and a railway may, if compulsory powers are refused, absolutely prohibit the working of the coal. In some hill districts half a dozen small freeholds bar the way to the line which can alone take the minerals to market; and Lord Redesdale would give every petty owner the opportunity of charging his own price for allowing the coal to cross his land. If all the minerals in a district were separated from the neighbouring line by private property, Lord Redesdale, if he is consistent, would allow the owners to levy a discretionary toll.

It is easy to see that one consequence of the adoption of Lord REDESPALE'S rule would be to cause railways in mineral districts to be constructed, not in the most convenient direction or with the best gradients and curves, but for the purpose of avoiding the obstructions which landowners might place in their way. Mineral property is usually held in tracts of considerable extent, more especially where the depth of the seams renders it necessary to raise coal from the largest possible area by a single pit. It may well happen that the mineral owner may, by the construction of a circuitous line, be able to obtain connexion with the railway, when it would be for the interest of all parties that he should adopt a shorter and cheaper route. The refusal in all such cases of compulsory powers would operate with varying harshness, but with universal inconvenience, in almost every separate case. The attention of the House of Commons has been called within the present week to the imaginary character of the supposed rule that no private person shall be allowed to take by compulsion the property of his neighbour. As Mr. STAVELEY HILL explained, no such doctrine has ever been formally propounded or accepted; and in some instances great proprietors have been allowed the same privileges with incorporated Companies for the execution of great public works. The more extravagant theory that no Company shall promote a line to a mine or to a mineral-field would, if it had been adopted twenty years ago, have prevented the construction of some of the most useful lines in the kingdom.

In the present temper of the House of Lords it would perhaps not be expedient to establish a general rule for dealing with wayleaves. The Committees which consider special applications have the opportunity of rejecting the powers which may be sought, or of imposing conditions on The question whether compensation should be granted for the tolls which may hitherto have been levied is not without difficulty. s not without difficulty. In the analogous case of drainage Acts, owners of land on lower levels have been compelled to allow the water above to find an outfall, on receiving compensation for interference with their property, but not for their mere right of obstruction. Perhaps a distinction may be drawn between wayleaves already established and those which derive their alleged value from the modern extension of mining enterprise. Where a bed of ironstone extension of mining enterprise. Where a bed of ironstone is discovered, or where a coal-field becomes capable of being profitably worked in consequence of the exhaustion of other sources of supply, it can scarcely be assumed that the land-owner who holds the key of the passage to a market is de-prived of any advantage on which he can have reasonably calculated by the construction of a public railway across his property. The whole system of compulsory purchase, which is indiapensable to the formation of channels of communication, is founded on the justice and expediency of providing the means of intercourse between consumers and producers. The former owners of the land which is now traversed by railways have not been allowed to charge a wayleave or a toll on the right to pass between London and Liverpool or Bristok. It is incumbent on Parliament, and more especially on the House which consists almost wholly of landowners, not to multiply unnecessarily the more invidious privileges which attach to the possession of land. The theorists who complain that both the surface of the land and the minerals below it are subjects of monopoly, might derive a new and plausible argument

from the claim of intervening owners to levy a tax on the transmission of coals, of iron, or of any other commodity. A great proprietor who some time since threatened that he would in a certain contingency discontinue the working of his coalpits incurred just criticism on the ground that he would, if he had executed his menace, have exposed the rights of property to a dangerous strain. The community at large has an equitable or moral claim to purchase the necessaries of life at market prices from those who happen to possess them and to be willing to sell them. Economists may doubt whether the consumer or the producer pays the tax imposed on a right of way; but the proposal that a tollgate shall in the majority of cases be erected wherever minerals seek connexion with a railway is startling and novel. A railway map of any coal-field shows a complicated ladder of branches connected with the main line; and in hundreds of instances the offshoots have been created by the Railway Company with the aid of compulsory powers. The attempts to introduce a new system for the exclusive benefit of a few landowners ought to be carefully watched.

THE DEBATE ON THE LICENSING BILL.

PARLIAMENT, like an individual, should settle what its object is before setting to work, and then there may be hope of some useful, although perhaps humble, result of labour. One member of Parliament is so anxious to remove all pretext for selling liquor after midnight that he proposes to make the theatres open half an hour earlier, in order that they may be closed soon enough to allow all concerned in them to get their suppors and drink within what he considers proper time. Unfortunately for this proposal, it happens that the West-End theatres are already open for half an hour or an hour before the best class of audience can be got to come to them. The hours of audience can be got to come to them. London are unnecessarily late, and as they cannot well be later, there may perhaps be a return, although that is improbable, to earlier hours. It seems strange that many hundreds of thousands of persons should prefer gas to daylight, but the habit exists, and is probably unchangeable. At any rate we do not think it will be changed in order to obviate the necessity of amending the Licensing Act of 1872. As regards the metropolis this necessity is admitted, and as regards the great provincial towns it cannot surely be impossible to ascertain whether the same necessity exists. If the House of Commons can go into Committee with the determination to ascertain and provide fairly for the public wants, the result ought to be accepted even by those who may be disappointed at it. In this as in many other departments of legislation the late Government caused dissatisfaction not so much by what they did as by the principles on which they did it.

It is admitted by Mr. MELLY that there is a considerable body of hard-working persons who are compelled to turn night into day, to whom it would be a great grievance to be deprived of the opportunity of obtaining refreshment; but he professes to think that it is right that some sacrifice should be made for the general good, and to seeme the great benefit that would accrue from the early closing of public-houses. It is so certain that Parliament will not legislate upon this principle that we need not inquire whether Mr. MELLY himself seriously holds it. fortitude which makes light of the hardships undergone by others is not an exalted type of virtue. It is sometimes convenient as well as safe to demand changes which are not likely to be adopted. The people who would have to sacrifice themselves for the general good must give up the prospect not only of bread and cheese and beer, but of a cup of coffee and a biscuit after twelve o'clock. It has been discovered that some forms of immorality are capable of existing apart from public-houses, and therefore is is proposed to apply further limitation of hours to places where "innocuous" refreshment is supplied. If it be true that the trade almost unanimously desires twelve o'clock as the hour for closing in London, it may be hoped that a tolerably satisfactory arrangement will be arrived at. The necessity for the public convenience of some extension of hours is more clear in London than elsewhere. But it is evident that, if the hours are to be fixed by the Bill, sufficient latitude must be given to allow provision to be made everywhere for the satisfaction of reasonable wants. The trade desires above all things that the hours shall

be fixed by the Bill, and it is apparently willing to submit for this object to considerable restriction. The public under these circumstances must look out for itself, and, as regards large classes of Londoners, their wants have been sufficiently made known.

But we do not find very strong demonstrations from the large towns. Mr. Melly says that in Liverpool the magistrates have condemned the proposed extension from eleven to half-past eleven o'clock, the clergy have con-demned it, the police have reported against it, and the licensed victuallers wish to be let alone. If there is any strong case on the other side, now is the time to bring it forward. Mr. HERMON thinks that the public has become accustomed to the new hours. There had been of course exceptions, and in some towns in the North, he believed, much public inconvenience had been felt. In his town (Preston) they had suffered as much as anywhere. Yet he, a Conservative, intimated disapproval of the proposed extension. It is difficult without local knowledge to estimate the nature or extent of the inconvenience sustained in Preston, but in a town of less than a hundred thousand inhabitants it is hard to believe that there can have been any large number of persons who were seriously prejudiced. Where there is real inconvenience we may doubt whether the proposed concession is sufficient to remedy it. In London it is certainly inadequate, and we may venture to doubt whether the closing of all places of refreshment at half-past twelve o'clock will be permunently maintained, unless indeed, as is probable, this strict law be largely tempered by evasion. Mr. Cross tells us that at present persons buy spirits at public-houses and take them to eighr and coffee shops for consumption. The coffee-shops are now to be brought under the same law as the public-houses, and perhaps zealots may be emboldened to propose to apply the same treatment to eight-shops. As regards Liverpool and other great towns, if the magistrates regards inverpool and other great towns, it the ingistrates and police are satisfied with the existing state of things, it would not be easy to show that they are mistaken. It is said that early closing of liquor-shops promotes "illicit" drinking elsewhere; but if this only means that people buy drink and carry it home with them, this proceeding is not "illicit" in any ordinary acceptation of the word. At the result was get death after instead tion of the word. At the worst men get drunk after instead of before they traverse the streets, and thus they escape notice by the police, and their town's statistics of drunkenness are not affected by their conduct.

Some of the questions arising upon this Bill are that question as to which a Judgo said, "A "jury would decide this question, but how they would "decide it, Heaven knows." On this account perhaps Government consented to allow these questions to be settled in Committee of the whole House of Commons. That House has been recently elected, and members ought to know what their constituents desire. If this course were not adopted, the only other satisfactory course would seem to be that of inquiry by a Select Committee. The Home SECRETARY had doubtless taken pains to ascertain the wants and wishes of the great towns, but it would appear from Monday night's debate that he had not been altogether successful. Probably the best solution of the diffi-culty would be found in that clause of the Bill which encourages early closing by a reduction of duty. If the trade in any district of the metropolis could agree among themselves to adopt an earlier hour than that fixed by law, they would gain the benefit of this reduction, and also all the other benefits of shortening their period of daily labour. In other districts, such as the Strand, some of them might think it worth while to keep open to the latest hour allowed by law, and the others would probably be compelled to do the same in order to avoid loss of custom. As regards the great provincial towns, the same method might be applied, either maintaining the existing hours, or extending them by the proposed half-hour, if it appears upon further discussion that the half-hour's extension ought to be conceded. As regards the demand of the beer houses to be placed on an equality with the public-houses, that also may be considered in Committee. But even if this demand be well founded, which we think doubtful, it is at any rate certain that an inducement should be offered to these houses to close early; or which comes to the same thing—they ought to pay for the privi-lege of keeping open late. The trade will accept any reasonable settlement of this question for the sake of getting it settled by Parliament, and taking it out of the hands of magistrates. We have profound disbelief in the

statistics of drankenness quoted by Mr. Mazzr. But the Home Office can easily ascertain from the police of Liver-pool or any other great town whether the working of the Act of 1872 has been favourable to sobriety. If it has worked well, let it be maintained. But an Act cannot be said to work well if it is largely evaded, and, as regards London, the statements of Mr. Cross leave no doubt that a considerable amount of illicit trade has been carried on. We do not believe that this could be done anywhere without the police either knowing or suspecting it, and the fact that a law of this kind is largely evaded goes far to show that it is impolitic. As regards relief from the penal clauses of the Act of 1872, the Bill has been generally approved, and the trade will do wisely to reciprocate the confidence which the Government has shown in it, and this indeed its leaders appear desirous to do. The movement in favour of uniform early hours is judicious, and if the publicans could reduce the public to the necessity of asking them to keep open a little later, their position would be greatly strongthened. They must be tolerably well persuaded that London is not prepared to see all houses of refreshment of every kind closed at midnight. In one respect the publicans are likely to be disappointed. are jealous of the grocers who sell bottles of spirit, and their organ the Morning Advertiser says that the contents of these bottles are drank in the streets. Even if they are, the grocers can hardly be held responsible. But the probability is that the bottles are carried home for "private," or, as some speakers in the debate said, "illicit," drinking. The law cannot interfere with that, and indeed it appears that the publicans compete, as they are entitled to do, with the grocers in this traffic. Some strong statements were quoted by Sir H. Selwin-Ibbetson as to the increase of this "private" drinking in provincial towns, and we may be reprivate "drinking in provincial towns, and we may be tolerably sure that the bottles are destined not so much for strictly "private" use, as for some club or party of persons who object to go to bed at eleven o'clock. These statements qualify the rosy view derived from figures. But if the limitation of hours by the Act of 1872 has not done so much good as enthusiasts believe, we can hardly be appropriated that it has done much positive laws and the statement of the statement persuaded that it has done much positive harm except to the Ministry which carried it. But in London it has undoubtedly caused great inconvenience.

SENSATIONALISM.

SENSATIONALISM.

We know not who was the inventor of the now popular word "sensational." Whoever he may have been, he provided a very convenient phrase, but one which, like most other such phrases, was misapplied as soon as it became popular. It has been used, that is, to condemn some perfectly sound as well as some very mischievous forms of art and literature. The ordinary mind contriges to modify all sound canons of criticism so as to adapt them to its own view of things; and a good service might be done by anybody who would explain a little more clearly what is the real force of a word which is used recklessly enough in the current cant of the day. The Bishop of Derry, preaching one of a series of sermons upon "the use and abuse of the world," chose this for the subject of his discourse; and, so far as we can judge from the report, made some sensible remarks upon it. At the same time we are bound to confess that he does not appear to have defined his meaning quite so plainly as might be desirable. Sensationalism, he is reported to have said, is "a morbid taste for producing sensation at any cost and by any means in every department of life, he is reported to have said, is "a morbid taste for producing sensa-tion at any cost and by any means in every department of life, conduct, and manuers"; and sensation means, it appears, "emo-tional sensibility, good or bad, astonishment, morbid curiosity, violent disgust, unwholesome attraction." Now, of course, a mor-bid taste for producing a morbid sensation at any cost is a very bad thing; and the novels of which the Bishop speaks, which are simply declarations against marriage and assertions that the affections cannot be restrained by duty, pruclaim a very objectionable code of morality. But this is little more than saying that vice is vice, cannot be restrained by duty, proclaim a very objectsousous cous of morality. But this is little more than saying that vice is vice, and that defences of vice are vicious. How are we to know where the injurious element intrudes? The devil is generally a great deal too cunning to reveal himself with hoofs and horns, and prefers to appear like Mephistopheles as a well-dressed gentleman perfectly conversant with the mages of good society. Where them does semantionalism in a had sense begin, and legitimate appeal to the emotions leave off? How far is such sensationalism really characteristic of modern life, and what is its cause and cure? These are the emotions leave off? How far is such sensationalism really characteristic of modern life, and what is its cause and cure? These are amongst the questions which we should like to see sufficiently answered; and the Bishop's sermon, as reported, does not seem to go very far towards clearing them up. It is pretty clear, indeed, that he made sufficiently distinct reference to certain special instances of the vice which he was attacking. Some writers, when we need not attempt to name, have offended so greatly against all the laws of decency that to attack them is like adding a chimney-sweep black. They prefer vice to virtue, and they impudently

avow their preference and call it a theory of art. When they do not offend against the laws, they can only be put down by severe moral reprolation; but it is not these flagrant offenders who can properly be described as sensational. They may be described in shorter, more old-fashioned, and more emphatic language.

The importance of making the definition rather closer appears has we consider some of the conclusions which will be incidentally in the second in Institute. The apparent inference would be that novelists ought not to deal with bigamy, murder, and other gross offences. Obviously such a rule would at once condemn many of the greatest performances in literature. The Greek and the novelists ought not to deal with bigamy, murder, and other gross offences. Obviously such a rule would at once condemn many of the greatest performances in literature. The Greek and the English drama would have to be horribly mangled. No decent person would be allowed to keep Hamlet in his library; (Jarissa Harlowe and Tom Jones would be put in the Index; and many even of our modern novels would be ruthlessly destroyed. There is a bigamy in Pendennis, one of the least sensational of novels; there is a seduction in Adam Bede; and Dickens, of whose moral influence the Bishop speaks highly, is full of incidents which fall beyond the line of prohibition. The Bishop of course does not share the misconception, but it is the popular interpretation of the phrase, and serves to justify some totally absurd criticisms. Whenever a milk-and-water novel is published, in which the most startling incident is an offer of marriage by a respectable clergyman to a young lady in his own position of life, it is praised for the healthiness of its sentiments, and the author is immediately compared to Miss Austen. And yet we would venture to say that some stories in which there is not so much as a hint at the possibility of a breach of a single social rule, to say nothing of the moral law, are less healthy reading than Hamlet or Othello. Indeed there are some novels of the so-called sensational kind which are much more edifying than their prudish rivals. Victor Hugo, for example, has enough of the sensational element to supply a whole generation of English novelists; and in some cases it produces very unfortunate results; and yet the Mistrables is a story which, in spite of its absurdities and its bombast, is not merely remarkable for its art but for its moral force. Now the indiscriminate condemnation of sensationalism, when it is taken to include all vigorous descriptions of the strongest human passions, justifies a revolt. Art is not to be put into a when it is taken to include all vigorous descriptions of the strongest human passions, justifies a revolt. Art is not to be put into a straitwaistcost, or rather into the drab coat of a Quaker, or it will burst its bonds and get into mischief. Thackeray, for example, complains in *Pendomis* that nobody has been allowed since the time of Fielding to draw a genuine man. We only permit that side of a man to be depicted which is presentable in a drawing-room. Popular writers often declaim upon the services rendered by Scott and Dickens in purifying English fletion. We certainly would not undervalue that service: and yet we cannot help remains when it is taken to include all vigorous descriptions of the strongby Scott and Dickens in purifying English fiction. We certainly would not undervalue that service; and yet we cannot help remembering that, after all, one meaning of it is that English society is so prudish that no novel can have a large sale which does not obey certain rigid rules of propriety. Sometimes those laws are evaded by smuggling in the forbidden commodity under an external appearance of propriety; and at times writers have rebelled altogether, and tried the effect of downright indecency. Neither result can be contemplated with antice satisfaction.

result can be contemplated with entire satisfaction.

The Bishop, therefore, should have preached a complementary doctrine, which, we must admit, it might be rather difficult to get doctrine, which, we must admit, it might be rather difficult to get comfortably into a sermon. And yet it might surely be said without offence that the dark side of human nature may be rightfully portrayed in such a way as to do good service to morality; and even that an art which entirely abnegates that function is pretty certain to become puerile or elieminate. The difference between moral and immoral art is not in the subject-matter, but in the mode of treatment; it is not that one writer deals with bigamy, and another never suggests a breach of the marriage laws; but that one possesses a healthy, and the other a morbid, mind. The inevitable tendency of mistaking prudishness for decency is to generate a confusion between brutality and manliness. A boy who has been brought up under narrow restraints is very act, as who has been brought up under narrow restraints is very apt, as everybody knows who has been at a University, to break out into degrading excesses. And some of our modern writers remind us everybody knows who has been at a University, to break out into degrading excesses. And some of our modern writers remind us of nothing so much as of strictly taught little boys who fancy that what is forbidden must have some romantic charms; and, as soon as they get loose, find a delicious flavour in outrages on decency. The doctrine, it may be said, is dangerous; and indeed modectrines have a dangerous side; but if they are not sometimes plainly stated, more dangerous misunderstandings are the natural

consequence.

If we sak, then, where sensationalism begins to be evil, the answer must be partly that there are no obvious external tests which can possibly decide. Good and evil are unluckily not ticketed so conspicuously as we could sometimes wish. We must even confess that books vary in their influence according to the reader; and that some minds may extract a poison from that which is healthy food to where. One thing more, however, may be said. For example, a picture of violent death may be either degrading or elevating. If the artist has taken a noble view of his subject, he may appeal to our compassion, to our sympathy with courage, to our admiration of the physical beauty and the moral attength of the victim. If he has taken a debasing view, we may "be affected simply as we are affected by the sight of blood, or the signs of pure shysical pain. The technical skill may be the same in each case; but one may sicken every healthy mind, and the other may help to elevate even a morbid mind. Some representations of the Crucifixion are amongst the greatest triumphs of noble, art,

and some are simply painful and dispesting. The ordinary cant about emeationalism would condemn both because both are suggestive of pain; or possibly would say that the death of a criminal is an imposing subject, and the death of a marryr demoralizing, because in one case vice is panished, and in the other virtue. Such methods of artistic criticism are seen by everybody to be ludicrous in this case; and yet they are substantially adopted by many simple-minded literary critics. The real question is whether the artist is so weak that he can only present the physical fact, or whether, if he is able to transform it by a powerful imagination, it is an imagination of a healthy or a discussed type. A sensational nov-list, on the same principles, is either a writer who, having no intellectual power, trics to interest us by cuttings from newspaper reports of crime and misery, or one who exarts greater newspaper reports of crime and misery, or one who exerts greater powers for degrading purposes. In both cases the instinct to which he appeals in his readers is one which ought to be suppressed rather than stimulated. The root of the ordinary sense-tionalism of the bad variety is sheer insensibility. A stupid clower, which have in the test transfer in the root of the ordinary sense. tionalism of the bad variety is sheer insensibility. A stupid clown, who has no intellectual interests, derives a sort of agreeable titillation from the sight of pure animal pain. His prototype is to be found in He, arth's disgusting, though well-meant, pictures of the stages of cruelty. He likes to see animals worrying each other, or men pounding each other into jellies, or kicking in agony at the end of a rope. On the same principle, a murder in a novel is only less attractive than in a newspaper in so far as it is less credible. This kind of sensationalism may be expected to disappear as human beings become, us it is supposed that they are slowly becoming, more civilized. It is blended, however, with that other form of sensationalism which is characteristic of a rather higher class of literature. This is the product of the weariness produced by the semantionalism which is characteristic of a rather higher class of literature. This is the product of the weariness produced by the incessant worries of modern life, or a surfeit produced by its excessive respectability. We are bothered by being incessantly driven backwards and forwards in omnibuses, and hunted by telegrams, and lectured daily by leading articles; and we are tired of having always to wear black hats, and to conform to the troublesome demands of social ctiquette. We are relieved for the moment by anybody who will show us a bit of unsophisticated nature, even if it takes the form of a mere brutal passion, or a revolt against virtue, as well as against the conventionalities. The revolt egainst virtue, as well as against the conventionalities. The remedy may not be an easy one; but it does not consist in simply denouncing the natural instinct which requires some more stimulating food than the petty interests of daily life. Hather we should endeavour to supplant the ignoble by a nobler form of sensationalism. We should show, as a great artist can show us, that there are still many things worth living for; that there are profound issues at stake; and that beneath the supericial current of daily life there are forces as great and passions as strong as were ever at work in society. We have spoken of Victor Hugo as a case in point; and if his unmistakable genius were under the guidance of a saner judgment, no one would be better able to show how a vigorous art may still be possible without pendering to the baser passions and the diseased appetites of the time. revolt against virtue, as well as against the conventionalities.

THE NATURAL HISTORY OF MEN OF SCIENCE

SCIENTIFIC men have been so long engaged in lecturing on other people that it is refreshing, as a change, to find them being lectured upon in turn. They are, as may be supposed, a very curious and interesting branch of the human species, and quite as worthy of having their natural history written as monkeys or star-fishes. Mr. Francis Calton has, it seems, for some time had has eye on them, and is preparing a microscopic analysis of their physical and moral peculiarities. In the meantime be has treated the Royal Insti-tution to a short lecture on the "nature and nurture" of Fellows of the Royal Society. His data have been obtained, he tells us, from a large collection of autobiographical notes communicated to him by many of "the leading members of the scientific world." Applicamany of "the leading members of the scientific world." Applica-tions for information were addressed to 180 Fellows of the Royal Society, who, in addition to their F.R.S., had gained medals or filled offices of recognized scientific position; and 115 replies have been received, most of which contain full and detailed answers to the questions asked. Mr. Calton believes that he might have included three hundred names in his list without descending in the scale of scientific position, and he reckons the proportion of men of science to the rest of the population at about one in 10,000. In the paper before us he attempts to unswer the question—What are the conditions of nature, and the various circumstances and conditions of life, which lead to the production of the scientific minority ?

The first quality, in order of importance, which is found among men of science is energy, both of body and mind. Dr. Livingstons and one or two other travellers are included in Mr. Galton's list, but these may be reported as exceptional cases. extracts are from the returns filled up by men of science of a more ordinary type. One correspondent writes:—"Have rowed myself in a skill 105 miles in twenty-one hours whilst undergraduate at in a skiff to5 miles in twenty-one hours whilst undergraduate at Cambridge. Rowed in every race during my stay at the University; rowed two years in the University crews." Another "walked many a time fifty miles a day without fatigue, and kept up five miles an hour for three or four hours." A third "oxcelled at school and college in athletic sports, especially in jamping (eighteen feet). Almost incapable of mental latigue by to the ago of thirty-eight. Usually engaged in literary work until long efter midnight." And a fourth says, "As a boy of seventeen I worked for three months all day and all night, with not more than four or five hours' sleep. When full of a subject and interested in it, I have written for seven or eight hours without interruption." Another proof of energy is the severe scientific work which is often done at night by men who have been engaged all day in anxious business. "In early life as a boy," writes one of Mr. Galton's subjects, "I was engaged in business from twelve to fourteen hours a day yet always found time to study and make my own instrusubjects, "I was engaged in business from twelve to fourteen hours a day, yet always found time to study and make my own instruments. Later on, my studies and scientific work were always accomplished after business hours, and it was generally my habit to commence after dinner, and to work at science until 2, 3, or 4 A.M., and to begin business again at 9 A.M. I never thought of rest if I had anything in hand of interest."

Mr. Galton's friends, notwithstanding their hard work, show an enviable bill of health, especially when we remember that the majority of them are middle-aged men, and many of them of an advanced age. One quarter of the whole have excellent or good health, a second quarter have good or fair, a third have had good

health, a second quarter have good or fair, a third have had good health since they attained manhood, and only one quarter make health since they attained manhood, and only one quarter make complaints or reservations. Here are two examples of excellent health:—(1) "Only absent from professional duties ten days in thirty years; only two headaches in my life;" (2) "Never ill for more than two or three days, except with neuralgia; no surgical operations, except inoculation, drawing of one tooth, and cutting of corns." Taken altogether these cases represent a very healthy group, and Mr. Galton notices that the fathers and mothers, as a rule, also enjoyed good health. From this he deduces very fairly that the children of couples in poor health are incapable of pushing their way to the front ranks of life. He also remarks incidentally that energy appears to be correlated with smallness of pushing their way to the front ranks of life. He also remarks in-cidentally that energy appears to be correlated with smallness of head. The average circumference of an English gentleman's head is 22½ to 22½ inches, but in his returns Mr. Galton has thirteen cases undef 22 inches, and only eight of 24 inches and upwards. The large-headed men of science have much less energy than the small-headed men, though intellectually on an equality with them.

Practical business habits are noted as another quality common among men of science. In Mr. Galton's list there are seventeen Practical business habits are noted as another quality common among men of science. In Mr. Galton's list there are seventeen who are active heads of great commercial undertakings, ten medical men in the highest rank of practice, and eighteen others who have filled important official posts. "I have no special talent," writes an eminent biologist, "except for business, as evinced by keeping accounts, being regular in correspondence, and investing money very well." Independence of character is also a feature which is said to be strongly developed in scientific men. Fifty of Mr. Galton's correspondents have it, as he thinks, in excess, and in only two is it below par. One ran away from school because he thought he was unfairly treated by the master. A second boasts that his "opinions are in almost all respects opposed to those in which he was educated," another that he has "a preference for whatever is not in fashion"; while a third holds that "his heresy prevented his advancement." In some instances the spirit of independence is hereditary. "My father," says a correspondent, "never took off his hat to any one in his life, and never addressed any one as Esq." As confirmatory evidence, Mr. Galton refers to the strange variety of small and unfashionable reflicious sects to which many scientific men or their parents have belonged. Dalton, the discoverer of the atomic theory, and Dr. Young, who discovered the undulatory theory of light, were both Quakers. Faraday was a Sandemanian. In Mr. Galton's returns there are numerous cases of Quaker pedigree, and libble Galton's returns there are numerous cases of Quaker pedigree, also representatives of other small sects, such as Moravians and Bible Christians. Unitarians are numerous. To these various qualities Mr. Galton adds a strong innate taste for science. This passion, though hereditary in many cases, is said to be more capricious than health or energy, and it often happens that the scientific man is the only member of his family in whom it is displayed. One correspondent says, "I had no regular instruction, and can think of no event which especially helped to develop it. Bones and shells were attractive to me before I could consider them with apparent were attractive to me before I could consider them with apparent profit, and I had a fair zoological collection by the time I was lifteen." Another writes, "If any tastes were innate mine were. They date from beyond my recollection. They were not determined by events occurring after manhood, but I think the reverse; they were discouraged in every way." "While a schoolboy," says a third, "I taught myself under great difficulties." Attention is also called to the provalence of mechanical tastes among men of acience. A chemist made a twelve-inch reflecting telescope; two minent surveyers have a great antitude for mechanical manipulascience. A chemist made a twelve-inch reflecting telescope; two eminent surveyors have a great aptitude for mechanical manipulation; two very eminent biologists had a passion for it, and both, if they had followed the bent of their own minds, would have been engineers by profession. Another peculiarity is said to be a deficiency in "the purely emotional element, and in the desire to influence the beliefs of others." "Scientific men," says Mr. Galton, "school a naturally equable and independent mind to a still more complete subordination to their judgment. In many respects their character is strongly anti-feminine." This description is certainly open to question. It may be true that "two out of every ten do not care for politics at all "; but they are not "devoid of partisanship." Men of science probably take very little interest in politics; but that is simply because they are occupied with other things. With regard to matters that really interest them they are often the keenest and most intense partisans imaginable. There is perhaps no set of people who are more dogmatic, intolerant, or prone to crush, at any rate with contempt and disdain, every one who ventures even on the minutest petint to disagree with them. The men of science, we are some

times told, are the priesthood of the future, and they occasionally display some of the least estimable qualities of the priesthood of the past. It has been said with considerable truth that the temper of some of them is more nearly skin to that of the Inquisition than of some of them is more nearly akin to that of the Inquisition than the temper of any existing sect. On the subject of education there seems to be a general concurrence on the part of Mr. Galton's correspondents in favour of latitude and variety. "Freedom to follow my own inclinations, and to choose my quantum subjects of study or the reverse," to which one of them attributes his success in science, would probably be welcomed by many young gentlemen, but would perhaps not invariably lead to a satisfactory

result.

Mr. Galton sums up the elements of the scientific character as follows—energy, health, steady pursuit of purpose, business habits, independence of character, and a strong innate taste for science. It must strike every one, however, that, with the exception of the last, these are just the qualities which one would expect to find, and which in point of fact are found, in men who distinguish themselves in any pursuit. Intellectual acuteness goes for very little in any sphere of activity without energy, and it is consequently the energetic men who make their mark. Persistency is of course only sustained energy, while business habits are another name for regulated force. These while business habits are another name for regulated force. while business habits are another name for regulated force. These are all qualities which, if applied in any direction, would be tolerably certain to produce notable results, and it is absurd to speak of them as if they were in any exclusive sense the possession of men of science. It would be as reasonable to draw special attention to the circumstance that men of science have eyes, mouths, and noses. If Mr. Galton had sent out his circulars to 180 eminent merchants, engineers, soldiers, cotton-spinners, or artists he would not have required practice much the same or artists, he would probably have received pretty much the same replies as from his 180 Fellows of the Royal Society. On the other hand, the men of science would in all likelihood have disother hand, the men of science would in all likelihood have distinguished themselves in other spheres if they had happened to be thrown into them. In short, it all comes to this, that, as a rule, men who are successful in scientific pursuits possess much the same native qualities which are essential to success in other pursuits. No doubt there is in certain rare cases a genius for scientific investigation as there is a genius for poetry or for generalship; but below this exceptional altitude, men of science are extremely like other men, and the secret of their schievements will be found to lie mainly in their special devotion to a particular subject. Mr. Galton himself points out that some of his correspondents are equally successful as men of business and men of science. don'ts are equally successful as men of business and men of science. Scientific study no doubt tends to give the mind a special bent, and Scientific study no doubt tends to give the mind a special bent, and to strengthen particular qualities; but as regards what may be called native faculties, a successful man of science closely resembles a successful lawyer or engineer, and would be just as likely to have succeeded in law or engineering as in science. It is the training that makes the difference. Again, with respect to energy and health, these are conditions common to all men who do much in the world. Apart, however, from their special application to men of science, Mr. Galton's returns on this point are valuable as another proof, if any wore wanting, that hard work is by no means so bancful as some persons fancy. Experience has shown that in all professions steady hard work is the best preservative of health, for the simple reason that it implies almost of necessity regular for the simple reason that it implies almost of necessity regular habits, and excludes the debilitating influences of social boredom. Mental over-work is a familiar complaint, but it is a rare disorder; and in most cases it is the stomach and not the head that has been ill-used. In general, when anybody professes to be suffering from mental exhaustion, the usual remedies for indigestion may be safely prescribed. On the whole, we should think it possible to produce a more precise and discriminating analysis of the psculiarities of men of science than Mr. Galton has given us. But liarities of men of science than Mr. Galton has given us. But what most excites our curiosity is whether he regards the sort of gossip he has favoured us with as science. Indeed, a distinct definition of a man of science would also have been desirable. A good many funny things, including Social Science, have been called science; but we rather think Mr. Galton has been anticipated in the line he has chosen by Mr. Albert Smith, who some years ago composed a series of treatises on the natural history of probe heller cards and other treatises on the natural history of the series of the s snobs, ballot-girls, and other types of humanity, which were quite as scientific, though not perhaps so amusing, as the essay on the "Nature and Nurture of Men of Science."

PRINCIPAL TULLOCH'S REPLY.

PRINCIPAL TULLOCH'S REPLY.

WE took occasion about three months ago to offer some comments on a paper of Principal Tulloch's on "Dogmatic Extremes," which had appeared in the January number of the Contemporary Review, and was supplemented and defended in an article from the pen of Mr. Hunt in the February issue of the same magazine. From that time till the appearance of the Contemporary for May Principal Tulloch has kept silence, but the fire has meanwhile been so hotly kindling within him—to judge from the tone of the reply which he has now made to our strictures—that we can well imagine the effort his silence must have cost him, and cannot wonder that he should at last have felt constrained to speak with his tongue. (At the same time there are cases where it is wise to refrain even from good words, and a careful perusal of Dr. Tulloch's second article has greatly strengtheed our impression that his silence is more golden than his speech. The original article was, it may be remembered, a protest, not so much against dogmatism, as against dogmas and creeks altogether,

except as convenient historical landmarks of contemporary thought. It was admitted that there is "such a thing as true opinion in religion," but it was implied that it is practically almost unattainable; for not only are all Churches fallible, but all creeds are from the nature of the case partially false and "haze is of the very nature of true religious thought." We ventured to point out that, apart from all theological controversy, this strange theory of religious belief is untenable in fact and directly in the fifth of all historical experience. The most elementary form of religion is based on the momentous and far-reaching dogma of a personal Deity, and the simplest intelligible form of Christianity includes a good many dogmas more. The immense majority of Christians in all ages have been content to sum up their faith in the Apostles' Creed, which categorically asserts various supernatural facts of overwhelming interest and importance, if true; while, on the other hand, no known religion various supernatural facts of overwhelming interest and importance, if true; while, on the other hand, no known religion claiming divine sanction and exerting a real influence among men has ever existed without a definite faith of some kind. We added, in reply to what seemed to us little better than a verbal quibble of Mr. Hunt's, that, because Roman Catholics accept their dogmas on the authority of Popes or Councils, it does not follow that other Christians do not equally need and equally hold dogmatic beliefs, though he may contend, if he pleases, that they have no right to do so. Justification by faith is just as much a dogma as Transubstantiation; and in fact it is exactly in proportion to its atrong grasp of a definite creed that Protestantian has tion to its strong grasp of a definite creed that Protestantism has

been a great religious power in the world.

In returning to the charge Principal Tulloch adds very little, beyond personalities, to what had already been urged by himself or his sympathizing admirer Mr. Hunt, and criticized in our former article. He is anxious at starting to insist that he was writing mainly for "theological students," and had probably underrated the crass ignorance of writers like his critics, "unaccustomed to theological thought," who emulate the infidelity of Strauss without either his knowledge or his strength. And then follows a long passage designed to enlighten us on the distinction between Roman Catholic and Protestant dogma, which supplies an admirable illustration of the here said to be which supplies an admirable illustration of the haze said to be which supplies an admirable illustration of the haze said to be so essential to true religious thought. The Catholic, we are reminded, as Mr. Hunt informed us before, accepts his dogmas on authority, whereas to a Protestant "dogma is "—the italics are the author's—"the reasoned expression or formulated statement of Divine Truth." And then he quotos Hooker and Mr. Matthew Arnold—who will have more authority with his unbelieving critics "than any professed divine"—to prove that dogmas are not found in the letter of Scripture, but "only deduced out of Scripture by collection." But Hooker was not speaking particularly of Protestant dogmas, and his description is so obviously spolicable to all dogmas whatever, and on whatever authority they larly of Protestant dogmas, and his description is so obviously applicable to all dogmas whatever, and on whatever authority they may be received, that the quotation is totally irrelevant. Dr. Tulloch has indeed stumbled upon what logicians call a cross division, or rather no division at all. He might as well have divided dogs into four-footed and long-tailed animals, as dogmas into formulated statements of doctrine deduced out of Scripture, and described an authority of the Church. All and doctrines received on the authority of the Church. All Christian dogmas are "the reasoned expression or formulated statement of divine truth," or what is accepted as such, and by a large number of Christians, Protestants and Fasterns, as well as Roman Catholics, they are received on ecclesiastical authority. But on whatever grounds they are believed, their origin and nature or whatever grounds they are beneved, their origin and hateners are the same; and though some statements in the Apostles Oreed, as also in the Nicene, are verbally contained in Scripture, their place and connexion in that formulary gives them, as Bishop Pearson has abundantly shown, a strictly dogmatic significance. Dr. Tulloch's distinction of Oatholic and Protestant againcance. Dr. Tulloch's distinction of Catholic and Protestant dogma is, for all purposes of his argument, a pure mare's-nest. And he only makes this the clearer in his attempts to prove the contrary. "The Protestant," he tells us, "may come to the same practical conclusion as the Catholic, and, agree with him that the dogma of the Homoousion is the very truth of God," but only because he is satisfied that it is the true sense of Scripture. Be it so; but the "dogma of the Homoousion" is either a fundamental tenet or a radical corruption of Christian doctrine, and not a tenet or a radical corruption of Christian doctrine, and not a matter about which believers can afford to be indifferent. Calvin's conviction on the subject was quite as strong as Torquemada's, though he may have arrived at it by a different process; and he was equally ready to assert it, in the trenchant fashion of his day, by the arguments of fire and fagget. Still more infelicitous is the ingenious distinction supposted between the Apostles' Creed and other dogmatic formularies. The author in fact cuts the ground from under his own feet when he solemnly repeats for our better information what we had ourselves intimated already, that there is hardly an article of that creed, the first not excepted, which does not involve deeper meanings than might at first sight appear; and that it "did not reach its present completion till the middle of the eighth century." Long before that time the Nicene and Athanasian Creeds had also reached their present completion, and theologians would say of them with equal plausibility what Principal Tulloch says of the Apostles' Creed, that they are merely expansions of the haptismal formulary. It is quite unnecessary to follow him into his disquisition on the doctring of the Atonement. Supposing that Oatholics and Protestants flave alike found the idea indefinable, that would only prove—what of course we never dreamt of disputing—that not all religious ideas have been, or can be, accurately formularised. It would not help Principal Tulloch's contention that religion can afford to dispusse with dogmas altogether. matter about which believers can afford to be indifferent. Calvin's

There is just a shred of truth at the bottom of this paradoxical theory, of which the writer appears to have a "hazy" conception without having guessed its real bearings. Dogmas, Catholic or Protestant, true or false, and on whatever evidence of authority or private judgment they are accepted, are the ultimate result of theological science, and are distinct from the process by which they are attained. Treatises such as the Cur Deus Homo of St. Anselm exhibit "the gradual evolution" of dogmatic systems, but contain, as is natural, a vast body of opinion and reasoning which forms no part of the dogmatic system of any Church in Christendom. It may also be true that there is a tendency in some quarters, and in the most opposite schools of religious thought, to erect theological opinions into dogmas. But all this is trite enough, and gives no support to a view as impracticable in itself as it is alien to the teaching of all the great religious leaders who have influenced the world, and not least to the teaching of those Westminster Divines to whom the author refers in terms of high praise. No doubt they did not consider religion "a thing only of creeds and catechisms," as neither did anybody else ever imagine who was not a fanatic or a fool. But it is surely possible to hold that faith is essential, and also that faith without works is dead. It is quite another thing however to say that the Westminster Divines would have schoed the advice of the late Charles Dickens about following "the broad spirit of the New Testament, and putting no faith in any man's narrow construction of its letter." If Dickens is rightly reported to have considered that "broad spirit" a Unitarian one, they would have been much more disposed to burn him than tesendorse his teaching. Nor is Dr. Tulloch more happy in his appeal to the early Apostolic Church "with all its creed-deficiencies." Creeds were the necessary outgrowth, or, if he prefers so to express it, the necessary evil, of a later age. But to say that, because the first were the necessary outgrowth, or, if he profers so to express it, the necessary evil, of a later age. But to say that, because the first Christiaus who had heard from the lips of Apostles what they had themselves learnt from their Master, needed no doguatic termularies, therefore the lapse of time and rise of conflicting heresics—that is, contradictory systems of belief—did not make them afterwards indispensable, is a strange paradox. In the words of a distinguished modern divine—who, we may add, was neither a disciple of Strauss nor a Roman Catholic—it is to seek "to restore the imbedility of childhood without its improvemen." cility of childhood without its innocence."

It is hardly necessary perhaps to return the Parthian shot discharged at us by Principal Tulloch in his concluding paragraph. After repeating, somewhat angrily, his wholesale indictment against all criticism of his views as "the mere echo in this country of the voice of Strauss," he falls foul of the obituary notice of Strauss which appeared in our columns, in order to expose once more the which appeared in our columns, in order to expose once more the profound ignorance—we cannot exactly say of his critics, for the article had no reference to him, but—of all who presume to look at these subjects in a different light from himself. Whether it is true that "nothing is so obnoxious to 'us'as the attempt to understand Christiandy," we will not stay to argue here; but indignation is up to be a little indiscriminate, and the following passage with its carefully italicized quotation of our words is more foreible than felicitous; it is at least sufficiently dogmatic. "This is the good we are told that Strauss has done. He has 'unmasked a host of shams, if he has put nothing better in their place, and has made the chaborate, however unconscious, subterfuges of such teachers as Semler, Schleiermacher, and Paulus," (the combination is exquisite to any one who knows even the rudiments of German theology) for ever impossible in the future." We might plead that, so far from having expressed any particular sympathy with Strauss, we had spoken in the very sentence before that quoted here of his "barren and unhopful creed"; but let that pass. The sting of the criticism is evidently contained in the italics. Yet we are constrained to acknowledge that the "exquisite combination" was quite deliberately framed. If Principal Tulloch means that the three writers named are typical representatives of three different phases of German theological thought there may be a careful to rection. typical representatives of three different phases of German theoical thought, there was as much intimated in an earlier portion of the article, and it was precisely for this reason that their manes were chosen. Paulus was a disciple of Semler, who had improved upon the teaching of his master, while Schleiermacher may be said to have led a reaction against them; but all three shared the common weakness which Strauss so mercilessly exposed, of professing to defend the authenticity of the Gospel narrative while other two—divesting it of its supernatural element. We had certainly imagined that thus much was familiar to every one "who knows even the rudiments of German theology." Principal Tulloch implies that we were mistaken.

LABOURERS' COTTAGES.

LAROURERS' COTTAGES.

THE opening of the spring Exhibitions, coinciding with the lock-out in the Eastern Counties, may well bring the subject of accommodation for their labourers home to the landowness who are being hustled through the galleries. Nothing can be more pictureaque then the cottages of Merry England in the foreground of a "bit" from the Surrey lanes or the Kentish weald. You have the gables disappearing under the masses of ivy; the quaint chimney-stacks bending beneath the weight of years over their girdles of rusty iron; the worm-eaten beams and the weather-beaten walls clamped with great crosses of iron, and propped against the gales by the fruit-trees that seem to cling to them. You have the small lozenged casements and the low-browed doorways, and

the inevitable pools of water coated over with emerald duckweed. The brilliant patch of garden is fragrant with old-fashioned flowers-stocks, and gillyflowers, and wallflowers, and all sorts of strong-scented berbs. The artist has dashed in a bedive or two background, and he seems to have let his fancy run riot generally in a wild luxuriance of vegetation. Yet possibly he has stuck pretty closely to the truth, and your memory recalls hundred of cottages of the same kind that looked embodied idyls of happy innocence as you came round the corner on them of a spring after-noon. But, like many similar scenes in the world, the glamour of poetry was on the surface, while the repulsive reality lay hidden below. You might fall in love with the spot at first sight, but on closer examination a good many drawbacks would suggest them-selves, if you had any idea of quartering yourself in one of these dwellings—say for a week or two of an artist's holiday in the summer-time. Although the walls could never have been extraordinarily substantial, they may have stood as they are for a couple of hundred years. In all that time they have been patched, and plastered, and cobbled, but not once have they been put in thorough repair. The site is damp, for the cottage stands low in a hollow near the water, like most buildings of our earlier architectural periods, from the manor-house downwards. The foundations have been settling down and the walls-splitting into cracks and rifts that have been roughly stopped with clay or mortar. The beams have warped and mouldered, and left gaping interactions between the roof and caves. The leaden framework of interstices between the roof and caves. The leaden framework of the casements has bent, and the small diamond panes are cracked and broken, and stopped with rags from the family wardrobe. The mud floor has gradually worn away below the threshold till the water trickles in when there is heavy rain, to collect in odoriferous pools in the middle of the kitchen. The rotten ceiling is tumbling to pieces, and either from the under or the upper room you may hear and see all that goes on in the other. The staircase that communicates between them is a rude ladder, with half the rungs long ago gone for firewood. Outside things are as bad as they well can be from a sanitary point of view, considering that the cottage is in the contry, and in one of the healthiest districts of England. Drains there are none; but an open gutter meanders towards the tittle weed-covered pool, and the two together generate the foulest mission when the sun is hot and the atmosphere close. The untrained sprays of the ivy, and the straggling boughs of the appletrees, shut out air and light from the little casements. When the weather is wet the drip from the trees overhead is perpetual, and in autumn the place is half buried in fallen leaves that are left to not in masses in the garden. The immates do nothing to help themselves, chiefly because their landlord has done so little to help them. The cottage is an object of general admiration to visitors with any perception of the beautiful, and, so long as he can keep it standing and roughly weather-tight, the proprietor is content. But his peasant tenants, having no sense of the beautiful, fail to appreciate the sole recommendation of their dwelling. They know that the rifts rudely held together by iron, which look so picturesque from the outside, let in those little streams of wet which are latal to paper, or even to whitewashing. They know that the rivy that holds the damp cracks the morter, making the Satorior of the cottage all through the rainy season feel like the inside of a streaming umbrella. They may have become habituated to sitting with their feet in the mud on the kitchen floor, but the presence of the mud discourages any attempts at scrupulous cleanlipresence of the mud discourages any attempts at scruptions cleaminess elsewhere. And the darkness and damp and discourfort in which they live breed physical as well as moral listlessness. It is not worth while to be up and doing where the work to be done would be perpetually recommencing. When the walls are mildewed, and the ceiling is in holes and tatters; when the windows cannot open, and the only means of ventilation is by the door; when the smoke circulates round the roun before it excepts up the chipmen; when and the only means of ventilation is by the door; when the smoke circulates round the room before it escapes up the chimnoy; when all shortcomings are covered by the prevailing gloom, it is worth no one's while to scour and polish and brighten. There is over-crowding of course. Probably the occupant has a large and growing family, and if he has not, he fills up his room with lodgers; for on properties where these picturesque cottages have stood from time immemorial there has been very little new building going forward. There can be no great privacy where the floors and partitions are more sham than real, and decency stands but a poor chance. The family struggles up somehow, herding together, and accustomed to rough it, and almost forgets its increasing years till it is time for its members to take wing or to marry. Naturally the domestic virtues languish in such a place, and, should the daughters turn out to be tolerable wives and and, should the daughters turn out to be telerable wives and mothers, it is very much to their credit. Even when they go out mothers, it is very much to their credit. Even when they go out of doors, in their dirty dress and unguinly manners they reflect very much the character of their miserable home.

Let it not be imagined that we bring a sweeping accusation against all those uncient cottages which are smong the most attractive features of the woodland landscapes in the home counties. Some of them no doubt are carefully cared for, and are cottages ornes within as without. But in too many cases we fear it is safe to assume that their tumbledown condition is real as well as apparent. They are of a piece with the ornamental but most masteful farming which often goes on around them—farming such as might have been practised in the days of the Tudors, and which on seatheric grounds we should be very sorry to see reference. The winding lause, with their great stranging hedgenous, cover the very maximum of space. There is waste grass account alongside the yewning ditches to support the horses

and donkeys of hordes of transps. The land is out up into endless enclosures, and the fields zigzag in all manner of angles, as if they had laid themselves out in a conspiracy to oppose the inroads of the plough. There are rank crops of thistles and ragweed in unconsidered corners, which propagate themselves season after season, blowing their down over the fallow and the meadows. The moss-grown trees in the orchard must be nearly contemporary The moss-grown trees in the orchard must be nearly contemporary with the cottages we have been describing, and have gone past the best of their bearing several generations ago. The transmithings, with the vast old-fashioned barns, were planned in their time with an utter indifference to the area they might cover, and landlord and tenant go on living alike in an odd mixture of extraorease and thrift. They are compelled to starve their daily expenditure, because they have never laid to heart the proverb of pany wisdom and pound folly, and because they will not farm on enlightened principles. They never have the money to grub copass, straighten fences, or sink drain-pipes; it would be impossible to at steam-ploughs to work in those cramped enclosures of theirs; and yet, merely to have the ground scratched by old-fashioned implements, they incur a lavish expenditure in horseftesh. If they cannot afford the money that would enable them to contend on ments, they incur a lavish expenditure in horseftesh. If they cannot afford the money that would enable them to contend on more equal terms with the farmers of more advanced counties, naturally they have none to spare for improving the condition of their labourers. Until the other day the labourers expected little. They found it a hard struggle to make the two ends meet, and to provide daily bread for their families; but they did not know that their class had better wages to the north of the Humber, nor had they ever heard of Canada or Australia. They had a roof over their heads, more or less weather-tight, and they had never hoped for anything more luxurious. But now, whether for good or for evil, these days are gone. The labourers have caten of the tree of knowledge: they have had The labourers have eaten of the tree of knowledge; they have had penny papers spelled out to them at the village pothouse, and have listened to the heart-moving harangues of Union delegates and listened to the heart-moving harangues of Union delegates and emigration agents. They are posted up in the weekly rates of libers, landowners who have been building sumptuous model cottages. They have learned something of Australasia and the Canadas as the labourer's El Dorados; they are told that free passages are to be had for the asking, with allotments of land at the end of the voyage. Naturally, if it were only for the novelty of the delegates are to be had something the respective of the covery of the sovelty of the sovely of the sovelty of the sove thing, they see everything across the ocean in the resiest of colours, and ignore the drawbacks which are judiciously kept in the background. They forget that the price of clothes and food usually keeps pace with the rise in wages; they know nothing of the heat of an Australian summer, or of the severity and length of a Canadian winter; they understand nothing of venomous thies and mosquitoes. We do not say that, if they had mastered more theroughly both sides of the quantum they would not said. more thoroughly both sides of the question, they would not still have good reasons for emigrating, both in their own interest and that of their children. But we do say that life in the colonies inevitably seems more inviting to them than it setually is, and that if they once begin to be thoroughly disgusted with their homes in England, the inducements to leave them may well appear irresistible—a result which would make the labour question more embarrassing for employers. What keeps the labourer in England at present, when so many people are urging him to leave it, is a vague dread of the unknown almost as much as his hereditary habit of local attachment. Although he may live within reach of the smoke of London when the wind happens to set from that direction, he has seldom gone beyond his market-town, and is shy of trusting himself out of the limits of his parish. The idea of making his way to the London Docks, of risking himself in a steamer upon the ocean he has never seen, and then steering away for foreign parts, must seem almost as formidable to him as the search for the other hemisphere seemed to the crows who shipped with Columbus. But his children will be brought up to be familiar with those colonies which he has only heard of late in life, and will probably be rather curious to with those than atherwise. Their neighbours who are hering to visit them than otherwise. Their neighbours, who are beginning to go to them now, will send good reports of them to the old purishes. Those who stay at home will hear of successes rather than of disappointments, and the spirit of adventure which has long animated our middle classes will lay hold at last of the classes below them. With far better reason too; for a steady working-man who keeps his health can scarcely tell to make a comfortable livelihood. anywhere, while our small capitalists and gentlemen emigrants are constantly coming to terrible grief.

Although, however, wages must tend to rise, they will ultimately find their level; and intelligent working-men may prefer to stay in England, though their actual earnings here may be relatively small. But, to induce them to remain to keep up the labour supply and to keep down wages, employers will find it necessary, as a mere matter of common prudence, to make their homes reasonably comfortable. They will unquestionably find the confortable. They will unquestionably find the men who do not live in chronic disconnent are much easier to deal with. Nor need the outley be upramunerative, even putting indirect profits out of the question. With wages as they used to be, spend what money you pleased on your cottage, you could accurely ask a higher rest for it, whetever amount of money it might have cost, for the simple reason that the tenants sould not pay it. But now that, and they may be fairly asked to return a reasonable parameter.

the landlord's outlay; while employers may be assured that they will out the most telling point out of the speeches of the agitators by seeing that their labourers are better housed.

WHAT IS BRIBERY!

WHAT IS BRIBERY?

I'I may be presumed that a number of ingenious gentlemen are at the present moment studying the reports of the trials of Election Petitions with the deepest interest, in the hope of discovering exactly what constitutes bribery. It may be doubted, however, whether their curiosity has its source in the purest motives. The old toy-maker in Dickens's story wished in making a barking dog "to go as near natur' as he could for six pence"; and it is the business of election agents and managers to go as near bribery as they can without getting their man unseated, and possibly the borough disfranchised. It is, therefore, of the greatest importance to them to know the precise limit between a generous and philanthropic open-handedness and legal bribery. It is difficult to say whether they will be encouraged or embarrassed by the decisions which have recently been given. One of the Election Judges has justified the haziness of definitions of bribery on the ground that it is not desirable to intimate to unscrupulous agents too precisely how far they can venture to go scrupulous agents too precisely how far they can venture to go scrupulous agents too precisely how far they can venture to go with safety. For instance, if it were laid down sharply and distinctly who was an agent, means would be found of getting all the dangerous things done by persons who were just outside the definition. The Judge, therefore, contented himself with a bread general statement that a candidate was responsible for all those who, to his knowledge, were engaged in promoting his election. This vagueness certainly leaves open many pitfalls, and nobody can be quite sure that the giving of money or its equivalent will not bring him to grief; but, on the other hand, it also leaves a considerable field of adventure for a briber who has both wit and enterprise. There is a proverbial protest against the partiality enterprise. There is a proverbial protest against the partiality which allows one person to steal a horse with impunity, while another is laid by the heels for only looking over a hedge. But it must be remembered that there are different ways both of looking over hedges and of stealing horses, and that clumsy folk must expect to suffer, while the nimble and dexterous slip through the meshes of the law. There are possibly many persons of ample means and overflowing benevolence who would be excluded from means and overflowing benevolence who would be excluded from Parliament if a too narrow and uncharitable interpretation were put upon their liberality. Colonel Richardson Gardner, for example, is evidently a man of whom many a small borough would be proud. At Windsor he built two hundred and twenty cottages for poor tenants, and took a lenient view of rent. He also distributed coals all round in winter. It is true that Colonel Gardner has his prejudices. Everybody has his pet abhorrence, and Colonel Gardner's generous nature receives a shock when he is confronted with a Liberals gradually disappeared from his cottages. Consequently Liberals gradually disappeared from his cottages, which becames compact and happy Conservative settlement, all the members of which were convinced that, if only their good landlord were also their member, everything would be for the best in the best of all possible worlds. Once there had been a flood, and it was on this account that Colonel Gardner began his benefactions; but he found the sensation of doing good so pleasant that he sould not refrain from continuing his gifts. In a contest of vagueness this gentleman proved himself a match for the Judge. He would not admit that he had made it a condition with a tenant that he should join the Conservative Working-Men's Association, but he frankly acknowledged that he was in such a frame of mind that the observation might naturally have fallen from him. He also distinguished delicately between an intention and a hope. was no intention to bribe, but he hoped that kindness would produce a reciprocity of feeling. Baron Bramwell held that, though Colonel Gardner had been indiscreet, he had done nothing illegal, inasmuch as his benevolence had been of a general character, and there were no specific acts which could be directly connected with the last election. He also remarked that generous treatment of electors who voted secretly was entitled to a presumption of disinterestedness, since there was no security that it would be repaid by votes.

The moral of this decision would seem to be that a candidate who trusts to money must not be generous by fits and starts just The moral of this decision would seem to be that a candidate who trusts to money must not be generous by fits and starts just as an election comes round, but must have a general character for benevolence, and have been doing kind things at other than election times. On the other hand, the candidates at Stroud probably suffered on account of the isolated character of the act which was construed as bribery. A breakfast was given in a Congregational meeting-house to a number of electors on their way to the poll. It was got up by the ladies of the congregation, and the minister took part in the proceedings. This minister was known to be a conspicuous partisan of the Liberal candidates, and it was therefore held that the breakfast had been given on behalf of the candidates. Tea and toast, it was contended, were a very innocent form of treating, but the Judge would not go into details of that kind; and besides, it is obvious that a teatotaller may be bribed by tax as other people are bribed swifth here. It could not be denied that a treat had been given to votes, and that it had been countended, if not arranged, by an agent of the candidates, sad, though the candidates knew nothing about it until afterwards, they were made responsible for it and unseated. No responsible season can suppose for a moment that this was really bribery, but the candidates were purished because what had been done in

their name fell under certain general conditions which make up the judicial definition of treating, and a door would have been opened for more dangerous forms of bespitality if this chasts and simple banquet had been permitted. Heer or wine might be substituted for tea, while a rich repeat would take the place of toast and eggs. The Judge probably felt himself unable to draw the line processly at any particular refreshments which would impart a criminal character to the feast, and so laid a ban on all refreshments indiscriminately. "Free beer "has been equally disastrous to the member for Poole. It was admitted that beer had been distributed to some of the voters, but it was said that it was not until the day to some of the voters, but it was said that it was not until the day after the election. The streets were then crowded with people waiting to see the procession, and one of the Liberal agents told the landlords of certain public-houses to give broad, cheese, beer, or the landlords of certain public-houses to give bread, cheese, beer, or other refreshments, up to a certain limit of expense, to people who applied for it. The Judge held that the treating had keen very general and had keen pre-urranged, and dockared the election void. The Launceston case is another example of the difficulty of deciding what is and what is not bribery. The charge against Colonel Deakin was that he had bribed his tenants by giving them leave to kill rabbits on his estate. It was arged on his behalf that these rabbits were a great trouble to him, and that, instead of being profitable, they were a loss. He had always told his keepers to keep them down, and at last he said to his tenants. "Confound tha profitable, they were a loss. He had always told his keepers to keep them down, and at last he said to his tenants, "Confound the rabbits I you may do what you like with them." This permission to kill rabbits was not, his counsel argued, bribary, but merely the Laws. Mr. Justice Mellor, however, decided that the raibits were given over to the tenants with a view to obtain popularity, and thus to influence the election corruptly; and Colonel Deakin has therefore been unwrited.

The decisions on the subject of treating have apparently created a good deal of alarm in certain quarters. It has been asmounced that the Conservatives of Warrington, acting under legal advice, have resolved to abandon a Whitsun-Monday picnic at Walton Hall Park, the residence of the borough member, who had undertaken to provide ten and cake. It would be a pity of course if benevo-lence and public spirit were unduly restrained by fear of an accusation of political corruption; but, on the whole, a disposition to sation of political corruption; but, on the whole, a disposition to keep away as far as possible from dangerous ground is perhaps the most healthy state of mind that can be cultivated both in candidates and constituencies. The Conservative working-men of Warrington will be none the worse for having to find tea and cake at their own expense. Tea may be a beverage which exhibitates without intoxicating, or it may be, as its enumers allege, a beverage which makes people hald and disorders their stumechs; but it would be difficult if not impossible to draw a distinction in present would be difficult, if not impossible, to draw a distinction in regard to treating between tea and beer or between beer and gin. Constituencies are perfectly free to drink as much ten and, within certain hours, as much beer or gin as they like, but they should pay for their liquor, whatever it is, out of their own pockets. What is wanted is that constituents should respect themselves and that candidates should respect this self-respect. If Baron Brauswell's principle that, under a system of secret voting, treating a voter may be presumed to be disinterested, were logically carried out, almost any sort of bribery would be legalized. The candidate out, almost any sort of bribery would be legalized. could say, "What I did was done out of pure be could say, "What I did was done out of pure honevolence, and the voter was free to do as he liked whether he accepted my gift As far as any general deductions can be drawn from the or not." recent decisions, they would seem to come to this, that any liberality on the part of a member or candidate to a constituency immediately on the eve of, during, or immediately after, an election immediately on the eve of, during, or immediately after, an election will be regarded with great suspicion, and will probably be scored against the person who practises it; but that general liberality, extending over a series of years, will be more charitably considered. In other words, it may be said that electoral ground-bait, freely distributed with a view of keeping the fishes in a particular quarter in good bumour, and bringing them round the distributor's pant, is not unfavourably regarded; but that a fly or a worm attached to a hook, so that only the fish that hites can get it or at least is entitled to get it. only the fish that bites can get it, or at least is entitled to get it, is clear corruption. Election agents have now been warmed that a sudden fit of generosity in view of an advantage to be immediately gained by it is especially dangerous. The breakfast at Stroug was given on the morning of the election, and though the tea and tonat were sober enough, the oratory which accompanied these mild delicacies may have been, or might be in another case, of a highly intoxicating character. The beer at Pools was given after the election, but it had been promised before. Again, in Colonel Deakin's case, however costly and troublesome his rabbits Colonel Deakin's case, however costly and troublesome his rabbits were, it does not appear that he ever thought of giving them to his tenants till be happened to be in want of his tenants' votes. This may have been an accidental coincidence, but at least it was suspicious, and the object of Election Judges is to make people especially careful to avoid anything which has even a suspicious look. On the other hand, Colonel Richardson Gardnes did not go out of his way to do anything unusual at election time. He had been for a year or two very kind to his Conservative tenants, and other Conservatives were led to reflect that Colonel Gardner's cottages were the nearest approach to Eden left for poor Conservative working-men who did not always happen to have their results ready, and who liked to get conis for nothing. And so the Colonel's seat is safe. It will be seen, therefore, that it is dangerous to take a constituency into keeping for a wock or two when an election is impending or in progress, but that permanent maintenance is Ekely to be excused. Henceforth, if there is

to be bribery, it must, in order to be safe, be in the form of regular bounties extending over a series of years. The decisions of the Election Judges and the natural influence of the Ballot Act both point in this direction. Candidates who set about buying individual votes will suffer if they are found out; but a candidate who invests in general popularity by continuous and sustained expenditure will be supposed to be disinterested. Entrance to the House of Commons will thus be facilitated for very rich men who chouse of Commons will thus be facilitated for very rich mon who do not mind paying handsomely for admission, and perhaps also for another class, for Railway Chairmen and the like who have the command of other people's money, and can promise all sorts of advantages to constituencies who have stations on their lines. Meanwhile the most disgraceful and demoralizing bribery of all is left untouched. Colonel Deakin, for the sake of popularity, as the Judge held, gave his rabbits to his tenants, and was unseated. But, after all, his rabbits were at least his own property. There are many candidates who offer other neople's property of various kinds many candidates who offer other people's property of various kinds as a bait to constituents, and they can do this safely.

MUTABILE SEMPER. T was said some years ago that if two American girls met in a stage-coach they would proceed without loss of time to "swop" bonnets. The author of that remark considered that in this particular the young ladies of America differed from those of England, but since that time the commercial instinct has been Basaar developed among ourselves. A publication called the Basaar developed among entirely to advertising articles of dress, furniture, books, and every kind of property, and it would seem to be the practice of many English ladies to sell or exchange everything they possess, from bomets to boots, for the mere sake of excitement and variety. Sometimes, indeed, there is a reason, or something approaching to a reason, for these transactions. "Lovely white embroidered muslin dress, uncut; mourning; cheap." This is a specimen of a large class of advertisements. But a much larger class must be ascribed to want of money or love of change. We need not say that many of these advertisements are to us unintelligible. We do not of course complain of the because the greater part of this publication is evidently addressed and heades and heades if we want to know what a exclusively to ladies, and besides, if we want to know what a particular article is, we can easily gratify our curiosity by buying it. But still we will venture to remark on the mysterious language of some of these advertisements. Here, for instance, is one of the most perplexing:—"Perfectly new black silk, lined with cerise silk, bow and jet buckle, massive carved black handle, height of fashion. Cost 19s. Price 11s. 9d., or the three (bought for sisters), 33s. Genuine bargain; no approval; mourning." It may have occurred to man of practical mind in ball recome for sisters), 33s. Genuine bargain; no approval; mourning." It may have occurred to men of practical mind in bell-rooms that a lady with a handle would be convenient as a partner; but we cannot say that this idea has yet been embedied in anything that could deserve to be called a good working model. But here it seems are three ladies who, when they are not in mourning, wear on some convenient part of their persons a "massive carved black handle in the height of fashion." Some advertisements declare plainly the reason of the offer. Thus six coloured linen shirts, for summer wear, good patterns, and new, may be had, "as I am pushed for money," at 5s. 6d. each. Many ladies and gentlemen want money, but nobody, at this moment can want anything for summer wear, and this advertisement may be regarded as proof rather of the severity of the season than of scarcity regarded as proof rather of the severity of the season than of scarcity of money. Perhaps before the winter ends the advertiser may have money to buy a fresh set of shirts. We cannot help thinking, however, that this and other advertisements indicate an unsupplied want. We suggest the establishment of a ladies' pawnbroker, where small sums might be advanced on articles of dress, without the publicity which usually attaches to a transaction under the three balls. Some ladies are doubtless so determined to combine economy with fashion that they are capable of selling off their coloured dresses when they go into mourning. But many of these advertisements appear to be due to the reason which is plainly stated in one of them. Perhaps the most melancholy of all announcements, however, is that of a lady who has a son to dispose of, and asks advice from persons who may know more of the world than she does. This is not an advertisement, but occurs in a column of queries upon such subjects as "rearing butterflies and moths." One queries seeks "a cheap inland town in the South of England," which we fear will be as hard to find as "an active career for a youth" (evidently genteel), "whose tastes incline him to a life of activity and enterprise," or who, in non-maternal language, has a dislike to plodding industry. Returning to the advertisements, we read that "berceaunette and French baby-basket, tastefully trimmed, perfectly new," may be had for 30s. It does not appear whother the baby is included; but any reader who desires whether the baby is included; but any reader who desires whether the baby is included; but any reader who desires of course do so. Another advertiser says, "I have half a bottle of Mrs. Allen's Hair Restorer to part with for 2s. 6d." It would be only fair to Mrs. Allen to state the reason of this offer, which must apparently are better from abundance of hair or desired. with fashion that they are capable of selling of their coloured dresses would be only fair to Mrs. Allen to state the reason of this offer, which must apparently arise either from abundance of hair or deficiency of cash. A lady who has moved into a small house offers among other tastoful articles "hearthrug, brilliant colours, registered design, life-size, Turks in room, amoking, coffee-taking, velvet pile." This beautiful example of the application of art to everyday life may be obtained for 21. 10s. Some advertisements evidently come from designs, who perhaps adopt this method to estab-

. 2M.

lish a connexion. Thus the statement "I have not disposed of my new kid gloves" would appear, coming from a lady, unaccessary. But we read further that these gloves are of various sizes, of really splendid quality, and will be sold at 1s. 1od. per pair. The epithets "really splendid" sounds tradesmanlike. When a lady wishes to sell one of her own dreeses, she says, and probably thinks, that it is "lovely." Sometimes she wants something in a "Afferent style of loveliness; sometimes she wants money; sometimes she is willing to take out the value in "dragons or long-faced Antwerp pigeons." One lady must want a pair of boots very much indeed. She offers "two high swansdown calico bodices, or amber necklace, or cash," for "new kid house boots, heeled, fours." To the simple mind of man it would appear that a lady who wants a new pair of boots and has money house boots, heeled, fours." To the simple mind of man it would appear that a lady who wants a new pair of boots and has money to pay could go to a shop and buy them. But no doubt amusement and excitement may be got out of the process of "equating," if we may use the word, an amber necklace against a pair of boots. We do not in the least understand how all these transactions, amounting to many thousands, are carried out. Of course, a pattern may be cut off a dress, and we observe that measurements are sometimes given of such articles as boots and corsets. Some advertisements declare that no "approval" will be allowed, and we infer that the mention of these exceptions shows the existence of a rule. But we should like to know whether all these transof a rule. But we should like to know whether all these transactions are effected by letter and parcel, or is there anywhere in London an "exchange" of a new kind, where a lady who desires to sell "three pairs coloured cotton stockings, light blue feather, small pink sash, and mother o' pearl buckle, all new, price 10s.," may expect to meet a customer.

some of these advertisements evidently proceed from dealers, who may perhaps be men. But the advertisements of men's shirts, collars, &c. are inserted, as we should guess, not by the owners, but by their indefatigably thrifty wives. When collars are offered but by their indefatigably thrifty wives. When collars are offered at 7d. each, the advertiser must certainly have a mind capable of the smallest transaction of a household. We find a class of "ecclesiastical" advertisements for which perhaps ladies are not entirely responsible. A silk Cambridge M.A. gown, best quality, very little worn, and a silk cassock, are offered for money. A sermon-case of black velvet, with cross in gold-coloured silk, and lined with white silk, is offered for 8s. 6d. It might perhaps be reacted if the advertiser would state whether agreeous would be lined with white silk, is offered for 8s. 6d. It might perhaps be useful if the advertiser would state whether sermons would be taken in exchange. No address is given by this advertisement, and we cannot but suspect that the affixed number disguises from everybody except a discreet editor the name and address of an interesting, but mercenary, curate who desires to turn into money the gift of an admiring lady of his congregation. It occurs to us that under this head of "ecclesiastical" articles a place might be found for workland worsted discourses. congregation. It occurs to us that under this head of "ecclesiastical" articles a place might be found for worked worsted slippers, of which interesting curates usually possess a large variety, including patterns as rich and tasteful as that of the Turk taking coffee on the hearthrug. Two pairs of "bouquet makers for the altar" can be had for something over 1l. The reason for selling these articles is not explained. The only article wanted is a "Cambridge gown and hood, M.A., cheap." Under this head of "ecclesiastical," and sub-head of "various," is offered a "great hawain." which is described as a "Highland minister's complete "Cambridge gown and hood, M.A., cheap." Under this head of "ecclesiastical," and sub-head of "various," is offered a "great bargain," which is described as a "Highland minister's complete vade mecum." It consists of "ministure testament, very large silver-mounted spirit flask, and strong serviceable corkscrew, fitted in superfine Russia leather case." This arrangement for qualifying the water of life with whisky is to us novel; but it may be usual in a damp country like the Highlands. "The letter killeth but the spirit giveth life"; and this is perhaps the reason why a very little Bible is associated with a large supply of whisky. An English minister would perhaps consider some book of prayer a necessary part of his equipment. But in the Highlands ministers despise cold formalism, and cultivate spirituality in their exercises. The corkscrew is doubtless an emblem of that power which is ascribed to the early Saints. One of them took Satan by the nose with a pair of tongs, another bound him with chains, and another made him build a dyke. The power to bind implies the power to loose, and as the ancient Saints shut up the spirits, their modern successor lets them out. That is all the difference. It is quite right that the corkscrew should be "strong and serviceable," for neither the large spirit-flask nor, we suppose, the small Testament, would be of much use without it. the small Testament, would be of much use without it.

Subscribers to this periodical, besides the opportunity of buying and selling every possible and impossible thing, enjoy the advan-tage of knowing what are the best novels and the best articles in the magazines and reviews. It would be a gross act of piracy to transfer this information to our columns. Correspondents may obtain answers to questions almost as various as the articles offered for sale or the tastes of the ladies who deal in them. Mr. offered for sale or the tastes of the ladies who deal in them. Mr. Trollope has spoken lately of the greatness of a writer in a review who is known by a privileged society to have "amashed" a book. But what is this to the greatness of the correspondent of a country newspaper who knows everything that happens, and a good deal that does not, in the political world of England and Europe, or the still more stupendous grandeur of the editor of one of those papers which know everything about art, science, literature, law, dog-doctoring; and gardening? To say that this editor is up to everything, from pitch and toes to manalaughter, would convey a feeble and wholly inadequate notion of his talents and accomplishments. But more wonderful even than his knowledge is the extent of his transactions. When strangers are dealing argesther the purchase-money for the article sold may be deposited at his office, and he charges a moderate fee for the accommodistion. But

rsons who advertise frequently find it convenient to give references as to position and character, and thus to avoid the necessity of deposit. The references must be "first-class" in London, and of deposit. The references must be "first-class" in London, and in the country they must be lawyers, elegymen, or doctors. He decides all disputes between buyers and sellers on inspection of the article and perusal of the correspondence respecting it. If we hok at the number of advertisements, and consider that each of them involves several letters, and many of them the passing of some article of dress by post, we shall gain some conception of the extent of the transactions which owe their origin to chesp postage. Notwithstanding the low fees charged on these transactions, we cannot suppose that many of them are directly profitable to the principals. But it doubtless charged on these transactors, we cannot suppose that many them are directly profitable to the principals. But it doubtless pleases ladies to survey their wardrobes, and reflect that they can, if they think fit, hold a sort of auction, to which all the readers of this periodical will be parties. Wealthy ladies can have really new dresses as often as they desire change, and those who are not wealthy can have dresses which are new to them by resorting to the Basaar. Among those who have discerned and profited by the tastes and tendencies of the age, the founder of this publication deserves an eminent place.

THE ROYAL ACADEMY.

MR. MILLAIS is a clever picture-maker rather than a great composer; he hardly ranks among the imaginative or intellectual creators of the world; he will not go down to posterity tollectual creators of the world; he will not go down to posterity by the side of Rubens, Veronese, and Tintoret; and yet no man has better known how to turn an idea to good account, or to make the most in a business sort of way of materials readily within reach. His last success, "The North-West Passage" (320), has the savoir faire, the worldly wisdom, which satisfies the practical common sense of mankind; to be over-subtle and profound, or to fly above the heads of purchasers in a commercial community, has never been among his failings. This most effective picture, which has rightly gained the place of honour in the large Gallery, is happy in its subject. An old seacaptain sits with a glass of grog at his elbow, a chart at his side, and a log-book at his feet; his daughter, apparently thrown in for contrast of youth and beauty, quietly reads, while the sturdy old sailor, pondering over the unsalved problem of "The North-West Passage," exclaims, with the clenched hand of strong resolve, "It might be done, and England should do it." Nothing can be more skilful than the whole arrangement, strong resolve, Nothing can be more skilful than the whole arrangement, whether we turn to the Union Jack on the one side, or on the other to a window which carries the eye over a sea sportive with boats borne onward by the wind. The artist as usual shows himself a good economist of time and trouble; he likes breadth because it saves detail; he seeks a brilliancy which is compatible with sketchy slightness. Some passages may have been in danger of degenerating into gayness, but the painter knows at what point to pull himself up, and he has wisely put his whole power into the head of the old captain; there is not a more trenchant study of character in the Exhibition.

To praise certain of our time-honoured Academicians Associates may be as superfluous as to paint the lily. What words, for example, can do justice to that piece of appalling solemnity, that perfection of wooden gravity and grandeur, "Troy-weight" (275), by Mr. Hart, R.A.P. Seldom have we seen its equal in the illustrious school of signboards. Again, seen its equal in the illustrious school of signboards. Again, no description can possibly convey an adequate idea of Mr. O'Neil's pretty and painstaking picture of poor "Ophelia" (579). Yet it might have been a mercy had she been drowned a little earlier. Also Mr. Thorburn's "Gospel in the Glen" (558) is one of those miracles in art of which seeing is essential to believing. It would appear as if one of the high uses of the Royal Academy were to do ample justice to alone of works which would hadde he constraint in of the high uses of the Royal Academy were to do ample justice to a class of works which could hardly be appreciated in any other Callery in Europe. People who cavil at the hanging seem to forget that Academies have sometimes, by a kind dispensation, become hospitals in disguise. It has been objected that this year landscapes have not received their due; but surely the fact must have escaped attention that Mr. O'Neil, A.R.A., and Mr. Thorburn, A.R.A., have each been rewarded for their recent efforts in landscape art by places on the line in the great Gallery.

We have to thank a goodly company of outsiders for the

burn, A.R.A., have each been rewarded for their recent efforts in landscape art by places on the line in the great Gallery.

We have to thank a goodly company of outsiders for the amends made for deficiencies on the part of members of the Academy. Mr. Boughton, for instance, has seldom been so happy as in "God speed! Pilgrims setting out for Canterbury; time of Chaucer" (982). The reading of the story is unhackneyed; it is wholly unlike the compositions of Stothard, Blake, and others. The picture may be said to rely on the multiplication of incident, episode, and by-play; several of the characters, foresking the beaten path, betake themselves to the springtide meadows; the liquid air and the budding trees are of the vernal time which the poet loved so well; indeed we may fancy that Chaucer's favourite daisy springs beneath the pilgrims' feet. In the foreground a pretty girl offers a draught of water to a youth whose weary journey seems likely to end in a pilgrimage of love. The best plansantly carried hither and thither among a company who wander as they list through a composition arranged rather after the older plan than according to our more concentrated modern method. There are freezes in the Campo Santo of Pisa which thus tell their story scene by scene. But Mr. Boughton is at great

pains to bring his subject together; indeed few painters are more studious of the just relation between thought and form, composition and colour. Mr. Marcus Stone is clever and brilliant as over; he gives a pretty play of line, an animated glow of light and colour, in an arrangement of figures among trees entitled "My Lady is a Widow and Childless" (100). Mr. Arthur Hughes throws awest, though rather sickly, sentiment around the "Convent Boat" (584). Mr. W. V. Herbert, in "Summer Song" (458), falls into formless reverie of fancy, and incoherent rhapsody of colour. Mr. Henry Wallis is more subtle as a colourist; tender and yet lustrous are the lights and tones which play on the marbles and figures, "From Naxos" (572). Verily we live in an age of colour.

But among the outsiders the great success of the season is made by Miss E. Thompson, in a pathetic scene from the Orimean war, "Calling the Roll after an Engagement" (142). An officer on horselack meets on the field of battle the sergeant with the muster-roll; the story to be told is evidently very sad; many are the missing and the dead, and the men who remain to answer to their names bear marks of rough service. Half covered in the snow lies a dead soldier, and over him, with bowed head and clenched hands, stands his comrade, a picture of desola-

head and clenched hands, stands his comrade, a picture of desola-tion. It is impossible for a narrative to be told more simply, truly, or pathetically; the incidents touch the heart, the drawing and the execution go direct to nature. M. Bellangs and M. Protais, of the execution go direct to nature. M. Bellangé and M. Protais, of the famous French school of battle-painters, who come nearest to this style, might have been as deep in sentiment, but hardly so undiinchingly true to reality. At the Academy dinner, in the course of the speeches made by the Prince of Wales and the Duke of Cambridge, the military accuracy of the picture both in grouping and expression was specially dwelt upon. The youth of the painter procludes the possibility of her having studied the scene on the spot, but she has been at the pains of verifying facts, and she is said to have taken surgical opinion as to the physical aspect and the colour of dead bodies on a battle-field. The current report, however, that she served in an ambulance in the late French and German war turns out to be unfounded. The success of the picture has been almost beyond precedent. in the late French and German war turns out to be infounded. The success of the picture has been almost beyond precedent. It is true that Miss Thompson is favourably known in the Dudley Gallery. She has been a student, too, in the classes at South Kensington; but she worked away in comparative obscurity until, as the saying is, she woke one fine morning and found herself famous. The picture, when it was brought in ordinary routine before the Council, is said to have been greeted by a world of charge. Sings the aparing of the Kickilitian by a round of cheers. Since the opening of the Ethibition, thanks, no doubt, in some measure to the laudatory speeches at the dinner, it has been so crowded as to be well high invisible. Under such favouring fortune it is not difficult to understand that the modest sum given to the artist on commission is now represented by at least a tenfold value. Surely the Academy is a lottery in which now and then a magnificent prize can be won, and the present case of fair play and full appreciation may be taken

and the present case of fair play and full appreciation may be taken as some set-off to occasional error and injustice.

The Exhibition shows a great want of "style." Reynolds defined style in painting to be the same as style in writing, and each is equally neglected in the present day. Blurting out truth roughly and readily, without form or ceremony, is the art which is now affected and most appreciated. We would quote as an example of the low style into which our British school is degenerating Mr. Orchardson's version of "Hamlet and the King" (265). The French actor M. Fechter brought down the lofty Kemble traditions to colloquial standards, and now a Scotchman comes and reduces the noblest of Shakspeare's creations to the level of common nature. The figure has what may be called a weedly growth in the length of the legs. Mr. Orchardson's specimens of humanity are apt to be angular and scraggy, and the lower exhumanity are apt to be angular and scraggy, and the lower extremities might seem designed for the cross-legged trade of tailoring, as if "nature's journeymen had made men, and not made them well, they imitated humanity so abominably." Neither is the art of Mr. Pettie, R.A. Elect, likely to die of dignity. "Ho, ho let (1362) is the title given to a clever composition representing a cavalier, drawing a caricature of Cronwell on a wall. senting a cavalier drawing a caricature of Cromwell on a wall. But smartness of thought and daring dash of hand are not enough is smartness of thought and daring dash of hand are not enough even for a painter who aspires to no higher walk than the byways of history. It seems to us that the blame which may attach to these and other brilliant artists of their kind is that they could do botter if they chose—a proof of which is at once patent in Mr. Pettie's "State Secret" (223). A cardinal seated before a table loaded with official documents has put fire to a paper which contains dangerous revelations. The execution is less scratchy and scattered than heretofore, and the colour, as always is resonant in tains dangerous revelations. The execution is less scratchy and scattered than heretofore, and the colour, as always, is resonant in deep-toned harmonies; the contrast between the warmth of the burning paper and the cool daylight is well managed. Mr. Halawelle is yet another example of a man who has formed himself on a false style; worse even than we could have feared is the group "Under the Lion of St. Mark" (210); the colour is obnoxious, the manner the reverse of refined. The artist has received wholesome reproof at the hands of the hanging committee. On the contrary, Mr. Burgess and Mr. Long, who also have been accustomed to take as their sketching-ground the two Southern peninsulas of Europe, have been rewarded for work free from pretence and merotriciousness by good places on the line. Both these artists may be supposed to have fallen in love with Byron's "Nut-Brown Maid of Cadiz." "The Visit to a Moor's House" (475), by Mr. Burgess, and "Mliss" (1354), the name given by Mr. Long to a little girl likewise tinted with the brown of Moorish blood, are welcome representatives of the 'modern Murillo achool which we owe to the 'atc Mr. Phillip. Mr. Holyoake's "Sanctuary" (386) is a mistake scarcely redeemed by merit; and much space is usurped without the piez of art treatment by Mr. Robinson's "Deposition of Francesco Foscari, Dogs of Venice" (908). In the same category may be thrown "Paris, 1793" (523), by Mr. Pott, and "Covent Garden Market, 1873" (531), by Mr. MacLean. These last-named artists are not without talent, but they are wanting in what Reynolds called "style"; they seem to forget that a picture, like a poem, ought to please; they do not bear in mind that art cannot be divorced from symmetry and beauty.

What used to be called "the St. John's Wood School" appears now to be divided between as many masters as there are men. At any rate, it is difficult to find very much in common between Mr.

any rate, it is difficult to find very much in common between Mr. Arnitage, R.A., Mr. Calderon, R.A., Mr. Marks, A.R.A., Mr. Leslie, A.R.A., and Mr. Hodgson, A.R.A. Perhaps it may be said that the prevailing character of this so-called school is a matter-of-

prosaic way of looking at nature; this secures a certain downrightness and strength; on the other hand, the abeyance in which the imagination is held starves and chills creation. Yet in which the imagination is held staves and chills creation. Yet Mr. Calderon is accustomed to move with fervour; his creative power has been facile and fertile even to excess. But now he inclines to take things easily, and to save himself thought and labour; thus in the "Queen of the Tournament" (335) he does not trouble himself to depart from ordinary routine. Yet the queen and the kneeling knight are so well planned, placed, and painted, that we have only to regret that more pains had not been given to some of the subordinate characters. Mr. Hodgson, at any rate, cannot be set down among those who shirk work; "Iteturning the Salute" (286) ranks among the most closely studied pictures of the year. The scene is laid on a const where the Moors have left their mark in tower and walls and horse-shoe argh. An ironclad lies within the hill-girt bay, and on the ramparts in the foreground stands a gun which a terror-stricken nigger is summoning courage to fire at arm's length. The fear of the coward, urged to duty by more manly European courades, enlivens the scene by a touch of comedy. The contrasted gravity of the general company is a piece of pictorial strategy of which the artist has before availed is a piecomeay. The companied gravity of the general company is a piecomean company of which the artist has before availed the composition is carefully calculated, and the execution has solidity and intention.

LE SPHINX AT THE PRINCESS'S.

THE hopes which have been frequently raised of the return to this country of the troupe of the Comédie Française have now been partially fulfilled by the appearance of one star from the con-stellation. Perhaps the greatest, because to English audiences the most novel, charm of the performances given here by the company of the Theatre Français lay in their completeness. In them, as in the works of great painters, there was no single finish of detail wanting, and there was none put obtrusively forward. Each part was valuable not only for its own sake, but because it helped to make up the harmony of the whole representation. It cannot but be recognized that by the star system these advantages are at once sacrificed. It must be said also that Madlle. Favart, who is the star on this occasion, in selecting a part for her brief appearance, has made a choice which her admirers will regret. It would be difficult to find a greater actress, a better artist, in her own line than Madlle. Favart. The London public had an opportunity of discovering this for themselves three years ago, and probably no one would have been wearied by a repetition of some of the representations which were then given. But, were this so, Madlle. Favart could easily have chosen many new parts which would have suited her better than that which she has chosen. We had occasion to speak last week of M. Octave Feuillet's last play, which bolongs to that objectionin the works of great painters, there was no single finish of detail M. Octave Feuillet's last play, which belongs to that objectionable class wherein all the dramatic force of the situations hinges on the faithlessness of a wife to a husband or of a hasband to a wife. In Le Sphinx indeed, for fear the interest should be too weak, both these incidents are combined. It is not a pleasant subject, and it

Blanche de Chelles, the lady who gives the piece its name, is married to a neglectful husband, who has been away from her for some time when the play opens. She is living not far from Paris with her father-in-law, Admiral de Chelles, and his house, as is her habit everywhere, she has surrounded her self with a group of adurers. A house close to the Admiral's is occupied by M. de Savigny and his wife, an old friend of Blanche de Uhelles. During the first act it appears that De Savigny does not at all approve of Blanche as a companion for his wife; he even resolves to quit the neighbourhood at once. The wife; he even resolves to quit the neighbourhood et once. The Admiral, however, is anxious that the intimacy between the two women should continue, thinking that it may have the effect of toning down his daughter-in-law's somewhat "fast" ways. There emeaded him of continual emity towards her, and reproaches him bitterly with wishing now to deprive her of the thing which is most precious to her, his wife's friendship. He replies that it is true that he does not wish his wife to acquire the same views of life which are held by Madame de Chelles, and when she makes a bitter reply to him, calling him a "moraliste sever," he asswers in this speech, which seems to open up an entirely new and very curious system of moral philosophy: system of moral philosophy :-

respect qu'elles méritent entre toutes, je ne refuse asserdment sux autres af mon indulgence, ni me sympathie . . . ni même, au hescin, mon estime . . . mais à une condition, je l'avous, c'est qu'en désertant le devoir, elles ne cèdent pas au simple attrait du plaisir et de la coquetterle . . . mais qu'elles obéissent du moins à quelque sentiment aérieux, élevé . . . è une de ces passions, enfin, dont une femme vit et dont elle est prête à mourir !

Those who are acquainted with French plays of the present day will not perhaps be startled at finding an illicit passion described as a "sentiment soricux et Clevé." Indeed, to be in love with some one clee's wife or husband is in one sense "sorieux." But the doctrine involved in the speech is, if we have understood it rightly, a little astonishing. It would seem that mere folly is beyond all question of pardon. To crime however, or to what is in its mature over the control of the contr question of pardon. To crime however, or to what is in its nature criminal, one may extend indulgence, sympathy, it may be even esteem. It is natural under the circumstances that these reflections should not trouble Blanche de Chelles, and that to De Savigny's tirade she should only reply ("d'un accent profond,") "Eh bien, alors?" She then avows that she is driven into all her follies and extravagances by one of those consuming passions "dont une femme vit et dont elle est prôte a mourir." She produces a packet of letters which she has written, but never sent, to the object of this passion, and, by an ingenious appeal to De Savigny's generosity, half tempts, half tricks him into reading them. As he opens and reads the first letter the curtain falls. The letters are, of course, addressed to him, and the rest of the play is occupied with his somewhat rapid yielding to temptation, and with the catastrophe which results from it. It is mentioned in the first act that Blanche de Chelles is in the habit of wearing a ring in the shape of a Sphinx's head is in the habit of wearing a ring in the shape of a Sphinx's head which contains a deadly poison. Whon, in the last act, open war is declared between Blanche and Madame de Savigny, the former breaks the ring and empties its contents into a glass of water. She has an impulse to administer this to the wife whom she has an impulse to its act to the last act of the ring and discontinuous she has an impulse to administer this to the wife whom she has an impulse the state of the ring and fine the result of wronged, but, resisting this impulse, she drinks it berself, and dies

as De Savigny enters the room.

The play is not one of its author's happiest efforts. There is, however, a fine dramatic irony in the way in which the opportunities which Blanche has for persuading De Savigny is, however, a fine dramatic irony in the way in which the opportunities which Blanche has for persuading De Savigny wifely from his duty are always unconsciously provided by an electronic state of the struction at the end of the third act is singularly impressive. Blanche, driven to desperation, has revealed to Madame de Savigny her resolution to clope that night with Lord Astley, one of her many admirers. This plan is communicated to De Savigny by his wife, who begs him to do all that he can to stop it. He accordingly bars Blanche's way, and opposes her project with so fierce a determination that she at last cries in triumph, "Ah! yous maimez done!" This of course is the cue for their rushing into each other's arms. The novelty in this situation is that the whole conversation between the lovers is overheard by the wife, who pretends, however, to have heard nothing. Like everything that M. Feuillet has done, the play is well written; yet, in spite of that, it is in parts not only disagreeable, but dull. It deals too much in disquisitions on character. Madame de Chelles is the same type of woman which M. Feuillet has drawn before under the name of Madame de Campvallon in his novel Monsieur de Camors. It may be supposed that this description of Blanche given by Lord Astley in Le Sphine is intended to be correct: to be correct :-

Madame de Chelles est une de ces femmes qui maissent mûres, pour ainsi dire, qui, par sutepeut-être d'une éducation facheuse, sont blasées avant d'avoir vécu, et pour qui le fruit defendu, même avant qu'elles y aient goûté, n'a plus de goût—à meins qu'il ne soit relevé par quelque savenr extraordinaire. Pour feur faire oublier, non leurs principes—elles n'en ont pas—mais leur délicatesse et leur fierté, il ne suffit pas d'un amour de salon, il faut un amour hardi, singulier . . . quelque chose d'héroique ou de criminel. . . Les femmes comme elle sont des astres échappés de leur orbite et qui n'ont plus de lois . . . ils touchent aujourd'hui à l'hérolame, demain au crime.

This description would apply exactly to Madame de Campvallon. The chief difference between the characters lies in this, that in Monsieur de Camors Madame de Campvallon did her best to poison her rival, and that Blanche, though this plan does occur to her, thinks it better in the end to poison herself. This we are probably that the contact of the proposed to grippe as approach to grippe. meant to regard in the light of heroism as opposed to crime. There is room in the length of a novel for the proper and artistic development of such a character as Madame de Campvallon or

development of such a character as Madame de Campvallon or Blanche de Chelles; whereas in the four short acts of a play there is not room for the method which M. Feuillet has adopted. He probably felt unequal to making such a character develop itself within his limits from the inside, and was forced to have recourse to such descriptions from the outside as that quoted above.

There are other reasons besides those of art which make it undesirable to deal upon the stage with subjects which may be fitly, even advantageously, handled in a romance. Therefore, in the first place, it is to be regretted that Madlle. Favart has chosen to appear in Le Sphinx. In the second place, the part of Blanche is by no means suited to her great, but somewhat peculiar, powers. It is in the exalted regions of emotion, not in the more level passages of everyday existence, that her genius finds its proper path. She excels in depicting violent passion, whether vented or suppressed, most of all perhaps in representing a lofty scorn. Those who saw her performance of L'Aventurière three years ago will remission. how the speech concluding

Relevas done les years, hanaftes gans, seemed to wither those to whom it was addressed. Her acting in that part indeed, as in many others, was almost finditiess. It is

true that there are outbursts and indications of passion throughout the part of Bisnobe de Cholies, and of these it must be said that the access makes the very most. The look in the first set, when the actuese makes the very most. The look in the first act, when Madame do Savigny first appeals to ber to change her ways, con-veyed a whole tragedy of servow and hopelessness and scorn both for the world and horself. Again, the kind of presciouse of coming for the world and herself. Again, the kind of prescionse of coming evil indicated through light words in her face and manner as also handled the fatal ring, was admirably imagined and executed. And the triumphant cry "Vous m'aimen done!" at the end of the third act was given with a rare force and concentration of meaning. But the smotion in the earlier portions of the play is for the most part masked beneath an appearance of light coquetry, of fascinating joyouaness, of playful petulance. Such a mask as this Madlle. Favart is incapable of assuming; and consequently her performance, artistic as it was in every detail, produced a jarring effect. In the last act the varving massions produced a jarring effect. In the last act the varying passions of Blanche de Chelles are bared without disguise, and there Maddle. Favart found for a brief space full scope for her powers. It would be difficult to interpret better the rapid amotions, expressed partly by voice, partly by countenance, which culminate in the moment when Blanche is tempted to water cummate in the inoment when manche is tempost or poison Madame de Savigny, and resists the temptation. The thought, the struggle with it, and the victory over it, were told in a moment, and told as only a great actress could tell them. It would have been well had the curtain fallen here, before the death-scene of which we had occasion to another the truck. It would have been well had the curtain fallen here, before the death-scene of which we had occasion that to speak last week. It might have been safely predicted that Madlle. Favart would represent this scene with loss horror of detail than is introduced into it at the Theatre Français. Her deathscene in Julie proved that she could represent death upon the stage so as to be appalling, yet not repulsive. Even in her hands the death of Blanche de Chelles is repulsive. The sudden rigidity of feature and limb, the inarticulate means of pain, the violent and irresistible tremor which accompany death by poison are things of horror which should not be dragged from real life to the stage. It should be mentioned that Madame de Chelles's last breath is omployed in calling for her veil, with which she desires to conceal employed in calling for her veil, with which she discrete to conceal her face from De Savigny. It is disheartening to find so great a writer as M. Octave Feuillet descending to such a paltry piece of theatrical effect as this. Madlle. Favart's representation in Le Sphinx will not, it is to be feared, add to her deservedly great fame. Those who have seen her genius at its best in such plays as Les Caprices de Marianne, L'Aventurière, and On ne budine pus avec l'amour, will be disappointed by her present performance, which, to those who have not seen her at all before, can give no just idea of her rowers. just idea of her powers.

NEWMARKET FIRST SPRING MEETING.

A FTER the misorable burlesque of racing witness d at the Craven Meeting, the improvement, however slight, in the sport of last week was doubly welcome. And though the Two Thousand was contested by about as moderate a lot of horses as ever took part in a big race, the One Thousand amply made up for any deficiencies in its more ambitious rival, and the interest of the meeting was fairly sustained to its close. Usually it is difficult for any laws number of nearly river on a require to the recommendation. for any large number of people who meet on a racecourse to agree exactly as to what they come out to see; but last week there was one pervading anxiety, to see how Ecossais would run, and opinions were pretty equally divided as to the chance of his winning or breaking down. The form of the French horse was so far superior last year to that of any other two-year-old that it was generally and year to that of any other two-year-old that it was generally admitted that, if he had made average improvement during the winter, the Two Thousand was at his mercy, especially as Marsworth was disqualified, and more than one of the prominent performers of last season, such as Newry, were not engaged in the Newmarket race. On the other hand, there was the fact of his having declined several valuable engagements towards the close of the past year, and of his having presented the appearance to ex-perienced judges, even on the first occasion of his running in public, of a horse who would not stand a long or a severe course of training. Still the weeks went on, weeks too of uninterruptedly training. Still the weeks went on, weeks too of uninterruptedly dry weather, and there were no signs either that Ecossis had given way, or that he was doing so little work as to be practigiven way, or that he was doing so little work as to be practically unlitted for the great struggle on the 6th of May. So his friends argued that, as he had stood training so long, he would have no difficulty in carrying off the Two Thousand from the ragged field opposed to him; while his enemies—and they were those who never put trust in a horse who has once been suspected of unsoundness—waited to have a good look at him before promouncing a final decision. But both friends and enemies admitted that, if Ecossis were really out of the way, the task of finding the probable winner of the race was only regulated more admonating and Spectator was selected in such an emerdered more ardnous; and Spectator was selected in such an emorgency, probably more because he ran second in the Middle Park Plate last year than for any other reason. But there never was a better chance for an outsider to win a great race; and accorda better chance for an outsider, to win a great race; and accordingly a large field might have been expected. Yet when the numbers went up it appeared that there were only twelve starters, the most notable absentees being Mr. Merry's pair, Rob Roy and Sir William Wallace. Had either of this pair succeeded in running into a forward position, Mr. Merry would have had some line by which to measure his Derby prospects; and it will be odd indeed if, with four candidates, the Ressley stable cannot furnish one

capable of taking his own part at Epsom in the very moderate company that may be expected to essemble there next month.

The field for the Two Thousand was made up of Recessis, Atlantis, representing Lord Palmouth instead of Aquilo, Reverberation, Spectator, Whitehall, Buscohel, Farnsfield, Earl Marshall, Vincent, Trent, Dukedom, and Lacy. A glance at the pages of the Research Culesdar will show how few of these had any protemious to compete in the great races of the year, and the majority had not even the merit of being brought to the post thoroughly fit to run. The field, take it throughout, was not only moderate in quality, but backward in condition, Whitehall, Reccobel, and Dukedom, in particular, wanting a great deal more time. Spectator indeed looked well, but he has not grown a bit since last year, and presented the appearance of a horse more suited to a six-furlong course than to a mile or a mile and a half. As for the favourite, Ecossia, we did not hear one solitary word spoken in his favour in the enclosure—to which, mile and a half. As for the favourite, Eccessis, we did not hear one solitary word spoken in his favour in the enclosure—to which, by the way, the public were admitted last week on payment of half a guinea for entrance; and it may be observed that, if the number of races at Newmarket is diminishing, the facilities offered to visitors to expend guineas and half-guineas show me signs of decrease. decrease. He had not grown much, he was not half trained, he had a great deal of flesh and very little muscle, he was soft, he walked very tenderly, indeed he was already lame in his off foreleg. Such was the tenor of the comments that caught our ear on every side; and we may safely say that no favourite for a great race ever went through his preliminary inspection with so little credit to himself as Ecossais before the Two Thousand. On the other hand, Atlantic was unanimously held to be trained to perfection, and to be fitter to run than any other horse in the enclosure. Still he recoded instead of advancing in public favour as the time drew on; principally on the strength of a rumour that, according to their trials with Andred, he was not better than, if so good as, his stable companion Aquilo. And, despite Ecossais's manifest want of condition, he became a stronger favourite every moment as it become more and many as it became more and more apparent how little there was to oppose him. We should add that Reverberation was not saddled in the enclosure, but that these who saw him were satisfied with In the enclosure, but that those who saw him were satisfied with his appearance, and, considering his recent dead-heat with Miss Toto, judged him fully capable of running into a place. There was unusually little delay at the post, and the story of the race is soon told. Atlantic, who carried a lot of dead weight, being ridden by the light weight, Archer, who is rapidly rising to eminence in his profession, forced the running, his superior condition justifying the adoption of this policy. It has been said that Atlautic was never headed from start to finish, but, according to our observation, that statement is inaccurate. Coming down the Bushes hill it ameeared to us that inscurate. Coming down the Bushes hill it appeared to us that Ecossais held a clear lead, which he retained till the commencement of the ascent, when he literally stood still from want of condition, and Atlantic and Reverberation passed him without an effort. We never saw a horse die away so suddenly and so hopeleasty, wat that Provents has not lost his fine turn of saved in effort. We never saw a horse die away so suddenly and so hopelessly; yet that Ecosais has not lost his fine turn of speed is manifest, for, though only half trained, he best all his opponents for speed over nine-tenths of the distance. Two days later, and the long-expected catastrophe happened. On pulling up after a good gallop Ecosais was found to be laine; and perhaps it would have been better, both for his own reputation and for the pockets of his supporters, if he had broken down before, instead of after, the Two Thousand. The struggle for victory between Atlantic and Reverberation was not so severe as might be inferred from the fact of Lord Falmouth's colt winning only by a neck. He had and Reverberation was not so severe as might be inferred from the fact of Lord Falmouth's colt winning only by a neck. He had always the best of it up the final hill, and stalled off the challenge of Reverberation without difficulty. The victory, we think, was won with something in hand, thanks to the winner's perfect condition. As regards the future, however, it is impossible for Atlantic to make any further improvement before the Derby, while Reverberation, whose rapid advance from plating form to the front rank is the most notable incident of the present season, is capable of being made at least 7 lbs. better. It is hardly likely that danger is to be superhended from anything that ran in the the front rank is the most notable incident of the present season, is capable of being made at least 7 lbs. better. It is hardly likely that danger is to be apprehended from anything that ran in the Two Thousand behind the leading pair, especially as Ecos-ais is not likely now to see the post on the Derby day; but Lord Falmouth has a second string in his bow in Aquilo, who, despite his inglorious exhibition in the Newmarket Biennial, is currently reported to be better over a mile and a half than his stable comparing Atlantic Angles the Technology as the Poster received to be panion Atlantic. Anyhow the field for the Derby promises to be of the most moderate quality, and ought consequently to be of large size, for really any horse that can gallop at all decently must

have a chance.

We may now pass to the One Thousand Guineas, the race for which is run on the Rowley mile instead of the Ditch mile as heretofore. Nine came to the post, including Apology and La Coureuse, who, after Miss Toto, held the highest rank among the two-year-old fillies, Lady Bothwell and Blanchefleur. Mr. Savile was represented by a plain-looking daughter of Skirmisher, Lord Ailesbury by Aventurière, Mr. Bowes by Polonaiso, and Sir Joseph Hawley by Devastation. No fault could be found with the condition of the French filly, La Coureuse. She at least was not half trained, like Ecossais; but she has grown very little since last year, and though neat and wiry, looked hardly so adapted to the course as Apology, who has grown into a remarkably fair mare, hits all the Heath House house this season, was in excellent condition, and carried Lord Falsmouth's popular colours conspicuously in the race; but the real struggie lay between La Coureuse and Apology, and the latter won by outstaying the former. Some

part of the credit for her victory must be given to her jockey, J. Osborne, who rode her with consummate judgment, and brought Osborne, who rode her with consummate judgment, and brought her up exactly at the right moment. It was just a case where an inferior rider would have lost the race to a certainty, for La Coureuse held a fair lead up to within a hundred yards of the finish, and was going strongly and well, while Apology, who may be a sluggish mare and who evidently requires a good dead of riding, had to be roused halfway down the Bushes hill. But when fairly called upon in the Abingdon Bottom, she responded gamely, and her superior stride enabled her to overhaul the French filly. M. Lefèvre has so far had most tantalizing luck in great races this season, but he may possibly have his revenge in the Oaks, if Miss Toto proves to be much better than La Coureuse. Otherwise Apology can hardly meet with defeat at Epsom; if she conces to the post fit and well, as a distance of ground evidently suits her, and a hill also. Blanchefleur, we may add, was a good third in the One Thousand, and Lady Bothwell, who seems to have wintered badly, last of all.

tered badly, last of all. Of the two-year-old racing of the week we may remark that Ladylove, a daughter of Blair Athol, and Peripatetic ran a close race for the Bathyany Post Sweepstakes, but that in endeavouring race for the Bathyany Post Sweepstakes, but that in endeavouring to concede 5 lbs. on a subsequent day, the former was decisively beaten by Chaplet, though she disposed of seventeen other runners with ease. Chaplet is a daughter of Beadsman, and fetched a very large price at Sir Joseph Hawley's sale; and she carried off her first engagement, the Spring Two-Year-Old Stakes, with so much in hand that her form must be pronounced the best that has been at present displayed by the juveniles. As usual, however, in races of this description, the majority of the competitors ceased to persevere when the pursuit of Chaplet was hopeless; and too much stress must not be laid on the fact of Ladylove carrying her penalty into second place, for it is probable that she only obtained that position by sufference. The remaining two-year-old event to which we need refer resulted in the decisive defeat of another penalized winner, Lady Rosebory, who could not get her extra weight anywhere near Quiver, a smart daughter of Toxophilite. It has been said that good two-year-olds can give weight to horses of their own age with ease; the inference from which would be that the two-year-old winners up to the present time have not—with the exception of Cashmers up to the present time have not—with the exception of Cashmers the inference from which would be that the two-year-old winners up to the present time have not—with the exception of Cashmere—established their claims to superiority. The general racing of the week need not detain us long. Oxonian ran in two matches, winning the one he might have been expected to win, losing that which he might have been expected to lose. At 7 lbs. he had all the best of the weights with the four-year-old Trombone, and the course—the last five furlongs of the Rowley mile—was exactly suited to him; yet, curiously enough, Trombone was made the favourite. The attempt to give no less than 5 st. to a three-year-old, even were he the worst three-year-old in training, was pretty sure to fail, and the course chosen—the last half of the Abingdon mile—made the task of the light weight more easy still. In this case to fail, and the course chosen—the last half of the Abingdon mile—made the task of the light weight more easy still. In this case the match was one in name only; for Oxonian had not the ghost of a chance. He was chopped at the start, and the race was over before he was fairly in his stride. Perhaps the best race of the week was one between those old opponents, Prince Charlie and Blenheim, at even weights. The splendid son of Blair Athol won by a head, but we cannot agree with those who thought he won easily. It seemed to us that he had to do all he could in order to win at all; and though Prince Charlie's trainer is reported as ready to meet Blenheim again on the same terms, and confident as to the result, we think the owner of Blenheim need not shrink from the encounter. The Newmarket Stakes lost all their interest through the accident which befoll Ecossais, who otherwise would have been brought out to meet George Frederick; wise would have been brought out to meet George Frederick; and Mr. Cartwright's horse had only a solitary opponent in Beggar-man. George Frederick won, as he was bound to win, from start to finish; but no information as to his Derby prospects could be gleaned from such a performance. In appearance he is still back-ward in condition, and gives one the idea of turning out a steady useful horse rather than a probable winner of any of the great races of the year. However, horses of that stamp could never have a better chance of distinguishing themselves in the Derby

have a better chance of distinguishing themselves in the Localitan this year.

The general character of the sport at the First Spring Meeting may be rathered from the preceding remarks, and it will be seen that there was a substantial improvement on the racing of the previous meeting. It is satisfactory also to notice a significant hint in the official organ of the Jockey Club that the general condition of racing at Newmarket had formed one subject of discussion at the last meeting of the Club. Discussion may possibly lead to action; and it is a step in the right direction to admit that the conduct of sport at Newmarket is not so absolutely perfect as to be beyond the reach of criticism.

perfect as to be beyond the reach of criticism.

REVIEWS.

MARKHAM'S PERSIA.

IF the author of this bulky volume had seriously claimed for it a place amongst the histories of great monarchies, we should have been tempted to remind him of the reply given by Bentley to

* A General Sheich of the History of Persia. By Clements B. Markham, C.B., F.E.S., Editor of the "Narrative of the Embassy of Clavijo to Samarkand." London: Longmans & Co. 1870

Pope when asked if he had seen his Homer. "Your Hom said the slashing critic; "oh, yes, I recollect; a very pretty p but you must not call it Homer." In the same strain we a say that Mr. Markham has compiled a very excellent volumes. we ought not to call it history. Indeed we do not gather, e we ought not to call it history. Indeed we do not gather, either from the preface or the contents, that the author aspires to anything beyond the praise of giving a connected and accurate historical elected of the various dynastics which have ruled over the Persian Empire, a geographical description of its cities and provinces, and a actice of the works of some of its chief poets. We are frankly told that Mr. Markham has depended on translations for his materials, and that he is not a Persian scholar. On the other hand, the execution of the work proves incontestably that the writer possesses some of of the work proves incontestably that the writer possesses some of the qualifications which we ought to expect in authors of the first rank, and without which no one ought even to attempt an historical narrative. He is conscientious and painstaking. His official training has taught him the art of analysing and condensing his materials. He knows how to discriminate between good and bad guides. And he has brought together, in some five hundred and fifty pages, an immense amount of facts about Persia, arranged with method and set off in a style which, if never eloquent or anigrammatic, is unpretentious, clear, and concise. In a quent or epigrammatic, is unpretentious, clear, and concise. In a volume running over with Oriental names and expressions the mistakes are few and not very serious. But in some places the notes takes are few and not very serious. But in some places the notes almost equal the text; here and there we have expressions which seem ext of place save in the diary of a "Special Correspondent," and now and then there occur errors in the translation or the spelling of Persian names. For instance, we are introduced to the officer who commanded in an action against the Persians in 1812 as "the Russian villain"; and in the next page we are told that the same Power left an ill-defined boundary to its consumer. "in order that a horse of contention wight exist over which quests, "in order that a bone of contention might exist, over which to play the part of the wolf and the lamb with their unfortunate neighbour." What Mr. Markham means is of course obvious; what he says is, that the strong Man is to play both parts in the trite fable, and that, we apprehend, is scarcely possible even for

The celebrated Mahommed Ali, the Pasha of Egypt, is called an old ruffian." The Kajar dynasty is characterized as "blun-"an old ruffian." The Kajar dynasty is characterized as "blundering," which we can only account for on the supposition that the author had the famous Bath letter before him while he was composing. We are hardly concerned to know that "there was a chimneypieco at Helmdon in Northamptonshire on which was the date 1133, in Arabian figures." The statement is introduced in connexion with the name of Abu-Ali-Sina, or Ibu-Sina, commonly known as Avicenna. We should very much like to see the authority for "a current story, that the Rajput Ranas of Meywar are descended from Noushirwan," the Just. The Hindu tradition, usually accepted, is, on the contrary, to the effect that the Rana of Codeypore is the representative of Rama, the mythical hero of a great epic poem and of a hundred exploits; and the present family, acknowledged to be the bluest blood in India, dates as far back as A.D. 144. It is quite certain that the Ranas of this principality nover gave their daughters in marriage to the Mahommedan Emperors as other Rajpoots did; that, in their own hill-forts and jungles, they maintained a noble stand against the Imperial forces; and that, amongst chieftains more punctilious than German princes about etiquette or precedence, the first rank amongst Rajpoota is still by universal consent conceded to Codeypore. The descent from Noushirwan, we think, may be taken as a little bit of Persian bombast. Mr. Markham is under the impression that Lord Ellenborough's gates of Sommath were sent from the Sutlej to the temple in Guzcrat, whence they had been carried off by Mahmood of Ghazni, with his iron mace, some eight hundred years before. connexion with the name of Abu-Ali-Sina, or Ibu-Sina, commonly of Ghazni, with his iron mace, some eight hundred years before. For a long time after the publication of the Song of Triumph the gates in question were set up in the arsenal at Agra, together with twenty thousand stand of smooth-bore muskets, and we have no reason to believe that their resting-place has been altered. "My brothers and friends," we may observe, cared very little about the "insult of eight hundred years," which was perhaps fortunate, as one-half of the princes of India would have been insulted twice over by an act of restoration intended to gratify the other half. The Persian title "Shah Jehan" does not mean "Seat of the King," but "Lord of the Universe." The poet of wine and roses is commonly Hatiz, and not Hatizh. A yabu is not an "inferior beast," except in the sense in which a pony may be called inferior to a horse. In his appendix giving a useful synopsis of Persian titles and terms, weights and measures, Mr. Markham appears to fall into a curious error in explaining the title Suraj-ud-Dowlah. This appellation, it may be recollected, was assumed by that Nawab of Bengal who is always held up to popular indignation as one of the twenty thousand stand of smooth-bore muskets, and we have no Bengal who is always held up to popular indignation as one of the ogres of history, in connexion with the Black Hole of Calcutta. In some of the writings of the last century his name is wonderfully metamorphosed into Sir Roger Dowler. Mr. Markham is not quite metamorphosed into Sir Roger Dowler. Air. Markham is not quite correct in saying that the interpretation of this title is "firmament of the State." The true rendering is "lamp" or "luminary of the State," but the author goes on to say that sirry is improperly used in India for the sun. Now a word in very common use in India for the sun is surry, derived from the Sanskrit surya, and there is no impropriety in its employment. The word sirry is simply Arabic, and is quite different.

But the detection of incidental errors must not blind us to the marks of the work, or derive its author, of the proise of suppossibility.

merits of the work, or deprive its author of the preise of successful mountry. Into no similar compass, as far as we know, has there been compressed such a quantity of useful information about the rise, progress, and fall of regal houses. It is a wide range of re-

search which begins with Rustum and Zal and ends with Baron Reuter; and it is not too much to say that any one requiring to verify a date, to trace the fortunes of a robber chief on his way to empire, to understand the tenets hald down in the Zandavesta, and to gain some general knowledge of the manner, customs, and rolligion of Iran, will have little difficulty in here finding just what he wants. To review such a work in detail is of course out of the quastion; but we can just indicate the steps by which the Persial Empire, once in a position to threaten Greece and to defy Imperial Rome, has come down to its present condition of driftless diplomacy, barbaric splendour, and inward decrepitude.

The earliest dynasty is known as the Peshdadian, from Pashdad, the title of the first of the line, Kaiomurs or Kaymoras. The term Peshdad, however, does not mean "just judge," as Mr. Markham translates it, but simply "lawgiver"; and the annals of this dynasty taken from Ferdusi's great poem and from an Arabian search which begins with Rustum and Zal and ends with Baron

dynasty taken from Ferdusi's great poem and from an Arabian work relied on by Maloolm, are about as historical as those of the early Roman kings. This dynasty was supplanted by Afrasiab, who came down from the great Turkoman desert, overran Iran, and, in his turn, had to give way to Kai Kobad, who founded what the Persians call the Kaianian, and the Greeks the Achemician life. nisn line. These princes occupy the space in history during which Pereia is known to us for more than five centuries, through the Greek and Roman writers, and English and German scholars have of late years respect the credit of deciphering difficult rock inactions, and of reconciling, as far as possible, the legacies of native tradition with the facts so familiar to us in the Bible and in Herodotus. About the end of the second century of our cra Ardeshir, descended on the mother's side from the Kaianians, and the second century of our cra Ardeshir, descended on the mother's side from the Kaianians. overthrew the reigning monarch, claimed for himself the appellation of King of Kings, and called the new dynasty Sassanian, after his grandfather Sassan. This house lasted for some four hunnis grandiather Sasan. This house lasted for some four hundred years, and it includes amongst its princes Noushirwan, whose justice has passed into a proverb, and Shapur, or Sapor, who captured a Roman Emperor. Next came the Arabs, and swept everything before them. After two centuries powerful lieutenants began to set up a standard of independence in distant provinces, and to throw off allegiance to the Khalifs of Baghdad. These events bring allowed first to Chenghiz, and then to Timur and the context of India and this has led Mr. Maskham sementations. the conquest of India, and this has led Mr. Markham, somewhat need-lessly, to introduce a sketch of Baber and his descendants, wound rith a note about the Indian Mutiny and the King of Delhi, which seems to have been added on the principle that accurate official statistics had better not be thrown away. Indeed one of the blemishes of the work is the constant introduction of topics foreign to the main subject, swelling out the book by collateral matter beyond its just proportions. After this we really get to what may be termed modern Persia. At the commencement of the sixteenth century the Shia form of Mahomment and the sixteenth century the sixteenth c mencement of the sixteenth century the Shia form of Mahom-medanism became the State religion; and at its close the Empire attained its greatest prosperity and its widest extent under Shah Abbas the Great. Then Islahan became, in familiar rhyme, suif Jehon, or half the world. From that date the pages of our author are taken up with accounts of kings who appear to have been born only to impel their subjects and country down the incline of national degeneracy. Cruel or effeminate, they were overrun by the Afghans or outwitted in diplomacy by the Russians. After Nadir Shah, a mighty Empire was split up into four considerable portions, each ample enough to supup into four considerable portions, each ample enough to support a dynasty, and a chief of the Kajars, of Turan or Turkish origin, became Shah of Persia at the close of the last century. The visitor whom all London stared at for ten days last summer, and who was termed the successor of Xerxes and Darius, is, in fact, the fourth in succession from the head of a tribe of Kuzzilbashes which had first appeared in Persia in the train of Chenghis Khan, and which had eventually settled down near

Chenghis Khan, and which had eventually settled down near Asterabad, to the south-west of the Caspian Sea.

In spite of the elegance of its language, the splendour and antiquity of its remains, and the polish of its inhabitants, Persia does not inspire us with very keen hopes for the future. One is rather perplexed to account for its ancient prestige and unquestionable strength. Mr. Markham says, at the close of his long sketch, that whatever may be its ultimate fate, there will always be a charm about its history, and that the palaces of Persepolis and the poetry of Sadí and Hafis will suggest the most delightful associations. This is all nerfectly true, and a pleasant tour in Persia may be This is all perfectly true, and a pleasant tour in Persia may be accomplished, with the excitement of an attack by Turkomans, at a moderate expenditure, and without fear of finding a party of Mr. Cook's tourists, on arrival at a serai, monopolizing the relays of horses and exhausting the supplies of the Bazaar. But what, the reader or traveller may ask, has become of the amplitude of rereader or traveller may ask, has become of the amplitude of resources which at one time frightened Europe, and at another sent a conqueror over half Asia? The truth is, of course, that an Oriental despotism has vigour but not vitality. Hordes of plundering cavalry, and able and unscrupulous commanders who have risen from the headships of tribes or villages to live in palaces and sit on jewelled thrones, succeed for a time. Every now and then we hear of a great ruler like Shah Abbas who boasts of a foreign policy marked by sagacity and an internal administration based on religion and law, or a name like that of Karim Khan stands out in bright contrast to others who have tortured their subjects or musdered their nearest relations. But the best of despots fails to charte a middle class, and the system by which the revenue is col-There are fine forests in the system by which the revenue is collected and the courts are administered is fundamentally had. Then the climate and the physical aspect of the country seem to us insuperable obstacles to national revival. There are fine forests in F.C.S. With numerous lliestrations. London: Chatto & Windam. 1874

the northern provinces; there are fartile strips and productive gardens wherever in the central districts water is to be had. But wherever in the central districts w half the streams have no outlet, or end in sands. The climater passes from an icy winter into a blazing summer. No tropical rains drunch and fortilize the soil; no rivers bring down the sommulated silt which works such wonders in the valley of the Mississippi, the Cangotic Pelta, or the Amanute peninsula; and if there are any mineral and are the Parents Street. there are any mineral resources in the Persian Empire, they are unexplored, or so little known as to be of no account in estimating the recuperative power of the nation. Mr. Markham gives us in extense the well-known concession of the Shah to Baron Reuter, but reminds us in a note that the Persian Government has just declared the convention to be null and void. That any one having even a limited acqueintance with the system of any Oriental State could have ever augured from such an undertaking any good result to either monarch or contractor, has always appeared to us an absolute marvel. From the very first it was obvious that the Baron could only succeed by putting the Shah and his functionaries entirely on the shelf, and by over-riding national customs, Oriental conservatism, and all private rights whatever. Nearly every one of the twenty-four sections of the concession bristles with the elements of discredit, confusion, and difficulty. To take the case of India as the nearest parallel, we will venture to say that there has been not a Governor-General from Lord Wellesley to Lord Northbrook who would have encouraged or allowed a single one of our feudatory Nawabs or Rajas to sign such a one-sided agreement. And why a convention which would be inequitable or impracticable at Jyopore, Hyderabad, or Puttiala, should be permitted to pass without protest or should be likely to succeed at Teheran, entirely passes our comprehension. Reforms in Persia must commence from within. The system of collecting the public revenue must be reformed. Turkoman raiders must be rooted out or driven back. It is quite possible to conciliate the tribes of the Ilyats and even to convert them into conciliate the tribes of the Hyats and even to convert them into useful Irregular troops. And there is no reason why roads and works of irrigation should not be constructed by the clovernment of the Shah without any abject surrender of all its dignity and power. The effects of the late famine will, however, be felt for another generation, and meanwhile our Minister at Teheran may usefully employ his time in re-catablishing a wholesome ascendency with the King and his advisors. We recommend Mr. Markham's work as a respect storphouse of facts but if any reader wishes to with the King and his advisors. We recommend Mr. Markham's work as a perfect storehouse of facts, but if any reader wishes to penetrate below the surface of Persian society, we should suggest to him to read Morier's *Hadji Baba*, if he can procure a copy. That the adventures of this worthy, both in his own country and in England, were not reprinted by some enterprising publisher during last summer has always surprised us. A due study of the works of writers acquainted with the country would have prevented the English press from discussing the late Persian concession in terms of innocent wonderment or undiscriminating praise.

FARADAY'S FORCES OF NATURE.

THE substance of Furnday's lectures on the Various Forces of Nature has long ere this been presented to a larger audience than the juvenile throng who hung upon his lips at the Royal Institution thirteen or fourteen years ago. By way of abstracts or epitomes, more or less full and accurate, the lectures found their way into print and were widely disseminated. The time that has since clapsed, so far from lessening their value or diminishing the desirableness of having them once more set forth in print, makes the present publication the more welcome and opportune, nukes the present purceases the more were one and opportunes, especially as we now have the advantage of seeing them in an authentic shape, taken down literatim from the author's mouth, and passed through the press under the care of a thoroughly qualified editor. The lightest utterances of this Chrysostom of scientific lecturers were of pure gold, and even the sparkless of his content of pure gold, and even the sparkless of his content of pure gold, and even the sparkless of his correction. exposition of nature—when, in his own unaffected language, he returned to his second childhood, and became again as it were young amongst the young—were something more than the transient entertainment of an afternoon hour. Simple as they are, and adapted to the capacity of any young person or even child of average intelligence, these lectures are pregnant with meaning to a degree which is not often seen in addresses to-more advanced or critical audiences. There is indeed no truer test or proof of genius in a teacher than this power of combining sim-plicity with depth, carrying with him the minds and sympathies of the youngest and least mature among his listeners, without of the youngest and least mature among his inteners, without those whose tastes or duties lie in the direction of oral teaching, these lectures may well serve as an example how best to reach the youthful understanding, and to prepare the food of the mind for the easy assimilation of babos. One main ingredient in the pleasure which these addresses originally gave is indeed to be enjoyed no more. His unrivalled dexterity and unfailing skill in experiments gave to Faraday's lectures a charm which no other teacher of science had possessed since Davy. There was, as his editor justly claims for him, no risk of apologies for an unsuccessful experiment; no hanging fire in the midst of a series of brilliant demonstrations, producing a depressing tendency akin to the pain

felt by an audience at a false note from a singer. Something has

felt by an audience at a false note from a singer. Something has been done to make up for this unavoidable drawback by occasional illustrations, as well as by brief descriptions of each particular experiment inserted in the text. For the rest, all must be left to the clearness of exposition inherent in the lecturer's own words, unobscured as they are by superfluous technicalities, and sparkling as they do throughout with the fire of sensibility and genius.

How is the idea of force, which the most profound among philosophers will feel the greatest hesitation in defining, to be brought home to the apprehension of a class of boys or girls? This is the problem which Faraday sets himself to solve in the first of these half-dozen lectures. Here the tact of the lecturer is shown in the way in which he leads his hearers on by successive steps of induction, from obvious and familiar instances of natural forces in action, to something like a distinct generalization of force in in action, to something like a distinct generalization of force in the abstract. The particular force dealt with in the opening lecture is that of gravitation. The notion of force first comes into the mind upon observation. The notion of force first comes into the mind upon observation of what is going on in nature, more especially of what we are ourselves conscious of being able to effect in nature, followed by analysis of what causes these effects. Prior to such reflection all things are taken for granted, exciting no kind of wonder. To the savage, and no doubt to the child, how he came here, how he lives, by what means he stands upright or moves from place to place, is a matter of neither curiosity nor howildenears. By degree it desugamatter of neither curiosity nor bewilderment. By degrees it dawns upon him that these effects come about in consequence of the existence of certain forces, or powers, or abilities to do things which may be of the simplest and commonest kind, yet which are essential to our existence every moment. It is in ourselves first that this idea of power originates. Set upright on its edge a sheet of paper resting of power originates. Set upright on its edge a sheet of paper resting against a support, and, by means of a piece of string attached, pull it over. Here, says the lecturer, is a power brought into use, a power of the hand carried on through this string in a way which is very remarkable when we come to analyse it. It is by means of conjoint powers, of which there are several here employed, that the paper is pulled over. Again, if I give it a push on the other side I bring into play a power, but a very different exertion of power from the former. I may pull it over once more, without touching it, by presenting to it a stick of shell-lac which I have rubbed with a merce of flamel. It might be blown over by the use of a morsel of gunpowder. In the shell-lac then, and in the gunpowder, there is what is called a power or force, though it gunpowder, there is what is called a power or force, though it would not be true to say that such a power or force was in the string. Not that we are to suppose that there are so very many string. Not that we are to suppose that there are so very many different powers. On the contary, it is wonderful to think how few are the powers by which all the phenomena of nature are governed. "Look at the lump upon the table. There is an illustration of another kind of power. There is heat, a very different power from that of pushing or pulling; and so we find by degrees that there are other powers (not many) in the various bodies around us." Passing on to the conception of matter, the lecturer next spoke of the sort of matter we call water, in the fluid state, in ice, and in vapour issuing from a boiling flask. In each of these three states he showed water to possess the power of weight that is cravitation. showed water to possess the power of weight, that is, gravitation, although the amounts of power in the three states respectively are various. Going on to weigh water against various kinds of matter, as platinum and aluminium, he drew attention to the different amounts of force inherent in various bodies, coming in the end to amounts of force inherent in various bodies, coming in the end to the common property of gravitation belonging to all matter alike, holding the earth, with its solid framework, its oceans of water, and its envelope of air, together. Some simple experiments with familiar toys, such as the Dutch tumbler, aided by the clever trick which had greatly puzzled him when a boy, how to hang a pail of water by means of a stick upon the side of a table, together with that of balancing a cork upon the point of a stick by simply tipping it with wings, brought to a close this elementary lesson in philosophy, which the lecturer summed up, and sought to stamp upon the memory of his hearers, by writing upon the blackboard, under the general heading Force, the word Gravitation.

Each subsequent tecture enabled him to write under this primary

Each subsequent lecture enabled him to write under this primary power the name of some additional force in nature. Cohesion, chemical affinity, heat, magnetism, and electricity were in succession unfolded, their presence and influence made clear, and their distinctive modes of working demonstrated. The distinction of powers displayed in the gravitation of particles of matter, in their mutual attraction under the power of a magnet, and in the attraction of cohesion, was made manifest by experiments which must have amused or delighted, whilst they edified, the juvenile auditory. An arch of iron filings was built up to illustrate the force of magnetic attraction. Two pieces of lend, scraped bright and cleanly cast and pressed together, were shown to become one by virtue of the cohesion of their particles. Crystals of alum, ground down to destroy their crystallization and thoroughly saturated with hot water, regained their crystalline form as the water cooled and was drained off, whilst a few pieces of clean coke thrown in during Each subsequent lecture enabled him to write under this primary hot water, regained their crystalline form as the water cooled and was drained off, whilst a few pieces of clean coke thrown in during the process formed the basis of a beautiful fabric of alum crystals like a natural mineral. A solution of perchloride of mercury being mixed with one of iodide of potassium, a precipitate of biniodide of mercury fell down, which was yellow at the first, but, as the iodide was increased, assumed a pale reddish tint, turning to brilliant scarlet. The resulting red substance, being made to undergo changes in the cohesion of its particles under the application of heat, was seen to change from red to yellow and back again in accordance with these varying conditions. The like change of properties as regards the faces of cohesion was explained to constitute the only difference that alists between common charcoal, straw charzed in a particular

way, looking like black-lead, and the diamond. kind of cohesion shown in crystals, such as well way, looking like black-lead, and the diamond. The peculiar kind of cohesion shown in crystale, such as rock-salt, calcareous spar, mica, and Iceland spar in particular, was signally brought out under the rays of the electric lamp, this being a branch of experimental science which has a peculiar spell for an audience of beginners. Nor is its fascination one whit less intense for the lecturer himself. Nature is with him ever fresh, aver lovely. As the rhombs of crystalline spar turn round in the vivifying beam, how are the luminous rings brought out-of-shing and changing, while barred and shaded by the black "cross!" Look at those colours—are they not most beautiful for you and for me?—for I enjoy these things as much as you do." We have here, in this natural challition of delight, the key to that unexampled charm which Faraday exercised over the minds and hearts here, in this natural challition of delight, the key to that unexampled churn which Faraday exercised over the minds and hearts of the young. His was no dull didactic laying down of facts or loading the memory with cut and dried formulas and definitions. Nature horself was made to tell her tale in tones of harmony and rays of light, and he, as her mouthpiece and illustrator, caught the sound of her accents, and basked in the light of her beauty. Nor was his delight in the loveliness and the richness of nature unaccompanied by a sense of awe and reverence for the infinity or mystery which invests all truth; a sense which, while it gives earnestness and gravity to the teacher, exercises a strongly attractive effect upon the taught. As the time came for drawing together into one the threads of inquiry which he and his class had been following during the period of each course, it was his wont to strike a chord of more or less solemnity, leaving upon the minds of those chord of more or less solemnity, leaving upon the minds of those from whom he parted somewhat of the same high aspiration with which he himself went on his way in the pursuit of truth. His simple earnestness gave emphasis to his assurance that all honest and observant study of physical laws was certain in the end to be rewarded by the discovery of—

Tongues in trees, books in the running brooks, Sermons in stones, and good in everything.

In the last lecture of the series Faraday remarked upon the orrelation of the various forces of which he had severally treated. correlation of the various forces of which he had severally treated. Illustrations were given of the way in which chemical affinity could be made to produce electricity, and electricity in turn became chemical affinity. Attention was carried on to the further wonder, made known, as he modestly puts it, within his own time, but in truth by one of his own happiest discoveries, of the power possessed by these two forces to produce magnetism—an affinity long suspected by philosophers, but nover demonstrated before. The evidences of this interchangeableness of force, as well as of the power of obtaining heat and light no less than electricity of the power of obtaining heat and light no less than electricity from a magnet, were shown in a succession of experiments leading up to the crowning principle of these lectures, the universal correlation of the physical forces of nature and their mutual convertibility one into the other. To the series is appended an interesting address upon Lighthouse Illumination delivered before the Royal Institution March 9, 1860. No part of his life, Furaday was fond of saying, gave him more delight than his connexion with the Trinity House. The direct application of science to objects the most practical and even sacred, the security of property and the salvation of life, imparted an additional zest to a study which had already, in the pursuit of truth for its own sake, a more than adequate reward. In the face of what science has added to the theory and use of electric illumination during the inter-vening years, this lecture still deserves to be read as a compact and instructive summary of the origin and the application of the electric light.

THE LATER WITS AND HUMOURISTS.*

THE LATER WITS AND HUMOURISTS.*

We have to make a confession in regard to this book—namely, that we have not read it through. We must add, however, that it is a book which scarcely asks to be read through. It is assuredly made in great part with scissors and paste, and Mr. Timbs contributes the elightest possible admixture of independent remarks. Possibly we might find fault, if we were so inclined, with the over-lavish use of tolerably accessible materials. When, for example, the article upon Thackeray, of whom Mr. Timbs has not much to tell us, is eked out with passages from Vanity Fair and from various papers published in his collected works, we do not feel that we are being quite fairly treated. However, the reader has in his own hands the very simple remedy of skipping; and in a book which is meant to be dipped into rather than read the error is venial. There is one other point upon which some adverse criticism might be made. The great merits of a compiler are accuracy and good arrangement. Now Mr. Timbs repeats stories rather unnecessarily, and he makes occasional errors of carelessness. When, for example, he tells us in the same page that Rogers the poet died in 1855, and that he went to Paris in "1843, four years before his death," we feel that a very little attention to the proof-sheets would have removed an obvious slip of the pen. We have noticed, one or two other slips of the same kind, but they are not grave offences; and a good deal may be pardoned to a gentleman who tells us in his preface that he published a book of the same kind fifty years ago. A certain amount of repetition and inaccuracy is a privilege of old age; and, on the whole, we are obliged to Mr. Timbs for a book which, if not a faultless specimen of writing, is full of amounts between the published Repulse & Repulse WE have to make a confession in regard to this book-

* Anarchite Lives of the Later Wits and Humanriess. By John Timbs, F.S.A. London: Bichard Bentley & Son. 1874.

The characters whose good sayings and eccentric performances are here collected form a curiously varied party. Amongst statesmen there are Cauning and Talleyrand; amongst serious writers there are Cauning and Whately; amongst novellats, Thackeray and Dickens; amongst politicisms, Cobbett and Curran; amongst humonrists, Lamb, Douglas Jerrold, Hood, and Barham; and archiget actors, Charles Mathews and Michael Kelly; with a iniscellaneous assortment of other celebrities of greater or lesser dignity. To give any general impression of so varied a collection is rather difficult; but a few remarks naturally occur as we turn over the pages. We have often considered the question what party we should like to meet if we were capable of summoning the dead from their graves. Who of all the brilliant talkers that have left a great reputation behind them would really be the most agreeable in conversation? Should we go back to the days of the "Marmaid" and listen to Shakspeare and Ben Jonson's wit-combats; or visit Milton in his blindness; or drop in at a coffeeand listen to Shakspeare and Ben Jonson's wit-combats; or visit Milton in his blindness; or drop in at a coffee-house to hear Addison and Steele; or dine with Pope at Twickenham to meet Bolingbroke, Swift, and Gay; or spend an evening at Holland House with Macaulay and Sydney Smith, or listen to some of the absurdities of Charles Mathews or Theodoro Hook? There is much to be said on behalf of various theories, for conversational reputation is necessarily of the most uncertain character. The fragments which people bring away from dining-rooms or coffee houses seem strangely to lose their brilliancy when repeated in cold blood. When we are told that such or such a remark threw a whole audience into convulsions of laughter, we are threw a whole audience into convulsions of laughter, we are inclined to wonder whether there was some special charm in the speaker, or whether the wine was specially good, or the anecdote cruelly misreported. Few indeed of all the conversational gems that once flashed so brightly are capable of sparkling when once taken out of their setting. The skull of Yorick does not differ more from his living countenance than the bare skeleton of a jest which once set the table in a roar differs from its appearance next e set the table in a roar differs from its approximately it is the difference between the flower in a garden between the flower in a Braden Dead, a meadow and the flower in a botanist's herbarium. withered, and scentless, we are astonished that anybody could have ever admired it. One cause is obvious in some cases. The pleasure, for example, which we receive from a specially felicitous pun depends in no small degree on its being obviously impromptu. If we had been present when Swift made the celeimprompts. If we had been present when Switt made the celebrated pun upon a lady's mantle knocking down a violin—"Mantan, væ, miseræ nimium vicina Cromonæ"—we should have been startled at the amazing felicity of the application. When we hear it in cold blood, we fancy, and perhaps rightly, that the violin and the mantle were invented to suit the riddle. The inversion of the relations between the scale which suggests the remark and the remark by which it is accounted taken all the venit out of the aveing relations between the scene which suggests the remark and the remark by which it is suggested takes all the point out of the saying. Indeed, there is a dramatic element in all good conversation which cannot possibly be replaced. Mr. Timbs, for example, quotes several of Douglas Jerrold's good things; and it is wonderful to see how little they stand the process. A gentleman, telling of some stupid practical joke, said, "I thought I should have died with laughter." "I wish to heaven you had," replied Jorrold. "All I want," said an orator, trying to interpose in a stormy discussion, "is common sense." "Exactly," Jerrold replied; "that is precisely what you do want"; and the discussion, we are told, was lost in a burst of laughter. Now we can easily imagine, when we'come to think about it, that interruptions of this kind may cause amusement at the time by the happy interjection of a little shrewd observation at the critical moment. But when written down in cold blood they leave little behind except an impression of gross rudeness. they leave little behind except an impression of gross rudeness

Suppose that from all the good sayings which pass current in society, to say nothing of those which are written in books, we were to remove three classes of witticism—those, namely, which were to remove three classes of witticism—those, namely, which savour of profanity, those which are more or less indecent, and those which are sharp personalities—and how much would be left? Of the first two classes we do not find any representatives in Mr. Timbs's book; but it is impossible not to observe how much pain must have been given by these witty persons, though their sayings are now repeated for our enjoyment. Rogers, for example, was spiteful himself and the cause of spite in others. His well-known remark about the fortunate man whom everybody had been praising for his good looks, his wealth, his abilities, and his rank, "Think God, he has got bad teeth!" was a frank expression of the natics which animates most of his witticisms. When Hook advised Rogers in his turn not to attend Byron's funeral, for fear the undertaker would claim him as a corpse interred six months before, the facetiousness covered a brutal remark upon a personal peculiarity. Talleyrand's sayings are still more offensive. The answer "Already?" to the man who said he was feeling the tormeuts of hell, and the remark to the man who said that his mother had been a heauty, "C'était donc monsieur votre père qui n'était pas si hell, and the remark to the man who said that his mother had been a beauty, "Cétait donc monsieur votre père qui nétait pas si bien?" strike us as owing nearly all their merit to their instrility. The last saying quoted, for example, is not one which could have occurred, to mobody else, but simply one which nobody else would have ventured to utter. Talkey-rand and Rogers, of course, have a name for cynicism; but we do not find that men of greater good nature are always much more agreeable. An aide-de-camp, we are told, asked Whately, pretty much in his own style, "What is the difference between a Roman Catholic bishop and a jacknes?" the answer being, that

"One wears a cross upon his back, and the other upon his breast."
"What is the difference," retorted Whately, "between an aide-decamp and a donkey?" "I don't know," replied the aide-decamp, interrogatively. "Nor I either," said Whately. After all, there is nothing very funny in colling a man a donkey to his face, and the particular turn given to the remark is one which we suspect to here been hit upon by some hundreds of schoolboys before it occurred to the Archbishop. Lumb was one of the kindliest of man, and his humour has the smallest possible infusion of ill-feeling, and yet even Lumb must have sacrificed a friend to a joke pretty often. When he replied to Coleridge's question, "Did you over hear me preach?" "I nover heard you do anything cise," we may be pretty sure that the remark did not strike Coloridge as altogether pleasant. altogether pleasant.

Is it quite possible, in short, to be a good Christian and a pro-fessed wit? And, if wit passes into cruelty on one side, does i fessed wit? And, if wit passes into cruelty on one side, does it not constantly descend to buffeenery on the other? Mr. Timbs, for example, records a long story of how Charles Mathews ones passed himself off for a Spanish Ambassador. He went in a post-chaise to Dartford, and his friends spread the report that he was the Ambassador incognite. Of course people believed and came in crowds to see. He astonished the people at the inn by mixing his food in a manner contrary to all British prejudices, and managed to put it in the fire when their backs were turned. He called in a private burse and completely took in the contained managed to put it in the fire when their backs were turned. He sailed in a private barge and completely took in the captain—a feat which does not seem very amazing when we are told that a frigate had been prepared to recognize him by signals, and that the officers received him in full uniform, and with due salutations. Why should not the poor captain of the barge betaken in? How was he to know that the officers of a royal ship werupil engaged in an elaborate piece of silly buffoonery? The captain of the barge, it is added, was brought to Mathews in the cabin of the ship, and "an indescribable score of rich burlesque was enacted." After a great deal more of this toufcolery the party landed at Ciravagud and added, was brought to suthews in the cann of the ship, and "an indescribable scene of rich burlesque was enacted." After a great deal more of this temfoolery the party landed at Gravescud and returned to London, "Invuriating upon the hoax." If—we beg parden for the hypothesis—the Duke of Edinburgh and his suite took the necessary trouble to convince the captain of a penny steamboat that some popular actor of the day was the Emperor of Russia, they would no doubt succeed; but we should find it difficult to enter into the fun of the performance. The party, we are told, never lost their gravity; we wonder rather that they could look each other in the face without blashing.

that they could look each other in the face without blushing.

Alas! these stories of departed fun are about as cheerful as the sight of a dinner-table after the guests have gone, and left nothing but half-empty glasses and cigar-ashes. And yet we do not mean to leave the impression that we should seriously propose that all wit should be suppressed by public opinion. There is even a time, it may be, for that kind of wit which borders most closely upon buffoonery; for, as the wise man tells us, there is a time for everything; but it is rather a ghastly ceremony when we try to revive its dead bones, and invite a later generation to look on and wonder. There are, however, many much better things recorded in Mr. Timbs's pages, and some which make us regret the impossibility of travelling in time as well as in space. And yet we can derive some kind of comsolation even from reading the best sayings of departed humourists. A witteism has a kind of immortality independent of its originator. The really goed sayings we find have never been first invented by anybody. They are handed down from one generation to another, and are much improved in the process. When, again, we compare actual reports of conversation with the written records of thought, we are struck by the obvious fact that what a man writes is generally much better than what he says. Even the greatest of with is happier in his study, where he can polish his own good things and introduce them in their due place, than in the random flashes of fun which owe half their merit to their temporary surroundings. We suspect that if all Lamb's talk had been taken down by the most skiful reporter, we should have had nothing half as good as the Emerical and the process. Alas! these stories of departed fun are about as cheerful as the own half their hort to that comporary surroundings. We staped that if all Lamb's talk had been taken down by the most skilful reporter, we should have had nothing half as good as the Fasays of Elia; and that the best part of Sydney Smith was not that which corusested during an evening at Holland House, but that which was deliberately committed to paper, and may be read by all men.

COX'S HISTORY OF GREECE. (Second Notice,)

BEYOND all doubt Niebuhr was justified in an expression which may be taken as the heyrote of Mr. Cox's view of the work of Herodotus, that it has an opic rather than an historical character. But Mr. Cox has shown with unprecedented force how the epical unity of Herodotus's History is the offspring of a religious conception of the course of burstian affairs, which is never at a loss for illustrations of the operation of the principles it This leads him to an unconscious selection of enuses of involves. This leads him to an unconscious selection of causes of a peculiar kind for every description of results, and obscures the real relations between causes and results which it is the business of the historian properly so called—the scientific historian, if the expression be preferred—to explain. So far it is impossible not to go along with Mr. Cox; but it will be observed that in individual instances he goes much further, and represents Herodotus not only as open—which he no doubt was—to the charm of supermatural causation, but as blind to the necessity of distinguishing between actual invention and fact. On these points we may recommand

serve our comments; meanwhile it will be conceded to Mr. Cox that Herodetus is almost as far removed in the spirit of his n tive from Thucydides as he is from modern historians. This extraordinary phenomenon in literary history is incontestable; but Mr. Cox has not as yet found an opportunity of accounting for it Mr. Cox has not as yet found an opportunity of accounting for it by a connected exposition of the causes which explain so signal a difference, and which, as he rightly recognizes, are by no means to be sought only or mainly in the difference between the personal adiosynerasies of the two men. Such an inquiry seems especially called for in a History which, like the present, attaches so paramount an importance to the criticism of its authorities. What, for instance, explains the relative significance attached to the rosponses of the Oracles in the one and in the other period? Mr. Cox has some acute remarks on the various kinds of oracular responses distinguishable among the tirreks, though he has probably sponses distinguishable among the Greeks, though he has probably over-estimated the proportion of those made after the event; over-estimated the proportion of those made after the event; but he has not as yet given a satisfactory account of the gradual diminution of the influence exercised by the Oracles in general. The amenability of the Delphic authorities to external influences has perhaps been unconsciously exaggerated by previous writers, and a more definite inquiry into the subject is cortainly not uncalled for. Pausanias was only acquainted with a single instance (that of Cleomenes) of the Pythia having been bribed. But this certainly does not availed the extremely probable supposition, which accords with exclude the extremely probable supposition, which accords with the actual tendency of many of the responses, that the opinion of the priests on questions of the day was of much importance in determining the inspirations of the Pythia, just as the views of ministers of religion are at all times likely to become those of the women, especially, of the women of an "exalted" mind, with whom

they are brought into constant personal contact.

But, as we have said, the general estimate of the standpoint of Herodotus given in this History seems to as just, though we are far from agreeing with every point in the claboration of it. Thus, to start with, there is, to say the least, some ambiguity in the remark that Horodotuse Convections of the great blessings of freedom 7.775) could have been formed only from historical testimony, and not from any personal remembrance of the previous fortunes of his country." It seems to us that no one could have had better personal reason for contrasting the results of "iσηγοριοη" with those of Tyrannical rule, and for understanding the "injustice and misery. which attend on the supremacy of foreign tyrants," or at least of Tyrants dependent on foreign support, then the historian who had with his kinsman been expetriated ca Λενδαμων του άπο Αρτομοπιας reference γρεώμενου Αλιουνασσού. And, as already remarked, while we allow that in Herodotus the influence of religious ways of thought impaired the power of discerning the true co-operation of influenceal causes, it does not follow that his judgment of the control what is a fact was completely destroyed by the influence in question. It is not easy to recognize in Herodotus's account of the conversation between Demaratus and Xerves a pure othical fiction, or to understand how Thersander (for Mr. Cox necessarily shifts the responsibility on him) should have remembered the story of the Possian at the feast of Attaginus with so circumstantial an in-The Paising at the least of Actingmis with so creatment in managements. But these are comparatively trifles. The scepticism of Ms. Cox as to Herodotus's mirrative of the Scythian expedition of Darius seems to us wholly unwarranted. Herodotus may have misrepresented Darius's motive and embellished the history of the retreat. The invention of the whole expedition, a theory which Mr. Cox (vol. i. p. 382) rather hints than ventures to express, is ont of the question in the case of an event separated by not more than a generation from the date of the historian's birth. Were we thank ourselves to fall into Mr. Cox's way of historical parallels, we might at least aver of the Scythian expedition of Darius, as compared with the Russian expedition of Napoleon, that the former was acquainted with the regions which he set out to subdue at least as well as the latter, and that he had at least as trustworthy allies. The doubts thrown on the Herodotean account of the armada of Xerxes, on the other hand, are thoroughly legitimate; though it would require more than the authority of Juvenal and of some modern archæologists to make us doubt the fact of the cutting of modern archaeologists to make us doubt the fact of the cutting of the canal through Athos (vol. i. p. 463; and cf. Mythology of the Aryan Nations, vol. i. p. 93), which even Sir (t. C. Lewis accepts. The cavils against the historian's representation of the nature of the struggle at Thermopying go beyond the mark, as they amount to the suggestion of a deliberate falsification in order to gratify the national pride. Nor can we see any contradiction between Leonidas's representing retreat before the enemy as an impossibility for a Spartan leader, and the statement that Cleombrotus withdrew from the Isthmus because of the occurrence of an eclipse withdrew from the Isthmus because of the occurrence of an eclipse of the sun. But scepticism is a tendency which requires on occasion to be kept in bounds as much as its opposite, credulity; and it is really irritating to find doubts thrown on the accuracy of the a really irritating to find doubts thrown on the accuracy of the anecdote concerning the arrival of Alexander in the Athenian camp before l'latere, and of his revealing himself with the words, "I am Alexandros the Macedonian," because "Aristeides at least would not have needed the announcement of his name," and because "his warning, though kindly, was not indispensable."

Two passages may in conclusion be noticed as certainly open to graver difficulties. The attack on Delphi, however, seems to us to be not disproved by the assertion of Mardonius before Platese—i.e.

as not disproved by the assertion of Mardonius before Plates.—i.e.

if year after the attack is supposed to have taken place—that the
Persians had no intention of going against Delphi and plundering
the Tample. The want of success in the case of the raid of which
the attachment directmentances were doubless falsified by superstition taget have induced Mardonius to use some diplomatic phrase

of disavowal, not perhaps very accurately reproduced by Herodotus. Otherwise he could hardly have left standing in a passage of his Otherwise he could hardly have left standing in a passage of his Ninth Book so glaring an apparent contradiction of a passage in his Eighth. In the speech made by the Athenian ambassadors at Sparta shortly after the murder of Lycides and his family at Athens, the Peloponnesians are informed that the Athenians, "unless they receive immediate aid, must devise some nearly a desire on the part of the Athenians to exercise all possible pressure on the Spartans; but with what justice can the speech subsequently delivered by the Athenian, Megarean, and Platsean envoys be described as "wretched bathos" after previous "lofty protestations"? Calmly read, the speech expresses a firm determination on the part of the Athenians to do their duty, coupled of course with a desire to make the Peloponnesians do theirs. Yet, because of the absence of an impassioned strain from this speech, Mr. Cox regards it as irreconcilable with so fanatical an act as the massacre of Lycides and his family, and is glad acact as the massacre of Lycides and his family, and is glad accordingly to reject the latter as "befitting the character only of Andaman savages." Nor has he, it may be incidentally remarked, shown any grounds for his assumption that the story of Lycides related by Herodotus is identical with that of Cyrsilus appealed to by Demosthenes, instead of the two being distinct, thereby similar accounts the story of the story

though similar, events.

In the examination of the history of the period discussed in Mr. Cox's second volume, the inquirer has, as he observes, to contend against a wholly new kind of fiction—that which is the result of personal or political jealousy, and of consequent intentional misrepresentation. The historian of Greece in the period of her most desperate party conflicts must undoubtedly be especially on his guard against misstatements of this description, though he will undoubtedly err unless, like Mr. Cox, he puts a general trust in the respect for facts exhibited by Thucydides. We regret the less to be able to follow more minutely Mr. Cox's comments on the Thucydidean narrative of the Peloponnesian war, inasmuch as they are generally kept within the bounds of legitimate comment. The conjecture (vol. ii. p. 266) that Gleon was sent out to Thrace, ough similar, events. The conjecture (vol. ii. p. 266) that Oleon was sent out to Thrace, as he had been to Pylus, by the machinations of Nicias and his partisans, seems however wholly unwarranted by evidence. The reatment to which Alcibiades is subjected cannot, to say the least, be regarded as free from exaggeration. He "presents an image of violent selfishness and ingrained treachery, standing very near the pinnacle of human wickedness." Allowing, in respect to his earlier doings, every epithet which Mr. Cox lavishes upon them, earlier doings, every epithet which Mr. Cox lavishes upon them, which is allowing a great deal (see e.g. p. 291), it is to be remarked, first, that the conduct of Alcibiades after his election as general, and after his second dismissal, is free from any suspicion of treachery, and is not to be accounted for except on the hypothesis of real patriotic feeling. Secondly, that —whatever may be thought of the causes of the defeat at Notium—the expressions that Alcibiades had at this time "given up" himself to his pleasures, and "handed over" the fleet to an "incompetent reveller," are scarcely fair. According to Mr. Grote, Alcibiades "abandoned himself partly to the love of pleasure. "incompetent reveller," are scarcely fair. According to Mr. Grote, Alcibiades "abandoned himself partly to the love of pleasure, partly to reckless predatory enterprises for the purpose of getting money to pay his army," which is a different thing. Nor can be said to have "handed over" his fleet to Antiochus, when he merely left him in command, as Mr. Cox of course states, "with a strict charge to avoid all engagements with the enemy "till his own return. Thirdly, Mr. Cox hardly furnishes any satisfactory proof of the statement that "the revived ascendency of Alcibiades came suddenly to an end, because his character was infamous." It would open too wide a question were we also to dwell on the position, briefly developed in an Appendix to Vol. II., that African conquest, as a motive for the Sicilian expedition, was, so far as our evidence goes, merely the "distempered dream" and "heated talk" of "Alcibiades and his fraternity." For our part, we confess to a belief in the old reading in the Aristophenia name a belief in the old reading is Kapxiicova in two Aristophanic passages in point. But, confining ourselves to the former statements, we must express our opinion that, were Mr. Cox's narrative generally written after so little temperate a fashion, its value would chiefly lie in the warning example which such assumptions furnish of the difficulty that even modern historians find in discussing Greek history except from a party view. Such blemishes, however, are happily not characteristic of the general tone of the book, any more than the exaggerated enthusiasm called forth by an anecdote about than the exaggrerated enthusiasm called forth by an anecdote about Callicratidas, whom, as contrasted with Lysander, Mr. Cox compares to the Archangel Michael in the presence of Mammon. While it would be unworthy not to acknowledge the nobility of the sentiment ascribed to Callicratidas by Xenophon, we are bound to express our heaitation in accepting, contrary to the cautious heaitation of Bishop Thirlwall, Mr. Grote's free rendering of the words καὶ τοὺς Μηθυμναίους as "the Methymmean and Athenian prisoners." The soundness of Xenophon's taxt may, as Mr. Cox says, be doubtful, and the statement that the Athenian garrison was sold may be spurious; and Mr. Cox's own acceptance of Mr. Grote's view may be an adoption of the "more likely" hypothesis. But while we remain in such uncertainty as to the nature of the act which Callicratidas performed—while we do not know whether it was the fulfilment of a solemn declaration or the partial stuttification of a fine sentiment—we should prefer to heaitate before declaring it to be one by which its nuthor "won a place in that company of merciful men whose rightsousness shall not be forgotton."

gotton. Points of detail like these, however, will always suggest differences of opinion, and are can only repeat our acknowledgment of the

eral candour and fairness of Mr. Cox's statement and examination general candour and fairness of Mr. Cox's statement and examination of matters likely to be disputed. To his main view of the causes of the Peloponnesian war he adheres with clear consistency. "The idea of the Athenian empire was one which could not be realized without reversing the most cherished principles of the ancient Hellenic and Aryan civilization; and for this change the Hellenic tribes assurably were not prepared." The treatment, however, which in the establishment of her empire Athens adopted towards the members of her confederacy was as Mr. Cox's asserts one tribes assurably were not prepared. Instruction, however, which in the establishment of her empire Athens adopted towards the members of her confederacy was, as Mr. Cox's asserts, one which gave them no substantial grievance "apart from the passion for interpolitical independence." Indeed in a burst of patriotic pride, unfortunately too vague to convey much comfort, he observes, towards the close of the second volume, that "in her relations with her allies Athens exhibited a dignity and a justice which, if they have marked the dealings of any other people, have marked tnose only of England." Apart from lesser and later charges, the accusations brought against Athens with reference to the period before the Peloponnesian war resolve themselves into three kinds. Her forcible reduction of revolters is to be regarded as an inevitable necessity. Her interference with the constitutional life of her allies is less easily justifiable. It is doubtless true that "Athens did not maintain democracies where the general opinion of a city went in another direction"; and on the assumption that it was the duty of all oligarchical governments to accept at once a democratical reform of their institutions, Athens was in this respect only hastening a series of legitimate developments. Of the benefits accruing to the allies from the transfer of more important judicial cases to Athens, on the other hand, Mr. Cox takes a hardly tenable accruing to the allies from the transfer of more important judicial cases to Athens, on the other hand, Mr. Cox takes a hardly tenable view. "The Athenian," he says, "provided a court to which all the allies might, under either of these circumstances" (namely, disputes between different cities or between the allies and the dominant State) "betake themselves, and admitted them by so doing to all his own judicial privileges. If he might, as an officer of the confederacy or as a private settler, summon a citizen of Chios or Byzantium before the Athenian Heliaia, these in their turn had the same remedy against him; and thus he might say with justice that the downfall of the Athenian empire would soon convince the that the downfall of the Athenian empire would soon convince the world not of the cruelty, but of the moderation with which they had exercised their imperial authority." And then Mr. Cox goes on to say that before the Peloponnesian war "the subject goes on to say that before the Peloponnesian war "the subject allies of Athens might find in the Athenian law courts a protection at least equal to that which the Parliament of England afforded to the natives of India in the days of Warren Hastings." It will, however, be hardly maintained that the natives of India were admitted to "all the judicial privileges" of Englishmen, among which that of sitting on juries, as well as of coming before tribunals, is usually reckoned. The transfer, though justifiable as an inevitable measure of policy, cannot possibly be reconciled with the character of the original compact. The truth seems to be that the working of the constitution of the Delian Confederacy in the spirit in which it had been concluded was in itself an impossibility, that its basis was a delusive Federal relation, and that the imperial tendencies of Athens had to be pursued after a fashion which most surely tends to mutual distrust and its consequences, under the only too transparent covering of a Federal union. It may be that Pericles himself distrusted the durability of so false a relation when he contemplated an Hellenic union on a broader basis. Mr. Cox he contemplated an Hellenic union on a broader basis. refers only in a note to this scheme, as to the date of which opinions differ.

In future volumes of this History we shall look for much which its author may, according to a plan necessarily as yet only in part unfolded, have judiciously reserved for them. His narrative of the Peloponnesian war, extending to a perhaps unnecessary length, has left him no space for more than incidental notice of those extraordinary, but not inexplicable, changes in the progress of Athenian life which it is the duty of the historian to examine, and, if possible, explain. It is here that the narrative must diversify its course with the aid of the whole wealth of Attic literature. We thoroughly agree with Mr. Cox as to the inexpediency of accepting the poets—the comic poets in particular—as historical authorities, whether on a Pericles or a Cleophon; but in any case their works, as remains of the age to which they belong, possess, like the works of plastic art, an inestimable value for the historian. We trust that Mr. Cox too will succeed in adding to the vividness with which the labours of previous historians have enabled us to realize something of the many-sidedness of Greek life in the "school of Hellas," the city for whose history he has so warm a sympathy. In his second volume he has been rather oppressed by a desire to do justice to the details of the noblest historical narrative the world possesses, while exercising his own right of critical inquiry into passages suggesting difficulties or justifying doubts. The freedom with which he criticises the narrative of Herodotus he has not surrendered in commenting on that of Thucydides; but he has found few opportunities in the latter instance for exhibiting any power of fresh combination or reconstruction. But the publication of his History is justified by much to which we have been unable to advert, as well as by some features to which we have sought to direct attention; and, as he adds freedom of movement and width of range to the keenness of judgment and candour of comment of which he has given abundant evidence, his book will vindicate for itself a place o

THE GENTLEMAN EMIGRANT.

ANY families of the upper middle class in England have a confessed subject of anxiety in the son who fails to pass his examination. A good-natured youth of twenty, with his share of bodily activity and general intelligence, decidedly averas to books, and cheerfully throwing away every chance of academical or professional distinction—what is to be done with him? He may, take the few hundreds it would have cost to finish his education, and see what he can do in the colonial new worlds, either of the Far West or farther South. Here is the first type of the gentleman emigrant. The second is perhaps a married man approaching middle age, whose independent income was but just enough to support his position as a bachelor in good society. He finds that the yearly interest of his few thousands is likely to fall short of the increasing family expenses. For himself and his wife he might rely upon the gradual practice of small household economies, and a voluntary abatement of their social pretensions. But the future settlement of their children in this country ton or fifteen years hence is a problem of great apparent difficulty to their anxious foresight. With a view, therefore, to what may hereafter prove the best for his growing boys and girls, this example of the second class of gentlemen emigrants is about to seek a new home beyond seas. It is for the instruction of both classes—the first called Colebs, the second Henedict—that Mr. Stamer has written a lively book of description, anecdote, and comment.

It is assumed, in his practical advice, that the gentlemen emigrants

It is assumed, in his practical advice, that the gentlemen emigrants have a liking for agricultural, or pastoral, or some kind of rural industry. The man who has neither connexion and capital for mercantile business, nor the skill of a common handicraft, must not think of town life in the colonies unless he be a doctor, or perhaps a land-surveyor. Farming, stock-raising, and sheep-breeding, in a rough unscientific fashion, may come to be paying occupations after two or three years of blundering, before "Mr. Newchum" has spent all his money. Almost every Englishman, even the cockney shopkeeper or the bookish recluse who does not know one cereal crop from another in the field, cherishes in secret a fond conceit that he could manage a farm successfully, if he were owner of the freehold with the necessary plant and stock. The result of such experiments in England has been witnessed by the acquaintance of many an elderly retired draper or stockbroker after his release from the counter or the deak. It is usually a persistent yearly loss, of no ruinous amount, which is readily borne as the price of a healthy and interesting pastime. But in a lew equatry, where the novice or sciolist in agriculture has less opportunity of spending large sums in complex drainage schemes or the purchase of artificial manures, a town-bred man of robust bodily health may hope to get a living, and in time a profit, out of his cheaply bought land. The pastoral enterprise of Australia is more hazardous to inexperienced men of moderate capital; they are rather advised to eschew it altogether. It is not the squatter or lessee of a vast sheep-run, speculating on the huge produce of wool from myriads of fleeey backs, that Mr. Stamer has in view. He treats rather of the situation of the farmer in distant lands. The settler or fixed colonist, who grows corn or meat which he is sometimes unable to convert into money, seems nevertheless to be secured against the total wrecks of his fortunes, as well as against risk of starvation. The question is, whe

This last clause touches a subject upon which one might have wished for more information than Mr. Stamer has given us. If it be for the future advantage of his children that the gentleman emigrant is willing to renounce his old home and habits, he would like to reckon the probabilities bearing on his hope of an indefinite addition, by the development of colonial prosperity, to the worth of the individual settler's investment in buying, clearing, and fencing his land, and in the buildings upon it. But Mr. Stamer is too cautious to deal in prospective estimates of the flourishing condition likely to be attained by those newly settled countries in which English families are only now beginning to feel at home. In exercising this reserve, we think he has set a good example, more especially with regard to Australia. The climate of Australia, and its effects upon the European race of mankind, descrupon cattle and vegetable products, must be observed through a larger cycle of years than hitherto, before we can predict its rate of increase either in wealth or population. In the case, again, of the Canadian Dominion, with the Federal Republic on its long frontier, there are political contingencies which might possibly affect the position of its landed proprietors. Those of Virginia, the "Old Dominion," are now most eager to sell out at prices absurdly lower than the prices of similar estates in adjacent Maryland or Pennsylvania. The probable amount of "unearned increment" which accrues to as estate from the general advance of social and economic welfare in the sommunity around is known in England to be a very substantial consideration. In a well-to-do colony, we may suppose, its reality is equally undeniable, while it bears a more obvious visible proportion to the actual outlay in bringing the land under cultivation, and providing agricultural appliances. But the elements of the problem so far as regards the future steady progress of the commonwealth are still uncertain while the historical experiences of the colony are

The Gentleman Emigrant; his Daily Life, Sports, and Pastimes in Canada, Australia, and the United States. By W. Stamer. 2 vols. Landon: Timbey Brothers.

It is rather the immediate personal experiences of the gentleman colonist, and the daily habits of his domestic life under new circounstances, that form the topic of discussion in these two volumes.

The author, who has five times visited British America, upon several occasions also the principal States of the Union, from the Atlantic shore to Ohio, but not those of the South and Far West, compares their local advantages and drawbacks. He finds, in all that he knows of the vast North American continent, only two that he knows of the vast North American continent, only two districts, each of limited extent, which he can personally recommend to the English gentleman emigrant with from 3,000% to 5,000% capital for agricultural investments. The first is that peninsula of Upper Canada which lies between the three Lakes Ontario, Erie, and Huron, south of the 44th degree of latitude. Here the reader is invited to accompany Mr. Stamer in a few weeks' sojourn at the comfortable abode of his friend Benedict, cheered, of course, by the presence of Mrs. Benedict, upon a ready-made farm near Toronto, purchased for 2,500%. The domestic and commercial economy of such an establishment, managed with intelligence and industry, and supported by 2,500%. managed with intelligence and industry, and supported by 2,500% more for working expenses, domand the visitor's complacent apmanaged with intelligence and industry, and supported by 2,500l. more for working expenses, demand the visitor's complacent approval. The gentleman farmer seems to be in a fair way of doing very well; but the lady who plays the farmer's wife has found two bitter grievances in the colony. We fear that merely to name these will set many an English middle-class matron against every proposal of an American rustic home. They are, in two words, neighbours and servants. The course familiarity of "those Hoffernans" can only be repelled at the cost of provoking their malicious enmity. The tyramny of the "help," as a peculiar American domestic institution is styled with the severest trony, is a persistent reign of terror over the nominal master and mistress a persistent roign of terror over the nominal master and mistress of the house. This formidable oppressor, who invades their private repose in the guise of a female hireling for needful services, may be either a haughty native American woman or an imported Irish Biddy. Whether the scold or the slut be the more appleasant is a point which Mrs. Benedict has not yet decided. It was in vain for Mr. Stamer to offer this good lady, when she poured out her griefs with her tea at the breakfast-table, such random consolations as might occur to the masculine ignorance of a rambling bachelor and sportsman. If he had himself been a Benedict, he would have known better than to talk to her in a reasonable way. He might then have spared the endeavour to persuade her, by any amount of argument or example, that the social evils of a Canadian

residence could be either remedied or endured.

The same disadvantage, to families accustomed to the English standard of refinement in manners and decorous reserve of private life, will of course be found to exist on the opposite shore of Lake Ontario, in the northern districts of New York State. The scenery here is highly picturesque, the soil is fertile, and there are good roads and markets. If one does not mind living in a great Repubroads and markets. If one does not mind living in a great Republic and discowning allegiance to the British Crown, the pleasures of an independent rural life may be enjoyed in this State, or in that of Pennaylvaniat. But the price of land is higher than in Canada. A poor gentleman, one whose fortune is less than 5,000l., cannot do much good for himself as an agriculturist in any of the Eastern or the Middle States of the Union, except in Virginia, where he has just now an opportunity of doing very well. Since the late Civil War, it appears, the impoverished and disgusted planters have been seeking to dispose of eligible farms, with good buildings, in convenient situations for railway, road, or river carriage to the markets, at six or seven pounds sterling an acre. It is true that in some instances, where the soil has been exhausted by tobacco crops in the wasteful times of slaveholding management, the numbers of such an estate may have to exceed something by tobacco crops in the wastern times of savenouing management, the purchaser of such an estate may have to expend something more upon it. Yet his undertaking seems likely to prove less onerous than in the forests of Canada. The climate of Virginia, too, is mild and genial, and is, in the section lying between Richmond and the Blue Mountains, not unhealthy or debilitating. To many Englishmen, moreover, of the gentleman amigrant class it will be an inviting consideration that the Virginian word proprietors are like our gentlers or wish at Singrant class it will be an inviting consideration that the Virginian rural proprietors are like our country squires, or wish at least to be thought like them, while they cherish a saving repugnance to the Yankess and the New Yorkers. Whatever may be the real merits of native society in one or another section, the preconceived notions of the newscener from Great Britain, unless he be a realet for abstract political democracy, will perhaps be most likely to meet a satisfactory response in Virginia. He will be less exposed to insulting sarcassus and invectives directed against the country of his birth than in the New England States or in New York, and he will have few Irish among his neighbours. The problem of obtaining household service with tolerable subordina tion and cheerfulness may be solved in Virginia, we are told, by hiring an elderly negress, as the least objectionable of American "helps." It is for Mr. and Mrs. Benedict to weigh these considerations on each aide, and to fix their choice upon Canada West or "Old" Virginia, which may best suit their taste. The long and stern Canadian winter, though undoubtedly salubrious, may deter stern Canadian winter, though undoubtedly salubrious, may deter pursons of middle age whose constitutions have grown soft in the temperate seasons of our insular clime. Agricultural labours in Canada are suspended during several months, from the middle of Novamber to the beginning of April. It may be suspected that the enforced idleness of this "slack time," relieved only by the pastimes of sleighing and skating, when the fishing and shooting of attumb are past, has its effect in these neighbourly scandals and discussions of which the Benedicte complain.

An English gentleman emigrant who possesses a small income, (asy) tweeds three hundred a year, independent of the proceeds of

his 3,000d or 5,000d sunk in the farm, may amuse hisself in these parts of North America, if he be an arient sportsman, at very small cost. Instead of renting a Scottish moor, a privilege of small cost. Instead of renting a Scottish moor, a privilege of partridge and pheasant shooting, or the fishing of a trout stream or salmon river, he is free to room the woods and try his skill at the finest game of the wilderness, "fin, fur, or feather." These pursuits have evidently taken up much of Mr. Stamer's attention in his repeated leisurely visits to the British American provinces and to his favourite States of the Federal Union. But we hand to his favourite states of the favourity and decorate for the states. and to his favourite States of the Federal Union. But we should think that the gentleman emigrant who depends for the subsistence of himself and his family upon his moderate agricultural investment will do wisely to eachew all such too tempting opportunities of "gunning." A careful and thriving farmer in England is commonly too busy, with his land, his crops, and his stock, between his market-days, for the reputed aristocratic diversions of the field. He may carry his gun for a chance rabbit in an evening hour's stroll across his own meadows, and with that ha is content. In a country where he must work both with head and hands, acting not merely as hind, but as the foremost field-labourer in his own service, clearing, fencing, delving or ploughing, sowing, hoeing, and reaping, the beasts of chase and fowls of the nir would concern him very little. It is otherwise, for a time at least, with Mr. Coelebs, the young gentleman of our first-mentioned emigrant class, who has received, like an innocent Prodigal Son, his paternal inheritance or gift of 1,200l., and is off to live in America as he can and will, "not with blinded eyesight poring over miserable books." He is discovered by Mr. Stamer in the forest of Nova Scotia, separated from town or village by roads that are impassable in bad weather through swamps and "windfalls" of the trees encumbering the way. For the trifting sum of 50l has bought 400 acres, a beautiful piece of woodland and riverside scenery, where he dwells like a Robinson Crusce, in a shanty or log but which he means to exchange for a commodious frame house now being built. His servants are an elderly Scotch couple, a male and a female factorum, in the adjoining shanty, with the In a country where he must work both with head he is content. a male and a femule factotum, in the adjoining sharty, with the occasional hiring of a woodcutter or a temmeter. As he does not intend to clear his estate, but to rear bullocks and pigs, availing intend to clear his estate, but to rear bullocks and pigs, availing himself of the natural grass and acorns, and to produce beef, pork, and butter for sale to the hungry and well-paid lumberers of Nova Scotia, his small capital is quite enough for a good start. The boiling of sugar from the juice of his tapped maple-trees is another safe branch of rural industry, which Arr. Stamer pleasantly describes. Our author speaks favourably of the sporting resources of the Acadian backwoods, and is delighted with their picturesque beauty, the effects of which are so admirably varied in different seasons of the year. The native colonial population, outside of the educated class in towns, are rather less to his mind than those of Canada; and of the Micmac Indians, a remnant of the fabulous once noble savare, he gives a contemptuous report. To read Evangenoble savage, he gives a contemptuous report. To read Evange-line newadays, on the shores of the Basin of Minas, is to indulge in a remarkie dream.

Upon the whole, if we may trust, as we are inclined to do, in the candour and judgment of this writer, and in the correctness of his information so far as it goes, we believe that in the colonies a single man of robust and active habits, with even less than 1,000%, can make for himself alone, or in partnership with another man, a comfortable home and livelinood. He will not forfeit his character of gentlemen or compromise the principles of good English breeding in this manly and honest endeavour, though he must toil day by day harder than any of our Warwickshire and Cambridgeshire farm-labourers have ever done for the wages they now refuse. Coslebs in a few years will have won a secure and honourable independence, which he may then share with a wife of his own social rank from home. Whether it bein Canada, in New Zenland, or in Tasmania that he has chosen to make his rustic abode, his chances of prosperity are, we are disposed to think, nearly equal. In New Zealand there is no sporting, but there is an agreeable chinate; in Tasmania the lover of natural history and scenery will find much to interest him. We have reason to think that the tone of colonial society in both those distint calonies is better than in some British American provinces. This may be a hint for Mr. and Mrs. Henedict, without meaning to admit the lady's disparagement of her residence in the best part of Canada, not a hundred miles from Toronto. Provided that Hemedist has a few thousand pounds, and an ordinary capacity for business, we feel no doubt that he may become a successful colonial farmer, if he is not too fund of the gun, and if his wife can rise promptly from the sofa to attend to her dairy and poultry. But we cannot promise that they will like their neighbours in America, on which mise that they will like their neighbours in America, on whichever side the fault may be, if they carry out with them to the new country their old ideas and habits of English private life. There is truth in the seeming paradox that an English family going to the Antipodes may find itself nearer home in this respect than by merely crossing the Atlantic. The remark, however, does not by any means apply, without large reservations, to Ameralia—that is to say, the continental provinces, New South Wales, Victoria, South Australia, and Quesneland. These solenies, and the position of the gentleman emigrant there, are discussed by Mr. Staner in a part of his second volume. It is not languages we had occasion to emmine their industrial opportunities in a review of Mr. Rimken's instructive books on the Dominion of Ameralia. The testimony of Mr. Staner, who has white Americans of Ameralia, is in accordance with that of many important and distinctured observers, and with that of many important of fallscious promise. Australia, in its present condition, is a land of fallscious promise. for large capitalists, and of employment for the rudest kinds of labour, at wages so high that the labourer may soon become his own master. But it is no country for the modest enterprise of an unaltilled man with a small capital.

WILKES, SHEBIDAN, AND FOX.

BIOGRAPHY is perhaps one of the pleasantest forms in which history (an be taken. There is an old controversy as to whether the great man shapes the age or the age the man, but there can be no doubt that in any case personal character goes for a good deal in its influence on the course of events. This element, however, is in some danger of being lost in the broad outlines of history, which thus become not only dull but defective.
Biography is at its best when it is written so as to combine the historical aspects of an individual life with the animation of per-Mr. John Morley's Edmund Burke is an admir sonal detail. axample of a study of this kind in its best style, and Mr. Itae's amusing sketches of Wilkes, Sheridan, and Fox may be regarded as a lighter work of the same school. These sketches are not biographies in the old contracted sense. The principal figures are shown in all their social and political surroundings, and each represents a period as well as a personal career. Mr. Rae has had the opportunity of working a rich mine of anecdote and incident, and has applied himself industriously to its excavation. The result is a very entertaining as well as instructive volume, which will probably be found more readable than most novels of the day. Mr. Rae's choice of subjects is perhaps in some degree accidental, and he would have done well to omit his second title. Wilkes, Sheridan, and Fox were certainly completely controlled the received he accounted Ministers of George III. but they cannot be accepted as an adequate embediment of the whole Opposition of those days. It is indeed an abuse of the word Opposition, in the semi-official and constitutional meaning which it has acquired, to employ it in connexion with a loose and irresponsible demagogue like Wilkes. An account of the Opposition under George III. in which Wilkes and Sheridan appear at full length, and in which Fox is the only other figure, would be a ludicrous mistake if the title were intended seriously. explanation probably is that Mr. Rao thought that these three men would furnish interesting subjects for his pen, and afterwards looked about for a general phrase that would bring them together

in a group. The character of Wilkes is one that has been needlessly vilified and abourdly exalted. He appears in reality to have been on the whole an extremely commonplace person, without remarkable qualities of any kind save impudence. He was dissolute and extravagant, but probably not more so than the ordinary fast man of his day. He was a poor speaker, and his writings, though better than his speeches, display little merit in respect either of thought or style. His connexion with great political questions was purely socidental. He was, as it were, only the wick of the lamp, and any worthless substance will do for wick. It was the popular discontent which fed the flame, and the blundering of the Government which lighted it. Wilkes's distinguishing quality was his impudence, which was extraordinary, not merely in its manual but in its plansibility. He was a must who, by or style. His connexion with great political questions was purely effrontery, but in its plausibility. He was a mun who, by taking pains, could make himself agreeable in almost any society. He was a shameless rake, but Hannah More thought him society. He was a shameless rake, but manner as a state of the was, as his contemporaries wery entertaining "in conversation. He was, as his contemporaries the very entertaining a shameled demander to the land of the state of the was a shameled demander to the was a shameless rake, but manner to the was a shameless rake, but well understood, an unprincipled demagague; yet Lord Mansfield pronounced him "the pleasantest companion, the politest gentleman, and the best scholar he knew." He even charmed away the robust prejudices of Dr. Johnson, who declared that "Jack was a scholar, Jack was a gentleman." It is doubtful whether he was either much of a scholar or, taking the word in the common conventional sense, a gentleman. But he knew the weak points of the tops when he wished to consiliate and was a depict and sorvible in fluttee. whom he wished to conciliate, and was adroit and servile in flatter-ing them. When Hannah More said he was very entertaining in ing them. When Hannah More said he was very entertaining in conversation, it was probably because he listened so respectfully to harself; and Manafield was probably impressed in a similar manner. How Dr. Johnson was got at we know from Boswell. Wilkes placed himself next the Doctor, and was very assidnous in his attentions. "Pray give me leave, sir. It is better here; a little of the brown. Some fat, sir. A little stuffing. Some gravy. Let me have the pleasure of giving you some butter. Allow me to recommend a squeeze of this orange; or the lemon perhaps may have more rest." "Sir, sir, I am obliged to you, sir," cried Johnson, and from surly virtue he was gradually ceazed into complacency. Wilkes plied Johnson with talk in the same spirit, falling in with his serceams on the Scotsh, and always taking his side and playing jackal to his talk. In spite of his hideous countenance he was a fevourite with women, and used to boast that he was only "ten minutes behind the handsomest man in the country." The explanation is that he was a dexterous and untiring courtier. "ten minutes behind the handsomest man in the country." The explanation is that he was a dexterous and untiring courtier. There was also a certain fuscination in the bedness of his character as well as in the ugliness of his countenance. As the first paindice were off, it enhanced by contrast the feeling which took its plane. Mr. Rae pays an equivocal compliment to Mr. Bright in likening him to Wilkes, and he also overrates Wilking's position in calling him "the leader of a strong party and the most useful man in the hingdom." Lord Russell has gone to the other extreme in depict-

Wellet, Chardian, Fox: the Opposition under George the Third. By W. lat. Letelen: Libiter & Co.

ing Wilkes as a revolutionist, " who always so he cried liberty." Nothing can be clearer than t ing Wilkes as a revolutionist, "who always meant linears when he cried liberty." Nothing can be eleaser than that, while Wilkes was utterly unsumpalous as to the means by which he acquired popularity, his tastes and instancts were by no means those of a revolutionist. He had the greatest contempt for the male of a used it merely as a bogis for his own purposes. He was extremely anxious to make a position in society, and he thought he could most readily make a position by becoming autorious. Of political designs to agristor was probably ever more innocent. Nothing can be more obviously hollow that the sickering cant about liberty with which he larded every sentence he uttered in public, while he secured in private alike at liberty and the necessit.

he sneared in private alike at liberty and the people.

No reasonable person, looking back upon the matter, can doubt that the prosecution of Wilkes for the publication of No. 45 of the North Briton, and especially the manner in which the prosecution was conducted, was a deplorable mistake. The theorems they do not the hands of the demagone, and did its best to invest him with the materials of the demagone, and did its best to invest him. with the notoriety which he coveted. It was, in fact, as Burke said, "a tragi-comedy acted by His Majesty's servants, at the desire of several persons of quality, and at the expense of the Constitution." Wilkes asserted that the impugued article merely conveyed the substance of remarks which had fallen from Lord Temple a and the passages which the Attorney-General selected as the worst he could find, though they are course and violent, certainly do not

strike one as seditious :-

The King's speech [anid the writer] has always been considered by the Legislature and by the public at large as the speech of the Minister. This week has given the public the most abandoned instance of Ministerial efficiency ever attempted to be imposed on mankind. I am in density whether the imposition is greater on the sovereign or on the nation. Every framed of his country must lament that a prince of so very great and available qualities, whom England truly reverse, can be brought to give the sanction of his secred name to the most edious rumours, and to the most unjustifiable public declarations, from a throne ever renowned for truth, honour, and unsulfied virtue. bullied virtue.

Lord Chatham had used much more violent language to the same effect in the House of Lords.

be proceedings which were taken by General Warrant against Wilker and the printers of his paper were clearly illegal, although General Warrants are known to have been reported to in other General Warranta are known to have been resorted to in other cases; and his condemnation for having published an observe travesty on Pope's Essay on Man, called an Essay on Woman, was equally irrogular. Wilkes did not publish the work. It was secretly printed at his private press, and a copy was stolen for the purposes of the prosecution. Nor was any proof given that Wilkes was the author of it. Indeed there is reusen to believe that it was written by Potter, the son of the Archbishop of Cauterbury. It was not unnatural that the mob should assume that Wilkes wa the victim of a political and aristocratic conspiracy, and should make him its hero. More soler and thoughtful men were grieved to see the powers of the Government strained to its own danger and discredit, and sided with Wilkes, as Chatham did, "merely and indifferently as an Euglish subject possessed of certain rights which the laws had given him, and which the laws alone could take from him." Mr. Rao has been at some pains to put together an authentic narrative, based on official papers, of the various proceedings against Wilkes in Parliament and of the various proceedings against Wilkes in Parliament and in the courts of law. In his estimate of the general political situation Mr. Rue commits a grave mistake in depicting George III. as the evil genius of the nation, which, it is assumed, would, if left to itself, have always gone right, instead of always going wrong as it did under his fatal authority. There can be no doubt that the King was anxious to establish his supremacy over his Ministers, but in any case the rivalries and quarrels of public men would necessarily have thrown a great deal of power into his hands. As it was, the power came to him almost into his hands. As it was, the power came to him almost without his seeking it. And as regards his personal opinions on most subjects of the day, they were also the opinions, not only of a majority of the House of Commons, but of the great body of the

The biographical sketch of Sheridan is as interesting as that of Wilkes, but here again it is difficult to understand how we can be saked to accept Sheridan as a serious statesman. Mr. Rae admits that Sheridan wrote and spoke, as he lived, with a persistent view to effect. "His whole life abouted in surprises; he perpetually occupied in perpetually occupied in preparing literary fireworks and letting them off." Yet in another passage he docurse that "take him for all in all, as wit and orator, dramatist and politicism, Sheridan was at once a luminary and leader of his age," and "one of the immortals ruling our spirits from their arms." There can be no doubt that Sheridan was a brilliant and successful draustist, but the School for Scandal, though its vitality has been fully attented, is scarcely the work of an immortal, and, except for his plays and his red nose in Gillray's caricatures, Sheridan would by this time be forgotten. His speech at the trial of Warren Hastings was unquestionably a dashing and impressive performance at the moment, but it very dashing and impressive performance at the moment, but it was the performance of an actor and a dramatist, and there was nothing in the anbetance of it to make it live. And the same may be said of his speeches in the House of Commons. Mr. Ras, remarking on Sheridan's poverty and the temptations which it presented to trim his political career to suit his personal interests, betrays some simplicity in imagining that it is easy for a politicism to change sides with advantage after he has once committed himself. Sheridan in the first instance shows the side which seemed to offer the best prompose—the side of the rising sum. He supported the Primes of Wales, and the Primes's friends; and on one common at least, as Mr. Ras himself acknowledges, his "indiscretion" exposed him to a charge of intriguing against the leaders of his party in order to help the Tories to a renewed lease of power. He made himself the tool and toady of the Prince, and there can be no doubt that he expected to be paid for it.

and there can be no doubt that he expected to be paid for it.

Mr. Ree repeats the familiar accusation of ingratitude against the Regent and Sheridan's other friends, "who pompously helped to bury whom they helped to starve." Nothing can be plainer, however, than that Sheridan's destitution was owing to his own recklessness and extravagance; and it would also appear that it was by his own misconduct that he cut himself off from friendly intercourse with the Prince. Mr. Rae has been misled by the clap-trap of Moore's Life of Sheridan, and does not seem to be aware that Moore in his own Diary gives a very different version of the matter: of the matter:-

18.18, October 7.—Had a good deal of conversation with Lord Holland about Sheridan; told me the most romantic professions of honour and independence were coupled with conduct of the meanest and most swindling kind.

A proof of this mixture was that, after the Prince became Regent, he offered to bring Sheridan into Parliament, and said at the same time that he by no means meant to fetter him in his political conduct by doing so; but Sheridan refused, because as he told Lord Holland, "he had no idea of risking the high independence of character which he had always sustained by putting it in the power of any man, by any possibility whatever, to dictate to him." Yet in the very same conversation in which he paraded all this fine flourish of high-mindedness, he told Lord Holland of an intrigue he had set on foot for inducing the Prince to lend him 4,000%.

What happened (see Quarterly Review, Vol. 93) was, that the Prince gave 3,000l. to be applied to the purchase of a seat for Sheridan, and that Sheridan got the money, or the greater part of it, into his own hands, and used it for other purposes. The depth of Sheridan's distress was not at first suspected by his friends, nor was there any reason to suspect it. He was supposed to be still living in his house in Savile Row; and Moore himself when he called on him with 150l. from Rogers—a sum, Sheridan said, "sufficient to remove all difficulty"—found him looking very well and sanguine about the produce of his dramatic works. An article in the Post for the first time awakened attention to Sheridan's destitute position, and "its effect"—so says Moore himself—"was soon visible in the calls made at Sheridan's door, and in the appearance of such names as the Duke of York, and of himself—"was soon visible in the calls made at Sheridan's door, and in the appearance of such names as the Duke of York, and of Argyle, amongst the visitors." The Prince sent him by Mr. Vaughan, better known as "Hat Vaughan," 2001. as a temporary assistance, which was to be followed by more; a considerable part of this sum was spent in relieving Sheridan's immediate necessities; but the money was repaid two or three days afterwards with a message that Mrs. Sheridan's friends had taken care that Mr. Sheridan should want for nothing.

We have left ourselves no space to speak of the third character.

We have left ourselves no space to speak of the third character in Mr. Rae's gallery. The story of Fox's life is sufficiently familiar, and perhaps the only point to be noticed in Mr. Rae's sketch is his endeavour to represent the historic chief of the Whigs

as a Radical of the modern type.

THE BERKELEYS OF CHARLES IL'S REIGN.

THE BERKELEYS OF CHARLES II.'S REIGN.*

WHEN Mr. Carlyle a few years ago delivered his Inaugural Address as Lord Rector of Edinburgh University, he said a good word for the old pecrage of England to the time of Charles I., and for Collins, the industrious biographer of peers. His own laborious experience, when he was reading far and wide for his Cromwell biography, had taught him the value of Collins's Peerage. "I got a great deal of help out of poor Collins. He was a diligent and dark London bookseller of about a hundred years ago, who compiled out of all kinds of treasury chests, archives, books that were authentic, and out of all kinds of things out of which he could get the information he wanted. He was a very meritorious man." The great Duke of Mariborough learnt all the English history he knew from Shakspeare's plays. Biography, and, in the natural course of things, chiefly peerage-biography, is another and excellent gateway to the same knowledge.

Several minor personages of the great ancient house of Berkeley figure in the Court and politics of Charles II.'s reign. Collins tells us all about them. There is great confusion among the indexmakers to the memoirs and correspondence of this period between two Lord Berkeleys. One is the then head of the house, George, Baron Berkeley of Berkeley Castle, counting fourteenth Baron from Maurice (summoned as Baron to Parliament by Edward I. in 1295), and created Earl of Berkeley Dostle, counting fourteenth Baron from Sir Maurice Herkeley of Stratton, so created in 1658, the Royaliet Sir John Berkeley of the Civil War, and directly descended from Sir Maurice Herkeley of Berkeley Oastle, was, at the age of thirty-three, selected to be one of six peers in the joint deputation from both Houses to wait on Charles II. at Breda on the eve of the Restoration and invite him into England. He was a pious man, a friend of learning, and a mild, osey-going, honest politician. He had been a friend of Oliver Cromwell, but had not entered his service. He was the intimate friend of

Memoirs 9: Sir John Berkeley. Containing an Account of his Negotiation with Lieutenant-tieneral Cromwell, Commissary-General Ireton, and other Officen. If the Army, for Restoring King Charles I. to the Exercise of the Generalization of England. London. 1699.

"noble author," having published a little work of religious mediations, which are neither profound nor brilliant, but show the amiable character of the man. The volume is dedicated, under the name of "Constans," to a Lady Honoria. Waller prefixed to the little work some verses of commendation, which do not appear in any collection of his poems. The unbelieving public, argued Waller, were indifferent to the mercenary religious teaching of classory but found the disinterested adversers of a rich public. clergymen, but feared the disinterested advocacy of a rich noble-

Divines are pardoned; they defend Altars on which their lives depend. But the profane impatient are When noble peers make this their care; High birth and fortunes warrant give That such men write what they believe.

Lord Berkeley's aunt had married Sir Robert Coke, the son and heir of Sir Edward, and his sister married Edward, the son and heir of Sir Itobert; he thus became possessor of Sir Robert Coke's valuable library, which he presented to Sion College. Besides Berkeley Castle and a fine house in St. John's, Clerkenwell, he was the owner of a beautiful place near Epsom, Durdans, where he exercised a large and splendid hospitality. He was one of the grantees, with Shaftesbury and a few others, of Carolina, for which Locke drew a constitution, and of the Bahama Islands. Lord Borkeley is accused by Shaftesbury of desertion from his old friends. Bocke drew a constitution, and of the Bahama Islands. Lord Berkeley is accused by Shaftesbury of desertion from his old friends in the House of Lords—the Liberal Opposition, headed by Shaftesbury, Buckingham, Holles, Halifax, and Wharton, at the time of their vigorous resistance to Lord Danby's Test Bill of 1675. Shaftesbury was the virtual author of an anonymous pamphlet published at this time, which has been erroneously ascribed to Locke. In this pamphlet we read—

If you ask after the Earl of Carlisle, the Lord Viscount Falconberg, and the Lord Berkeley of Berkeley Castle, because you found them not mentioned amongst all their old friends, all I have to say is that the Earl of Carlisle stepped aside to receive his pension, the Lord Berkeley to dine with the Lord Treasurer; but the Lord Viscount Falconberg, like the nobleman in the Gospel, went away sorrowful, for he had a great office at Court.—Letter from a Person of Quality to his Friend in the Country, in Parliamentary History, vol. iv. Appendix 5, and in Locke's Works, vol. x., 1812, 800. Shaftesbury proceeds to twit Berkeley with having been Cromwell's friend, whom all would be surprised to see ranged on the side of arbitrary power. Lord Berkeley was not a man of great ability, but he was of a moderate temper, and far above being bribed. He was made a Privy Councillor in 1678. But on the remodelling of the Privy Council in April 1679 he was not retained in it; and he was made an Farl in the following September. When James II. succeeded, Lord Berkeley was, appointed one of his Privy Council. He early declared for the Prince of Orange at the Revolution, and was immediately on the accession of William and Mary made one of their Privy Council.

accession of William and Mary made one of their Privy Councillors. His quiet honourable life ended in 1698.

John, Lord Berkeley of Stratton, was a man of greater ability and less amiable character. The eldest son of Sir Charles John, Lord Berkeley of Stratton, was a man of greater ability and less amiable character. The eldest son of Sir Charles Berkeley of Bruton, in Somersetshire, of a younger branch of the great Berkeley family, he served prominently in the military service of Charles I, at the outset of the Civil War, and with his father followed the royal fortunes till the Restoration. He was one of a Commission of commanders of the King's forces in Cornwall in 1643, and had a chief part in the brilliant victory of Stratton. He afterwards showed consummate generalship in Devonshire, and in the siege of Exeter; and in 1645 he was selected to command the siege of Taunton. His military reputation was of the highest, and Charendon, who disliked him, has never directly disparaged it. When the King had fallen into the hands of the army, and was lodged at Hampton Court under their supervision, Sir John Berkeley was despatched from Paris by the Queen on a confidential mission having in view the King's extrication; he fell in at Hampton Court with John Ashburnham, a King's favourito, who had come to him on the same errand. Under Ashburnham's advice the King resolved to fly; Berkéley, who had not been consulted, obeyed the King's orders to attend his flight. Ashburnham and Berkeley between them put the King into the hands of Colonel Hammond, the Governor of the Isle of Wight. Then there was no escape for Charles. Ashburnham published a vindication of himself, and Berkeley did the same. Berkeley had the best of the controverse He Isle of Wight. Then there was no escape for Charles. Ashburnham published a vindication of himself, and Berkeley did the same. Berkeley had the best of the controversy. He had not advised the King's flight, and was not privy to it till he received an order to attend; Ashburnham had undertaken to have a vessel ready to convey the King abroad, and the vessel was not forthcoming; it became a necessity to sound Hammond; and he was overborne by Ashburnham to consent to taking Hammond to the King's place of retreat, after having chivalrously offered to stay with Hammond while Ashburnham went to the King alone to consult him, Ashburnham having refused to stay, as Hammond desired, while Berkeley went. The unfortunate proceeding left no stain on Berkeley's character. After the death of the King, Sir John Berkeley, who was high in the Queen's favour, became governor to the Duke of York. He quarrelled with Clarendon, who always speaks ill of him in his Memoirs, and represents him as full of self-assertion and greatly exaggerating his services. But of his earlier military services there is no doubt. It is equally doubtless that he was not a man of over-delicate mind, and had a keen eye to fortune and advancement. His services were recognized by eye to fortune and advancement. His services were recognized by Charles II. by making him a peer in 1658. His father, Six Charles Berkeley, was Comptroller of the Household and a member of the King's Privy Council. After the Restoration Lord Berkeley of Stratton was much employed, and he was clearly a man of much ability. He was made a Commissioner of the Nevy. In 1664 he

made one of Commissioners for the office of Master of the nance, and also one of the Commissioners for Tangiers. He Ordinance, and also one of the Commissioners for Tangiers. had had good pickings as Commissioner of the Navy, and hos had had good pickings as Commissioner of the Navy, and hoasted one day at a gathering of the navy officers in the august presence of the Lord High Admiral, that he had made 50,000l. by selling offices in three years and a half since the Restoration (Popys's Disry, October 5, 1663). He was made Lord-Licutenant of Ireland in 1668, when Lord Roberts resigned. Bishop Burnet speaks ill of him. "He was a man bold and enterprising, on whom it appeared with how little true judgment Courts distribute favours and honours. He had a positive way of undertaking and determining in everything, and looked fierce and hig, and was a very weak man and corrupt without shame or decency." So says Burnet, who in another passage mentions that he "seemed to lean to Popery." He was not charged with inclination to Popery in his administration of Ireland. In a debate on Irish affairs, February 18, 1674, one of the most farvid Protestants of the House of Commons spoke of Lord Berkeley as "a great stay to the Protestant religion in Ireland" (Sir W. Bucknall, in Grey's Parliamentury Debates, ii. 439). He had ceased to be Lord-Lieutenant in August 1672, and had been succeeded by the Earl of Essex. The reason of his recall had been insufficient pliancy in executing the wishes of the King and Buckingham for favour to the Roman Catholic interest. Burnet Buckingham for favour to the Roman Catholic interest. Burnet further says of him that he was "certainly very arbitrary in his temper and notions." If Burnet and his authority, Sir Ellis Leighton (net a very estimable character), are to be believed, there would be a proof of this in a story told to Burnet by Leighton, that in 1673, when the King was at issue with Lords and Commons about the Declaration of Indulgence and was forced to rigid! "the Duke of Euclidence and was forced to yield, "the Duke of Buckingham and Lord Berkeley offered to the King, if he would bring the army to town, that they would take out of both Houses the members that made the opposition" (Own Time, i. 348). There is no other authority for this statement. Leighton, brother of the exemplary Scotch bishop, was a keen Roman Catholic, and a parasite and tool of Buckingham. Lord Berkeley was at the time in some favour, and was appointed one of the major-generals of the army afterwards raised, which was to have been commanded in chief by Buckingham, but was ultimately placed under the chief command of Schomberg, against the Dutch. In 1675 Lord Berkeley was appointed one of the mediating Commissioners to the Congress of Nimeguen, Sir William Temple and Sir Leoline Jonkins being his colleagues. He

died in 1678, before the termination of the Congress.

A younger brother of Lord Berkeley of Stratton was Charles
Berkeley, a great favourite of the Duke of York and of the King. He Berkeley, a great favourite of the Duke of York and of the King. Ho was notorious as intermediary agent in the King's connexion with Lady Castlemaine. Pepys is told, December 15, 1662, that "Sir Charles Berkeley's greatness is only his being pint to the King and to my Lady Castlemaine." Pepys also is told, July 31, 1663, that "Sir Charles Berkeley hath still such power over the King as to be able to fetch him from the Council Table to my Lady Castlemaine when he pleases." "It is wonderful," observes the same writer, May 15, 1663, "that Sir Charles Berkeley should be so great still, not with the King only, but Duke also; who did so stiffly reason that he had intrigued with her [the Duchess]." The King showered favours on him. He was made Privy Purse whon Bennet was made Secretary of State. He was created Viscount Fitzharding in the Irish peerage, and soon after Earl of Falmouth in the peerage of England. Immoral peer-making had now violently set in. "In Charles L's time," says Mr. Carlyle, "it grew to be known or said that, if a man was by birth a gentleman, and was worth 10,000!. a year, and bestowed his gifts

had now violently set in. "In Charles I.'s time," says Mr. Carlyle, "it grew to be known or said that, if a man was by birth a gentleman, and was worth 10,000l. a year, and bestowed his gifts up and down among courtiers, he could be made a peer. Under Charles II. it went on with still more rapidity, and has been going on with ever-increasing velocity until we see the perfect break-neck pace at which they are now going. And now a peerage is a paltry kind of thing to what it was in those old times."

Charles Berkeley, Earl of Falmouth, perished by the Duke of York's side on board the Royal Charles, in the first great victory of the first Dutch war, off the coast of Suffolk, June 3, 1665. Libertiniam spart, he appears to have had good qualities, which commended him to the friendship of the able and high-minded Sir William Coventry, who highly praised him to Pepys for "his generosity, good nature, deaire of public good, and low thoughts of his own wisdom, his employing his interest in the King to do good offices to all people, without any other fault than the freedom he do learn in France of thinking himself obliged to serve his King in his pleasures" (Pepys's Diary, August 30, 1668). On the death of Lord Falmouth the Irish peerage of Viscount Fitsharding went by a provision of the patent to his father, Sir Charles Berkeley, who held the post of Treasurer of the Household, and who lived for several years after.

There was another son, another brother of Lord Berkeley of Stratton, Sir William Berkeley, who rose in the navy to be an admiral, and bravely perished in the second great engagement of the first Dutch war on June 1, 1666. His flip, the Swiftsure, had not been seen in the fight, and nothing was known of her till the fight was over. She had got astrey from the fleet, and fell early

the first Dutch war on June 1, 1000. His snip, the Signature, had not been seen in the fight, and nothing was known of her till the fight was over. She had got astray from the fleet, and fell early into the enemy's hands. Sir William Berkeley was killed before his ship was taken (Pepps's Diary, June 7, 8, 16, 1666). Dryden, in the Annus Mirabilis, where he gives a long poetical account of this battle, does special honour to Berkeley:—

They charge, re-charge, and all along the sea They drive and equander the hage Balgian fleet; Barkaley alone, who nearest danger lay, Did a like fate with lost Greuns meet. "Who nearest danger lay" were words introduced by Dryden in

the second edition of his poem. In the first edition he had said, "not making equal way." He probably thought that these words might be understood to convey a reflection on Berkeley, who had got astray, but not behind, and had not shirked the battle.

LONGFELLOW'S PROSE WORKS.

No satisfactory arrangement having as yet been found practicable for acquired interesting the same property of the ticable for securing international copyright between England and the United States, the publishers of both countries are left to deal with the works of Transatlantic authors as may seem good to their individual consciences or tastes. Some firms recognize an honourable obligation, though no legal obligation exists, to obtain the consent of the writer whose works they desire to reproduce. Nor are commercial motives wholly wanting for such a course. The author can indeed confer no exclusive privilege, but the warranty and moral support of his sanction are something, and in the case of a new book early proof sheets are more. Another method is simply to convey to one's own use—"convey the wise it call"—the fruit of the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a second call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour as a matter of course and call according to the stranger's labour accord without remark or apology. This, we believe, is, to the credit of both nations, becoming less common than it was. There is yet a third way, which is to lay unauthorized hands on Transatlantic books with a cynical ostentation, either regarding the present state of things as one of avowed hostility in which it would be abourd to forego one's share of spoil, or following the occasional example of judges who, instead of tempering an inconvenient rule of law, push it to extreme consequences, so that its inconvenience may be forced upon the notice of the Legislature. Mesers, Chatto and Windus have adopted from their predecessor this last fashion of treatment of American books. The present edition of Mr. Longfellow's Prose Works is a somewhat striking example of the method, and as it does much more than recupiery injustice to the author, it is as it does much more than pecuniary injustice to the author, it is well calculated to promote, so far as any one instance can do it, the laudable object of working up the grievances of men of letters on both sides of the ocean to an irresistible demand for international copyright. If in the meantime it were to drive Mr. Longfellow to issue a complete and authentic edition in self-defence, we should have sufficient reason to be thunkful for it.

The injustice we refer to is of the following kinds.

fair to a living author to reproduce his earlier works without his consent or supervision. We cannot tell what alterations he might himself choose to make if he were consulted, or how much he might desire to reproduce at all. We can tell, indeed, in this particular instance, that the publication is to some extent not only without the author's consent, but against his will, for the English editor takes credit to himself for having "restored" two essays from the first edition; that is, for having republished what Mr. Longfellow himself has deliberately abstained from republishing. The editor may be of opinion that the suppressed chapters are the best things in the work, but the author is the only person entitled to judge of that. It is well known that Mr. Tennyson's poems have been much altered, and we believe that there are competent critics who prefer the earlier to the later forms of some pieces, and regret the total disappearance of others. But what should we say to an American publisher who got hold of the now scarce original edition of the poems and reprinted it without Mr. Tennyson's leave ! So again Mr. Herbert Spencer has recast two or three of his works at different times, and, even apart from any question of copyright, we should hardly call it an exercise of legitimate industry for a Transutlantic enthusiast who preferred the earlier to the later statements of Mr. Spencer's philosophy to republish these treatises as they first stood. Another and perhaps greater hardship is the intrusion of an unauthorized editor and illustrator. If people must reprint American books without license, they might at least confine themselves to simple and unaderned reprinting, "The author of Tennysoniana" is so obliging as to furnish an introduction, in which he informs us that "no reputation was ever more spotless and unsullied in its character" than Mr. Longfellow's. We trust Mr. Longfellow will be duly grateful for the patronage of the author of Tennysonuna. If this means literary reputation, it is only an awkward and somewhat doubtful compliment, amplifield by the following both clumsy and extravagant one, that "no man's writings have ever been so thoroughly pure and wholesome in their tendency." If it means personal reputation, it is something worse than a literary impertinence. Mr. Vstentine W. Bromley, whosever he is, has brought the art of beautifying "thoroughly whoever he is, has brought the art of bautifying "indroughly pure and wholesome" writings with thoroughly vulgar illustrations to a degree of perfection seldom equalled. The volume is in an ungainly form, partly due to its being stuffed out with pieces which, as we have said, the author himself has done his best to withdraw from the public, and with trilling fragments which we can hardly think he would have cared to insert. Altogether the publishers, the editor,

would have cared to insert. Altogether the publishers, the editor, and the illustrator appear to have spared no pains to disfigure Mr. Longfellow's work in its passage through their hands.

Its ving thus spoken, as we have thought it our duty to do, of the manner in which Mr. Longfellow's prose writings come before us, we are free to make the best use we can of the occasion of their results of the content of the occasion occasion occasion. their being there, and to hope that their popularity—in other and, if possible, authorized editions—may continue to increase. Mr. Longfellow has been more fortunate in this country than other American writers of like versatility in getting a fairly equal recognition for all his works. Mr. Emerson has written poetry which is much to be admired in its kind, though it savours more of the Hadu

^{*} The Proce Works of Henry Wadeworth Longfellow. London: Chatte & Windon.

or Greek pree-Socratic schools in which philosophy had not yet diverged from pactry than of modern lyrical fashions; but this, we imagine, is little known here in comparison with his prose. Mr. Lowell is a refined essayist, and—we venture to say it in his lifetime—a classical poet, but Mr. Lowell has for English readers almost extinguished himself with Hosea Biglow. But we have taken kindly from the first to Mr. Longfellow's prose as well as to his poetry; whether because his work is altogether of a more popular kind, or from some obscurer motive determining the apparent caprice of the English reading public, it might be difficult to say. One thing in his favour, as far as the immediate present is concerned, is that he is less distinctively American than his compents. He is a cosmopolitan who happens to have been born in New England and to write English. The same quality present in others; but they have worked a cosmopolitan element into the American character without making it less American—doing, in fact, for their literature what Bacon advised every traveller to do for the improvement of his own mind and manners. With Mr. Longfellow the nationality is almost overlaid—we except, of or Greek pres-Socratic schools in which philosophy had not yet Mr. Longfellow the nationality is almost overlaid-we except, of course, his distinctly local and patriotic deliverances—and the in-ternal evidence of his work would show him not to be an Englishman by the absence of English rather than by the presence of American tokens.

This particular quality of Mr. Longfellow's work has done him good service in Hyperion, which is deservedly the most successful of his press works. In this he has caught the spirit of German romance, without any servile imitation, but with a faithfulness and appreciation which only a cultivated citizen of the world can bring to the study of a literature not his own, and, more than this, of the national character which produces the literature. The book is neither long nor ambitious; but it may claim to have naturalized a now type in English fiction. More than thirty years have passed since it was written; its popularity has stood the test of time, and it remains, so far as we know, without a rival on its own peculiar ground. Two or three passages call the reader's attention to the changes that have occurred since 1839, when *Hyperion* first appeared. We hear of Stolzenfels as a glorious ruin, and we envy those who were fortunate enough to travel on the Ithine before the castles were restored in modern sham Romanesquo or sham Rothic, otherwise the Rundbogenstyl or the Spitzbogenstyl, as the case may be, according to the exhaustive dichotomy of Badeker. Also we find Interlaken considered quite a mountainous place, and the motion of glaciers spoken of as a thing dimly surmised. Had Paul Flomming been crossed in love at Interlaken in this conception he used not have fluid to the Taral at Interlaken in this generation he need not have fled to the Tyrol for distraction, but might have found ample change of scene and occupation in doing battle with the mountain giants of the Oberland. Before we leave Hyperion we should note that there is an occasional touch to make us remember that the hero is American, as where he compares speculative philosophies to roads in a Western

forest which end in a squirrel track and run up a tree.

Mr. Longfellow's other tale is purely American. Although not equal to Hyperion in beauty or interest, Karamayh gives a picture of domestic life in New England which is quite worth having. The characters are ingeniously if not strongly drawn, and in sundry places there appears a sense of humour of which one would sometimes like to find a little more in Mr. Longfellow's poetry. This postscript to a letter from a good young man jilting his mistress (with expressions of the most proper esteem) has considerable excellence:—" P.S. The society is generally pretty good hero, but the state of religion is quite low." An artistic advertisement which is elsewhere given is so good that we are inclined to suspect it of being founded on fact:—

"The subscriber professes to take profiles, plain and shaded, which, swed at right angles with the serious countenance, are warranted to be

infallibly correct.

"No trouble of adorning or drossing the person is required. He takes infants and children at right, and has frames of all sizes to accommodate.

"A profile is a delineated outline of the exterior form of any person's face and head, the use of which when seen tends to vivify the affections of those whom we esteem or love.

"William Bartam."

The collection of notes of travel originally entitled Outro-mer is somewhat light and desultory, and, considering how many books of travel in all countries have been written since, we think it possible that Mr. Longfellow, if he had been consulted, would have preferred not to reproduce it. Still there is much pleasant reading in these chapters, especially in the Spanish portion.

There are also several essays on the poetry of European nations, extracted from a work in which they stand as prefaces to translations from the respective languages. It seems to us decided out of place, to hump them into one volume with Humarica. For

extracted from a work in which they stand as prefaces to translations from the respective languages. It seems to us decidedly out of place to lump them into one volume with *Hyperion*. For the reasons already given we say nothing in detail of these, or of the other stray pieces gathered we know not whence to make up the book. Without at all implying that they would have any evil to fear from criticism, we must repeat that they are not properly before the critic, as Mr. Longfellow is in no way responsible for their present appearance. their present appearance.

HISTORICAL COMPENDIUMS.

THE authors of small books written with the avowed purpose of imparting useful information seem, if we may judge from

* A Chappendium of English History, from the English Times to A.D. 1872.

Facts and Features of English History. By John Hill. London: Marshall & Co. 1873.

the prefaces with which they usher the efforts of their genius into the world, to look on the possible readers of these books as divided into two classes. One set address themselves to those readers who are supposed to be eagerly bent on cultivating their minds with a view to making themselves more attractive as members of society; the other to those whose sole object in opening a book is to get help in passing some one or other of the desaded examinations which bar the way to their future prospects of promotion or subsistence. Without having either of these objects in view, no one is expected to read anything but novels. The old-fashioned profile of helping at learning of the property however hampels, as comething of looking at learning of any sort, however humble, as something good in itself, the notion that there can be any pleasure in knowing good in itself, the notion that there can be any pleasure in knowing something which we did not know before, seems to be fast fading out of sight altogether. Both the books now before as are unblushingly announced by their authors as belonging to the cramming class. Both offer themselves as aids to candidates whom a hard fate dooms to the fiery ordeal of being examined, and both, sound the trumpet of their own praise in proclaiming that they contain all that a candidate is required to know. But of the two, the Compendium of English History, although much higher in its aim, is decidedly lower in its performance, than its humbler brother, the Facts and Features of English History. The "Compendium" is clearly put together by a professional crammer. Mr. Glinton seems to have found his pupils too restive to go through even the small amount of reading to be found in the ordinary text-books. For amount of reading to be found in the ordinary text-books. For their benefit, then, he has put together a volume of three hundred pages so closely cranized with the names of people and places that at first sight it looks very much like an almanack or directory. Its object may be best explained in the words of the compiler. It is intended by tallaries is intended, he tells us,

to give both the chronological order of events and such an arrangen facts as may best impress the memory and convey clear notions of English history, and also, by quotations from recognized authorities, to enable those who have not the time or opportunity to go beyond manuals, to form an estimate of the value of important events.

Each reign is arranged in three sections. The first gives an Account of the Sovereign—his parentage, issue, claim to the succession, &c., and an estimate of his character by an authority on the period.

These "quotations" are thickly sprinkled over every page, and the novel idea of introducing them seems to afford Mr. Clinton much pride and pleasure, as being a new and winning way of coaxing the dullest dolts into a seeming acquaintance with the writings of those who in his eyes are the authorities best worth consulting on English history. As Mr. Clinton does not venture to put forth any opinions of his own, it is by these quotations that we must judge him, and try to find out what his views of English history may be. An odder and more incoherent jumble than these same quotations make, we have seldom seen. All books seem to be slike quotations make, we have seldom seen. All books seem to be alike to Mr. Clinton, provided they lear the watchword English. History on the title-page. Of the relative value of the different authorities whom he quotes, of the discoveries brought to light by the researches of students of our own day, he appears to have no idea whatever. Nor does he seem able to see the absurdity of mixing up passages from writers who directly contradict one another. Extracts from authors of the most opposite views jostle each other in his pages without a word of guidance or note of warning to help the perplexed "candidates" to choose between them.

These quotations, too, are nearly as remarkable for what they leave out as for what they put in. We should hardly have expected to find a writer of the present day who professes to teach English constitutional history, and yet who has clearly never heard of Professor Stubbs, and who talks a great deal about the Saxons and the control of his control from Komble. and does not take one of his quotations from Kemble. Nor can he ever have read Allen on the Royal Frerogative, or he could not help knowing better than to give the following definition of Folkland and Bocland:-

The land was divided into Folk-land .-

"occupied by the common people, yielding rent or other service, and perhaps without any estate in the land but at the pleasure of the owner" (flullum);

and Boo-land (or Book-land),-

"beld in full propriety and might be conveyed by boe or written grant. . . . Boeland was divisible by will; it was equally shared among the children; it was equally shared among the children; it was equally taken; and in case of a treacherons or cowardly desortion from the army, it was then forested to the Crown" (Hallam).

Still more droll is it to find quotations from Palgrave and from Mr. Freeman side by side with others from Thierry, setting forth those false views of the relations of Normans and English forth those talse views of the relations of Normans and English which the two former writers have so completely overthrown. No doubt Thierry was all very well in his own day; but now that increased light and knowledge have proved how mistaken his theories are, to return to them after having some alight knowledge, or at least the means of acquiring knowledge, of better things, cannot but remind us of the homely proverb of the sow that was washed and yet still indulged her taste for wallowing in the mire. But Mr. Olinton's mind is clearly a sort of weathercock that were about with the bream caused by turning the magnet of seath different about with the breeze caused by turning the pages of each different book as he opens it. In his first chapters he appears to have some faith in those writers of our own day who are striving to establish the identity of their own nation with itself, and who have at last unc-ceeded in getting people to believe that the English never could be anything but English; but by the time he gets to the reign of John he impresses on the minds of his pupils the opinion of Macauley, printed in his most impressive type son, that with Magna Charta "commences the history of the English nation." Mr. Clinton chings, too, to the old-fashioned and unmeaning term Anglo-Saxon; indeed it is so grateful to his car that he coins for himself, after the same model, the still more ridiculous compounds "Anglo-Norman" and "Anglo-Scottish." The former he applies to the Nurman and

Angevin Kings indiscriminately, the latter to the House of Stuart when seated on the English throne.

For the later reigns Mr. Clinton has no ideas beyond Hume, Froude, and Stanhope. It does not seem to have yet struck him that the writers who lived and wrote in each several reign might that they have been above that when these who save after the reign than the save and after the reign than the save and after the reign than the save after the reign tha perhaps know more about that reign than those who came after them, peshaps know more about that reign than those who came after them, and that the stories told and the portraits drawn by such men as Chrendon and Walpole might be more lively and sparkling when springing fresh from the original source than after they have been aftered through the minds of others. Nor are Mr. Clinton's notions of events that have happened under his very eyes much less foggy than his views on the doings of days gone by. For instance, in the first year of Victoris, we learn that "Louis Napoleou (III.) takes refuge in London." Of course we naturally ask who Louis Napoleou the First and Second were, and we are inclined to the that even Mr. Clinton himself would find it hard to give me that even Mr. Clinton himself would find it hard to give us a coherent answer. Even the most ardent Bonapartist could scarcely make good the claim of Louis Napoleon to any title whatever at that part of his life; and certainly neither the first Napoleon nor the Duke of Reichstadt would own to the Louis. As regards one most important event in modern French history, however, Mr. Clinton is not so much in the dark as l'inglishmen mostly are, for he has found out that the Coup d'état did not happen in the same year as the abdication of Louis Philippe. He is not so well up in German matters either of an earlier or of a more recent date. He still bows to the superstition that there have been Emperors of Germany, and he supposes the present Emperor William to be their representative and to bear their title:-

Francis II. emperor of Germany (auccessor of Leopold II. 1792) dropped the Imperial title, and styled himself "Francis I. of Austria," 1806. The title of "emperor of Germany" was revived by the king of Prussia, William I., in 1871.

We would counsel Mr. Clinton when next be takes a holiday trip to choose Germany as the scene of his wanderings, and to scan carefully any groschen or gulden that may come within his ken. He will find that, if the image they bear be that of the Emperor William, the superscription will describe him as "Deutscher Kaiser"

König von Preussen."

The "Compendium" is enlarged by genealogical tables, and a complete list of what are called "British Battles and Sieges." The scenes of the greater part of the battles and sieges named in this list must be sought, it seems to us, in any other country than Britain. It is clear that to Mr. Clinton the word British can have no meaning whatever, for he applies it indiscriminately to the defeat of the Picts and Scots by the Romans at the imaginary Mons Grampius, to the victories of Æthelstane at Brunanburh, of William at Hastings and of Robert at Gerberoi, of Bruce at Bannockburn, of Dutch William at the Boyne, and of Marlborough at Blenheim. We cannot part from the "Compendium" withat Blenheim. We cannot part from the "Compendium" without expressing our disapproval of the pretentious and really hurtful class of books to which it belongs. Such books do harm not only to the authors of whose writings small scraps are here cited with about as much intelligence as is shown in the choice of motley texts to adorn pious almanaes, but to the minds of the candidates for whom they have been prepared, by strengthening in them the conviction that to outwit examiners by a clear pretence of knowing something of which they are ignorant is all that is required of those who present themselves for examination. As for Mr. Clinton himself his quotations, which we take it were intended to adverwho present themselves for examination. As for him. Chimself, his quotations, which we take it were intended to advertise the extent and amount of his reading, have only shown his tise the extent and amount of his reading, have only shown his lack of knowledge of his subject, and his utter incapacity to see the difference between one writer who is an authority on that subject and another who is not.

A short time since, when treating of certain other small books, we were rash enough to express a wish that we might be favoured with a sight of the "Facts and Features of English History," which form part of the same series. Some malicious fairy must have overheard that wish, for we now find this very book swellhave overheard that wish, for we now find this very book swelling the pile of small histories which it seems hopeless ever to think of getting through. But the "Facts and Features" is a book of a much humbler and a less mischievous class than the "Compendium." It is marely a reading-book, intended for use in National Schools; and instead of the hopeless attempt to cram all the principal events in English history into one small volume, which has hitherto been the fashion with book volume, which has hitherto been the fashion with little books of this class, each reign is represented by a short life of some person who acted a conspicuous part in it, or by a description of some event specially characteristic of the tendency or spirit of the times. Between these Reading Lessons are lists of the chief events of each reign with the dates. These little chronicles chief events of each reign with the dates. These little chronicles are called "Memory Exercises"; but certainly, if the children for whom they are intended are not told something more about the battles, treaties, invasions of foreign countries or rebellions at home, and so forth, than the mere-large pames to be found here, we cannot help thinking that their memories will suffer less by forgetting them by remembering them. As a further aid to memory, the Appendix contains a set of kistorical tables which the settler table me have been specially compiled with a view to meeting the requirements of Civil Service, College, or other professional examinations."

As we turn over the pages of these "Facts and Features," we cannot help noticing the great improvement which has of late years taken place in such historical milk for babes. Little by little the old nonsense is being swept away, and the results of the labours of our great historians are making their way downwards even to the very low level of National School books. The old myths, and, still worse, the old prejudices, are not however quite dislodged. Among other evidences of this we find a victory of Arthur's set down among other facts to be learned by heart. In Arthur's set down among other facts to be learned by heart. the life which is chosen as best suited to set forth the characteristics of the reign of Henry II., that of St. Thomas of Canterbury, he is described as the "first of English descent who after the Conquest rose to any considerable eminence in the State." Here both the "fact" and the "feature" are decided blunders. On what grounds could Thomas, the son of Norman parents, be called English by "descent," whatever claim to the title his birthplace might give him? As for the implied "feature"—the deadly hatred between the two races—that feeling, as less been clearly shown by the latest and best authorities on the subject-certainly did not last down to the reign of the second Henry.

NO ALTERNATIVE.

THERE are many proverbial phrases which express the hopeloss difficulty of certain tasks; spinning ropes out of sea-sand is one, and looking for a needle in a bottle of hay is another. We might add Mrs. Pender Cudlip's attempts at constructing a reasonable novel as an illustration of the one, and of the other her artistic qualifications for writing novels at all. We have her artistic qualifications for writing novels at all, ceased to wonder at this lady's facile rapidity of production. Given the command of a hundred and fifty or two hundred words—a the command of a fundred and my or two numbers words—sub-liberal allowance for our present author—and the mechanical power of transcribing them, and there is no reason why we should not have libraries full of such books as that before us, or why the author should not throw off her twenty pages daily with no more mental effort than it takes to write out a washing bill or to scribble a batch of notes to a few intimate friends. Buch works as No Alternative cost nothing in the way of intellectual effort. They are innocent of all traces of thought or study; they are only crude first ideas put down on paper anyhow, without rediction or revision. Plot, character, circumstance, diction, are equally wanting; and we look in vain for anything to warrant the existence of the book.

Beginning with the elementary vice of all Mrs. Pender Cudlip's work, No Alternative is no freer from slang and no purer in grammar than its predecessors. To call a msn "a bad egg" may be a playful way of expressing conviction of his worthlessness, but it is not a savoury simile; when a young lady, defending herself from the charge of flirting, assures her sister that "a dog that could stand on his hind legs and do the steps and save me from banging against other people would have done just as well as this Mr. Ferrier," we can take our choice between playfulness and vulgarity; and the same may be said when she surmises that a man would have to "sheer of " because of certain circumstances connected with the family were he to fall in love with this sister. But we do not see how judgment can be elastic in regard to such sentences as "whom they were," the feminine flows which are "ceded up" to women as their precious rights by the nobler sex, and "Doctor Grayling, pleased with his breakfast, pleased with the way he had put the remarks which had silenced his wife," &c. way he had put the remarks which had silenced his wife," &c.-Also Harty's hypothesis is somewhat more clumsily put than we fancy Blair or Murray would have approved:—"If we had one of us been a boy instead of a girl, mamms would have had something to totter against for support." And when Mrs. Vernon rises and "takes sights over Mabel's shoulder at the hat and coat, and boots, and stick of the welcome invader," we know with whom we have to deal, and how far superior to the arbitrary rules of refinement and syntax are Mrs. Pender Cudlip and her questionable school.

The characters of No Alternative match their verbal setting. We have as the central group Mr. and Mrs. Devenish, with the two daughters of the wife by a former marriage, Hurty and Mabel Carlisle. Round these revolve two handsome young men as the primary satellites, and a host of secondary luminaries not specially noticeable. Mr. Devenish is a weak and prevish malade imaginaire, adored by his invertebrate wife, conseted by Mahel, the typically sweet and considerate, but not renuinely unselfish, home-stay-ing girl; hated and quarrelled with by Harty, the heroine, who understands his character better than the others, and who has suffered by his misconduct. One fancies that Mrs. Pender Cudlis may have got her idea of Mr. Devenish from the character of the father in Mr. Albery's play of the Two Roses, to which it has a strong resemblance; also perhaps she may have had a glimmering recolresemblance; also perhaps she may have had a glimmering recollection of what the reviews said of Mias Mitford's father, and so produced a personage who, she says, is possessed of considerable powers of fascination, although she has ingeniously contrived to hide every trace of the charm. Why Mr. Devenish's wife should love him as she does is one of the many mysteries with which such work as this abounds. Besides being weak and prevish, selfish, ill-tempered, and profoundly disagreeable, Mr. Devenish is also dishonest. He committed a theft, and then contrived to turow the blame on a fine young fellow of the regiment, who cut his throat rather than

^{*} No Alternation. A Novel. By Annie Thomas (Mrs. l'ender Cadlip), Author of "Dunis Donne," &c. &c. a vols. London: Chapman & Hall. 1874

face the inquiry and prove his innocence. He was thus morally guilty of Frank Ferrier's death; the young fellow "as handsome as a star," who was half-brother to one of Harty's lovers, and guilty of Frank Ferrier's death; the young fellow "as handsome as a star," who was half-brother to one of Harty's lovers, and loved like a brother by the other. But apparently no one in the family knows the infamy of Mr. Devenish save Harty, though why it was not made public is not very clear. So much of it, however, was known that Mr. Devenish was forced to sell out and beat a retreat into obscure and distant quarters; and that Harty broke off her engagement with Olaude Powers for the not very intelligible reasons that she would not marry if she could not see her mother, that Claude naturally enough declined to know Mr. Devenish, and that Mrs. Devenish was such a poor creature that she would not have visited even her daughter if it was unpleasant to her adored Edward. Thus Harty loses her lover for the sake of a mother to whom she is not in any way necessary, who does not care for her especially, and to whom her absence would have been a relief as causing the cessation of daily bickering between herself and her stepfather. We may have overlooked other qualifying clauses which make the No Alternative of the title a feasible peg on which to hang the plot. We do not pledge ourselves to accuracy; for the story is told in a queer backwards and forwards kind of way—now this fact in the past touched on, and now that enigma in the present half explained—so that we confess we laid down the book a little bewildered about the various points of junction and departure, and not very clear as to how it all happened, and why it came about as it did.

If Mrs. Devenish is molluscous, Mr. Devenish feebly fiendish, and Mabel prettily false and caressingly selfish, Harty is the author's favourite presentation of feminine faultiness redeemed by the one sole quality of straightforwardness. Of course she is not

author's favourito presentation of feminine faultiness redeemed by the one sole quality of straightforwardness. Of course she is not pretty, but her face is described in the following extract:—

pretty, but her face is described in the following extract:—

A face that was partially framed by a lot of loosely-arranged, fluffy, bronzed, brown hair. A face in which a pair of weary-looking hazel eyes were deeply set under dark, clearly-defined brows. A face that was too nervously mobile for beauty, but that one looked at again and again as it changed from grave to gay, from domineering to penitential, from pleading to pretty imperiousness. A face that would tell its owner's story all too plainly for her welfare. A face that would nost surely win many to hate, and sone to love her, in either case very far from wisely, and in either case very much too well.

A face that was rapidly, succinctly, and satisfactorily summed up and described by Mrs. Grayling.

"Nothing to talk about one way or the other; that's one comfort in a place like this, where young men are so apt to be led away by anything new; darker by a shade than any of my girls—though their carelessness about sunburn is enough to make one marvel that any one can undertake the duties of a mother, I'm sure."

With this remarkable face she naturally means all the man in love.

With this remarkable face she naturally mases all the men in love with her, taking them in turn—Claude Powers, Jack Ferrier, and Bertie Maitland; but failing somehow to secure one of the three. We have seen something of how it happened with Claude, who of course lives near Dillsborough, where the Devembles come on their retreat from the world which knew them in the days of Mr. Devenish's crime. They meet him in the society of the place, which has opened its doors frankly to these strangers; and the love which has opened its doors frankly to these strangers; and the love affair botween him and Harty is renewed. As far as we can make out Harty is as madly in love with him as she ever was, and we out Harty is as madly in love with him as she ever was, and we have wan faces, and mute, beseeching, pleading eves, and resolute self-victories to any extent; but through them all the one fact of the girl's passion for the man, and the man's passion for the girl, remains plainly visible. But there is another luminary revolving in the same orbit as Claude Powers—his friend Jack Ferrier. Is it to be supposed that such paltry considerations as loyalty or propriety would be suffered to interfere with the instincts and inclinations with which Mrs. Pender Cudlip endows her characters? Jack Ferrier falls in love with Harty, twom his best friend, Claude, sadores; and Harty, trying her best to win Claude, falls in love with Jack Ferrier, and throws over the old sweetheart for the new with Jack Ferrier, and throws over the old sweetheart for the new with as little compunction, and apparently with as little diffi-culty, as a woman has in casting aside an old glove. Her state of mind in the earlier stage of her change is thus expressed:-

Meanwhile, demure, y as ano paced along between the two men, she was in a very tempest of agitation, doubt, and bewilderment, and (it must be written) of flattered, fluttering vanity. She was no impossible monster of perfection, this poor little tossed-about heroine of mine. She was casentially human, therefore very faulty, and very lovable, and the conduct of her two companions taught her clearly that she was this latter thing, and well she liked the teaching.

She caught herself comparing them contrasting them defining delicate

well she liked the teaching.

She caught herself comparing them, contrasting them, defining delicate paints of resemblance and difference between them, as they tried to talk lightly and easily about commonplace things, leaving her the while in silence mercifully. And it never does answer to contrast or to compare two people together whom we have hitherto thought we liked equally well, and were equally well worthy of our liking. It never does answer. One must lose, and as a rule, the one who loses is the one we have believed in the most blindly and fondly hitherto.

The end of this definition o "delicate points of resemblance and difference between them" is her engagement with Jack, and difference between them" is her engagement with Jack, whom she then has to enlighten not only as to the part her step-father had played in the bloody tragedy of his half-brother, but also as to the part she herselt had played with his friend Claude, and how she had led him on and made him believe that she still loved him and him only, up to the very day when she engaged herself to his friend; and how, in fact, she was a demon of deception at one moment and an angel of truth the next. And when he heard her, lack, who would not have minded her flirting, saying, "A girl has straight as a die, and yet get into a dozen fixes of that the lack who "couldn't stand in any woman I thought of for

a wife" that she should have "led a fellow on with lies, and then thrown him over," gives her up on the spot; and we cansot but think he is to be congratulated on his decision. In the end Claude Powers marries Mabel, for whom the author has evidently a strong disdain; and Jack Ferrier marries Agnes Greyling, of whom we see but little save a certain diseases in the earlier pages that might be the result of honesty or of the claim in the earlier pages that might be the result of honesty or of the larty hears from Jack that he is going to be married—"and Jack told it out in his practical way, just as he would have told the tale of going out to dinner"—she is first breathless with physical agony, and then holds out her hand; "and he, fervently wishing that he could marry both, or not marry at all, took it, and felt it wreathing itself about like a living serpent in his grasp." When he tells her that he is going to marry Agnea Greyling, "ahe spoke out her words"—one of which was that she "would just as soon think of sending a message full of kindly feeling to Calcraft if he were going to hang me, as of sending one to Agnes Greyling, now that I know you are going to marry her." It is to be hoped that no silly girl who reads Mrs. Cudlip's stories will hold herself justified in following Harty Carlisle's example, and that, if she meets a man who was to have married her but is now going to marry some one else, she will not "tell the truth holly, intemperately, feelingly," even though, like Harty, she has afterwards grace enough to be ashamed of herself, and to wish she had not done it. We confess that we do not like Mrs. Cudlip's work. Shallow and egotistical, it moves in one narrow sphere, and one only. It is destitute of generous aims and lofty motives; it is simply a plea for the indulgence of society to the frailty of women, a plea founded on nothing deeper than the meaness of naughtiness. a wife" that she should have "led a fallow on with lies simply a plea for the indulgence of society to the frailty of women, a plea founded on nothing deeper than the niceness of usughtiness. Charity might be urged on nobler grounds; and frailty has a more pathetic side than any of those presented by such books as No Alternative.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annua. Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is 21 10s. 6d., or \$7 50 gold, and may be forwarded direct to the Publisher, at the Office, 38 Southampton Street, Strand, or to Mr. B. THE SESSION TO WHITSUNTIDE.

RLIAMENT breaks up for a short holiday after two muchs of mild and uninteresting labour. not been a time so utterly quiet, so serene, and so tame for years. The Ministry has been faithful to its programme of a gentle-paced Liberalism. It has made no enemies; of a gentle-paced laboralism. It has made no enemies; it has done very fairly well what it had to do; and if it has done very fairly well what it had to do; and if it has done to the pacent of its eager friends, they have been they have reached is not that which they thought they had some to. To look at the Emperor of Russia his daughter, and to speculate which friend will be lest without a harometer are the only distractions of a left without a baronetcy, are the only distractions of a languid society. The Ministerial majority is very strong, but it has seldom any occasion to show its strength, for no set of people are more contented with the Ministry than the Opposition. It is exceedingly comfortable to a mark and distracted Opposition to have nothing to opposit weak and distracted Opposition to have nothing to oppose Just before the beginning of the Session an apprehension was entertained that Mr. GLADSTONE was determined to resign his leadership. But that cloud passed away, and the Liberal party was saved the trouble of deciding which of its frogs could be so bloated as to look something like an ox. Mr. DISRAELI has moreover taken the utmost pains to conciliate his late adversaries, and he and his colleagues are studiously polite to their vanquished opponents. When one of the speakers on the Address attacked Mr. Gladstons on account of the unexpected dissolution, Mr. Diseasul immediately announced that the attack had been made without consultation, and comwhich has been really successful in his chequered career When a very minor Conservative chose to bespatter Mr CLASSICEE with such abuse as he thought likely to be most offictive, the Ministry remained perfectly silent, and left Mr. Grapsrows to expend as much unnecessary energy and cloquence as he pleased in smashing and confounding an assaulant who deserved nothing but the contempt of silence The Irish officials will not hear of any attack on the excelt nobleman who was lately Lord Licutenant, or on his administration, and make his cause completely their own To these who remember the sparring that ordinarily goes on between the Chancellors of different Ministries there a comething quite beautiful in the way in which Lord Name and Lord SELBORNE take sweet counsel together.

The moment it seemed as if Mr. WARD HUNT was to make a strong case egainst Mr. CHILDERS Mr. Goscows as the destroyers of the English navy be was insmediately recalled to wiser ways by his be was infimediately recalled to wiser ways by his intractand. Sir Starrord Northcote good-humouredly interest the First Lord of the Admiratory meant philitest the First Lord of the Admiratory meant philitest navy nothing more than a real and most interest navy on which a few thousands extra might not not injudiciously expended. Sir Starrord recordingly by framing a Budget so thoroughly in a complication by framing a Budget so thoroughly in the first style that Mr. Glassecon had nothing to say the style that Mr. Glassecon had nothing to say the style that Mr. Glassecon had nothing to say the style that he misses were about taking off the duty on horses. The misses must have been the most cantankerous of thatby had not benefit allified by all these gentle arts. First own that to live under a Busiania Ministry was win a way good time for beaten and disappointed men.

is not to be moved from his purpose to complete the Judicature Bill of last year, and resists like a rock the pitcous supplications of noble friends to let the House of Lords retain the name of its old jurisdiction. The Irish and Scotch Judges are sorry that the fitting is appeal is no longer to be to a tribunal with which the have been familiar for years; but if England is conjugate to have seen change, they are capable of seeing the abundary of having the jurisdiction of the Peers kept alive for a siny handful of Scotch and Irish appeals. Whatever was settled by the last Government and the last Parliament is taken as the law of the Medes by this most conciliatory of Ministries; and Lord Calans, while owning that he should like to see the Appellate Judges better paid, bow respectfully before the adverse decision of his predecessors, and will not dream of raising even a finger so as to give them a moment's mortification. He and Lord Selborns and Vice-Chancellor HALL have between them settled a Bill for registering transfers of land, which on such eminent authority is taken as beyond discussion, and is accepted as sure somehow to be all right. The Licensing Bill is the tribute paid by a grateful Government to the great beer interest, which fought for the Conservative cause with so much electioneering vigour and success. A trifling extension of the hours during which public-houses may be kept open, and some change more nominal than real as to endorsing convictions on heeness, are the simple and innocent fruits of that great and noble struggle. But the publicans do not seem put out of concent with their friends. No one indeed appears to have the least notion of quarrening with the Ministry for not doing what it was hoped it would do for the numerous interests which we were told last antumn have been so fellettly harassed and despoiled during Mr. Gladstone's term of office. Even Oxford is still intended by the Government to be a military centre, although the one object of Mr. Gatheres Harby's Parliamentary life when he was out of office seemed to be to get this stern decree of Lord Cardwell set aside. It would scarcely he surprising to hear Mr. quarrelling with the Ministry for not doing what it was seconed to be to get this stern decree of Lord Cardwell set aside. It would scarcely be surprising to hear Mr. Hardy now state, if he were asked the question, that he thinks an order to put into official returns an imaginary girth for the chests of recruits is a most proper order if only every circumstance is taken into consideration. Lord Sandon has indeed stirred the wrath of scalous educationists by reducing the standard of education in the case of some children whose wages he thought especially necessary for the support of their parents. And for once the Government had to use its majority so as to check all animation of feeling at its outset. But Lord Sandow was vehement in declaring that he was really no more reac-tionary about education than Mr. Forsten is, only that he as more alive to the necessity of not setting men's afficial against the new scheme of education by forcing it on the very poor too rapidly. That all the excited talk about the necessity of calling the late Government to account the Ashantes was headed away is almost a matter of the second talks. Ashantee war has died sway is almost a matter of biggs now that there is a new Ministry. The pleasant task fell to the lot of the present Government, of moving the thanks of Parliament to the General and his troops, and they have framed a scheme for the government of the Gold Coast. Lord Carnaryon has achieved this disty with care and ability, and he and Lord Kimessant have the same trotherly ways about them when colonial affairs are to be discussed as mark the intersections of Lord Surveys and the Carnary ways the intercourse of Lord BELEGERE and the CHARCELLOR.

. The only debate with an approach to seriousness in it that has taken place was that on the extension of the county franchise. Mr. Demant took occasion to make a

est new Palmerstonian manner. There ace of Conservatism in his remarks. the sultural labourers were excellent people, and as well able to vote as other men, he was quite ready to admit; but he wished Mr. Trevellyan, whom he no longer rebukes as an adventurous interloper in big subjects, to observe that those worthy persons are just now absorbed in the engrossing occupation of squeezing another shilling a week out of the farmers, and so have really no time to attend to Parliamentary matters. Besides, the question is a big question, and full of thorny points as to how the new voters, if they were created, would be distributed. Finally, this scarcely seems to be the right time to worry England with a new Reform Bill. There will be the Derby in a few days, and there is more Royalty about than usual, and an affable Ministry must really be left to enjoy its honeymoon undisturbed, and so the county franchise may surely be left as it is just at present. His release from office enabled Mr. Lown to return to his old convictions about Reform. Mr. GLAD-STONE was away, and Mr. Forstun was almost the solitary representative of the late Ministry who supported a measure which a few months ago was supposed to have been selected as the battle ery of Liberal candidates. The foreign policy of the present Government is, naturally, so exactly that of the last that the great difficulty for Lord GRANVILLE and Lord DERRY must be to feel sure which of them is in office. Lord DEERY, indeed, was so excessively cautious in replying to Lord Russell on the state of Europe, and so anxious to guard himself against being hereafter discovered to have been in the wrong under different contingencies, that Continental alarmists took it into their heads that something mysterious and dreadful must be concealed under all this cloud of reticence. But the spirited foreign policy which used to be daughed before the public when the Conserva-tives were out of office has been judiciously consigned to the lumber-room where the political stage properties of Opposition statesmen repose when they have, as members of a Government, to play a different part. Even the Home Rulors have given the Ministry no trouble. The new IRISH Secretary was guilty of one indiscretion at the beginning of his new career, and lapsed from the present programme of his party into a revival of antiquated Conservative notions. But he was wise enough to see where he had gone wrong, and has since been as pleasant to his Irish opponents as possible. One solitary defeat the Government has indeed sustained, and that was on an Irish question, and on the question of giving money to Ireland. But no harm was done; the Irish never really got the money; and perhaps the defeat was not without use to the Government, as men are liked better who have occasionally some slight break in the wearisome course of a uniform success. There is every wearisome course of a uniform success. There is every prospect that in the next two mouths of the Session the breaks in Ministerial success will not be much more serious than the only one that has occurred before Whitsuntide.

SPAIN.

MARSHAL CONCHA has left Bilbao to continue the Campaign against the Carlists. Although the moral effect of raising the siege must have been great, the investing force retired in good order and with little loss when it had ascertained that the position was turned. General Eddo, who is said to have been afterwards deprived of his command, went so far as to congratulate his troops on the change of circumstances which had restored their liberty of movement. The general of an investing army who is satisfied because he has been compelled to raise an important siege may be regarded as a model of content; nevertheless it may be true that the Carlists are more formidable in the field than in the defence of fortified lines. The mass of artillery which Serrano had collected for the relief of Bilbao cannot be used in an active campaign; and the prependerance of numbers may sometimes be neutralized by skilful generalship. The brother of Don Carlos has, according to some reports, defeated a body of Government troops in a considerable skirmish; and no advantage has been claimed by General Conchasince his arrival at Bilbao. Time will show whether the enthusiasm of the insurgents has been damped by their recent failure. Observers from without are confirmed by the relief of Bilbao in the belief that the Carlists have no classes of carrying the war beyond the boundaries of the Northern provinces. It is possible that the volunteers

who cling so obstinately to the cause of Don Carlos may be actuated by an exclusively local patriotism which renders them indifferent to the condition of the rest of Spain. The mysterious resources which enable the insurgents to maintain the war have apparently not yet been exhausted; but they have not hitherto encountered so obsiderable a force as that which is now commanded by Marshi Coursel. The so-called Republican army appears to feel implicit confidence in its chief, who is assisted by many efficiency of experience and ability. The latest accounts afford no sufficient indication of the purpose of Coucha, who was moving in a southerly direction. His countrymen, whether friends or enemies, seem to have been astonished at the conduct of a general who, after obtaining a considerable advantage, proceeds to complete his victory by following up the beaten enemy. A movement against his own friends was deemed a more natural result of military success. As Marshal Concha is supposed to be a partisan of Princo Alfonso, it was thought extraordinary that he should not at once restore the Monarchy with the aid of the army. It is still uncertain whether the Marshal meditates opposition to the Government of Madrid. He has of late co-operated effectively with Serrano, who is deemed the chief obstacle to a reatoration of the Bourson dynasty. It is but reasonable to assume that he was influenced by plain considerations of duty, and that he may have regarded his reputation as involved in the suppression of the Carlist revolt. That a victorious soldier should recognize the rights of any Government which he has the means of overthrowing seems to be in Spain a surprising proof of moderation.

SERRANO rested his fortunes on the relief of Bilbao. He might perhaps have declined to leave the seat of Government to command the army; but, having once undertaken the enterprise, he could not have retained his official and political position if he had returned after an unsuccessful campaign. Although Marshal Concha received the greater part of the credit of victory, the President of the Republic has been greatly strengthened both by the check inflicted on the Carlists and by the increase of his former military reputation. During his absence in the North his Ministers were with difficulty prevented from breaking up the Covernment. The Cabinet represented a coalition; or, in Spanish phrase, it was a Government of Conciliation, including Moderates, Progressists, and one or two members who inclined to Republicanism. In the midst of the operations in front of Somorrostro Admiral TOPETE was compelled to pay a hurried visit to Madrid for the purpose of preventing or postponing the imminent rupture. The Minister of War, General ZABALA, discharged with energetic loyalty the paramount duty of providing supplies and reinforcements to the army. His colleagues were divided by every form of political and personal jealousy, and some of them were probably not well disposed to the Chief of the Government. It might have been supposed that, as long as these were no Cortes to manage, political differences might be conveniently suspended, but Spaniards are still more averse than Frenchmen to compromise and toleration. After his return to Madrid, Serrano allowed a short interval to elapse before he announced his decision. He would willingly have preserved the party truce which was represented by his Government; but as some of the Ministers positively refused to co-operate with others, he was compelled to make a choice, and he inclined to the Conservative section of the Cabingt. In Spain, as in other Continental countries, the Minister of the Interior is in ordinary times the most powerful member of the Government. He appoints the civil servants, who in their turn govern the country, and by their aid he countrols their turn govern the country, and by their aid he controls the elections. If Marshal Serrano has at autotime occasion to summon a Cortes, he must procure a majority who may be trusted to support him. Within two or three years Spain has been represented by more than that number of homogeneous Parliaments. One Cortes, returned, as the opponents of the Government complained, by gross corruption and violence, refused implicit completione in Sagasta. When Zorrilla succeeded to effice, he also obtained at a fresh election a leave majority. he also obtained at a fresh election a large majority; and finally, the Cortes assembled after the abdication of the King was divided between the two Republican sections. It is above all tillings necessary to place at the Home Office a functionally who can be be said to manipulate the elections skillfully.

States who possesse greater efficiel experience than

thought indispensable as Minister of the Interior. The Progresuists not unresidentally refused to take a share in the Government while the chief political power remained in the hands of the leader of the Conservative party. After some fatile attempts at conciliation General Zahala, what is rather a soldier than a politician, consented to take the first place in the Government, while Sagasta at the Home Office will probably exercise the principal power. The rest of the Ministers are Moderates or Communities, and the Republicans not unreasonably complain that the PRESIDENT of the Republic is exclusively surrounded by the supporters of monarchy. For the moment it is perhaps a more serious inconvenience that General Pavia has resigned the military command of Madrid. It is supposed that he resented the termination of the compromise which he had himself originated when he turned the Cortes out of doors. Serrano will be fortunate if he can find another Captain General for Madrid as fully able and willing as General Pavia to keep the rabble in order, and equally indisposed to conspire for his own advantage. SAGANTA, as the ablest member of the new Cabinet, will be the real head of the Ministry as long as no open opposition renders necessary an appeal to the The Republicans in some of the large towns threaton insurrectionary movements which would inevitably result in the establishment of the undisguised supremacy of the army. Serband and the other military chiefs are not likely to forget the condition in which the country was left on the proclamation of the Republic. At that time there were no means of maintaining order, or even retional unity. The Coulist was beginning or even national unity. The Carlist war has been so far beneficial that it has facilitated and rendered necessary the reconstruction of the army; nor can there be any doubt that, unless the principal generals should quarrol among themselves, any attempt at a Republican ontbreak would be summarily repressed. The ulterior intentions of those who control the destinies of Spain are still undisclosed. It is believed that Serrano desires a prolongation of his provisional power such as that which has been accorded in Franco to Marshal MacManox. Torere is closely allied to Serbano, who again appears to repose full confidence in the loyalty of Concha. The Ministers are probably inclined to the party of Don Alfonso, whose pretensions are unacceptable to Serrano and Topete. When there are difficulties in the way of any decided course, it is probable that nothing will be done. For the present, a President of a nominal Republic, ruling without the aid or incumbrance of a Parliament, will perhaps serve the country better than any competitor.

THE FALL OF THE FRENCH MINISTRY.

THE overthrow of the Brogue Ministry by the desertion of the Right is one of the least intelligible incidents of contemporary French politics. In voting for the prolongation of Marshal MacManon's powers last November the Legitimists had apparently descended from the impracticable heights of pure principle, and taken their place in the everyday would of compromise and arrangement. The scheme for putting the Count of Changer on the throne had failed, and it was open to them to declare that their alliance with the Orleanists had come to an end with it. They had united for a particular purpose, and when that purpose was shown to be out of reach, they might fairly have dissolved partnership. Instead of this, they renewed the compact for a totally different object. In concert with the Date of Brocket for a totally different object. In concert with the Date of Brocket for a fixed number of years. What was to happen at the end of that time was not expressed in the contract. No doubt the Dake of Brocket and his Legitimist allies thought it best to keep their ideas upon this point a the secret from one another. Thus much, however, seemed settled, that all thought of a Restoration was for the present given up, and that Legitimists and Orleanists acting together would secures working majority to the Ministry so long as the composition of the Assembly underweat no further change. For some time past there have been ayangtoms that the Ratycone Right were growing reached under this self-angued obligation to acquisese even for a time in a nominally Republican Constitution. They had done the same thing when M. There was President; but that was before they had realized their own strength or and been excited by the near prospect of a Restoration. The

culation, and so long as it was doubtful where the cold not go along with M. There in setting up the Republic submission was the only course which the Right had open to them. A half-and-half friend is often a cause of greater irritation than an avowed enemy, and it is not wonderful that the Legitimists looked upon the Duke of Brocurs as no better than a half-and-half friend. If the Orleanists had not had their trumpery scruples about flags and charters, there would have been a majority in the Assembly in favour of a Restoration even after the publication of the Count of Chambord's letter; and when the Legitimists saw themselves compelled to abandon their hopes because the Orleanists insisted on guarantees which the Count of Chambord did not choose to give, it was natural enough that they should be in an ill-humour. But after the decisive acceptance of the new state of things involved in the vote of the 19th of November, it was scarcely credible that they should, only six months later, set themselves deliberately to overturn the Cabinet. It seemed far more probable that their threats of descrition were merely so many outbursts of childish passion, having as little to do with their ultimate acts as the angry assurances of children usually have. Whenever the moment for voting came they would surely be guided by the same motives which had actuated them on the 19th of November, and voto—under protest and with all manner of reservations—in support of the Ministry which after all must come nearer their idea of what a Ministry ought to be than any other which could at present be obtained.

This reasonable expectation has been completely falsified. The vote of the Right can only be accounted for on one of three hypotheses. Either it was an outburst of unrestrained rage which blinded them to all considerations either of prudence or duty; or they think that the prospect of effecting a Restoration by their own unsided strength is more promising than it was before the fusion of last August; or they calenlate upon a new ally turning up in the confusion into which they may hope Franco will be reduced by the defeat of the Duke of Bucours. On the whole, the last cottese explanations seems the most probable. At all events, the choice lies between that and the first. The notion that they have any hope of proclaiming the Count of Chamboko King by the votes of the mere fraction of the Assembly which alone is willing to accept him on his own terms is too absurd to be entertained even by ultra-Legitimists. The theory of uncontrollable rage is less impossible, and if the Dake of Brootse had done anything fresh to excite their anger, it might be accepted as an adequate explanation. But, as matters stand, it can hardly be so accepted. If the division had taken place on the Bill creating a Second Chamber, and investing the President of the Grand Council with the Executive power in the interval between Marshal Mac-Manon's vacating his office and the subsequent settlement of the form of government by the Grand Conneil and the Assembly, the result would have been easier to understand. The Legitimists consider, rightly or wrongly, that this provision was especially designed to give the control of events at a critical moment to the Duke of AUMALE; and as the Duke of Acmale is the member of the Obleans family whom they most hate and fear, they might have gone any lengths in opposing such a Bill. But the decisive vote was taken on a much less momentous question, and even if the Legitimists had made up their minds to do anything rather than allow a post of this importance to be created for the Duke of Aumair, they would naturally have waited until the Bill was under discussion, and taken their chance of being able to modify it, or, failing in this, to throw it out. action upon this question would have been just as decisive in its effects as their vote of last Saturday, while it would have been very much easier to explain. They might have plausibly accused the Duke of Brogur of meditating something not far short of a breach of faith against his allies, inasmuch as, under cover of postponing the final decision between Monarchy and Republic, he had contrived that the decision should be made with an Orleanist

Prince commanding the whole strength of the Executive.

It seems unlikely, therefore, that the vote of the Hight can fairly be set down to passion. It is more probable that they have somehow persuaded themselves that if all moderate Governments, can be made impossible, and Marshal MacManon reduced to choose between a Radical Ministry, whether before or after a dissolution, and some kind of some d'état, he will prefer the latter. Even supposing this to be the case—and the Marshal's conduct throughout the present Ministerial acquisitions has been so

straightforward as to make the supposition highly improbable—it is hard to see how the Legitimists would be the Marshal MacManon could have no inducebetter for it. ment to put the Count of Chamberd on the throne. Man for man, it seems likely that Napoleon IV. would be a more popular puppet than Henry V., and there can be no question that he would be a more pliable one. Whether the Marshal consulted his own interests or those of France, he would rather, of the two, be the guardian of the Bona-partist than of a Legitimate throne. He would be a greater man in the former case than in the latter, and the danger of civil war would be decidedly less. But, though the calculations of the Legitimists have no foundation, they are valuable as showing to what a depth the party has fallen. After twenty years of political exile and haughty abstention from the unclean thing of Imperialism, they have come so low as to practise the very same tactics and to build their hopes on the very same possibilities as the party for which they have expressed so much contempt. The legitimate King is to be restored to France by a military surprise, and the means by which this surprise is to be effected is the corruption of a successful soldier. By comparison with this Bonapartism becomes respectable. In the imagination of NAPOLEON III. the nation had at least a place. He could assure himself that his coup d'état was designed to rescue France from utter confusion, and the vote which followed showed that, bad as the means were, they were not so bad but that some millions of Frenchmen were to be found who thought that the end justified them. No similar excuses can be made for the Legitimists. There is no popular sentiment to be evoked, no actual confusion out of which a way of escape is needed, for, whatever Marshal MacManon's Government has failed in, it has been completely successful in maintaining order. On the contrary, it is an essential part of the Legitimist plan that the disease should be created in order to make work for the physician. Society in France is to be reduced to chaos that the Count of CHAMBORD's state coach may move upon the face of the waters.
It would be doing the Duke of BROGLE gross injustice to

compare him with men who only differ from Bonapurtist adventurers in that they bear historic names and were once supposed to be high-minded. But though he might fairly resent being classed with them, it must not be forgotten that they were the allies of his deliberate choice. A year ago the Orleanist party had to all appearance the fate of France in their hands. If they had frankly allied themselves with M. THIERS, they might have founded a Conservative Republic under conditions more encouraging than two years earlier seemed at all within the bounds of reasonable expectation. They threw this chance away rather than surrender the last hope of restoring the Monarchy. Even when their eyes were opened by the Count of CHAMBORD's letter, fortune was again kind to them. If under cover of the Septennate they had been willing frankly to organize the Republic, they might have commanded sufficient strength in the Assembly to set the Legitimists at defiance. Instead of doing so, they made common cause with the Legitimists to stave off the Republic, and the vote of Saturday last has been their reward. It remains to be seen whether the Duke p'Audiffret Pasquier or the Duke Decazes will have learnt wisdom from the fate of their leader.

MR. SOLATER BOOTH'S RATING BILL.

BILL introduced by the Government to amend the A law respecting the liability and valuation of certain property for the purpose of rates is less ambitious than some recent measures of the same kind, and it is juster and more practicable. In the last Session the House of Lords rejected, on the ground that sufficient time had not been allowed for consideration, a Bill by which Mr. STANSFELD, then Prosident of the Local Government Board, proposed to extend the area of rating. His successor will have little difficulty the area of rating. His successor will have little difficulty in passing his Bill through both Houses. In the course of the autumn Mr. STANSFELD, misapprehending like others of his colleagues the feeling of the country, used the failure of his Bill as an argument for the abolition of the House of Lords. No revolutionary scheme has ever rested on a more trivial foundation. Little harm could be done by the maintenance for one year more or inequalities which have lasted for three centuries; and if the Peers entertained any suspicion of the ulterior designs of the former promoters of the lift, they are now reassured by the accession of their the next payment. Assessment Commissioners will generate the inclined to add a percentage to the actual zent on

to ratepayers, and additional contributions from the public revenue have been promised with more liberalit, than wisdom. The kinds of property which are hencel ith to become rateable will be exempt from a part of the cost of maintenance both of lunatics and policemen. The examptions which are to be removed have been invidious, since

tions which are to be removed have been invidious, since they have furnished a pretext for agitation.

It would be difficult to prove that land devoted to the growth of wood, or valuable rights of shooting, or metal-liferous mines, were entitled to an immunity not accorded to pasture, to arable, or to coal-mines. The owners of woods, of mines, and of land devoted to sporting, have watched recent projects of legislation with jealousy, because they had some reason to fear a reaction by which excessive they had some reason to fear a reaction by which excessive taxation would be substituted for exemption. Mr. Goschen and Mr. GLADSTONE had more than once uttered mysterious threats against the landowners who had presumed to outvote them on the motion of Sir Massey Lopes. That land profitably occupied ought to share in the burdens of other land is wholly indisputable; but it would have been easy to devise rules of assessment which would have been iniquitous and oppressive. Mr. Sclatze Booth, probably feeling no animosity against landlords or tenants, and having no object but to abolish existing anomalies in the simplest manner, has framed a Bill which will give general satisfaction. The occupiers who are at present exclusively liable to rates will in some districts obtain acquilible relief in addition to the satisfaction of firing a sensible relief, in addition to the satisfaction of fixing a new liability on landowners. The only provisions of the Bill which are likely to cause serious discussion are the clauses which relate to the taxation of mines. It may be doubted whether the rent under a lease granted without fine for the ordinary term, according to the custom of the country, indicates in all cases with sufficient accuracy the rateable value of the mine. The value of land used only for a plantation or a wood is to be estimated as if the land were let and occupied for other ourposes in its natural and unimproved state. It commonly happens that the most barren and inaccessible parts of an estate are planted because they are comparatively useless for any other purpose. It may be approximately calculated that in such cases the growth of wood produces at long intervals a return which corresponds to the annual profits of ordinary land of equal fertility. A larch plantation of forty years' growth may probably be worth a sum equal to a rent of fifteen shillings an acre for the same period. In the case of woods, as in the case of game, the occupiers who form the majority of the Assessment Commission may perhaps be biassed against a kind of property in which they have The simple rule of valuation established by no interest. this Bill will render any gross injustice difficult or impossi-ble. The value of saleable underwood, which is rated under the Act of ELIZABETH, is to be estimated as if the land were let for that purpose. In this instance also it will be easy to ascertain the value of the underwood in the hop districts, which are principally concerned in the valuation of underwood. If the land is used partly as plantation or wood, and partly for the growth of underwood, the Assessment Commission may at their choice value it either as wood or as coppiec-wood; and of course it is intended that they should prefer the higher valuation.

Rights of shooting and fishing, when severed from the occupation, are also to be included in the list of rateable hereditaments. It is only within thirty or forty years that rights of sporting have acquired any considerable pecuniary value. In former times an owner who cared nothing for shooting generally allowed friends or neighbours to sport over his land; and the enormous head of game which is now maintained in many parts of England was altogether unknown. Lord Palmerston describes, in a letter published in his biography, a day's shooting for which he had posted down to Hampshire and back, with the result of less than a dozen head falling to three guns. The citally preserves and the high sporting rents of modern times fully justify the proposed extension of the area of rating. The provisions of the Bill with respect to the assessment of rights of sporting seem to be unobjectionable. When the cwner, according to the usual practice, lets land, and retains the game for himself, his right of shorting is not to be agrerately valued; but the gross value of the land is to be esti-

William Committee to the State of the State

secount of the reservation of the right of sporting; and in some parts of the country where the tenantry is of a comparatively high class, the occupier would often be willing to pay a reasonable addition to his rent for the right of sporting. Small farmers, though they may grumble at the game oven when it is scanty, would seldom be willing to purchase the opportunity of either preserving or destroying it. No provision is made for rating rights of fishing where they are occupied with the land; yet in some rivers fisheries are more valuable than any right of shooting. It is only when rights of shooting or of fishing are let that they are to be separately rated. The Bill contains the curious provision that in such cases the rate may, according to the discretion of the local authority, be charged either on the owner or the occupier. The lessees of grouse hills and deer forests will be the principal sufferers by the proposed enactment, because the constantly increasing competition may probably enable the owners to keep up the prices of their shootings. The grievances endured by the unfortunate tenants will, it is to be feared, meet with little sympathy. In Scotland the addition of the rate to the rent will not exceed a small percentage. If the taxation of rights of shooting in cultivated districts were to discourage the practice of letting, the Bill would diminish one source of discontent. Tenants naturally grudge a stranger the privileges which they might tolerate when they are exercised by the landlord; and the person who hires a right of shooting is in the great majority of cases anxious to make the most of the bargain by strict preservation.

Mines of every kind, not mentioned in the Act of the forty-third of ELIZABETH, are to be subjected to rates; but the mode of rating defined by the Bill applies only to tin and copper-mines. It is doubtful whether lead-mines and fields of ironstone are covered by the enacting portion of the Bill. It is generally admitted that mines ought to be rated; but there will probably be an animated controversy on the provisions of this part of the Bill. Minerals are in the nature rather of capital than of income, as the process of exhaustion commences with the opening of a mine. The Government has judiciously declined to adopt Mr. Goschen's proposal of rating houses by some arbitrary standard of their estimated cost. There is no reason why houses should not, like other kinds of property, be rated at the rent for which they might be let. A large mansion is in many instances a heavy burden, and, except in the limited number of cases when it would command a high rent, it is not a source of profit to the owner. Rates are imposed, not according to the wealth of the contributor, but in proportion to pecuniary value. Woods and game may be turned into money, but a poor man with a large house has seldom the opportunity of deriving profit from the possession. As Mr. Stansfeld approves of the reintroduction of his own measure, it may be supposed that the Bill will pass without serious opposition.

THE EMPEROR OF RUSSIA IN BELGIUM.

Where he will no doubt be received with as cordial a welcome as he found here; and if to enjoy a contrast gives him pleasure, he will not have a better opportunity of tasting this enjoyment than by exchanging London for Brussels. He leaves a country which is of all countries in Europe the best protected geographically, and he enters a country which is the worst protected. Belgium, in fact, is not protected at all, except by a sort of feeling that it is better that it should be left alone. But, although it has now had nearly half a cintury of independent existence, it has always lived in danger of seeing its independent existence, it has always lived in danger of seeing its independent existence, it has always lived in danger of seeing its independent existence, it has always lived in danger of seeing its independent existence, it has always lived in danger of seeing its independent existence, it has always lived in danger of seeing its independent existence, it has always lived in danger of seeing its independent existence, it has always lived in danger of seeing its independent existence. They may be bullied by a powerful neighbour, or have a slice of their territory torn away from them. But the peculiarity of Belgium is that the question which perpetually presses on it is not whether it shall undergo some humiliation or loss, but whether it may not wake up some morning and find that them is no Belgium at all. No Power except Prussia objected abdrongly as Russia to the separation of Belgium from Holland, and no Power was less likely in those days to look with favour on the erection of revolted provinces into a petty kingdom placed under the patronage of France. The previsions of those who pointed out the danger of thus

been realized, but they have been in a great measure justified by what has actually taken place. Belgium has twice on the eve of anaexation to France, although both times the schemers of the change were buffled or lost courage at the last moment. It is true that England is deeply interested in the integrity of Belgium. It is a deeply interested in the integrity of Belgium. It is a matter of considerable importance to England that Antwerp should not fall into hands at once unfriendly and powerful. It is also a point of bonour with us that we should not be openly diagraced by failing in our engagements to a little Power which we have always invited to lean on us. Belgium also has gone on so well, has been so lucky in its sovereigns, has kept up with England social relations of such cordiality, and is altogether such a respectable, decent, well-conducted little State, that Englishmen would feel indignant if against its will it were eaten up by a big neighbour. But England is the only real friend that Belgium has ever had. Prince BISMARCE was quite ready to listen to, as he says, or to invent, as M. BENEDETTI says, an audacious proposal for letting France have Belgium in return for Germany having corresponding advantages. Neither party to the project considered that Russia would object, or that England could object effectually if the principals came to an agreement. Possibly, however, Belgium may now seem of more importance to Russia than it did in former days, and it may become part of Russian policy to uphold the very independence to which it was once so much opposed. If this is so, the visit of the Emperon to the King of the Belgians may contribute in some indefinable way to the growth of an interest in Belgium on the part of those who have the disposal of the forces of Russia. Sovereigns are of absolutely no political effect if the friendliness they temporarily manifest is not in accordance with national interests. The visit of the King of Pressua to Paris at the last Exhibition is a memorable instance of this. But when feeling and interest go together, the interchange of civilities is something more than a mere matter of ceremony.

The war between France and Germany did much to change the position of Belgium. It committed England avowedly and formally to intervention on behalf of its little ally. The risk we ran was then extremely slight, as Germany was not in the least disposed to attack Belgium, and France oven at the beginning of the war was too wellaware of the seriousness of the task before her to wish to have a quarrel with England on her hands. After the tide of German invasion had once begun to roll over France, there was necessarily no danger whatever of France being strong enough to think of threatening any State outside her. But the result of the war has been to create a new danger to Bolgium. It is true that France has now quite enough motive to go to war without regarding Belgium as the prize of victory. The recovery of Alsace and Lorraine is enough in itself to satisfy the ambition of Frenchmen. But it is only through Belgium that France can now get at Germany. Belfort does not open the door to a French army seeking to pass into Germany, as such an army would find itself hemmed into a corner with the Rhine on the one side and the Swiss frontier on the other. Had Luxemburg remained a German fortress, the avenue into Germany on that side would have been closed also. But now that Luxemburg, mainly through the intervention of England, has been dismuntled, it is just possible that a French army could find its way through in that direction. But to get there it must violate the neutrality of Belgium. France might indeed remain on the defensive, but what chance could it have of France might indeed getting back Alsace and Lorraine if it remained quiet or merely tried to retake Metz and Strasburg? The Gormans would have every advantage in such a war. They would fight as little or as much as they pleased, and they could take care that the seat of war was exclusively on French soil. The character of the French army and of the French people would also tell adversely to the chances of national success in such a contest. What the army and the people like is something rapid, brilliant, and daring at the outset, a great venture and a few victories encourage them at first. They could in a German war only got these things by breaking into Germany as soon as war was declared. The French could only get into Germany by going through Belgium, and to go through Belgium would be, or ought to be, to come to a rupture with England: When a new war between Franco and Germany is spoken of as if it were a light matter, it is forgotten that the French, to win, must attack, and that to

attack they must quarrel with England. We might or might not wish for an alliance with Germany, but the alliance would be inevitably forced on us. England is really the German fortress that replaces Luxemburg, and, without national vanity, we may venture to say that the substi-tution is not one that Germany need regret.

The German papers have recently occupied themselves with pointing out that the visit of the EMPEROR to England is a pledge that peace will be preserved. Of course it is more or less a pledge that peace will be preserved as between Russia and England, but it not at first sight so obvious what the Imperial visit here has got to do with the preservation of peace between France and Germany. But the fact that the EMPEROR leaves England to go to Belgium serves as an explanation of what the Gormans mean. France must, if it is the assailant and chooses to pick a quarrel with Germany, go to war with England also. But it would be madness for France to encounter such a risk unless it was sure of an alliance with Russia. Russia, if it went to war in alliance with France, would enter on the contest not merely to help France, but for objects of its own, and the objects it would propose to secure are such as England would do its utmost to place beyond the reach of Russia. As Russia cannot ally itself with France against Germany without finding England on the side of Germany, it must see its way to a great struggle with England before it accepts a French alliance. If then it does not mean to quarrol with England, and thinks that Constantinople and India may stand over for the present, it will not commit itself to help France. The better, therefore, the relations between England and Russia, the less chance is there of a new war between France and Germany. If the peace of Europe is for a time to be maintained, the best sign of this is the exhibition of cordiality between Russia and Belgium, as the violation of Belgian independence would be one of the first consequences of war being declared, supposing that it was France that provoked the war, and there is no chance of such a violation unless Russia sanctions it. If Germany were to be the assailant, if there was any foundation for the suspicions often expressed as to the policy of Prince BISMARCK, and it were true that he wished for another war simply to crush France before it has had time to recover, then Belgium might probably have nothing to do with such a war; and England, if it had anything to do with it, would be concerned, not as protector of Belgium, but as interested in the maintenance of the public law of Europe, if we may assume for the moment that there is such a law, and that England has some wish to maintain it. Generally, however, when the probability of a new French and German war is discussed, what is meant is a French war of rovonge, and against such a war it is not very far-fetched in German politicians to see a safeguard in the visits of the EMPEROR to London and Brussels.

PATRONAGE IN ENGLAND AND SCOTLAND.

THE question of patronage is under discussion in both the Established Churches of Great Britain. For Scotland the Government has undertaken to effect a radical change in the law; for England the House of Lords has appointed a Committee of Inquiry. It is unfortunate perhaps that the Bill and the Committee should have come into being in the same Session. The coincidence gives an accidental and misleading colour to the notion that patronage is at bottom the same thing in the two Churches, and that it is only a question of time when the precedent about to be set This makes it in Scotland shall be copied in England. important to show that, as a matter of fact there is no connexion between the two cases. In Scotland the system of patronage has always been a weakening and disrupting force within the Church; in England it has been a strongthening and cohesive force. In Sootland it has taken away from the popularity and universality of the Established Church; in England it has had a directly contrary effect. In Scotland its abolition is widely demanded, trary effect. In Scotland its abolition is widely demanded, and may be hoped to exercise a healing and softening influence on the schiems which divide the Presbyterian body; in England there is no popular cry for any change, and such a change as that which it is proposed to introduce into Scotland would be a simple cause of confession. Consequently it is perfectly possible to have with the Government as regards its Scotch Bill, while supercrating any change in the same direction in this countries.

The reason why patronach has worked so different in Scotland and in England is to be looked for parti in the social position of the Presbytevian dergy, partly in the dootrinal and corremental unity of Presbytevian Church. The wealth of the Church England, and the dignity conferred on her by the fact that her bishops are Peers of Parliament, have converted the system of patronage into an arrangement between equals; while the poverty of the Ecotch Church has ordinarily made patronage an arrangement between superior and inferior. The lay patron in the one case has exercised his right in favour of a relation or a friend, in the other case has more offer arrection it in conferred on her by friend; in the other case he has more often exercised it in favour of a dependent. Consequently, the presente in the Church of Scotland has possessed meither the social dignity which goes with a family living, nor the popularity which goes with election. He is imposed upon his congregation without any act of their own, and he does not often possess the title to respect which belongs to a presentee who is of the same rank with his patron. The system of patronage has been one main cause why the Church of England has maintained up to this time her immense comprehensiveness. Supposing that all the livings had been in the gift of the bishops or of the Crown, we should have had a series either of purely party appointments, or of appointments expressly designed to exclude men of pronounced views. In the former case the balance would have leant almost entirely to one side, for from the Revolution downwards Bishops of decidedly High Church views have been merely exceptions to the general tendency of Episcopal opinion. In the latter the clergy would have held aloof from the religious movements of their time, and secessions such as that of the Wesleyans would probably have occurred again and again. The fact that a large proportion of livings are in the gift of private hands ensures the representation of all schools of thought within the Church. There has been no sudden rush in one within the Church. direction or the other, but a steady intermingling of men of views as widely different as can be held by men who are assumed to be agreed upon all essential points. Nothing but private patronage could have secured this to anything like the same extent. A system of popular election would have been just as fatal to it as a system of Episcopal or Royal appointments. In every congregation there would have been a majority for some one set of opinions, and a clergyman once chosen for his acceptance of the views of the majority would naturally have done his best to make those views take permanent root in the congrega-tion. But under a system which legally leaves the patron free to appoint anybody he likes, on any ground that he likes, and morally saddles him with no obligation beyond that of choosing a man who will be useful in the parish, every shade of opinion gets represented in due course. On the other hand, in a Church where, at least in the sense in which the term is understood in this country,there is no difference of opinion, this advantage cannot operate. The patron may impose a clergyman upon an unwilling congregation; but the reason why the congregation dislikes the appointment will ordinarily be that the presentee is unfitted in some way for the work entrusted to him. If the quarrels about patronage in the Church of Scotland had arisen from incumbents belonging to one school of theology being nominated to congregations belonging to another school of theology, they would at all events have prevented stagnation. But where these events have prevented stagnation. quarrels have arisen from an incompetent incumbent being presented, they can only be regarded as unavailing efforts on the part of the people to escape from stagastion. Their subsidence is not, as in the former case, attributable to the growth of liberality and tolerance consequent on the friction of different opinions; it only signifies that the malcontents have either ceased to take interest in religious matters or have migrated to some other communion.

It is probable, therefore, that the respective mades of dealing with the question indicated for Scotland in the speech of the Duke of RICHMOND, and for Hughand in the speech of the Bishop of PETERBOROUGH, though seemingly we different from one another, have the common merit of stating the circumstances against which they are directed. The Duke of RICHMOND was that mothing about of the continuous was that mothing about of the continuous pare that mothing about of the continuous speech and the continuous spee of RICHMOND says that nothing short of the entitle abolition of patronage will meet the wishes of Scotch Chandleson. The Bishop of Perundonous has no wish to shall be patronage, nor would be prevent the free meeting of the right of patronage from hand to hand, All that we preposes is to deal with the sale of next premutations—which in many cases is equivalent to the sale, not of the right to present to a

benefice, but of the henotice itselfpowers of the Bishop in case of grossly unit appointments. In principle both these changes are clearly right. There is no reason why the right of presenting to livings should not be light and sold. Indeed, as the action of a clargyment over his parishioners is one of the most important means of exercising useful influence, to buy the right of giving its men these immense opportunities for good seems one of the most natural forms of for good seems one of the most natural forms of philanthrophic expenditure. To bay the right of immediately appointing yourself to a particular parish is a wholly different transaction, and the abuses to which it has proved to be open are quite serious enough to call for legis-lative intervention. In Scotland a reform of this moderate kind would apparently answer no useful purpose. The abuses connected with patronage there have little to do with the money aspect of the question. Indeed, when it is remembered that the average value of a presentation in Scotland is only one year's purchase, while in Eugland it is sixteen wears' purchase money always can hardly be said sixteen years' purchase, money abuses can hardly be said to exist. But with Presbyterian congregations patronage is a matter of principle. They are great sticklers for Church authority, and in a Prospyterian church the appropriate and in which pointment of ministers is the principal mode in which Church authority can be exercised. The Government have done wisely in vesting the nomination in the commu-nicants—that is, in the congregation, properly so-called— rather than in the parishioners. Some opposition will probably be made to this provision on the plea that it is inconsistent with the theory of an Established Church. But the theory which makes the essence of Establishment to consist in the assumed co-extension of the Church and the nation has long ceased to have any meaning. The Churches of England and Scotland remain established, not because every subject of the Crown in the two countries respectively is regarded as belonging to them, but because a sufficient majority of the people in each case belongs to them to make it convenient for the State to maintain special relations with them in the shape of privileges conferred and control maintained. It is idle to talk about parisbioners in any other than a civil sense in a country which within thirty years has witnessed a schism which literally split the Established Church in two. To make the right to appoint the minister a mere accident of residence, no matter whether the person claiming it were a member of the Free Kirk or a United Presbyterian, or perhaps not a Presbyterian at all, would be to retain the very element which has made patronage so unpopular in Scotland. Nothing would be gained by taking it from the hands of lay patrons, and committing it to a popular body outside the Church. At the same time it might be well if provision could be made, by the reservation of a certain amount of Crown patronage, for the occasional correction of popular violence. The State cannot wholly escape responsibility for the acts of the Church so long as the connexion between the two is even nominally maintained; and if every man of liberal and moderate views is to be banished from the Church of Scotland, this responsibility will become both un-pleasant and discreditable. A Church in which there is no room for minorities can be neither great nor useful, and unless some efficient counterpoise to mere election can be introduced into the Government Bill, minorities are likely to have a bad time of it in the Presbyterian Establishment.

IRISH RAILWAY GUARANTEES.

THE unfavourable anticipations which were formed of the Parliamentary conduct of the new Iriah members have thus far not been realized. One at least of their number has shown himself an effective debater; and discussions of matters really important to Ireland have been earnestly and ably conducted. The O'CONOR DON lately moved a resolution on reilway guarantees which produced an instructive debate. The motion raised two dissimilar issues. Some members objected to the principle of guarantees, and others to the constitution of Grand Juries. It may be contended that an aristocratic body, not elected by the ratepayers, ought not to be recognised by Parliament in represental the country. One of the speakers took the limits to prove the undisputed proposition that the Grand lary has no power to originate a tax. In Irish counties the Freeentment Semions, consisting of some of the largest interpretation that the justices, inconstant the local expenditure which is afterwards

sanctioned by the Grand Jury. Neither body can grant a guarantee for any public enterprise on behalf of the ratepayers; nor indeed would not enter-ference of Parliament be required if there were a local authority with a general power of taxation. In the absence of any institution of the kind, Parliamentary Committees have not unreasonably relied on the opinion of the only organized bodies which happen to exist. Grand Juries, supported in some instances by Presentment Sessions, have voted in favour of guarantees, which have consequently received Parliamentary sucction. There can consequently received Parliamentary anaction. There can be no doubt that the greatest benefit which can be conferred on a remote rural district in Ircland is the construction of a railway. Reads are few, commercial intercourse is stugment, and agricultural progress is checked by the difficulty of reaching a market. In some instances counties have never been called upon for payment of the guarantee which they have given, and in other cases guaranteed railways have become self-supporting as soon as they have had time to create for themselves a traffic. In some parts of Ireland cattle, butter, pigs, and cheese have doubled their value as soon as a railway has been opened; and purchasers in the towns of England have received a corresponding advantage. Demonstrations that a highly profitable investment is theoretically irregular produce but a feeble conviction. A rate of threepence or fourpeace in the pound for five or ten years is a small price to pay for a great addition to the wealth of the community.

One objection to guarantees was suggested with remarkable candour by Mr. Conomy, who complained of the possible competition with existing railways which might be caused by the projection of new enterprises. There is no reason why Railway Companies in Ireland or elsewhere should not receive due protection against unnecessary competition; but it can scarcely be supposed that a guarantee would be recommended by the landowners of a county unless a railway were really required. The Sligo and Leitrim scheme to which Mr. Conotty referred was intended to accommodate a district entirely devoid of railway accommodation, although it was possible that the proposed line might divert a certain amount of traffic from the Midlaud Great Western. It happened that on the same day the House of Lords ordered by a small majority the recommittal of the Sligo and Leitrin Bill, which had been rejected by a Select Committee on an objection to the guarantee. The Midland Great an objection to the guarantee. The Midland Great Western Company had opposed the Bill on its merits, but the question was decided on other grounds. The Committee in the first instance refused to sanction the guarantee; and, as the promoters had stated that the guarantee was indispensable, the Committee logically rejected the whole project. Unluckily it had happened that in former cases guarantees had been sanctioned only when they were unopposed; and the Committee hastily inferred that a pre-cedent had been established for requiring an impossible unanimity. In the particular case only one considerable proprietor objected to the guarantee, and yet his name was not attached to the petition. If the decision had not been questioned, an entire stop would have been put to the extension of railways in Ireland. Such enterprises offer little attraction to speculative English capitalists; but there are always large sums of money ready to be invested at a moderate rate of interest on sufficient security. Objections which were raised in both Houses to the guarantee of dividends on ordinary stock rest on no sufficient foundation. Undertakers of public works can obtain money most advantageously by consulting the inclinations of all classes of capitalists. Some lauders only require security for a fixed interest, while others prefer an investment of a more classic character. Guarantees of interest and of minimum dividends are equally legitimate. The Committee which will now reconsider the Sligo and Leitrim Bill may perhaps again think it expedient to reject it; but it will loyally conform to the deliberate judgment of the House of Lords that opposition is not a conclusive argument against a guarantee.

The O'Conor Don urged forcible reasons for some change in the mode of sanctioning or recommending railway guarantees. Grand Juries would probably not be better ook the qualified to discharge their duties if they were constituted by popular election; but it would be impossible to grant countries them, under their present constitution, new powers of taxation; and it is equally impossible to deny that in resustices, and it is equally impossible to deny that in resustices, they outstop the limits of their legal authority. One

remedy which was suggested for the present anomaly was the adoption of new Standing Orders, by which a certain proportion of assents might be required as the condition of considering the expediency of a guarantee. There are many precedents for the plan, as, for instance, in Acts which have been passed for the settlement of the affairs of insolvent Hailway Companies. A certain majority of the holders of each separate class of securities or stocks must concur before the consolidation of different kinds of shares, or in some cases the issue of additional capital, will be allowed by Parliament. On the same principle the consents of owners are required to Drainage Bills, and to other enterprises which affect the interests of special districts. Only those who are practically acquainted with Ireland can form a judgment whether it would be possible to obtain by a system of voting-papers the genuine opinion of a county or a barony on a proposal for guaranteeing a new railway. It is possible that demagogues might persuade their followers that a new railway project was an English plot; and the priests probably approve of railway extension as little as of any other innovation which tends to loosen the ties between the people and the soil. A sounder opinion might be expected from the landowners; but if they were allowed to determine the expedience of the guarantee they to determine the expediency of the guarantee, they might be reasonably required to pay a certain proportion of the tax.

The opponents of guarantees avail themselves, as might be expected, of the commonplace objections to railway enterprise. It is in their opinion probable that money raised by taxation would be used to promote the interests of engineers and contractors. It is of course possible that when money is forthcoming for a public work, it may be employed to some extent for the benefit of those to whom it is entrusted; but the risk of irregularity is a reason for vigilant precaution, and not for inaction. That a railway through a rural Irish district may be profitable to pro-moters, and that it may impose the smallest possible liability on those who guarantee the capital, it is above all things necessary that it should be cheaply constructed. A railway costing for land and works only 6,000l. or 7,000l. per mile requires a gross mileage traffic of one-tenth of the amount to pay 5l. per cent. on the outlay. No abstruse calculation is needed to prove that a very moderate amount of traffic will relieve those who give the guarantee from their nominal liability. It is proper and necessary that engineers and contractors should be duly remunerated, and it is for their nominal. should be duly remunerated; and it is for their employers to take care that they make no unreasonable profits. As far as contractors are concerned, any arrangement which renders their business less speculative tends to economy in the construction of rullways. When the price of contracts is paid wholly or partly in shares, the terms of construction become more onerous, inasmuch as the capitalist has to insure himself against the risk of failure. In Ireland indeed it would be impossible to induce contractors to make railways on the chance of future profits. It is always more or less uncertain whether a railway will produce a large roturn to the undertakors, but it nover fails to increase the prosperity of the districts which it opens for intercourse and trade. It seems reasonable that the owners and occupiers who receive the advantage should be allowed the opportunity of facilitating useful enterprise.

OUR IMPERIAL VISITOR.

THE CZAR—or EMPEROR of All the Russias, as it seems the prefers to be called, rather to the confusion of some worthy Common Councilmen, who can remember only one Russia when they were at school, and wonder how many there are now in the family—has come and gone, and it may be assumed that he carries away with him a not unpleasant recollection of his brief and busy visit. There is at least no reason why he should not. He has been shown everything which it was thought would interest him, official porsons have applied themselves energetically to the formalities of welcome, and his reception by the people, though perhaps somewhat cold and languid, has been per-

the account merely because the Expense chooses to look in the account merely because the EMPEROR chooses to look in upon us for a day or two. These are things which cannot and ought not to be forgotten, but it would have been equally foolish and unmannerly to make the EMPEROR personally responsible for them. Questions of policy are properly left to responsible him terms, and it must be presumed that Lord Debey and his predecessor have said all that it is necessary or desirable to say in answer to Prince GORTCHAROFF'S despatches. English statesmen of all parties are agreed that nothing has occurred in the relations between this country and Russia to justify hostilities; and it is hardly worth while to hiss a potentate with whom you hesitate to go to war. At the same time it would be unfortunate if the Emperor were led to misunderstand the good-natured attentions which have been shown to him by all classes, or to imagine that there is no limit to the meek endurance of the English people. Political differences ought not to affect the interchange of personal courtesies; but personal courtesies ought not to be strained to bear more than their natural and simple meaning. It was perhaps inevitable that the usual nonsense should be written on a subject of this kind. A number of people who had nothing better to do went into the streets to see what the Emperor was like, and this harmless curiosity is represented as the deliberate homage of a great nation to the Liberator of the Serfs. On the other hand, the EMPEROR tried to look as pleasant and amiable as possible while receiving complimentary addresses, and bowed graciously to the crowds; and these commonplace civilities, only the absence of which would have been remarkable, are construed into an expression of ferventaffection for England and intense admiration of English institutions. Then again, because actually no altercation took place between the EMPERGRAND and any of the diplomatists who waited on him at Buckingbam Palace, because there were only sweet smiles and soft words, the advent of a millennium of peace is immediately proclaimed. It is difficult to conceive upon whom these imbecilities are intended to impose. Unless the EMPEROR and his visitors. had preserved a Quaker-like silence, it was impossible that they should have exchanged any but respectful salutations. The EMPEROR has repeatedly announced that he is anxious for peace; but every monarch and statesman is anxious for peace unless he sees reason for going to war, and the Russian Government has lately seized more than one opportunity of showing that its desire for peace does not imply any self-restraint in pushing forward its own designs. Peace on such terms may satisfy the Peace Society, but hardly anybody else. When a Spaniard receives a guest, he assures him that his house and family and everything that he possesses are at his disposal; but disappointment would probably result from too literal an interpretation of this generous offer. The amiable things which have been said all round during the EMPEROR'S visit must be taken with a similar qualification. There is nothing but good will towards the EMPEROR and his family, and a sincere desire for friendly relations with Russia as with all other nations, and no doubt the EMPEROR on his part, is very well disposed towards the country to which he has given his daughter; but there is no reason to suppose that the broad lines of either English or Russian policy will be very materially affected by these considerations.

If at the end of eight days the EMPEROR and the English people perfectly understand each other, it must be regarded as highly creditable to their acuteness and quick discrimination. The EMPEROR'S supposed enthusiasm for English institutions did not lead him to visit the House of Commons, where he might perhaps have been amused by Home Rulers playing the part of Poles. The scenty representation of the ironclad fleet below Gravesend may possibly have given an apparent confirmation to Mr. WARD HURT'S rash depreciation of the national resources, if the EMPEROR judged only by what he saw, and not by the abundant information with which he is kept supplied at St. Petersburg by competent authorities. The sample of the army burg by competent authorities. The sample of the army which was exhibited at Aldershot cannot fail to have suggested a favourable idea of the smartness and effiomenal persons have applied themselves energetically to the formalities of welcome, and his reception by the people, though perhaps somewhat cold and languid, has been persons there has indeed been no enthusiasm, but then there was no occasion for enthusiasm. It is impossible to say that the recent policy of Russia towards this country has been either friendly or honourable, and it gidiculous to suppose that such incidents as the repudiation of the Rhack See chauses of the Treaty of Paris, or the violated pledge in regard to Khiva, are to be wiped out of

been the successful promptitude with which, when he was diverted from Gravesend, the preparations for his reception were transferred to Dover. The Empanon, when he went diverted from Graves to Guildball, may have remembered Baron Haussnann's magnificence at the Hôtel de Ville; but the Lond Mayor had certainly no reason to fear the comparison. The decoration of the civic palace had real artistic merit, and all the arrangements for accommodating and entertaining the vast company worked with perfect smoothness. It will be interesting to see whether the Eurescon may not be disnteresting to see whether the Eurescot may not be dis-posed, among other English importations, to establish a Lord Mayor at St. Petersburg. The history of the office, if he had any one to explain it to him, would per-haps enable him to understand the toughness and com-plexity of the English administrative system. The Crystal Palace has come to play a curious part in State festivities. It has acquired a sort of semi-official connexion with the Court, and the crush on Saturday last was certainly quite equal to anything at a drawing-room. When a Sultan, a Shah, or a Coar visits our shores, it is natural that the public should wish to see him, and, on the other hand, as he is sure to be told by the newspapers, the great thing to see in this country is the people. At the Crystal Palace the foreign potentate and the people can have a good stare at each other, and take a common enjoyment in music and fireworks. In this way everybody is pleased, and if the foreign potentate does not think much of the people, or the people of the potentate, they can console themselves with wonderful rockets and cascades of fire. On the whole, although the EMPEROR has seen perhaps as much as could be seen in eight days, it comes to very little, and if all he knows of England is what he has seen, he has much to learn. Unfortunately a monarch has never much chance of knowing anything at first hand, and the EMPEROR's impressions of England will probably continue to be derived as before from what he is told. Still the mere glimpse of human faces has a certain influence on the mind, and, as a rule, no one is ever so bitter against those he has seen as against those who are a mere name to him. This influence, within its limited range, will probably be at work both with the EMPEROR and with Englishmen; but it will have small effect except as a predisposition to mutual good will.

THE COMING AGE.

Deen the characteristic doctrine of a large school of political writers. Reformers naturally believe in the approach of a millennium which is to begin when their favourite measures are adopted; the philosophers who helped to bring about the French Revolution imagined that the reign of pure reason was about to supplant the reign of antiquated prejudice; and popular interpreters of the creed pushed the doctrine to the extreme of assuming that all social changes were invariably for the better. The cruel disappointments in which many recent experiments have ended have not entirely dispelled the illusion, though it scarcely shows such vigour as in the last generation. Many distinguished thinkers whose views are in no sense retrograde believe that, so far from improving, society is at the present time advancing with great rapidity towards a dissolution, or at least towards a catastrophe which may involve many generations. We need not ask whether the gloomy or the cheerful view be correct. It is at least tolerably plain that there is no such indisputable presumption as the old revolutionists supposed in favour of the continuous and universal progress of mankind. The most palpable facts of history fiatly contradict any such hypothesis. The phenomenon which we call progress is clearly limited, both in time and place. A very large part, probably a great majority, of the human race, is, and generally has been, in a state of stagnation, and often of decay. It is only from the weakness of our imaginations, which prevents us from realizing how large a part of the whole population of the globe lies outside our circle of ideas and influences, that we are able to forget that the exceptions are much more numerous than the conformities to the rule. And, again, it is plain enough that even in the progressive rade the progress does not extend to all the faculties. We are quitf ready to allow that we cannot build, nor paint, nor write poetry as well as many people could do in former ages. The Greeks, to mention no other case, had ce

life gradually appeared, and the forces which once wreathed the rapours and shock the earth's crust presented themselves in the shape of plants and monkeys, and ultimately of philosophers. But this condition can be no more permanent than that which preceded it. Nothing is eternal; in every system there is some little defect which will gradually upset the existing equilibrium. At some inconceivably distant period the planets will drop into the sun; the great masses now distributed through space will agglomerate themselves, and then, it may be, the process of evolution will make a fresh start, new solar systems will be developed, and the everlasting series of cycles be repeated. The speculation is a tolerably daring one, and probably Mr. Spencer himself, whose views we do not profess to have set forth with perfect accuracy, would lay very little stress upon it. It may, however, represent vaguely the kind of theory which suggests itself to the sementific imagination, even if the scientific reason pronounces that it lies beyond the legitimate bounds of human thought. Our guessos at the plan of the universe scarcely challenge implicit confidence. It is enough to say that there is no particular reason for supposing that this little atom of a planet will continue its course for ever, or that its inhabitants will go on—even if they have hitherto continued—getting steadily better, wiser, and happier. Analogy would rather suggest that in some way or other the most permanent of material objects will go through a period of decay, which may possibly be protracted through as many ages as the period of progress. And therefore there is no insuperable weight of antecedent presumption against the decirne that the world has already seen its best days; though it would be lamentable to think that it could do no better. When one considers the vast amount of misery and stupidity which exists in the most civilized countries, and the immense improvements which might follow from even a slight rise in the general standard of intelligence

The question therefore suggests itself, what would be the proper attitude of mind if such a conclusion were clearly established? attitude of mind if such a conclusion were clearly established? The popular prophets of progress are apt to represent their own view as the only one which would supply us with sufficient motives for activity. Men who are trying to make the world better would relax their efforts unless they had some cortainty of success. And yet the converse view would be quite tenable. If it should be clearly established that we were gradually declining, we might still endeavour to make the process as tolerable as possible. Whenever the day comes, if it ever does come, at which the industrial power of England vanishes along with its coal-mines, we might perhaps reconcile ourselves with comparatively little reluctance, because without disgrace, to descend into the position of a second-rate Power. National decline when it results from demoralization is of course humilisting; but if it were due of a second-rate Power. National decline when it results from demoralization is of course humilisting; but if it were due to a disappearance of the physical conditions essential to the greatness of a country, submission with a tolerably good grace might be the best possible policy. What is true of any particular nation would be true of the world. There are changes beyond the power of man to arrest, and, long before our planet has dropped into the sun, it will have become an unsuitable alode for civilized beings. Probably the most highly organized animals would be the first to feel the change, and would slowly depart from the scene, to leave the world in its second childhood, and allow the "monstrons oft," who was once its ruler, to resume his old pre-eminence. Before that happens, howruler, to resume his old pre-eminence. Before that happens, however, it would be as well to prepare ourselves for the coming event. The last age of man need not be merely a repetition of his barbarous infancy. Some of the lessons which he has learnt might enable him to decline with dignity, and to grow weak without becoming ferocious. There might be consolations in the old age of the Our remote descendants will indeed have many causes for humility. In their time the material advantages of civilization will have disappeared. They will preserve a railway engine or a fragment of telegraphic wire as mysterious implements which had a meaning to the ancients; and will visit with reverence the mouths of those huge caverns from which the extinct mineral was formerly extracted for purposes of fuel. Possibly, indeed, some of our machines will be invested with superstitions awe; for superstition, even of a degraded kind, is a growth which has not yet been extirated, and which may possibly be expected to put forth new developments as the intellect grows weaker. For not only mechanical contrivances, but the intellectual schievements of our day, will become unintelligible as the vigour of the race declines. In the museums of that day there will be preserved specimens of examination papers, and men will tell passes other with wonder that in distant ages, not only the most each other with wonder that in distant ages, not only the most learned, but even lads who were plucked at the Universities, were able to understand those mysterious symbols. As the impulse which formerly created the fine arts declines, our descendants will be reduced first to merely mechanical imitation, and then, abandoning even that attempt, will be content to admire such relice as they are able to preserve. In those days Radicals and Conservatives will change places. Men of a sanguine temperament will hope that it may still be possible to keep alive for a few generations the arts and the political and philosophical theories bequeathed by a more vigorous race; whilst the despondent and melanchely will acquieses in changes from which it will be generally recognised that no real improvement can be anticipated. War, it

may be hoped, will be discouraged, because the hot passions characteristic of youthful development will grow gradually weaker, and the wisest statemen will admit that the nearest approach to stagnation is the greatest blessing which can be auticipated:

But we renounce the attempt to draw any adequate portrait of the supposed period. It has of late been very fashionable for imaginative writers to draw fanciful pictures of the coming age; and, to say the truth, it does not appear that any great strain upon the imagination is generally implied in such efforts. For the most part, the changes contemplated by these travellers to Utopis are of a very simple and obvious kind. They look forward to a few scientific discoveries, and endeavour to imagine the results of mankind acquiring the command of new powers of nature, and making use of forces which are to electricity what electricity is to steam. Undoubtedly if we could travel through the air, or kill our fellow-creatures by the million instead of the thousand, the external form of society would be considerably changed; but it does not follow that men's characters would be essentially different if they could take a morning's trip across the Atlantic as easily as they can now pay a visit to Brighton. Neither do the various theories which have been worked out as to the possible effect of extending women's rights strike us as very interesting. If, wherever there are now a man and a woman, there is to be at some future time a couple of men, things might be better or worse; but, except a slight increase of the general monotony, we do not know that any very remarkable effect would be necessarily produced. And therefore we venture to advise the next constructor of a funciful future to try his hand at depicting society in a state of pronounced and recognized decay. The moral need not be altogether useless. He might, for example, show us to what extent the belief in indefinite progress, so frequently invoked by politicians, really colours our habitual views of life; and how far they would be altered by substituting an entirely different conception. And further, he might incidentally throw some light upon the problem, not altogether an uninteresting one, how far symptoms of such a change are already manifest to an acute mind.

SCOTCH MINISTERS.

THIE question of Scotch Church patronage would be less casily disposed of them it promises to be were the value of Scotch preferments greater than it is. But even if the sale of advowsons had, ever been in fashion in Scotland, the livings must necessarily have gone cheap, for the class who would have bid and bought had next to nothing to offer. The Scotch parish is not bestowed upon the son, brother, or cousin of the reigning patron as a comfortable subsistence in the meantime and a stepping-stone to something better. Probably in the long and troubled history of the Church since it shook itself free from the toils of the Scarlet Woman, there has never been an instance of the cadet of a noble family seeking ordination; and, if he had sought ordination, it would certainly have been from shear devotion to the work, and not from the desire of filthy lucre. The livings are livings to men brought up with something less than moderate expectations; but for any one else they would be mortification, if not starvation. Take them all round the country, and we fancy we should not understate the average were we to place it at 200% a year. And then it must be remombered that there are no prizes. There are one or two livings in rising cities where the globe or church lands have been built over, and where the elergyman consequently draws a good income from ground-rents. There are one or two others where he has been lucky enough to happen upon a stone quarry of prime quality; for, although stones are a drug in Scotland generally, first-class granite or freestone is always valuable. But these are only the exceptions that prove the rule, and no youth of promise counts upon them when meditating the Church as his vocation in life. There are no epiritual peerages with palaces and proportionate revenues attached; no deaneries, canoaries, pre-lends, preventorships. Your spiritual ministrations are simply renumerated by a modest competency, and the kirk in which you officiate is the type of your own quiet manner of living. Nowadays ther

stantial repair. They have saldom been rich; over a great part of the country the wealthier of them have always been disincepalian, and naturally in neither the one case nor the other de they care to launch out in lavish expenditure. The true blue Presbyterians who form the bulk of the congregation play into their hands, and spare their pockets, by identifying external simplicity with the genuine sanctity of the heart and spirit. Hence it is that Presbyterians have always worshipped with dumplacency in those hideous barn-like edifices which disfigure some convenient eminence somewhere about the centre of each Scottish parish.

As the kirks are when contrasted with the English eathedrals and grand old parish churches, so are the ministers compared with the English clergy. They are drawn for the most part from the class of society whose ambition would otherwise have been limited to making a good livelihood out of a good farm, or getting into a

class of society whose ambition would otherwise have been limited to making a good livelihood out of a good farm, or getting into a comfortable medical practice in the country. The education of very many of them has been more or less of a struggle from first to last, carried on at a certain sacrifice to their relations. The candidate for orders has had the talent of the family; he has shown himself able as well as diligent at the parish school. He has been sent to the University at an early age—sixteen, fifteen, or possibly fourteen. He has preluded his career by compating for a "burnary," and, if he be worth the educating, has doubtless won one of the value probably of from 121. to 351. With some such moderate assistance, supplemented alightly from the funds of his family, or by his personal exertions, he may do very well. The session lasts for some five months in the winter time, and for the rest of the year he may live under his father's roof. He may work out his keep somehow on the paternal farm, and, if his origin be still more humble, as is not unfrequently the case, he may go in for rough daily labour for daily wages, always devoting his leisure to the prosecution of his studies. During the winter and the session he will try to eke out his means by teaching, and there are very few intending ministers who can afford to dispense with this resource. Then comes the course of his divinity studies, exresource. Then comes the course of his divinity studies, extending over three years or more; and the student is ready to be admitted to orders. When he is ontitled to write Reverend before his name, it naturally is rather an anxious time with him. There is no intermediate state as in England in which he may support himself in more or less comfort as a curate, holding on in the hope of obtaining substantial preferment. He may be aphimself in more or less comfort as a curst, hadding on in the hope of obtaining substantial preferment. He may be ap-pointed assistant to some elderly minister who still clings to his post, or whose people may be unwilling to part with him although health or strength may be beginning to fail. But, except for some such rare chance, he must still live by his teaching till an occasion of preferment turns up. Pending that desirable consummation, and if he has no immediate expectations, he may very likely accept a parachall schoolmestership. But the objection to doing so its a parochial schoolmastership. But the objection to doing so is that a parochial schoolmaster is generally considered to have shelved himself, in a humble consciousness of the absence of those more brilliant gifts which would have made him a shining light in more brilliant gifts which would have made him a shifting light in the pulpit. The shorter and more certain path to promotion used to lie in obtaining a tutorship in the family of some lord or laird who was likewise a patron. Many of the great Scotch landed proprietors have a dozen or even a score of livings in their gift. If the tutor had a clover head on his shoulders, and an elequent tongue—still more, if he had a heartfelt sense of the responsibilities of the office to which he aspired—his bread and butter were convenity cut for him in advance. He had alcenty were generally cut for him in advance. He had pleuty of opportunities for displaying his telent. The parish clergyman was always willing to be assisted in his arduous labours, and huppy to place his pulpit at the disposal of the laird's protegs. When the youthful probationer preached the congregation was predisposed in his favour, and crowded the church with the gusto of epicures who like something fresh to tickle their palates. If his sermons came clearly from the heart, or if he were clever enough to steer between the Scylla of cold formalism and the Charybdis of highflown sensationalism, his reputation grew rapidly, and the way to advancement was prepared for him. The "sough" went through the country side that the laird's tutor was a rising young man, who had the root of the nutter in him, and who expounded a text to edifleation. So, when a vacancy occurred, the laind night exercise his patronage in favour of his dependent without any sense of invidious obtrusion. He "presented" a man who was pleasing to the people, and all parties were satisfied.

invidious obtrusion. He "presented" a man who was pleasing to the people, and all parties were estisfied.

This easy manner of arranging matters belonged, however, rather to the earlier Erastian days, before revival and reaction had succeeded to the prevailing listlessness. When the Evangelical agitation had troubled the spirits of the Moderates, the parties came to a compromise with the feeling of the times by offering congregations a choice of candidates. They drew out a list, comprising six or a deven eligible names, and the various competitors preached in rotation. This was a trying ordeal for the man who had everything to gain by obtaining a charge. Some of his rivals were "placed ministers," who entered the lists because their success would gain them a somewhat better living. These men came to the contest with an established character for eloquence or piety, and with an experience in which he was wanting. Their style was formed, and all they had to do was to nick the base samples of their abounding reporter, and deliver the base samples for manners to the other hand, had the samples for the review to the other hand, had the samples for the review to the other hand, had the samples for the review to the other hand, had the samples for the review to the other hand, had the samples for the review to the other hand, had the samples for the review of the samples of the samples

they miseated mean thin the idea that a led west giving himself after among them. For were it only the matter of his discourse, that he had to be careful about they were almost more critical over the method of his delivery. It was enough to shake the courage of incharisment youth to look down over the pulpit cushions into a great square pow beneath, beimful of austare elders, who were nothing at all if they were not severely dogmatical. And behind these were all the heads of similiae who had not been adopted to the percelial senate, but were all the more captious on that very account; and behind these again, the ancient womed, even more irrationally fastidious than the elderly male would be apt to condemn him for over-confidence; if, in modest deprecation of their judgment, he clung closely to his modest deprecation of their judgment, he clung closely to his maker, and reed out the discourse in tremulous accents, they would be disposed to shake their heads with contemptuous compassion, and pronounce him "ower young for sircan important charge." But then, again, there was always the chance, and a fair one, that their choice might light upon him with an enthusiastic secont. For, coverie puribus, the congregation rather preferred a yeath on his promotion to a "placed minister" with a made regulation. The gifts of the rising genius might redound to the credit of the parish that had recognized them; and his experienced parishioners might hope to mould him to their own tastes and ways. And if he did get through the critical occasion and secure his election, from a worldly point of view he was pretty well made for life. As there were no great prizes in the Church, he had no strong reason to desire a further change, unless indeed it was his simbition to make a hit as a popular preacher in the citics. He came into an income that seemed wealth to him. He stepped straight into a comfortable manse, with its garden, and its anug gleba, that gave him all the secular distractions he wanted in the way of farming. He became at

MANCHESTER CATHEDRAL.

A SCHEME has been lately put forward for providing the city of Manchester with a new cathedral church. It has been largely discussed in the local papers in letters coming from one who signs himself. A Member of the Chapter," and from the Bishop himself. It even appears that designs for such a building have been actually made, and that they are likely before long to be made public. But the interest in the matter has spread beyond Manchester; it has been more briefly noticed in more than one London paper, and the Times itself not long ago devoted a whole leading article to the subject. That article, like other signs in the same quarter, belie us to see how things look in the eyes of people who have no special knowledge of the matter in hand. The main argument was that the present church of Manchester is very unworthy to be the head church of so great a city, that Sir George Head, when he wrote about the manufacturing districts, did not think it worth while to say much about it, that altogether it would be a good thing to get rid of it and build something better. Like most popular ways of looking at a thing, there is in this rough and ready way of settling the question some truth mixed up with some error. There is no denying that the cathedral church at Manchester belongs to quite a different class of churches, and to a much lower class, than cathedral churches in general, and if the greatness of the city is to determine the greatness of its church, there certainly seems something specially incongruous in Manchester legging so far behind Lichfield, Ely, Wells, or even St. David's. Bit we are not quite sure that it follows from this truth that it is desirable even to translate the episcopal chair of Manchester from the old church to a new one; still less are we sure that, if it be thought desirable to do so, it stall follows that the building of the new church need involve the pulling down, or worse than the pulling down, of the old one.

That Manchester Cathedral is something very inferior to, or to speak more assumately something very different from, cathedral churches in general is the secessary consequence of the history of the church and city. We have put our comparison in very guarded words, because it is quite unfair to compare Manchester Cathedral either with churches that were cathedral entered and Gloucester. It has a building of saits another kind, but it holds a very high mak in the own-kind. It was not built to be the church of a bishapers or a great abbay. The librie is what from its history it might make an about the beautiful and distinctively. English of the great Register distinctively and distinctively. English of the second of Manchester in the flagship and the second of Manchester in the second of the second of Manchester in the second of the second of Manchester in the second of the second of the second of Manchester in the second of the second of

of his wealth in founding a collegiate body in his purish church. The present church therefore arose, having its twofold character clearly impressed on the building. It is a great church, whose character is escentially perochial; only, as being also the church of a collegiate body, it has a choir of size and stateliness ususual is a merely perochial church. It does not affect, because there was no reason why it should affect, the character of an episcopal or abbatial minister. Simply put away the ideas surgested by the word "cathedral," compare the church of Manchester with churches of its own class, not with churches of quite another chass, and it will certainly hold its own among the first of that class. Transport it to either of the regions of great Perpendicular parish churches; move it either to the East or to the West; set it down either at Norwich or at Taunton, and no one would despise it, even in the face of such formidable rivals as it would meet with.

Still there is the fact that Manchester the greatest eniscopal

Still there is the fact that Manchester, the greatest episcopal city in England after London—indeed, if we take the word London in the strictest sense, a greater city than London—has the smallest and the least dignified of our episcopal churches, except those of the village cities of North Wales. Modern arrangements made it convenient to place a new bishopric at Manchester, and to place its episcopal chair in the existing church of Manchester. As a fact, therefore, that church, however high it might stand among churches of its former rank, has been raised to a rank for which it is quite unsuited. Now in this Manchester does not stand quite alone. Nearly the same may be said of the episcopal city next in greatness to itself. Hristol also has a cathedral church quite unworthy of the greatness of the city; we might almost say, quite unworthy to be a cathedral church at all. It is a mere fragment of a church which, when perfect, would only just reach the second rank—the rank, not of Ely and Peterborough, but of Tewkesbury and Sonthwell. And not only this, but at Bristol, unlike Manchester, the episcopal church was distinctly surpassed by one of the parish churches of the city. The cause is the same as at Menchester; the bishopric of Bristol was a late foundation planted in a church which had never been designed for its new rank. Still at Bristol things could be easily mended; the church was a fragment, and it could be easily restored to its proper proper tion. The nave is now again rising, and if its builders can only be persuaded not to crush it with needless western towers, they will have a church, not indeed designed for its present rank, but still not wholly unworthy of it. There is no such easy remedy at Manchester. There the church is a perfect and admirable one of its own kind, but of a different kind from what is wanted. There is no case for rebuilding, adding, or altering. Either the present church must be left alono—allowing for better arrangements inside—or something new must be built from the ground.

We confess that we have a lurking feeling in favour of the former alternative. We have no wish to throw cold water on a scheme which in itself is so noble as that of building a cathedral church in these later times. It it were Liverpool or Birmingham instead of Manchester, we should say, build up your minster by all means, and if you can make it outdo Fly and Winchester, so much the better. But Manchester has a history, and we should feel a certain pain at seeing that history quite wiped out, even in the favour of so great a work. We must confess to a certain satisfaction in seeing the history of the church and city written so plainly as it now is on the material fabric. The three-fold character of the building, parochial, collegiate, and cathedral, answering to as many stages in the history of the city itself, is there clearly to be read. We confess to a certain shrinking from forsaking the old site and the old associations. And if we got over this feeling, if we could think the jar on our historical memories more than made up by the prospect of a new Fly or even a new Beverley, we are at once haunted by another feeling. Are we the least likely to get a new Fly, or even a new Beverley? The new church will doubtless be bigger than the old one; have we any reason to think that it will be better? Have we that trust in our modern architects that we can, under any compulsion short of physical tecessity, give up an uncient building to be supplanted by a new one?

Manchester Cathedral, whatever it is or is not, is English; it is a good specimen of a good type of English buildings. What is the new one likely to be? One trembles at the thought of the devices from France or Venice or the banks of the Rhine, from any part of the world in short except Old England, which our modern architects would be likely to show off on such a golden opportunity. And the prospect is yet more fearful, if the form of the scheme which seems to have won most favour should really be carried out. This is not the comparatively harmless process of pulling down the present church, as it. Wulfstan did at Worcester—though to be sure he wopt when he had done it—and building up the new one on the same site or close by it. It is the more wonderful and fearful process of incorporating the old church into something new, lampthening it, making the present church into the nave of a new same, raising the western tower and sticking on a central tower and sticking on a central tower site. It is the more wonderful and fearful process of incorporating the old church into something new, lampthening it, making the present church into the nave of a new same, raising the western tower and sticking on a central tower site. It is the people who propose those streets as a hideoms nightmore to an architect or antiquary suffering from indigestion. The people who propose those streets as the present church; they can indeed have no notion what a treasure they will be a sufficiently sets farth its twofold idea. But the sufficient will be sufficiently sets farth its twofold idea. But the sufficient which could be sufficiently sets farth its twofold idea. But the sufficient which could be sufficiently sets farth its twofold idea. But the sufficient which could be sufficiently sets farth its twofold idea. But the sufficient in the sufficient which could be sufficiently sets farth its twofold idea. But the sufficient in the sufficient which can be sufficiently sets farth its twofold idea.

makes it one of the most perfect things of its own kind, to form a long sprawling shapeless nave, attached to something which, if a long sprawling shapeless nave, attached to something which, if it is to have the peculiar character of a minster, must be something utterly incongruous with the ancient buildings to which it is to be tacked on. A well-designed ancient building has a meaning and a proportion of its own which is at once destroyed by this reckless kind of treatment. How, for instance, is the nave to be heightened? The building is well proportioned as it is, but what is to become of it if—the only conceivable way of heightening it—something is to be built at random above the clerestory which would probably crush the nillars which were not meant to support would probably crush the pillars which were not meant to support it? Manchester Cathedral is architecturally a parish church, and it cannot be turned into a minster by heightening, lengthening, and adding to it. One might as well, because the cat and the lion both belong to the genus felis, try to turn the cat into a lion by sticking on him the mane and tail of his more majestic cousin. Barbarous as would be the notion of utterly destroying the existing church, it would be less barbarous than the notion of pulling it about in this reckless fashion, in the vain hope of changing it into something which it is not and never can be.

Our counsel then would be, if we could prevail so far, to leave things as they are, to let the city still keep the visible sign of its peculiar history; but, at all events, if there is to be a new and purely episcopal church built, let it be on some other site. Let the present church remain as one of the noblest of English parish churches, and let the new minster arise somewhere else. If the two could be placed near together, after the precedents of Coventry, Wostminster and Bury it would be no harm; but at all events let Westminster, and Bury, it would be no harm; but at all events let the old church abide. It is part of the history of Manchester and of the history of England. It is a noble work of its own kind, suited for the purpose for which it was at first meant, and it ought not to be despised or thrust aside, still less put to the fearful tortures with which it is threatened, because it does not answer a wall as a waster middle as were the formula of the forest of the formula of the formula of the formula of the formula o so well as another might a purpose which its founders never thought of.

M. OCTAVE FEUILLET.

(I) hear any one continually called the Virtuous may not only here the public it may and by hearning discours As Alexander bore the public, it may end by becoming tiresome to the object of the monotonous praise. He fancies himself called upon to prove that, if he is correct, it is not for want of passions or of opportunities to be wicked; and he foels it to be due to himself to plunge into excesses for which perhaps he has very little taste. The literary career of M. Feuillet, the author of Le Sphine, which is being played just now at the Princess's, is a remarkable example of being played just now at the Princess's, is a remarkable example of the dangers of possessing too good a character. It is probable that people who have been disappointed in Le Sphinz, and who do not find M. de Camors peculiarly edifying reading, have wondered how M. Feuillet acquired his reputation for harmlessness. He used to be called "Le Musset des familles," and the qualification seems to promise an innocent gaiety and respectable passions, which are not prominent in Julia de Trécaur and Le Sphinz. The fact is that some years have passed since M. Feuillet deserted the pious early manner which made his books so admirably suited to adorn the drawing-room table. Yet even in his latest works we may note remains, and what are called survivals, of an early condition of remains, and what are called survivals, of an early condition of stagy innocence, and didactic utterances. It may be worth while

stagy innocence and didactic utterances. It may be worth while to trace the steps of a progress in which art has perhaps improved at the expense of morality.

The earlier successes of M. Feuillet were the deserved result of a keen eve for opportunities, and a readiness in seizing them. The Parisian public, naturally fickle, and corrupted perhaps by the constitutional monarchy of the period, was beginning to weary of the passions in tatters of the Romantic school. A play even of M. Hugo's—Les Burgraves—had only a moderate success. The master sent a message requesting a friend to introduce some young enthusiasts to act as an amateur claque. The triend was M. Cilestin Nanteuil, a leader of the Romantic movement of 1830. He used to paint melancholy damsels in the movement of 1830. He used to paint melancholy damsels in the movement of 1830. He used to paint melancholy damsels in the stiff-neck and gold-leaf style, and his admiring comrades have recorded that he had *Pair moyen-dys*, and that his locks were like a nimbus. But M. Nanteuil had to answer despairingly, "Il n'y a pas de jeunes gens." There were no more sweet enthusiasts; the year of grace 1830 had long gone by. People had ceased to be shocked at the license of the stage, but they had also ceased to care for the fevers and passions of De Musset, and had begun to answert that something might, he said on the side of common to suspect that something might be said on the side of common morality. This was the moment which M. Feuillet adroitly seized. He saw that he might be "all for virtue, and that sort of thing," He saw that he might be "all for virtue, and that sort of thing," like De Quincey's homicidal amateur, and yet be sentimental and suggestive. A wife might reclaim an erring husband, or a husband win back a wife on the point of error, by artifices which the audience appreciated, and which had the new merit of being on the side of honesty and of the family. Vice was made to hoist, in the usually quoted way, "with its own petard." Such pieces as La clé d'or, La crise, Le cheves blane, were the successful working out of this idea. They contained all the coquetry and all the ardour of De Musset; and, after all, no one was burt, husband and wife were made happy, and the children were embraced on every side, as in the play of the Rovers. But there was another trait or trick of De Musset's which M. Feuillet also adapted to family use. This was the introduction of interesting acquires, who were only too anxious to be able to believe. De Musset's and to leave them in their size; but M. Feuillet did better—hercelaimed them. To

be sure their conversion was usually the result of some happy accident which did not appear very garmane to the matter of their theological difficulties. Thus the heroine of Redempties is an actress whose life is passed in dishevelled orgine—always good scenes on the stage—and in argument with a pious abbé. But she is brought back to the fold, not by the abbé, but by falling in love. Still, in one way or other religion and morality were reconstructed, and this was pleasing to the best sort of society.

M. Feuillet did not confine his method and his theology to the stage. Besides writing comedies and proverses, he became known as the author of safe novels. Society pronounced that, unlike the tales of Feydeau and Houssaye, M. Feuillet's were remances which you could read, which you could put into the hands of young people. This was the happy result of his good sense in always making his heroes Brotons of high birth and Catholics, or with the makings of good Catholics. He chose his scenes from the life of country houses, and of excellent families who alumed the dangerous air of Paris. Persons of no birth were only introduced to be sneered at, and infidel men of science encountered painful shapes of social nemesis. Thus M. Feuillet won a large and aristocratic public, and smoothed his way to a chair among the Forty. His style was always impeccable and lively, the action of his pieces animated, his situations ingenious, his sentiments correct. And so he won the sweet voices of all the better sort of literary ladies. To be sure some people may have thought him almost too didactic animated, his situations ingenious, his sentiments correct. And so he won the sweet voices of all the better sort of literary ladies. To be sure some people may have thought him almost too didactic in those early days. The history of Sybille, for instance, begins very much in the manner of Miss Edgeworth. Sybille is an orphan, living with her grand-parents, members as usual of one of the first families in Normandy. Even in her cradle Sybille is all soul. She cries for a star, and refuses to be comforted when she is prevented from riding round the lake on the back of a swan. But these early faults of character are currected, and Sybille grows up one of those from riding round the lake on the back of a swan. But these early faults of character are corrected, and Sybille grows up one of those angel-children, with a passion for doing good to their elders, who are frequent in fiction, and not unknown in real life. She does good to the Abbé, to the village idiot, to her grandmother in Paris; she converts her governess, and wherever she goes, moral resolutions blossom in the dust of weary hearts, as they do when "Pippapasses." Even Sybille, however, had once her religious doubts, and was the female Musset of the nursery. But she is reconciled to the faith by observing the courage of the abbé in a shipwreck, and after her return she becomes a little intolerant. She refuses to marry her lover because he is an unbeliever, though an unbroken series of successes might have shown her that she could convert any one. This lover, by the way, has all the women in the book sighing for him, and is obliged to make a tour to Persia to cure his cousin of her hopeless affection. On his return he finds that the cousin still loves him, and as a man cannot always be in Porsia, cousin of her hopeless affection. On his return he made that the cousin still loves him, and as a man cannot always be in Persia, the position is becoming dangerous, when Sybille as usual rescues and reclaims the lady. But she can think of no way to bring conviction to her lover, except to die, which she does at the age of nineteen. With all her virtue there is an air of Blanche Amory and a certain staginess about Sybille; but it was a very popular staginess. Women, as Sainte-Beuve said, felt that there was a Subille in their characters and that in the proper circumstances. staginess. Women, as Sainte-Beuve said, felt that there was a Sybille in their characters, and that in the proper circumstances they could have been all that she was. So the book was a success, though strictly speaking it was more a fantasy than a novel, and it increased M. Feuillet's deserved reputation for pleasant writing

and correct opinions.

An even less equivocal success was Le jeune homme pauvre.

This was the most popular novel of its year, and the shop of the bookseller who published it was besieged by carriages. The jeune homme of the tale finds himself ruined at the death of his father, and he has the fortitude to refuse his name to a promoter of companies, and his hand to a rich young lady whom he does not love. The faithful solicitor of his house gets him a situation as steward to a wealthy family in Brittany, and he solaces himself by keeping a voluminous journal of his experiences. If we can imagine one of Scott's most respectable young men born in the middle of our century, and relating how he was a good rider, a skilled artist, modest, brave, honest, how he leaped down from a lofty window out of regard for a lady's character, and how he was rewarded by marrying her, we have a fair idea of this novel. The Breton scenery is prettily described, and the romantic leap from the tower of Elven made the fortune of the play founded on the

the tower of Elven made the fortune of the play founded on the story.

Soon after the publication of Le jeune homme, M. Feuillet woke one morning to find himself permanently famous. M. Sainte-Beuve had consecrated to him one of the Causeries de Lundi. The great critic advised his young friend to desert his religious little girls and meritorious young men, and "to plunge into the vast ocean of human nature." Now M. Feuillat had already ahown, in the play called Dalila, that he could deal with fiery passions if he liked. There is a fisherman in one of his novels who, when he is prevented from risking his life at a shipwreck, complains that people will hold him no higher than an Englishman. M. Feuillet was perhaps afraid that he also would become like one of those English novelists whom M. Taine snears at (rather groundlessly) for their uncessing decency. So he took his critic's advice, plunged into the hidden depths of human nature, and brought up that very curious pearl M. de Camora. Now Camora is a novel which we cannot imagine an English author writing. M. Feuillet is for ever free from that reproach, and, like Richardson after Lovelnes, no one can doubt first he cannot which drags so wicked a here through somes so werible and harrowing. Louis de Camora was a young man of good family

and of good impulses. He had gone no further than ruining the happiness of his oldest friend, when his father shot himself, leaving some written advice and vary little else to his son. In this curious document M. de Camors shre advised his son to have no code but that of honour, to despise all men, and to reserve the "bloody sport of revolution" to cheer the satisty of old age. The rest of the story displays M. de Camors energetically carrying out his father's programms. He passes from sin to sin, and accumulate horrog to horror's head. His last achievement is to desert his own with the Medeure de Camorsallon, the wife of his greatest benefactor. father's programme. He passes from sin to sin, and accumulates horrog on horror's head. His last achievement is to desert his own wife for Madame de Campvallon, the wife of his greatest benefactor. This lady did not care for more frivolous pursuits, and disdained any passion that was not grandly criminal and in the style of the sixteenth century. The sympathetic reader is desolated on fluding that M. de Camora refuses to gratify her by poisoning his wife. This want of thoroughness in his character gains upon him, and he dies at last crushed by the misery of having lost even his honour. And here M. Femillet is on his old and favourite didactic ground, "Ou un Dieu ou pas de principes," he says. This is the reiterated moral, and by this device M. Femillet conciliates his old audience and the readers who, before he wrote Camors, inclined to think him dreary. His friends, also, the good people, found their natural enemies satirized. Every one could point to the wives of rich men of no rank, like Madame Bacquière and Madame Van Cuyp:—"Elles jugèrent délicieux de prendre les chapeaux de leurs maris, de mettre leurs pieds dedans, et de courir en cet équipage un petit sterple-chase d'un bout dedans, et de courir en cet équipage un petit sterple-chase d'un bout du salon à l'autre." This sort of thing taught new people their place, and showed them what the world thought of them.

To compose a novel of modern life more terrible than M. de

To compose a novel of modern life more terrible than M. de Camors seemed difficult. But M. Feuillet performed the feat, and surpassed himself, in Julis de Tréccur. This story need not be analysed. There are passions "heteroclital," as Sir Thomas Browne says, which are the "veniable part of things lost." We can endure them in the gravity of the Greek stage, or amid the remote fancy of the Elizabethan drama. But they become offensive when introduced among modern surroundings, and in the environments of familiar life. In Julia de Tréccur M. Feuillet has permitted himself the choice of such a motive. That he has produced a terrible story is true enough, but when tragedy so deep is brought so near, it runs the risk of becoming incredible and merely brought so near, it runs the risk of becoming incredible and merely absurd. One scene is quite in the Elizabethan manner. The absurd. One scene is quite in the Elizabethan manner. The heroine, balanced between madness and crime, plucks wild flowers, and utters foolish tender speeches to them:—"Toi, ma chère, trop maigre! toi, gentille, mais trop courte! toi, tu sens mauvais!—toi, tu as l'air bête!" It is like Cornelia's raving in Webster's Vittoria Corrombona:-

You're very welcome;
There's resemany for you, and rue for you,
Heart's case for you—I pray make much of it,
I have left none for myself.

Clearly in Julia de Trécœus we have left a long way behind us the domestic sentiment of La crise, the elevation of Sybille, the complacent propriety of Le jeune homms pauvre. M. Feuillet has advanced with the age, and has always met the demand of the day. He is a proof that is much better for a writer to start with actions a good character and sow his hierary wild out after getting a good character, and sow his literary wild oats after his admission to the Academy, than to begin with extravagant romances, as M. Gautier did, and subside into innocent stories like spirite. Possibly if M. Feuillet had begun with Julia de Trécaur, the Academy might never have lent its sanction to his moral teaching. For even Julia de Trécaur has a moral—namely, that it is a mistake to spoil children. Perhaps this original truth might have been inculcated without the use of such an awful example as Julia's. M. Feuillet must think the moral maladies of his country very terrible when he applies remedies of such peculiar and poisonous strength.

BOOKBINDING.

NERY pretty controversy might be stirred up even now by a short passage in one of Cicero's letters to Atticus. He asks for a couple of librarians to glue his books; glutinators, he calls them; and Dibdin, "Froggy" Dibdin, Lord Spencer's tame bibliographer, translates the simple Latin by the questionable English, conglutinate. In the first syllable of the word lies the kernel of the whole question. Did Cicero mean to have his manuscripts made up into books, as Dibdin evidently supposes, or did he only require the sheets to be fastened together into rolls? It is usually laid down by recent authorities that Dibdin made a mistake whenever he could, and very often it was possible to him when it would have been impossible to any one else. Had we any intention of going into the matter, we should probably differ with when it would have been impossible to any one else. Had we any intention of going into the matter, we should probably differ with him, and any one who is at the trouble of looking into his Cicero will perhaps do the same. Learned guides are not wanting. There is Salmasius, and there is also the profound chapter "De Ornamentia Librorum," by Schwartze That Cicero referred to the art of glueing together sheets to make reils there can be little doubt. It was for this he begged a couple of his friend's Greek slaves. Whether, as some my, Phillatius introduced the use of the pastepot and scissors, or Julius Casar first made his manuscripts into little welcomes in which he wrote Commentaries on passing events, it is There is Salmasius, and there is also the profound chapter "De Ornamentia Librorum," by Schwartze That Cicero referred to the art of glueing together sheets to make relis there can be little doubt. It was for this he begged a couple of his friend's Greek slaves. Whether, as some may, Phillatius introduced the use of the pastepot and scissors, or Julius Cesar first made his manuscripts into little volumes in which he wrote Commentaries on passing events, it is not perhaps possible now to decide, nor yet whether the Athenians, forest, it is interest to the importance to literature of the peculiar method of Phillat." In raised a statue to his honour; the question has not much importance to the world that now is. The oldest book, in spike, with which, as he says, binders do commonly asyour their

no sense of the word, now extant, or lately extant—for it is said tat the specimen generally referred to perlahed in a French reve-tion—was made of absets of lead outside and in, and only dated hation from the fifth century. Bookbinding in strictness must be treated as a comparatively modern art. Job may have written with an iron pen, and Catullus may have put his lighter thoughts got a leaden leaf, as we infer from one of his posmus; but as most of sight felious have long been transformed into bullets, we may dismiss the ancient with another quotation. Suides tries to prove that the Abras. with another quotation. Suidas tries to prove that the Anyo-nantic expedition was made in search of a book containing the nautic expedition was made in search of a book containing the golden secret of the Alchemists, and bound in sheepskin. A greater chemist than any who sought for the philosopher's stone was, in later times, a bookbinder. Faraday spent thirteen years of his life at the conglutinating-pot before he went to Albemarle Street. Another great man, and in a different sense a philosopher, was, not by profession, but by preference, a bookbinder. Roger North bound divers books of account, so we read, both for himself and for his friends, in a very decent manner. But his fame is eclipsed by that of another Roger. A hundred years ago Roger Payne was engaged in what the language of his day termed the bibliopegistic art. His triumphs were wrought for the Spencer Library. Some of them may now be seen at the International Exhibition, although for want of a few labels it is not easy, except for a very practised eye, to distinguish them. Poor Payne's bills for his work are among the curiosities of literature. He lived a miserable life alternately devoted to books and the lived a miserable life alternately devoted to books and the bottle, and Dibdin's choicest flowers of speech are employed in describing his troubles with Mrs. Wier, his partner's wife, who used to beat him, and the kindness of a bibliomaniae doctor used to beat him, and the kindness of a bibliomaniae doctor whose books he bound, and who used to heal him till he was past healing. The French Payne is Derome, but Derome labours under the imputation of cropping—a sad sin in the eyes of the bibliophilists. Payne, too, had his faults. His books are said to be tight in the backs. They are certainly well sewed together; and while his eulogists assert that they may be laid down in a and while his concepts assert that they may be take down in a pavement and remain uninjured after the passage of a waggen, his detractors have the choice of retorting that books are not usually required for pavements, or else that his are fit for little more. Into the merits of such important questions this is not the place to enter. They seem to turn chiefly on the larger question, wh books are mount to be read, or only to be looked at from without. Perhaps it is because the learned in these matters prefer the outside view that no work of importance has been written on the

side view that no work of importance has been written on the subject.

Yet there is much of interest in the history of bookbinding as an art. Several show-cases at the British Museum are filled with choice and ancient specimens, and at the International Exhibition, this year, some of the best, both ancient amples of all ages from the twelfth century down to the present time. Visitors may begin with the German hymn-book cover designed by the late Prince Consort, which occupies such a prominent place. Being bound so as closely to resemble a miniature coffin-lid, with black velvet and silver nails, it may have been primarily intended for sepulchral concealment. As an evidence of taste it fails, and admirers of a character eminent for eathetic qualities will wish it buried out of sight. Gremation is not in vogue as yet, and Mr. Bowring will perhaps prefer not to use his possession in a suttee to the memory of its designer. But the earlier books abound in curiosities of design, and many of them are to be seen close at hand. Johnson, not the and many of them are to be seen close at hand. Johnson, not the lexicographer, who only cared for the insides of books, but a typographer of the same name, mentions an old English binding typographer of the same name, mentions an old English binding on which were stamped the arms of Christ, surmounted by a full-faced helmet, surrounded with mantling and a scroll, with the legend, Redemptoris Mundi Arma. He attributes it to John Reynes, who bound for Henry VIII., and kept his shop in St. Paul's Churchyard. Both coffins and heraldry are in the hands of undertakers. But it is a pity something cannot be done to resuscitate velvet binding. Embroidery on book-covers deserves more attention than it has received of late. Two or three examples only are at South Kensington. The finest velvet binding is in a case with circhesen volumes from the Library of Westminster. only are at South Kensington. The finest velvet binding is in a case with eighteen volumes from the Library of Westminster Abbey. It covers the indenture made in July 1500 between Henry VII. and the Abbot for the erection of the King's Chantry, the counterpart being among the chief treasures at the British Museum. Perhaps this is the book for the garnishing of which "Master Quintin" received, in 1503, the large payment of 101. The two volumes are ornamented in the same way with besses, and have the seals in silver cases appended. The books of King Corvinus of Hungary were similarly decorated, which made them a prey to the Turks when they took Buda in 1526. But there is a magnificent Bible in velvet at the Exhibition, embroidered all over with Bible in velvet at the Exhibition, embroidered all over with the arms and badges of Charles II. in gold thread. It is a pity some more specimens of similar work are not shown. Many

books. Savouring for the leaves of books has its modern practice, but whether embroideries for their covers will be revived is a question. Orimson velvet embroidered in gold and colours forms a very suitable, and what is more to the purpose, a very dorable, binding for a certain class of books. Young ladies are said to be addicted to working slippers for the feet of unwary curates, but some very desirable parsons might perhaps be entrapped more easily by delicate attentions to the covering of favourite homilists.

A very different style is that of Grolier, itself an imitation of the earlier work designed for Maioli. Both are familiar names in the annals of binding, and, with Thuanus or De Thou, have been largely used by modern artists in this line. But books covered with stamped and painted patterns are more for show than use. If the leather is stiff and old you may break the back when you try to examine the contents, while, if it is new, the heat of the hand may obliterate a gilt letter, or dull the sharpness of the tooling. A prudent collector puts dummy leaves into his precious covers, or at best treatises on grammar and rhetoric. The gayest of inlaid colours and the greatest wealth of gold tracery adorn the interesting pages of Croscentius Of Agriculture, or the Varie Lectiones of Peter Victorius. If Dians de Poitiers read the books which bear her badges she must have been more than a little blue. But reading is not a rule with bibliomaniaes, still less with collectors of bindings. Book-hunters of the true Dibdin type look with suspicion at the man who reads what he buys, much as foxhunters eye the man who prefers to avoid torturing the vermin he destroys. To collectors of bindings the interior of a volume is doubly sacred. You may borrow of them, perchance, but woo betide you if you would open a book. The clasps may come off in unaccustomed lingers, or a significant crack may amounce the ruin of the stitching. How far the et amicorum of Grolier had a meaning we know not. The wide dissemination of books from his library must be accounted for by their sale at his death, rather than by the efforts of dishonest borrowers. The books of De Thou were kept together for some years after his death, rather than by the efforts of dishonest borrowers. The books of De Thou were kept together for some years after his death in 1617, but they were eventually dispersed, and now adorn the shelves of many a public and private museum. The ponderous boards in which some old manuscripts are bound, and especially those ornamented with pain

But much of the modern work exhibited is very good. After all that one suffers in ordinary life from the destructiveness of book-binders, it is pleasant to see that care for the interior of a volume is not considered beneath the attention of first-rate workmen. How often has a different tale to be told! Sometimes it is sad, sometimes absurd. All our sympathies are aroused for the bibliomaniae who recently bought—picked up, is the technical term, we are informed—an old and dilapidated Bible, with a fly-leaf bearing the single letter A before the title, and who, having sent his treasure to be bound, had it returned without what the binder naturally thought a useless appendage. On the other hand, a volume of old wills carefully labelled by a tradesman who boasted of a smattering of Latin, "Vetus Testamentum," may raise a laugh. But binders, as a rule, prey on their employers. A fly which catches and devours innocent spiders is among the recent discoveries of zoology. The removal of cobwebs is a necessary part of a binder's work, even though in many cases the book operated upon suffers in the process. It is a pity the French binders are not represented this year. They excel in harmonious colonning for half-binding, and combine cheapness and beauty in a manner unknown to us. But there is great hope for the art, as an art, in the recent developments of cloth, or rather, cotton binding. Some of the patterns exhibited are both suitable to the subject of the work they cover, and also boautiful in themselves. In this respect we may congratulate readers. Books are now published in very substantial cloth-bindings calculated to last, and not, as in former times, to be speedily replaced by morooco or calf, and it is found well worth while to make the exterior of a popular work as attractive as possible. The thing may be carried too far, and several flagrant examples are to be seen; but, on the whole, this is the direction in which some of the most original art of the day has been employed, and it should be noted with approba

FRENCH HONOUR

DARIS just now, having nothing else to think about except a mero change of Government and perhaps Constitution, is deeply interested in a question of personal honour which has arisen between a couple of noblemen. Have you a right to compel a man to expose himself in a duel because his wife, entirely of her own accord, and for reasons of her own, chooses not to know you? This is the point at issue between Count Jean of Montebello and Prince Metternich, formerly Austrian Ambassador in France, and it has been solemnly submitted to the judgment of

the public by the seconds who have had some difficulty in bringing these two discreetly punctilious gentlemen opposite each other in a field. It appears that the Bonapartists have taken warning from the mistake of the Legitimists during the late reign, and, instead of sulking in a dreary old faubousg, throw open their houses to the world, and dance and make merry. On the 14th instant a ball was given by the Countess of Pourtails—a familiar name at the Imperial Court. Count Jean of Montebello was one of the guests, and Princess Motternich another. The Count bowed to the Princess, whom he had known in other days at the Tüfleries, and the Princess instinctively acknowledged the salute; but, after a moment's reflection, she told the Count that henceforth are desired that they should be strangers. The reason given for this was that the Count had not been loyal to the Imperial Government. After Sedan he found himself a prisoner, and he then wrote a letter, not however intended for publication, in which he criticized very sharply the policy and conduct of his late Sovereign, to whom he owed at least a brisk English trade in the champagne which bears his name. Many persons will be of opinion that the Imperial Government rather laid itself open to criticism about that time, and in any case the Count was entitled to form and express his own opinions. On the other hand, Princess Metternich is known as an enthusiastic Bonapartist, and she too was entitled to her own oninion as to the institute of the canapares. Metternich is known as an enthusiastic Bonapartist, and she too was entitled to her own opinion as to the justice of the censures directed against her friends. It was only natural that under such circumstances she should be exceedingly sensitive to anything reflecting on a family to which she was bound by such intimate and confidential relations; and the only way in which she could show her disapprobation of the Count's ingratitude, as she conceived it, was by refusing to know him any longer. The County has a more to be an appropriate to the county of the ceived it, was by refusing to know him any longer. The Count, however, who seems to be as mousseur as his wine, could however, who seems to be as mouseeux as his wine, could not endure to sit down tamely under this rebuff. He could not call out a lady, but he was determined to call out somebody, and he fixed upon the Princese's husband, who was requested to give an apology or a meeting. Prince Metternich had not been present at the ball, and knew nothing of what had occurred, but he was willing to fight fany pretext could be found for it. When the seconds on each side consulted together what is called an "unexpected incident" if any pretext could be found for it. When the seconds on each side consulted together, what is called an "unexpected incident" arose, though we should have thought it was just what might have been expected. The Prince's seconds declared that the Prince could not see that he had insulted the Count, with whom he had had no communication whatever, and that he did not consider himself responsible for words spoken by the Princess at a ball at which he was not present. It was added that, if the Count wanted to fight, he must seek a personal quarrel on some other ground than the incident of the ball. If the Prince had simply refused to engage in a duel with a man whom he had never offended, and who had not offended him, he would have had common sense on his side, and, we should imagine, the code of honour, offended, and who had not offended him, he would have had common sense on his side, and, we should imagine, the code of honour, too, in its only rational construction. He declared, however, that he was quite ready to fight, and the whole dispute turned on the question as to which should be considered the person offended. It is the offended person who has the choice of weapons, but this again was not a matter in dispute, as the Count was quite willing to leave the choice to the Prince. But then the Prince could not receive it as a favour from the Count and the Count could not receive it as a favour from the Count, and the Count could not receive it as a favour from the Count, and the Count could not receive it as a favour from the Prince; each claimed it as a right. This of course threw the negotiations back on the original question, whether a husband is bound to fight every one at whom his wife turns up her nose. The Count's seconds held that, as he had received a public affront from Madame de Metternich, and as he was unable to reply to a lady, he had a right to address himself to the Prince as responsible for the acts of his wife. The Prince's seconds held that the claim was preposterous. Ultimately, however, by the intervention of friends, a better understanding was arrived at, and the quarrel between the Count and Prince has been fought out. The Prince has thus apparently sacrificed the principle that husbands are not answerable in person for their wives' demeanour. We know several husbands, but we shall not name them, to whom the maintenance of this principle would be literally a matter of life or death, the opposite principle is admitted, it would seem to be only a reasonable extension of it to hold that if two married ladies quarrel their husbands ought to fight; and as married ladies seldom meet without quarrelling, the male half of polite society would be likely soon to reduce itself to the condition of the Kilkonny cats. not receive it as a favour from the Prince; each claimed it as a

The Count's view was that he was the offended party, and therefore entitled to choice of weapons, but while he insisted on his right, he offered, in consideration of the Prince's rank, to yield the choice to him. The Prince's view was that he was entitled to the choice of weapons; but, if we may venture to express an opinion, we should say that, according to the recaived Franch code of honour, this was incorrect. It is clear that if, in the course of a discussion, an offence is offered, the person who has been offended is the injured party. If, therefore, the Count was entitled to hold the Prince responsible for what his wife said or did, the Count was the injured party, and entitled to choice of arms. But if the Count was not entitled to hold the Prince responsible, then he would seem to come under the rule of the Code that, "if a man sends a message without a sufficient cause, he becomes the aggressor, and the seconds, before they allow a mesting to take place, must insist on a sufficient reason being manifesting hown." The seconds displayed a laudable anxiety to find a sufficient reason

if they could, and at lest they may have discovered the precedent of Sir Lucius O'Thigger, who says, "Then, sir, you
differ in column with me, which amounts to the same thing."
According to that precedent, a difference about the mode of differing would suffice to justify a duel. But there is another rule of
the Clods, that "if in the course of a discussion, during which the
rules of politeness have not been transgressed, but in consequence
of which expressions have been used which induce one of the
partysto consider himself offended, the man who demands satisfaction counct be considered the appressor, or the person who gives it
the offender; the case must be submitted to the trial of chance."
With the utmost humility, we would suggest that this rule might
offer a colution of such an unfortunate complication as has arisen
in this affair. In effect the rule says that, if a quarrel is about
nothing, it is impossible to say who is the appressor, and therefore lots must be drawn for choice of arms. The parties to
this discussion should approach each other in the spirit of the
English prizefighter who said to another member of the Ring
with whom he desired to make a match, "Why wont or fight
I? I never did ought to offend 'ee." There seems no substantial
difference between arbitration, which has been proposed, and drawing lots, which the code prescribes.

The most remarkable part of the affair is, however, the impudent publication of the negotiations which have been carried on with a view to the perpetration of what in this country would be deemed murder, and what even in France is regarded as a serious crime. It is impossible to imagine a more cynical exhibition of contempt for the law than is contained in the socalled "official" proces-verbal of the seconds, which for the glorifica-tion of themselves and their principals has been printed in the Figure; and it is also an importmence to the public. When gentlemen take to advertising themselves in this way, they lay themselves open to criticism, and the impression which was at first forced on one by reading the narrative was that there was considerable eagerness on each side to lay hold of any show of excuse, however flimsy, for not proceeding to extremities. Both men professed to be anxious to fight; they were agreed even as to the weapons—pistols—which were to be used; but they discovered that they could not possibly use the weapons upon each other besy happened to differ as to whether one or the other should be considered the offended person. This difficulty, however, has been overcome, and a duel has taken place which ought not to go unpunished. If the affair had been kept secret, it might have been urged that it was not the business of the Government to search too curiously into it; but the offenders have, as it were, placarded an information against themselves, and challenged the authorities to take notice of it. If there is any life left in the French Government, such a defiance can hardly be disregarded. Duelling is one of those offences against social order in regard to which in all countries public sentiment has linguised behind the law; but there is only one way to encourage a more healthy sentiment and to make the law respected, and that is by enforcing it sternly, especially in any case which thrusts itself wantonly and impudently into notice. If the effrontery of Count Montebello and Prince Metternich and their seconds goes unpunished, respect for the law in that country will have received a serious blow. A few weeks ago a couple of English schoolboys fought a duel with sixpenny pistols, one of which exploded, to the injury of one of the combatants. The boys no doubt thought they were doing something very noble and romantic, and they at least put their courage to the test. Duelling in England is now confined to weak-minded schoolboys, and in Germany to hotheaded students; and it is an indication of the moral weakness of France that this monstrous practice should still find favour there. It is true that French duels seldom lead to more than a scratch, as in the present instance, and ingenious methods have also been discovered of swaggering as fire-eaters before the world, while taking extremely good care to keep out of the way of fire. The most appropriate penalty for such an offence would certainly be some punishment that would make the actors supremely ridiculous; although it is difficult to imagine how they can be used a more ridiculous to the table of the contract. made more ridiculous than they are at present. It is melancholy to reflect that in France attention should be diverted from the grave events which are now happening to such contemptible

PRINCE BISMARCK AND HIS CRITICS.

THE recent publication of two letters written by Count Arnim at the time of the Vatican Council, which we noticed not long ago, seems to have created a sensation in Germany which at first eight their contents can hardly be said to justify. The matter still continues to be discussed with considerable warmth in the German newspapers; and yet it is neither day to understand why the Count himself should have been so annoyed at the publication, however unauthorized, nor why the explanatory letter which he thought it necessary to address to Dr. Dollinger should have so greatly provoked the Prussian Government as to lead to his retirement, for the time at all events, from the diplomatic service. The report that he would decline the post at Constantinoplist hid to be offered him on his recall from Paris was indeed at first declared to be a pure invention, but the strong language used by some of the Ministerial organs makes it clear

that his acceptance of it was never seriously intended, or, to say the least, not desired. Prince Hismarck has shown perfore now that he is not of a reticent or forbearing mature whesi his now that he is not of a reticent or forbearing mature whesi his own authority is at stake, but it is some proof of the extreme bitteness and tension, so to say, of the pending ecclesisation curroversy, that so small a spark should have kindled so considerable a flame. The substance of Count Arnim's original letters will be fresh in the memory of our readers, and need not be reproduced here. The appearance of these documents in print, to his "deep regret," in the Norddeutsche Allgemeine Zeitung, with the alleged connivance of the Prince Chancellor, led to his writing a letter to Dr. Döllinger on the subject which was at once sont to the news-Dr. Dollinger on the subject which was at once sent to the newspapers. After personal expressions of his high respect for the eminent Catholic divine he proceeds to observe that the published version of his former letters is substantially correct, and that there is no such divergence of view as been represented in some quarters between the earlier and later of the two. He had always, he says, attached less importance to the infallibilist dogmanisal than to the manner of its authorization and had he approximate. than to the manner of its publication, and, had he supposed it to be a more abstruct theory, or "empty vase," he should not have considered it a matter about which Governments need trouble themselves. But the attitude and explanations of the German and Austrian Bishops both before and during the Council convinced him that this was far from being the case, and that it was roally a "Pandora's box," the nexious contents of which would be scattered over the world. He regrets that the proposal of Prince Hohenlohe for a joint action of the different tovernments did not lead to more serious negotiations, by which "the rankling weeds" cultivated at the Council night have been nipped in the bud, so that "we should not now and ourselves in the incomprehensible perplexities which bring almost everything into question that has long second to have become the common property of Christendom." The wording of this last seutence is so characteristically German as to border on being muntelligible. But, whatever be its precise meaning, the offence which has been so promptly visited may be presumed to lie in the intimation that Prince Hohenlohe's advice ought to have been acted on; to which it has been replied with much plausibility that it is not at all clear from his own despatches what Count Arnim wished to be done in pursuance of Prince Hehenlohe's suggestions, or in what way the European Governments, and especially the Protestant Governments, could have intervened effectively in the proceedings of the Council. The Government organs add, with less direct bearing on the pression and the pression of the pressi less direct bearing on the practical question, that the rankling weeds cultivated at the Council had their roots, if not in earlier ages, in the Papal policy of the last half-century, dating from the restoration of the Jesuits by Pins VII., and that the Vatioan decroes merely gave formal expression to their extravagant pretensions and crowned the edifice of Papal ambition. This is true, but it is equally true that a course of aggressive policy which has been steadily but stealthily advancing for years assumes a very different position when it is openly avowed and "crowned." The public avowal becomes at once the rellying cry for old adherents and fresh recruits and a starting-point for further developments. The existing complications may be a incomprehensible to nobedy who is acquainted with the history of Roma and Germany," but it does not follow that no precautionary measure a could have or diminished them. And the closing remark of the writer we have been quoting simply begs the whole question in dispute. These complications, he says, "call nothing in question but the

overweening pretensions of ambittons priests to worldly power."

To speak in such terms of the tactics of the Jesuit Camarilla and their triumph at the Vatican Council would be intelligible enough. As a description of Prince Bismarck's ecclesiastical legislation, it is at least not exhaustive. So much as this might be reasonably inferred, if only from the fact that the new laws are as little liked by the Loungelical as by the Catholic clergy, though their power of resistance is of course greatly inferior. Only the other day, in introducing some measures for the regulation of Protestant synods, Dr. Falk thought it necessary to go out of his way to defend himself, with considerable warmth, from the charge of being a disciple of Strauss, which emanated apparently from his coroligionists. But, supposing Catholic interests alone were involved, the laws now in course of execution for restraining the worldly arrogance of ambitious priests must appear to an outsider not altogether undeserving of the censure pronounced on them in the Pope's recent latter to Dr. Bundry, the Coadjutor Bishop of Cologne. Let it be remembered that four Bishops are already in prison, and one of them deposed by the civil courts, not for acting on the Vatican decrees, but for continuing to administer their dioceses as they have done all along; that unless they are prepared to accept conditions absolutely incompatable with their position in the Roman Oatholic hierarchy, it is confessedly a mere question of time—and of a very short time—how zoon all the rest of the Prussian episcopate incur the same extremo penalties; and that by the supplementary laws just passed in the Reichstag they will thereby become liable to banishment for life and loss of all rights of citizenship. Let it be further remembered that their places cannot be filled up by any successors remaining in communion with Rome; that all priests who continue in any way to recognize their authority after civil deposition, or who refuse to obey such now ecclesiastical superiors as the S

becomes evident that the present legislation, if consistently carried out, must in the course of two or three years at most put an end to all Roman Catholic worship—by which we mean here worship conducted by persons acting under authority of Rome—throughout the Prussian dominions. A scheme has indeed been formulated for the Chapters to elect to the vacant sees without reference to Rome; but these bodies without a single exception—the report about the Chapter of Cologne holding aloof turned out to be fabulous—have protested against this arrangement, and refused to act upon it, as it was beforehand certain that they would do. It will remain therefore for the Government to nominate Bishops, and get them consecrated, and, when consecrated, acknowledged, as best it can. What the Imperial Chancellor anticipates as the ultimate result of these energetic measures it is not easy to conjecture. That he has fallen into the error, common with statesmen of decided views and resolute will unless they happen to be also something more than statesmen, of seriously underrating the influence of moral forces in human affairs, seems obvious enough. But, more than this, the scope of his policy as further developed and completed by the supplementary laws, and the sort of language often used in recommending and defending it, give a certain plausibility to the startling assertion made by persons who ought to know something about Germany, that he actually contemplates a fusion of the Catholic and Evangelical Churches by Act of Parliament, as the late King of Prussia forcibly united the Lutherans and Calvinists into one State Church. We are far from meaning to affirm that so acute an observer of men and things has really allowed himself to entertain so impracticable an idea; we only say that the theory, which is none of ours, would go far to explain what looks otherwise so inexplicable in his course of section.

It is probably true, as the Allgemeins Zeitung observes in a recent article on the Arnim correspondence, that the ecclesiastical conflict would not have broken out if the Vatican Council had connect would not have proken out if the varican Council had a different termination, and if the absolutist party in the Roman Catholic Church had been defeated. The Papal prestige, he says, was destroyed by the extravagance of the new dogmas, and the Bishops therefore had to fall back on their natural relations towards the State. But what are these "natural relations"? The terminan elections containly but it must be extracted a good let. is an elastic one certainly, but it must be stretched a good deal to include all the arrangements established by the Falk laws. It may be true that the Bishops, acting under orders from Rome, are inclined "to make a point of honour of mere details," but this explanation does not go to the root of the matter. What may and must be the consequences of an indefinite prolongation of the contest is stated with an almost cynical frankness by the apologist of Prince Bismarck whose words we have already been quoting. "The religious usages of the people run the risk of being interrupted. And behind this looms the further danger of their getting accustomed either to dispense with religion altogether or to embrace fanatically such forms of it as are most hostile to the This is not, adds the writer, the wish of the Covernment, State." This is not, adds the writer, the wish of the Covernment, and the whole responsibility for it will rest on the Court of Rome. But this does not seem quite obvious. If we turn from a German to an English advocate of the Falk laws, what were we told the other day by the sympathetic Correspondent of the Daily News? He exults in the very point which other supporters of the Ministerial policy have strenuously but not very successfully attempted to deny. Not only does he inform his readers with evident satisfaction that the new laws "will enable the Executive, within the next few months, to get all the prelates and their vicurevident satisfaction that the new laws "will enable the Executive, within the next few months, to get all the prelates and their ricargenerals, besides a considerable sprinkling of the lesser clergy, into prison or across the frontier, while the civil power will have secured the entire and exclusive administration of the vacant dioceses," which it hopes to fill with "priests of the Old Catholic or Reformed Catholic persuasions," but he expressly insists that such of the clergy as "submit to the secular arm" will thereby "sever the connexion existing between them and the Vatican."
That is exactly what, for instance, Mr. Arnold said the Prussian Government was not doing and ought not to think of doing. But the Daily News is certainly right as to the facts. Let us take again what are at first sight the most plausible provisions of the new code, and are held up to special admiration by a writer in the current number of the Fortnightly Review and by other in the current number of the Fortnightly Review and by other Liberal panegyrists of Prince Bismarck's Church policy; we mean the laws about clerical education. The proposed change may be a good one in itself, and there may be Roman Catholics who view it in that light. But they would not the less protest against the injustice of the State forcibly closing all boys' seminaries and clerical seminaries, and insisting that henceforth all members of the Prussian priesthood shall be trained from childhood upwards in the public schools and Universities, under civil instead of enisconal control. Let us imagine for a trained from childhood upwards in the public schools and Universities, under civil instead of episcopal control. Let us imagine for a moment that our own Government had introduced a Bill forbidding the Bishope of the Established Church to ordain any one who had not apont a certain number of years at a public school and taken an Oxford or Cambridge degree afterwards. There would be a universal outery against so arbitrary a proceeding, and the Bill would of course have no chance of becoming law. Yet it would only enforce absolutely what is already the general practice, and what is in full accordance with public opinion in the Ohurch, both lay and chorical; whereas the Falk laws enforce a system of training which, however desirable in itself, is directly opposed to the prevalent Roman Catholic practice of the last three or four canturies and to the views of the hierarchy.

But, after all, these educational requirements form only one detail, though an important one, of the new system, and, if that were all, some modus vivendi would have been discovered before now. It is clearly not the chief object of Prince Bismarck to get the clergy better educated—which might indeed make them more formidable opponents—but to subjugate them completely to the State. By his Exeter Hall admirers in this country the enterprise is rather oddly represented as a fresh triumph of the sacred cause of liberty of conscience, though—to do him justice—he has irimaelf put forward no such incongruous vindication of his policy. It can only be accepted by those who hold that the contest will necessarily advance the interests of Protestantism, which is far from being obvious, and that such a result, by whatever means attained, must promote the cause of religious freedom, which also is not self-evident. If Prince Bismarck can manage to stamp out the religion of some eight or nine millions of the subjects of the Empire, he will no doubt have achieved a success, whatever may be its moral or material value; if he fails to do this, the chances are that he will provoke a powerful reaction. The faggots of Torquemada and the dragonnades of Louis XIV. were in a certain sense successful, though a terrible nemesis in each case ultimately followed. But such trenchant methods of controversy are gone out of fashion now, and persecution which is not thorough has generally proved to be a blunder as well as

GUNPOWDER.

THERE is a manifest necessity for an amendment of the law as THERE is a manifest necessity for an amendment of the law as to making and storing gunpowder and other explosives. A Magazine Committee, of which Sir John Burgoyne was President, reported that "to guard against the accidental ignition of gunpowder requires an unremitting caution carried to a scrupulous extent in handling, removing, and storing the powder, and in the construction of the special receptacles in which it is enclosed. Speaking generally, we may say that explosives are treated by non-military hands in entire disregard of the principle here laid down. The precautions adopted at manufactories of gunpowder are inadequate, and when the article leaves the place where it was made it mostly takes its chance. The head-constable of Liskeard reports that a few years ago he seized a ton of powder which was being conveyed in two open carts, and from the defects of one of the barrels a train of powder was left in their wake. In order to remedy this evil, it has been suggested by the members of the trade themselves that each been suggested by the members of the trade themselves that each firm of powder manufacturers should be required to submit their barrels or cases to an inspector. This proposal merely involves the creation of a place which would probably be filled by a deserving officer of artillery. But what number of officers could control the reckless dealings of miners with blasting-powder? The head-constable of Middlesborough says that he has known miners filling "straws," or preparing them of an evening for the work of blasting-powder in a young where there has been a fire and candle burning. next day, in a room where there has been a fire and candle burning and the cask of powder under the bed in the same room, and the man greasing the straw with warm tallow to keep the powder in. In one case the roof of a house was blown off, and on inquiry being made the man stated that he was tallowing the end of the straw when he put it too near the candle, which ignited the straw; he threw the straw away, and it fell into the barrel and caused the explosion. The head-constable of Richmond, who was formerly a chemist's apprentice, says he has weighed up in packages from 1 lb. to 7 lbs. by gaslight, 300 or 400 lbs. at a time. He has frequently seen miners with a quarter-cask (25 lbs.) making their charges by the fire, and they generally keep it under the bed or in the pantry where their children have access to it. The provision of magazines for their children have access to it. The provision of magazines for miners is not compulsory, and consequently powder is kept in all sorts of unsafe and unsuitable places. Instead of the risk being concentrated and minimized in one well-kept magazine, it is distributed over the whole neighbourhood of the mine, and throughout all the small shops in the adjoining villages, in the most unsafe manner possible. The colliers, says a witness, are most reckless how their powder is kept; under the bed or a chair is considered particularly safe stowing, and the men are often "in a state in which it would be better that there should be no powder in the same house." Another witness says that the powder is kept in ammunition barrels quite open and in a small closet adjoining the kitchen where the labourer's meals are cooked. The closet is not locked and the children have free access to it. In another district the powder not immediately required is left at the butty's house under powder not immediately required is left at the butty's house under the bed or in the pantry. In another, powder is carried in a loose way into dwelling-houses, where serious explosions sometimes happen. The workmen carry their powder in flasks, and a collier very often makes up his "shot" in an easy way with his lamp in his hat and his pipe in his mouth.

Large quantities of powder are used in the construction of railways, and as the only existing law as to magazines is inapplicable, contractors get a ton or two tens of powder at a time, and store is as may be most convenient. In these stores the barrels are opened by having the heads battered in by a stone or an iron implement. There is no attempt to exclude grit. Major Majendie, which has been employed by the Government to report on this suffect, says that he watched the operation of issuing powder and stores from a mining magazine, and he found that the men, women, and children crowded into the magazine in their ordinary shows to receive their

candies, all, powder, dec, and some of the pitmen came down to the magazine anoking, merely putting their pipes into their waist-coat pockstawhen they got close to the magazine. Twice this officer was taken into magazines by persons carrying a naked candle in the hand, and he was assured, in answer to remonstrance, that this had have done for year. The management of heree atoms candle in the hand, and he was assured, in answer to remonstrance, that this lad been done for years. The management of large store magazines of dealers is very imperfect. The men go into the haddings in iron-shod boots, and the floor is covered with dirt and gritemized with powder escaped from the barrels. Major Majendie writes, after a visit to one of these stores:—"The sensation of walking about upon the gritty, powder-covered floor of a magazine containing several tons of powder, accompanied by a farm-labourer in iron-shod boots, was one which I had not before experienced." As regards conveying powder from place to place, the regulations are, as might be expected, utterly inadequate. The Railway Companies charge high rates and afford small facilities for carrying egulations panies charge night rates and afford small facilities for carrying powder as such, and consequently it is sent under some other name. As regards carriage by ordinary road, almost no precaution is observed. A newspaper reporter getting upon a Wigan omnibus was requested to put out his pipe, and was shown a too-lb. cask of powder beside which he was seating himself. A chief constable in the North of England says that powder is conveyed with no more caution than any other article of commerce. It might be resaible caution than any other article of commerce. It might be possible to require the carriage of large quantities of powder to be performed either in special vehicles or under some warning mark or flag. But the loading and unloading at wharves and depots which are usually near masses of population could hardly be controlled without account investing trade. Thus an instance is most investinged. without seriously impeding trade. Thus an instance is mentioned where powder is shipped and unshipped with other goods at a wharf on which a steam crane is at work. The law controls, although partially and imperfectly, the establishment of magazines, but a wharf or depot where a brisk trade is done in powder is more dangerous than a magazine. is done in powder is more dangerous than a magnine, because powder in motion is more liable to explode than powder in store, and no control of wharf or depot appears practicable. The magazine at Erith was probably placed there for convenience of water-carriage. It exploded in 1864, and a breach was blown in the river wall, and a destructive inundation was only averted by the exertion of large bodies of soldiers, who were sent from Woolwich to the spot. A magazine on the bank of the Coventry canal is said to be specially dangerous for the same reason. The cities of London and Westminster, borough or market towns, royal palaces, and parish churches, are specially protected. But it is palaces, and parish churches, are specially protected. But it is obvious that this list ought to be considerably enlarged.

The most unsatisfactory part of the whole subject is, however, the retail trade in explosives. Indeed it is better perhaps not to

consider too closely the risks to which we are all exposed in a great city from the carelessness of some of us. All boys, without excity from the carelessness of some of us. All boys, without exception, will play tricks with gunpowder, particularly if a drawing room offers itself for the performance. The fascination of toy cannons for boys almost equals that of dolls for girls. But, luckily, the quantity of powder at a boy's command is such that at the most be can only harm himself and his playmates, and the furniture amid which he operates. The greatest danger in towns arises from retail dealers in explosives and small makers of fireworks. Many stories are told of process' appropriates sticking a paked candle in the powder of an open harrel. in towns arises from retail dealers in explosives and small makers of fireworks. Many stories are told of procers' apprentices sticking a naked candle in the powder of an open barrel, supposing it to be onion-seed, and of the master fetching the candle out. But in one of these stories the master, valuing life more than property, left the shop as quickly as he could, and the boy returned for the candle. Since breechloading weapons have been adopted for sporting purposes cartridges are usually filled by gunmakers. This practice is strictly illegal, but it is general and uncontrolled, account by the contion of those who against it. A gunmaker. except by the caution of those who engage in it. A gunmaker, however, is likely to be more cautious than a grocer, because his mind is more directed to the nature of explosives. It seem to have been thought sufficient to restrict dealers in gunpowder to a limit of 200 lbs., and to allow them to store, handle, and sell that quantity in any way thoy may choose. But Major Majondie remarks for our comfort that 200 lbs. is far too large a quantity to be kept, except under well-defined restrictions. The amount of damage except under well-defined restrictions. The amount of damage which may be done in a crowded neighbourhood by the explosion which may be done in a crowded neighbourhood by the explosion of this amount of powder, or even of one-half this amount, is very great indeed. If it exploded in a dwelling-house it would almost certainly destroy that house completely, and probably would seriously damage neighbouring houses. In an explosion at Stirling about 30 lbs. of powder destroyed a house, and did damage estimated at 2,000. At Stubshaw Cross two cettages were destroyed, one person was killed, and eight persons were seriously injured, by the explosion of 27 lbs. of blasting consider. It results from these and other examples that the limit two cottages were destroyed, one person was killed, and eight persons were seriously injured, by the explosion of 27 lbs. of blasting powder. It results from these and other examples that the limit of 200 lbs. is not low enough to afford security against an important disaster in the event of an explosion. It also results that no practicable limit could be adopted which would relieve the neighbours of a dealer—to say nothing of the dealer himself—from the consequences of an explosion. It is satisfactory to find that this conclusion, at which we had some time since arrived by the light of nature, is confirmed by the elaborate investigation of a scientific officer employed by Government and reporting in a blue-book. It is suggested that all retail dealers in powder which he required to be registered, and, when they were thus in the process of the constant of the explosion at least be made to induce them to the process of the explosion at littleback of the explosion at littleback Cross was occasioned by der camefally. The explosion at littleback Cross was occasioned by

a sperk from an open oil lamp which a women was conving at the time ahe was weighing out in the kitchen at the of guspowder for a customer. At Brynnawr a boy was sent by the shoptneper into his powder-store to get powder. He took a candle and some matches. The candle went out, and the boy streek a match to light it, and fired the powder. By this explosion one parson was killed and many were injured, and 3,000k worth of damage was done. At present the mere fact of selling powder constitutes a dealer, and the mere fact of dealing enables him to keep 200 lbs. of powder anywhere and anyhow, and without any supervision whatever. There being no official indication of the existence of a stock of powder, firemen and others are exposed in case of fire to an extra unknown risk. This was exemplified in a fire at Chelsea, where an unexpected explosion of powder created great Chelses, where an unexpected explosion of powder created great alarm, frightened the horses of the angine, and caused them to run away, knocking down and injuring several persons. It is saudoubtedly objectionable that firemen should be liable to have a mine sprung upon them while engaged in extinguishing a fire. There would, however, be great difficulty in framing any useful regulations which would not soriously hamper trude; an we might be quite prepared to put down the retail firework dealers, it would be impossible to interfere with the blasting processes of mines and collieries. Masters and overlockers will do well to endeavour by precept and example to correct the negligence of which so many fatal results have been recorded.

THE ROYAL ACADEMY.

THE last great effort of Mr. Frith, R.A., falls rather flat upon the public, notwithstanding the favour shown by the hangurs. The public, notwinstanting the favour shown by the nangars.

People probably see at a glance that the religious cornerory of "Hessing the Little Children," even though it takes place only at Bonlogne, is not quite so much within the painter's vocation as "The Perby Pay," or "The Railway Station." The composition before us, in spite of its semi-sacred character, is an amusing as a profess medley. It is true that a bishop in mitre and full canonicals stands as the centre, around which throng mothers with children in arms, girls in gala costumes, and boys on crutches. And the painter has done his best to concentrate attention on the main action; but the eye of the spectator is inevitably distracted by curious incidents and comic byplay, until it at last wanders inadvertently far away up the street along which the bannered procession slowly toils its way. Unfortunately, this street vists is almost the only artistic passage in the picture. The composition is like some plausible story, too clever by half to be true; the style is recommended by its alluring flashiness; what is true and what is falso are so mingled together that each may be mistaken for the other; the execution, if dexterous, semetimes degenerates into wooden texture; the atmosphere, though open to the sky, is without daylight, so that the whole scene lacks relief and lustre. It must be admitted that many of the characters are true to the life; in fact, character is the painter's strong point. Nothing could be happier than the droll and sinister expression of a on the other hand, when we come to the young girls, they are without simplicity. The fundamental fault of the picture would seem to be simplicity. The fundamental fault of the picture would seem to be that it halts between two opinions, and thus, like a house divided against itself, it is in danger of falling. Perhaps the safer course would have been to abandon the serious aspect altogether, and thus to gain an undivided unity in the line of comedy and common-

The faults of Mr. Frith, R.A., are assuredly not shared by r. Marks, A.R.A. "Capital and Labour" (179), by the latter, Mr. Marks, A.R.A. "Capital and Labour" (179), by the latter, is vigorous and unflinching in its naturalism; on the one side stand a company of masons urging their grievances, on the other is respectfully listening the squire, attended by his architect and the clerk of the works. The composition, without favouring either party, is a clever hit at a social movement of the day. The "Latest Fashion" (125), also inclines to quiet satire, made the more Fashion" (125), also inclines to quiet satire, made the more pleasing to the eye by a colour, finish, and refinement not habitual to the artist. But of all the men who go to nature without the idea of monding or adorning her, Mr. Legros is the most uncompromising. "Un Chaudronnier" (24) is something truly appalling in its power of repulsion; the tinker might have been a favourite in its power of requision; the uniter might have been a invourned model of Caravaggio, or of other naturalists and temebroni artists of Naples. But a redeeming point is supposed to come with the tinker's old kettle, which certainly might well have descended from the studio of Velasquez. It has been said that this masterpiece is hung unfairly; but a work of this knock-down velamence is almost of necessity thrust into distance, so as to mitigate the terror of the ordinary spectator. It seems a pity that this artist, whose talent is universally admitted, cannot see his way to a compromise by which nature might suffer little and art might sain whose talent is universally admitted, cannot see his way to a compromise by which nature might suffer little and art might gain much. Surely a painter by condenending to please need not surrender his honesty or independence. Mr. Filles is another artist who makes a protest against the popular principle that a picture ought to be agreeable. Assuredly for once he goes too far in the opposite direction when he depicts with revolting reality the squalor, the dirt, and the rage of a herd of miserable "Applicants for Admission to a Cessel Ward" (504). An appeal to the practice of all the best schools condemns the composition as a mistake in choles of subject and a misdirection of time and talent. We

will go so far as to add that the pictorial sin is aggravated by the genius brought to its consummation; neither can we accept mitigation a quotation from Charles Dickens, inasmuch as it h for obvious reasons always been held that in written description a place may be found for horrors which become intolerable when brought into pictorial form bodily before the eye. It is an anomalous sign of the times that our painters turn more and more to the shadow side of nature; thus Mr. Faed, R.A., again touches chords of pathos in a cottage (227), while Mr. F. Holl calls for sympathy for a deserted baby (487). The worst of the matter seems to be

for a deserted baby (487). The worst of the matter seems to be that, when a painter is lost in emotion, he is lost to art also.

But so many-sided has our English art become, that if in an exhibition shadow strikes on the one wall, sunshine is pretty sure to beam on the opposite. Hence a variety which plea neam on the opposite. Hence a variety which pleases everybody in turn. The present Exhibition is not great in any way, but on all hands we hear it spoken of as pleasing by virtue of its variety. Certainly, as a set-off to what we have found to be gloomy, we have works cheerful and sersone. For instance, Mr. Leslie, A.R.A., is now, as ever, pleasing and placid; he has always been so innocently calm as never to have been guilty of a storm, even within at teacup. "The Nut-brown Maid" (197) is a simple scene commended by beauty and teste; the chief fault in the country lassie who stands by the sylvan fountain is that her face has been shured. That art can never be right which sinks the head into subordination; in all schools the face has necessarily been the medium of expression. Before leaving this picture, we wish to draw attention to the truthful and tender way in which the accessory landscape has been painted, for the sake of refuting a gratuitous and unfounded assertion recently made by an anonymous letter-writer, that figure-painters cannot hang or otherwise justly deal with landscape art. On the contrary, the noblest landscape-painting has been, and always must be, that which is close to, and not divorced from, the figure. Of this Titian's "Peter Martyr" may be adduced in proof. Also, for the reciprocity between figure and landscape art, and as showing how the one may bring human interest and the other give outlook or extended horizon over fields of nature, we would point to such refined and poetic compositions as "The End of the Journey" (1020), by Mr. P. R. Morris, and "Guinevere's Ride to Almesbury" (1021), by Mr. Hole.

The crying injustice within the Academy would seem to be not so much that figure-painters do not appreciate landscape as that even Royal Academicians who usurp a place on the line cannot paint the figure tolerably well. "Taming of the Shrew" (201), by Mr. Cope, R.A., is a clumsy cradity, black and white as opaque chalk. It is melancholy to see how here and in other glaring examples Shakspeare and the best authors of all countries are made to make off the worst of pictorial wares. "The Finding of made to pass off the worst of pictorial wares. "The Finding of Imagen" (677), by Mr. J. Barnes, and "Don Quixote at the Puppet-show" (1431), by Mr. Lockhart, received more than their Puppet-show" (1431), by Mr. Lockhart, received more than their due when placed away from sight above the line. But we gladly except from what may be stigmatized as the low literary art of the Academy a brilliant idea, "Half-hours with the Best Authors" (166). We owe to the ready pencil of Mr. Calderon this satire on the invetorate habit of the pretiest ladies to sleep over the best books. Mr. Elmore, R.A., also, as an exception to his brethren of the brush, throws high style into a literary theme taken from "Poweril of the Peak" (327). On the whole, the Exhibition apparently points to the conclusion that painters are not reading men. By the time an author gets on the stage we may expect to see him on the walls of the Academy, but not before. expect to see him on the walls of the Academy, but not before

It is interesting to trace from time to time within the Academy the rise or the fall of a new school. Formerly all the figure pictures might be classified under styles classic, romantic, or naturalistic. But latterly there has appeared in London, concurrently with a like movement in Paris, a school of Eastern origin. This Orientalization in the arts, which first began with carpets, chins, and curtains, acreems and fans, has now extended to easel pictures; and an infatuated public, not content to import the wares they want from China or Japan, are willing to extend their patronage to initators nearer hume. Hence the production of a class of goods such as "Embroidery" (999), and "A Japanese Cleopatra" (1001), severally by Mr. A. Thompson. As for this Japanese Cleopatra and her companions, squatting in a shoppy sort. Japanese Chopatra and her companions, squatting in a shoppy sort of way among acreens and draperies evidently borrowed from Regent Street, they are not human beings, but wooden dolls. The art is simply berbaric; the execution seems to be studiously instractic, especially in the painting of the heads. The mistake is that the defects of native painters are slavishly insitated, whereas the endeavour ought to have been to take what is good and to leave what is had. But let the artist try again. "Embroidery," the better picture of the two, shows that we have something to gain by these curious experiments. Mr. F. Moscheles, also joining in this fashionable Eastern pilgrimage, seeks out new art semations "On the Banks of the Hampawa" (1006). We doubt whether he has every been there: and, if not. seeks out new art sensations "On the Banks of the Rangawa" (1006). We doubt whether he has ever been there; and, if not, all such work, even at its best—but here unfortunately at its worst—must be little more than copyism, compilation, and compromise. Mrs. Jophing adopts the bolder and more independent course of painting as an English hady rather than like a native artist. "Five o'clock Tea" (1047), a symmetrical composition of Orientals squatting, imbibling, and goestping, has the breadth, contralization, and maity of Western art. The colour too has beening; he gains continued the painting the rencords in the arrander of the violent contralization and the maillant barmonics which are usually in this ultra-Orientalizaty pushed to extreme. Yet some fatality is seree to befall these vagrant seccutricities; thus here, instead of study, we have

mere show; and where we have a right to look for care, we carelessness. The picture, we fear, can scarcely be naturalized either in England or Japan; the hands are too hadly drawn for London m England of Japan; the halls are too being in the markets of Yeddo. The conclusion forced upon us by these and other works of the kind is that the uses to which Chinese and Japanese art can be turned are chiefly, if not exclusively, those of decoration. Little is to be learnt in the way of architecture, sculpture, or the painting of the human figure.

painting of the human figure.

How much purer are the styles derived from Italy, whether for beauty of form, concord of line, or even for refined harmony of colour, may at once be seen if the spectator will turn from the above-mentioned pictures, all in the Lecture Boom, to a neighbouring composition, "A Game of Knuckle-bones" (943), by Mr. Maclaren. The subject is the classic pastime in which the huckle or ancle-bone of sheep or gouts was thrown by women and children into the air and then caught on the hand. The game has been minutely described by classic writers; we remember an outline in numble, in the purest Greek style, of two figures playing with these bones in the Naples Museum, and the subject is further illustrated in the British Museum. Mr. Leighton in years pust has not overlooked this favourite theme among classic artists. past has not overlooked this favourite theme among classic artists, and now Mr. Maclaren, much to his credit, evokes the beauty and the grace which by prescriptive practice belongs to the subject. The ancient modes of treatment were allied to the designs painted on classic vases; the work before us naturally in-clines to modernism and decorative modes. Delicious for tone and colour is the background of yellow reeds with the green leaves and pink flowers of olender. French neoclassicists have seldom surpassed this well-considered composition. In conclusion, we may aurpassed this well-considered composition. In concussion, we may add that the preceding comparison between recent revivals of Oriental and of Italian schools need not be to the disadvantage of either. We think, however, that our contemporaneous Eastern revivalists may do well to remember what was done in Venice long ago by the Bellini, by Titian, Veronese, and others. We know of only two capitals in Europe which have given satisfactory interpretations or paraphrases of Oriental art; the one was Venice in the fifteenth and sixteenth centuries, the other is Paris in the ninetcenth century.

REVIEWS.

JEVONS'S PRINCIPLLS OF SCIENCE.

TROM a neat and well-arranged handbook of the Elements of Logic, published in 1870. Professor Jevons advances in the volumes, Principles of Science, to a comprohensive treatise containing original speculations on all, or most, of the capital problems involved in the theory of knowing. On a subject so well forn it is impossible that much can be advanced which is, strictly But inasmuch as Professor Jevons is not a man speaking, new. to copy his predecessors, or to adopt ready-made conclusions, and has besides been many years revolving his subject in a mind of no ordinary vigour and fertility, the result is that his discussion even of the familiar theme of the theory of the reasoning processes has the stamp of that originality which means flowing freshly from a creating and shaping intellect. In philosophy such discussion is always profitable, and this kind of originality is probably all that can be looked for.

In the part of logic which treats of Deduction there can not only be nothing new to say, but even the statement of the rules and principles admits of little variety. It is in the theory of In-duction that modern logicians find free scope for fresh speculation, and indulge the hope of arriving at views less vague and less em-barrassed than those which are current in logical books. Mr. Jevons considers that Bacon, though he correctly insisted upon constant reference to experience, had no correctly messed upon consuming method by which, from particular facts, we educe laws of nature. Bacon's axiom, "Vere scire esse per causas acire," has turned many other logicians besides himself off the right track. In Mr. Mill's Logic the term "cause" seems to have resempted its old noxious powers. Mill is entangled in the confusion of sequences with coexistences, of what he calls eventr with qualities, and of science with power of prediction. Though modern logicians busy themselves with power of prediction. Though modern logicians busy themselves mainly with Induction, while the ancient logicians treated the reasoning process as entirely deductive, yet both the modern and the ancient were engaged upon one and the same problem. This problem was, to accertain the laws of thought by which the mind is governed in inference—in travelling, i.e. from knowledge possessed to new knowledge. The theory of logic is not tasked to provide the premisers. Whether we are arraing against an opponent or drawing our own conclusions, some propositions are known, assumed, or conceded, and from these we advance to further propositions which are necessary consequences of the propositions are known or conceded. What are the laws of this mental procedure?

The ancient logician, attaching himself exchanted to the phenomena of demonstration, investigated the method of deducing a less general truth from a more general truth. Aristotle almost prefected the theory of Deduction. He reglected, though he did not ignore, the theory of inductive inference. The modern logical

The Principles of Science: a Treatise on Lagie and Balantiffe.
By W. Shullay Javois, M.A., F.R S., Fellow of University College.
Professor of Logic and Political Economy in the Owner College, Man
a vols. London: Macmillan & Co. 1874:

investigator, on the other hand, may be said to demine the theory of Deduction, though he dres not ignore it. He observes that the beasted demonstrative process is not really the passage of thought from knowledge possessed to new knowledge, insamuch as the major premies always virtually and implicitly contains the conclusion. He says, liefore you can assert the major to be true, you must have already known that your conclusion was true. All this parade of argument therefore, if not mere verbiage, is at must a development of the connexion of known truth, not a discovery of truth. The mode by which thought really passes from the known to the unknown is that, neglected by the old logicians, of Induction. From a certain definite number of examined cases we can infer a universal law. This law is strictly new knowledge; for the premises were singular instances, the law is universality. The new element in any inductive conclusion is its general applicability. Strictly speaking, as Mr. Mill has shown, the inference is not from particular to universal, but from particular to particular. The universal is merely a memorandum, or aid to memory, and the new knowledge consists in the unexamined case to which I am entitled to infer from the examined cases. The general law is only a mark remainding me that I am so entitled to infer whenever occasion requires. This combination into one homogeneous compound of two processes, Induction and Deduction, which had been hitherto treated as distinct, or rather opposite; this presentment of the problem of Inference as one connected whole, is claimed by Mr. Mill's friends as the capital addition which he made to the science of logic. By this method of statement syllogism was subordinated to induction. The domonstrative process which had been the central and inspiring object of the ancient logician was subordinated to induction the inductive problem.

At this point Mill's Logic left us. This was the one clear and commanding position to which he had conducted us. But it is apparent that logical inquiry could not rest in this position as an altimatum. If logic is to investigate all the conditions of scientific proof, it cannot be satisfied with the statement that all inference is from particular to particular. We are immediately impelled to go on to the question, When may we draw this inference from particular to particular? What are the guarantees that the passage from the known fact to the unknown shall not be arbitrary, capricious, casual—shall be inference and conjecture?

be arbitrary, capricious, casual—shall be inference, not conjecture? It does not appear that this question was answered directly by Mill in the whole of his two volumes. At any rate it was not answered by him as explicitly as it is now done by Mr. Jevons. He maintains that all inference may be resolved into the detection of likeness. In all acts of inference, however different their apparent forms, there is involved a detection of likeness. Inference may be described as "substitution of similars." To this mode of explaining inference Professor Jevons was inclined, in his assay published in 1869, to attribute great importance as an advance in logical theory. In his present work he puts the same statement forward again with even increased confidence. In his first essay, he says, he had but an imperfect conception of the importance and generality of the process. He thought it then but one among a number of other modes of inference. He now sees all logic to be a development of the all-important principle of sub-titution. He does not indeed claim for himself to have been actually the first logician to propose the theory, as he finds that he has been anticipated by Beneke. But he may claim independent originality, inasmuch as his imperfect acquaintance with German had prevented him from acquiring a complete knowledge of Beneke's views.

We should be little disposed to dispute any claim which Professor Jevons may make to priority of discovery. But we confess that we are still at a loss to understand the importance of his theory. And by this we mean its relative importance in the science of logic. The utility of logic itself, indeed, has frequently been questioned. It has been affirmed, and cannot be denied, that all the great discoveries in science have been made without the aid of logic. It is not an instrument of discovery, or a road to knowledge of any kind. This question is one which it would be inappropriate to raise in reviewing a treatise on logic. And when we say that we are unable to share Professor Jevons's lofty estimate of the value of his principle of "substitution," we mean merely because it does not appear to throw any light on the theory of knowing. "So far as there exists likeness, what is true of one thing will be true of the other." How does this substantially differ from Mill's type of the reasoning process? "Certain individuals have a given attribute; an individual resembles them also in the given attribute." The sufficient proof that the new theory, or terminology, "substitution of similars," has not the novelty or importance which the author would attribute to it, consists in the fact that in his own two volumes he makes throughout hardly any further use of it. It is left alone, unproductive of any results.

of the first volume, we find no further use made of m. me left slone, unproductive of any results.

It may perhaps be alleged that this mode of stating the principle of inferential reasoning has the advantage of directing attention to the fact that the difficulty of reasoning correctly really resides in ascertaining the degree of likeness. This is, it must be admitted, an important observation. The formal part of induction is, in practical science, of little or no corresponde. The meterial part is all-important. The operations subsidiary to induction, the rules of observation and experiment, seem to embrace the whole of the logic of discovery. If this be to examplify his theory, Mr.

Jevous has assigned due importance to this part of logic, by treasing at length, in his second volume, of the rules of the second statement of likeness. His chapter on "The Character of the Experimentalist" is not the least interesting in the book. His remainds us that no logic, no system, no organization of labour in research, can yield us new discoveries of laws of nature. Genius, or the philosophic mind, must for this purpose he in as great request as ever. In pleading for the endowment of scientific research as a national object, no one imagines that money and opportunities of study can create genius. It may be that is politics "the individual withers, and the world is more and more," but this is not the case in science. The vast armics and accountation of material of war in our times have not decreased the value of the skilful general; and the genius of such a man as Darwin is more, and not less, valuable than it would formerly have been, now when there are numerous scientifically trained men in all parts of the world prepared to discues, illustrate, and apply his theories. Bacon contributed to spread the notion that rules could be given which would facilitate discovery. It is notion of scientific method was that of a kind of scientific bookheeping. Facts were to be gathered from every source, and posted as in a ledger, from which would emerge in time a clear balance of truth. There is no such thing as a distinct process of induction. The detection of likeness is the all-essential act, and the power of doing this is a natural gift—is wit, or gonius. Buffon said that "gonius is patience," and patient components. But no one should suppose that patient labour alone will invariably lead to those conspicuous results which have made the names of the great discoverers famous. A Newton may modestly and sincerely attribute his success to industry and patient thought, for true genius is unconscious; but there must be present also powers of in ellect beyond what are commonly possessed by men. Fertility of imagination

Professor Jevons does not attempt any psychological analysis of genins, but dwells on that aspect of it which lits in with his logical theory about induction. He denies what Mill had affirmed that all inference is from particular to particular, and speaks of it in scornful terms. "No one who holds the dectrine that reasoning may be from particulars to particulars can be supposed to have the most rudimentary notion of what constitutes reasoning and science." As this sweeping contempt would involve many of the greatest names in logical history, including Aristotle and Mill, we must look out for some other interpretation of Mr. Jevons's words than what seems their obvious meaning. That the cycle which this human intellect traverses begins in particulars and comes back to particulars again, is so certain a truth that no one can even profess to deny it. We must not therefore understand Professor Jevons to be dony in. We must not therefore understand Professor Jevons to be dony in. We must not therefore understand Professor Jevons to be dony in. We must not therefore understand Professor Jevons to be dony in. We must not therefore understand Professor Jevons to be dony in. We must not therefore understand Professor Jevons to be dony in this fundamental conception of human knowledge. He can only mean, what is equally true and undeniable, that science deals with universals. Mr. Jevons writes, "In the very birth-time of philosophy this was held to be so; nulla scientia cet de individues sed de solis universalibus was the doctrine of Plato, delivered by Perphyry." Plato did not live in the birth-time of philosophy, nor did Perphyry write in Latin, but nevertheless the dictam thus produced is emphatically true. But it is not at all inconsistent with the principle that human knowledge begins and ends in particulars. What Professor Jevons should have said, perhaps what the structure of the structure. There is the stress of the logical problem, and of this problem we only used in modern logic with very perplexed to infer fro

Professor Jevone has evidently felt that this is the question to be answered, and that it is not answered in the logic which is current in this country. The uniformity of nature is an ambiguous expression; the reign of law an unverified hypothesis. His language is obscure, and sometimes contradictory; but on the whole we are not in deabt as to the ensurer which he proposes to give to the question which the modern logic haves in a haze of doubt. Mr. Jevons says there is no such process as inferring from sparticulars to particulars. All inductive reasoning is an inverse application of deductive reasoning. A so-called inductive law is a hypothesis. We do not affirm, but we adopt it, and try, not all the cases by it, but it by all the cases, modify it as the cases require, reject it if one case is unconformable. Science then, accord-

ing to Professor Javons, deals with probabilities, not with certain-

ing to Professor Jevons, deals with probabilities, not with certainties. The certainty attributed to the results of demonstration is as illusory for him as it is for Mr. Mill. No inductive conclusions are more than probable. The theory of probability which enables us to estimate quantities of knowledge is the basis of the theory of reasoning. Inductive results differ infinitely in scientific value, because they differ infinitely in their numerical data. The value of quantitative laws depends on the degree of quantitative approximation to the truth probably attained.

The theory that inductive physical laws are only hypotheses subject to eternal verification is by no means a new one. It has been repeatedly enunciated by modern philosophers, by Herschel, by Whewell, and others. But we do not remember any modern logical treatise in which all knowledge has been resolved into frequency of occurrence, and inference declared to depend on the probability of recurrence. When we are warned by writers on science that to the philosopher all opinions are provisional only, that he must be prepared at any moment to relinquish his most cherished belief when any fact turns up which is inconsistent with it, we have regarded these as valuable educational precepts, or as descriptions of the philosophic termon of the principles of the philosophic termon. cherished belief when any fact turns up which is inconsistent with it, we have regarded these as valuable educational precepts, or as descriptions of the philosophic temper, of the spirit in which all scientific research is to be undertaken. In Mr. Jevone's treatise this becomes a rigid theory of logical proof; all knowledge is resolved into hypothesis; certainty, science, truth, have no existence. "Perfect knowledge alone can give certainty, and in nature perfect knowledge would be infinite knowledge, which is beyond our capacities. We have, therefore, to content ourselves with partial knowledge—knowledge mingled with ignorance producing doubt."

with partial knowledge—knowledge—ducing doubt."

The theological applications of this theory of knowing are obvious, and Professor Jevons points to them in a concluding chapter. These concluding remarks will probably be the most generally read part of these volumes, and will interest many who care little for the theory of logical inference. It follows from the theory as expounded by Professor Jevons that the reign of law is an illusion. The prevalent notion that the course of nature is althoughout the principles of mechanics which have an illusion. The prevalent notion that the course of nature is determined by invariable principles of mechanics which have acted since the world began, and which will act for infinite ages to come, is superficial, and derived from a false view of scientific meaning in nothing incompatible with logic in the disinference. There is nothing incompatible with logic in the discovery of objects which should prove exceptions to any law of nature. No finite number of instances can warrant us in expecting with certainty that the next instance will be of like nature. with certainty that the next instance will be of like nature. There is no necessary truth even in such fundamental laws of nature as the Indestructibility of Matter, the Conservation of Force, the Laws of Motion. The theory of evolution places us under the necessity of believing in creation—i.e. disturbance of law at an assignable date in the past. And if in time past there has been discontinuity of law, why may there not be a similar event awaiting the world in the future? The idea of the uniformity of nature in any sense in which it is true does not imply that extensive alterations, or sudden catastrophes, are impossible. The uniformity of nature is theoretically consistent with the most unexpected events of which we can form any conception. events of which we can form any conception.

To the consideration of this uncertainty of physics must be

To the consideration of this uncertainty of physics must be added the even greater uncertainty of all general conclusions about political and social phenomena. Even if there are any abstract principles of morals or economics which are approximately true, they never can be applied to predict social events. A science of history is an absurd notion. The theory of evolution is a highly probable theory, but Professor Jevons cannot for a moment admit that it will alter our theological views. Its results, like the results of all science, must be limited to affirmation. We cannot disprove the possibility of divine interference with the course of nature. Such interference might arise in two ways. It might consist in the disclosure of the existence of some agent or spring of energy previously unknown. ways. It might consist in the disclosure of the existence of some agent or spring of energy previously unknown, but which effects a given purpose at a given moment. Or the same power which created material nature might create additions to it, or annihilate portions which do exist. Granting that the hypothesis that there is a Creator who is at once all-powerful and benevolent is surrounded with difficulties verging closely upon logical contradiction, we are equally exposed to inexplicable contradiction in other directions of thought. Continuous quantity, e.g. leads us into difficulties. Subdivide as we will, we never reach the absolute as defined in geometry. But if an infinite series of infinitely small quantities is thus involved in all our conceptions of magnitudes, all our reseasonings about the universe, its component parts. tudes, all our reasonings about the universe, its component parts, and what is possible in it, seem to be overturned.

We quote Mr. Jevons's concluding sentence in his own words:—

We quote Mr. Jevons's concluding sentence in his own words:

Among the most unquestionable rules of scientific method is the law that whatever phenomanon is, is. We must ignore no existence whatever. We may variously explain its meaning and origin, but if a phenomenon does axist, it demands some kind of explanation. If then there is to be d composition for scientific recognition, the world without us must yield to the undoubted existence of the spirit within. Our own hopes and wishes and detarminations are the most undoubted phenomena within the sphere of consciousness. If men do act, feel, and live as if they were not merely the brief product of a casual conjunction of atoms, but the instruments of a farresching purpose, are we to record all other phenomena and pass over these? We investigate the instincts of the ant, and the bee, sand the beaver, and discover that they are led by an inscrutable agency to work towards a distant purpose. Let us be faithful to our actiontific method, and investigate also those instincts of the human mind by which man is led to work as if the apprecial of a higher being were the sim of life. Vel. if, p. 470.

BISHOP GRANT.

IT is not easy to attach a definite character to the subject of a hiography which is all panegyric. When every virtue and every grace are attributed to a man we class him among saints, but we form no distinct conception of his actual personality. This was our feeling at the first glance over the pages before us. To confess the truth, the name of Thomas Grant, first Bishop of Southwark previous no managing in us. for our feet and improved the pages of the state of the saint and improved the saint and sa wark, revived no memories in us; for our facts and impressions we were almost wholly dependent on the biographer, and according to her idea of perfection he seemed to be perfect. Faith, charity, devotion, self-abnegation, humility, sweetness, simplicity, obedience all under the direction of judgment, perception, capacity, and exercised with strength of will and indefatigable industry—were catalogued in orthodox order and illustrated by the most telling anecdotes; and these qualities, we found, were all rewarded by the most startling successes, till the wonder grew that the world had yet to learn what it is the business of this work to tell it. By degrees, however, a form emerges out of this excess of light. At last we see a man, and the more distinctly we see him the easier it is to understand—without charging his culogist with any deliberate or blameworthy exaggeration—how it was that these signal merits and qualities, exercised with zeal and untiring energy, did not make Dr. Grant famous. Characteristics incompatible with real greatness were, indeed, the main causes of his prominence and high position within his own sphere.

In whatever Church or denomination Dr. Grant might have been born, there he would have remained. It was his nature to wark, revived no memories in us; for our facts and impressions we

prominence and high position within his own sphere.

In whatever Church or denomination Dr. Grant might have been born, there he would have remained. It was his nature to accept implicitly the creed first presented to him, and, we might add, to hold it fanatically. If his father had been a Methodist instead of a devout Papist, he would have lived and died a credit to Wesleyanism. His was a temper incapable of hesitation or doubt; but unquestionably the Church of Rome fell in best with his mental constitution, as supplying a vast and also growing and accumulating mass of dogma. What may be called a natural bias was strengthened by circumstances of birth and training. His father's family had suffered in the furious party strifes between Catholics and Protestants, common in Ireland. Such contests and their bitter memories make, to use the biographer's word, "robust Catholics"; and Thomas Grant, she tells us, inherited from father, mother, grandfather, grandmother, "a robust primitive faith, a thoroughgoing allegiance to the Church, and a child-like devotion to the Mother of God"—a faith little disturbed by intellectual subtleties. Bernard Grant, the father, had been put to the trade of a weaver, but his turn was military. He enlisted into the 71st Regiment, and was present at the battle of Waterloo. While the regiment was still in France, Thomas, the future Bishop, was born in November 1816. Endowed, as it is said, from his cradle with a power of making his way into everybody's heart who came in contact with him, it was his fortune through life to be a universal favourite. All the trials we read of proceeded not from other men—nobody ill-used him, he had no enemics—but were either self-inflicted, or arose from bodily infirmity. Born extremely small, this smallness of stature was part of himself, and fitted in with the sort of petting that characterized everybody's dealing with him. smallness of stature was part of himself, and fitted in with the sort of petting that characterized everybody's dealing with him. Soldiers, old ladies, children, nuns, clergy, from childhood to death, fell into the same strain, and he was the l'ope's piccolo Santo. The child-like, often childish, simplicity of his manners never scally proported his taking the place for which his proported with the results and the same strain. Santo. The child-like, often childish, simplicity of his manners never really prevented his taking the place for which his powers qualified him, and they enlisted others in his service. As soon as he could speak plainly he answered the inquiry "What will you be when you grow up, Tommy?" by the invariable reply, "I should like to be a bishop"; and before he was eight years old an old lady bequeathed to him a gold cross, for "Tommy when he became a bishop." The priest—Dr. Briggs, of Chester—to whom his father presented him on coming to England, became so fond of him that he undertook his education, and at the age of twenty sent him to the English College at Rome, where he soon distinguished himself, more especially by the strength and tenacity of his memory, and by a certain quickness in seizing the point of a subject. The editor is candid in her admission of the one quality wanting:—

His intellect was wanting in the creative faculty; it was not endowed ith what we call originality. It was acute and comprehensive rather than with what we call originality. It was acute and comprehensive rather than broad, clear rather than deep. His was a sort of official intelligence; active, prompt, wide-awake, admirably adapted to the business habits of thought and administration that it was called upon to exercise in the bishopric.

Grant's great capacity for business found early recognition; and in 1841 he was ordained, created Doctor of Divinity, and appointed secretary to Cardinal Acton, under whom he stadied appointed secretary to Cardinal Acton, under whom he studied canon law, and won eventually the reputation of being the first "canon lawyer of the English Church." Three years later he was appointed Rector of the English College, an office he held from 1844 to 1848. Immediately before this he had made the acquaintance of Father Faber, who visited Rome while still a nominal member of the English communion, bringing introductions to Doctor Grant, who was exactly the man he was in search of. If he came to be convinced and converted he did not want a controversialist, which was never Dr. Grant's line, but a man of large and confident convictions, with a bold, fearless way of expressing them and acting upon them. This was Dr. Grant's power with certain minds—minds that wanted to be persuaded; he settled them and made them comfortable. Argument had certainly little left to do in the mind of "the Anglian."

First Bishop of Bushwark. By Co.

minister who made the Catholic priest promise to say the Salve Regims for him every time he passed the Church of Santa Maria Maggiore"; but Paher compliments Dr. Grant with the merit of a large share in his conversion. They fitted into one another as friends—as fr Maggiore"; but Paher compliments Dr. Grant with the merit of a large share in his conversion. They fitted into one another as friends—as friendship goes in these relations. Dr. Grant was filled with admiration for Faber's beautiful eloquance, and Faber paid tributs as the holiness and learning of the future Bishop. Moreover, both were distinguished for that cheerfulness which becomes a technical term in these narratives, and which is something distinct from the simple, calm, equable gaiety of the English parsonage. Cheerfulness is cultivated as a grace, enforced as a weapon. "Above all things be cheerful," Dr. Grant writes to 'the students. "Prever devotion to Mary, and cheerfulness," was his last message "Above all things be cheerful," Dr. Grant writes to the students.
"Prayer, devotion to Mary, and cheerfulness," was his last message to them. "Cheerfulness was his surest weapon against the devil."
"Laugh at him, nothing makes him savage like that; he soon leaves a soul alone that meets him with a hearty laugh." In the exercise of this grace, when Father Faber and Dr. Grant got together, they would laugh like a pair of schoolboys till they hardly knew what they were laughing at. It was in pursuit of this great desideratum that the Bishon cultivated his telest for siddles which he was for they were laughing at. It was in pursuit of this great desideracing that the Bishop cultivated his talent for riddles which he was for ever propounding at recreation times to his orphans and in society. To learn to laugh at nothing, to be amused with small jokes and witless trifles, is put forward as an important, we may well say serious, aim. To us it is a natural result of perfection in the science that Dr. Grant had no real intimacies—that is, no friendships in the full meaning of the term :-

It has been asserted by persons well fitted to pronounce on the subject that the Bishop of Southwark was never intimate with any one, not even with those he trusted implicitly, and to whom beyond any doubt he was sincrely attached. "You always felt," says one of these witnesses, " has there was a point beyond which you could never get with him. It was not that at any given point he repelled you, or that you felt as if you came upon a hardness or a coldness, but simply you felt you could go no further."

We do not know any quality more deterrent of true intimacy than this resolute cheerfulness, whether cultivated as a virtue or a grace, especially when it is busy and constructive, and comes out in what is termed "a happy knack of irrelevance," such as breaking in upon discussion or remark when it grow too warm by a riddle—Why is so and so like so and so? With Bishop Grant this was a favourite device for changing the conversation. He would thus silence a critic or divert an objectionable topic. Men must be of an unusually deferential turn of mind who like these interruptions to their own eager current of thought and expression; and, in fact, we perceive that the Bishop was most at home in, and preferred—if we may use the word with regard to conduct influenced by higher motives than conscious preference—the society of his subordinates, students, nuns, the clergy under his rule, and above all children. His humility was, we may almost say, elaborate; but it was his nature to lead and direct, and to conform circumstances to his own ideal. Any attack on his favourite dogmas, and we cannot but think that some men of his own communican must wince cannot but think that some men of his own communion must wince cannot but think that some men of his own communion must wince under his statements of these dogmas and his matter-of-fact mode of using them. Nature having denied him the gift of imagination, he could conceive of the invisible world, which he saw so vividly with the eye of faith, only as a repetition, in all matters in which he had to deal with it, of the world he knew. Nothing in it was doubtful, obscure, or indistinct. All was mapped out and inhabited with precision and absolute clearness. St. Aloysius's post-office would be to him a mere branch of our own; he delivered letters there with the same confidence that they would reach their destination. Perhaps Dr. Grant's highest intellectual faculty was his power of management and conduct of affairs. He was an excellent man of

Perhaps Dr. Grant's highest intellectual faculty was his power of management and conduct of affairs. He was an excellent man of business. We see this in his transactions with the Government at the time of the Crimean war, and in his choice of and instructions to the Sisters of Mercy sent out by him. Active and ardent zeal was under the control of practical sense and sound judgment. His newly created diocese grew into form and order under his direction. Churches, priests, communities, orphanages, rose and gathered round him. Rome knew the right man for the office when she placed him there. But this faculty of business in a man when she placed him there. But this faculty of business in a man of robust faith inherited from peasant ancestors, who viewed nothing in the abstract but as something to be turned to practical account and put to present use, certainly produces some singular effects upon the Protestant reader, and we should have thought upon some Catholice also. Thus he bribed the children under his enects upon the Protestant reader, and we should have thought upon some Catholics also. Thus he bribed the children under his direction to pray by submitting bargains to their consideration. So and So wants such a situation; if he gets it through your prayers he promises to come to Norwood and teach you some amusing games." The great principle of barter and exchange he supposed to be carried on with as much exactitude among the souls in purgatory as in any mercantile firm or company of this world. Those "Dear Souls" were subjects of his particular devotion, it would sometimes seem, because he could negotiate with them on liberal terms. If his stydents wanted fine weather for an amountion, he taught them to say a De profundie for it. A fine day thus secured was to remit to them so many days of penal fires. On this subject he spoke with so much knowledge and unction that a firm of Catholic lawyers were induced to promise a certain number "of Masses to the Holy Souls" if a complicated and uncromising task in which they were engaged were successfully infinited. They gained it sochaspilly that the promised offering was proportionately increased. "We are not told what were the marries of the cause determined through this instrumentality—a question of some importance in considering the case.

Dr. Grant was one of the most unselfish of men. We entertain

no suspicion that any personal and of gain or emittion was made, the subject of these transactions with the unsemp but it is one of the trials of the propagandist that he must have money; hance money was an abiding subject of thought and interest to Dr. Grant. How to save it and how to raise it is a leading topic in his biography; when it was once produced, he was visited by no doubts; he falt infallible in the use of it. He was successful with mortals, but his chief trust, we are told, by higher than any human agency. At any great emergency "all the forces of heaven were requisitioned to the service." The more business-like the tone of these appeals for funds, the higher the faith assumed. As soon as he makes up his to the service." The more business-like the tone of these appeals for funds, the higher the faith assumed. As soon as he makes up his mind to some work involving expense, "the usual engines are set in motion, namely, the prayers of children and the intercessive of the holy Souls." Asceticism itself had to give way when a good round sum was in question. It is related that on the occasion of his entering, at the age of twenty-five, on his secretaryship under Cardinal Acton, Dr. Grant adopted the habit of keeping his eyes down. "So few of those who only knew him after this date had an opportunity of seeing his eyes that it may interest them to learn what they were like." We are told that they were very fine—

the only beautiful feature he had [says our informant] ... perhaps humility had some share in the sacrifice which he imposed upon himself of keeping them downcast as a guard over his senses. How rigorously be adhered to the self-imposed rule all those who knew him in England can testify. ... He could, however, relax this discipline when charity or some other importions motive demanded it. A collection was being made in his discess for the orphanages, and a charitable lady, who was very scalous in the cause, met him on the stairs of St. George's one day, and said, "My lord, an accentric person has promised me 50. towards the collection if your Lordship will only look at me." "And why should I not look at you, my dear child?" replied the Bishop, at once raising his eyes to her with grave kindilnass. "God bless you!" he added; and the orphans got their 50.

This habit had a populiar effect on his physiognomy. Dr. Ullac-

This habit had a peculiar effect on his physiognomy. Dr. Ullathorne speaks of "the pulpitation of the eyes under the vell of their lids as indicating that tremulous state of scrupulous, delicate conscience which constituted his first great source of suffering." To the less observant his appearance was insignificant, leading to some exercises of humility. He was mistaken once for a mason coming to do a job. A street Arab wanting to carry his carpet bag, and his help being courteously declined, retorted, "Then you are no gentleman." "Perhaps not, my dear, perhaps not," was his really engaging reply. This grace was, however, put to a severet — one clearly trying to his hisographer. If not to himself from -one clearly trying to his biographer, if not to himself, from the fact of her recording it—when, on occasion of his officiating at the marriage of the Count of Paris with the daughter of the Duke of Montpensier, instead of being invited by the princes of the Orleans family to join the guests at the wedding breakfast, he was sent off to get refreshments at an hotel where a separate meal had been ordered for him; and this though he was a spiritual adviser of the Queen Marie Amalie. His severely literal mode of accepting all counsel and all downs shows itself in such traits as his fulfilment of the rule to eat what was set before him by eating a rotten egg; and by putting salt into his tea on the sly by way of penance, to the admiring horror of a nun who caught him in the

Dr. Grant's busy life of devotion to his Church was brought prematurely to a close in February 1870, by a painful disease, at the age of fifty-three. He received his summons to the Council when death was imminent, but so eager was he to obey that Dr. Gull thought it best to give way to his wishes, warning him that he would not return from Rome alive. The excitement revived him, as he thought, miraculously, and he prepared a speech which was to be delivered on the 14th of February; but while the Bishop who preceded him in the order of the day was speaking he fell on the floor of the Vatican Hall, and was at once removed to the English College, where he died shortly after. His intellect and will remained in full vigour to the end, so that the Pope's saying was quoted, "He is a saint, but one of the obstinate saints." Dr. Grant's busy life of devotion to his Church was brought

PLANCHE'S CONQUEROR AND JUS COMPANIONS.

PERSONNE CONQUEROR AND HIS COMPANIONS.*

DESTIDES the official title which Mr. Planché displays on his title-page, he is known as the writer of divers plays and of his own life, while his best title to reputation is probably that which is least generally known, that a good many years ago he published a very useful little book on British Costume. One or two scattered writings have shown that Mr. Planché has given some thought to the history of the eleventh century. He has now tried to put together a book of personal notices of the chiefs among the army which conquered England.

Mr. Planché, as Somerset Herald, writes rather as a book of

Mr. Planché, as Somerset Herald, writes rather as a herald than as an historian, but he by no means shows the herald in his lowest form. He rises above many of the follies of his graft. He does form. He rises above many of the follies of his maft. He does draw the line somewhere; he does not, like Sir Bernard Burks, put down anything that anybody chooses to tell him. He is not offended at the manifest fact that hereditary armorial bearings were not known in the times with which he has to do. Now this last is a sacrifice to truth which must need a great effort on the part of one who dates from the College of Arms, and Mr. Planché is entitled to all honour for making it. To believe that the non who "came over with William the Conqueror" really hore no lions or dragons guies or or or anything else, or that a height, if the fancy took him, might adorn his shield with a lion or in

^a The Conqueror and his Companions. By J. R. Pianché, Somerset Herald. 2 vols. Landon: Tinsiev Brothers. 1874.

one battle and with a dragon gules in the next, must be a hard lesson indeed to those who are professionally bound to believe, not only that people have always borne lions and dragons, but that the arrangement of lions and dragons in this or that fantastic fashion really makes a science. Mr. Planché has looked at the Bayeux Tapestry too often to be persuaded that William really bore the lions or two learners or whatever the correct thing is on his lions or two leopards, or whatever the correct thing is, on his shield, when nothing can be clearer in the contemporary record than that he did not. Mr. Planché has thus brought himself to gulp down an unpleasant truth, and we honour him for it. But something of the herald still clings to him. He clearly thinks that anything that has been said by an elder herald has some authority in itself, whether any original sources are referred to or not. Perhaps indeed he thinks that some measure of the same authority Perhaps indeed he times that some measure of the same authority belongs to himself; at least he is always saying things which may be true and which may be false, but for which he brings no evidence. In a book which deals so much with detail, with names, dates, pedigrees, and the like, it is provoking beyond measure to be so constantly left without references as we are by Mr. Planché. Sometimes he simply says a thing, sometimes he speaks of some modern writer, without so much as giving chapter and varue for the nuclear vertex. He has also notions about trudiand verse for the modern writer. He has also notions about tradition as something outlied to respect, even when unsupported by written testimony. And so of course real tradition is when you can get it; but Mr. Planché ought to know that what commonly passes for tradition in antiquarian matters almost always turns out to be the more guess of some antiquary of the seventeenth or of the best and the guess of some interest of the seventeents of pedigree is almost always interested and barefaced invention. Perhaps the leaving out of references is by way of making his book popular, for Mr. Planché seems, from his preface, to be in a desporate state of anxiety whether the general reader will like the Conqueror and His Companions or not. That question we must leave Mr. Planché and the general reader to settle for themselves. The book comes before us as a contribution to history, and as a contribution to history we must deal with it.

contribution to history we must deal with it.

We may sum up our judgment on the book by saying that it would have been of real value if Mr. Planché had given references. In attempting to give a sketch of the lives and pedigrees of all the recorded companions of the Conqueror, he naturally deals with a great mass of detail which is really quite worth examining into, but which the historian, strictly so called, can hardly be expected to deal with. History must, in the nature of things, be satisfied with dealing with the chief men, and perhaps with a few smaller ones, taken here and there, as anscimens of classes. No historian of ones, taken here and there, as appeiment of classes. No historian of England, no historian even of the Norman Conquest, could be asked to look up the pedigree of every man whose name is found in Wace's Catologue. It is much to Mr. Planché's credit that he takes Wace as his groundwork, and sets very little store by Battle Abbey Rolls and such like impudent fictions. A writer like Mr. Planché, a herald and genealegist, whose notions of evidence are not very sound, but are still much sounder than those of heralds and genealogists in general, might do good service by going over the ground and picking up such scraps as are to be found about the smaller people about whom history cannot find time to say much. And if he can find out anything by the way to throw more light on the greater people, so much the better. In such a way real Planché has not done some real service. We only say that Mr. Planché has not done some real service. We only say that he would have done much more service if his general notions of evidence had been sounder, and, above all, if he had given us his references, had been sounder, and, above all, if he had given us his references, to enable us to judge whether particular statements are trustworthy or not. Let us take one example. We have been told over and over again that Hagh Lupus, the first Earl of Chester, was a nephew of the Conqueror. We have never been able light on any confirmation of this statement. We can find nothing about it in the almost boundless research of Mr. Stapleton's Rotuli Sciencia i Normannia, nor is there snything like it in the thoroughly trustworthy genealogical tables of Duchèsne. Earl Hagh's father, Richard of Avranches, is a perfectly well-known person, and was most certainly not Duke William's brother. Mr. Planché tells us that Richard's wife and Hugh's mother was Rimma, a daughter of Herleva and Herlwin of Conteville, and therefore half-sister of the Duke. We can only say that we have lighted on no such person, but we cannot disprove her existence, therefore half-sister of the Duke. We can only say that we have lighted on no such person, but we cannot disprove her existence, and we are not prepared with any other mother for Earl Hugh. If Mr. Planché would only have given us a returence for this bit of genealogy, we should be able to judge whether the evidence for it was good or had. This is of course a question of evidence, and Mr. Planché may be right, though he has not proved himself to be so. But we do not ask for any evidence to disprove his constitutions and the constitution of t notions as to the origin of the paszling surname borne by the great Earl on the other side of England :-

I am inclined to believe the Normans were considered by the French as a race of Goths (as endeed they were)—a barbarous people, such as even now we should describe as "Goths and Vandals;" and the south of France having been subdued and occupied by them for nearly five contaries by that branch of the great Sythic family, distinguished as the West Goths or Visigoths, the latter appellations being more familiar to the French may have been corrupted into Vigot and Rigot, from which source I would also derive the well-known Norman name of Wigod.

The example I have already given of similar corresponds in the name of Baoulds Gael (p. 70, safe) will, I think, justify rise in suggesting, on these greeneds, that the family of I E Bigod was of Visigothic origin, and, as in the uses of Buldric the German, or Robert the Frieum, had assumed or been dissipated by the name of their race and country, of which they were proud, test substanting the same wherein it was applied by the French to the Normans generally. We have "Is Angevin," "Is Florning." Is Breton, " "Is Pultavin," I am inclined to believe the Normans were considered by the French as

"le Scot," dec., and in this category I think we may class "is Vigot," an abbreviation of "le Visigot," spelt, as we find it, indifferently with a "B" or a "W" (Biget and Wigot), according to the particular dislatet of the writers. The application of the name to the Normana generally, while it proves that it was not derived from any hereditary possession or personal pseculiarity, as in other cases, also testiles to the parity of the fearly, which was distinguished amongst its own people by the designation of that great Gothic stock whence they commonly proceeded.

About "the great Sythic family" we must simply ask in belighess ignorance for some further light. If it has anything to do with Mr. Rawlinson's "Scyths," we beg, in the name of Alaric and Atault, to disclaim the connexion; and as for Wigod, or more properly Wiggod, the name is not Norman at all, but as good English as it can be. Perhaps Mr. Plancho may have been led astray through Thierry's having mistaken Wiggod of Wallingford, King Edward's kinaman, Sheriff of Oxfordshire, and what not, for "un soldat appelé Vigot" in the ranks of Duke William's army.

army.

We will now go through some of the chief points in Mr.

Planche's book, in which he brings forward new views or tries to reestablish old ones, and generally seeks to call in question the results of modorn research. In one place we may say that he failed to attack a modern writer when he might fairly have done so, and has attacked an ancient writer instead. It is plain that in Mr. Freeman's account of the four knights by whom Harold was killed, after that he had received his wound from the arrow, there is a certain amount of exaggeration or misconception, owing there is a certain amount of exaggeration of misconception, owing it would seem to the historian's having failed minutely to compare the account given by Bishop Guy of Amiens with the accounts in Wace and the Tapestry. But Mr. Planché, instead of attacking Mr. Freeman, falls foul of Bishop Guy as a "Latin liballer, flinging his wretched calumnies on noble and distinguished warriors." can assure him that the Bishop is quite guiltless, and that the modern writer must bear all the blame. At the same time we do not quite follow Mr. Planche's argument when he tells us, "Mr. Preeman says: 'Nor are we amazed to find the son of Guy of Freeman says: 'Nor are we amazed to find the son of Guy of Ponthieu foremost in showing despite to the man who had one been his father's prisoner.'" "Why," continues Mr. Planché, "what had Harold done to injure Guy of Ponthieu? He was the injured, not the offender!" Mr. Planché would seem never to have heard the proverb that the man who has injured you will never forgive you, nor to have read the beginning of Lord Macaular's Reserved. Lord Stochastic History. lay's Essay on Lord Stanlope's History.

It is wonderful how little Mr. Planché has to tell us about the

Conqueror himself and his own family, except to be sure one fact which, if new, certainly is not true. Here and there, to be sure, his knowledge of costume comes in. He suggests that the trade of Herlevn's father was not, as everybody before him has thought, that of a tanner, but the somewhat more savoury craft of a furrier. He reminds us too, when he gets to the absurd story of William courting Matilda by striking her with his spurs, that "the spurs of that day were not rowelled, but made with one spear-shaped pint," as indeed in another story she is represented as dying from later blow of the same kind. This story indeed he does not believe, but he takes the worst possible view of the Conqueror's character in all matters. He believes the legend about Matilda character in all matters. He believes the legend about Matilda and Brihtric; and he makes a ladicrous misquotation of a passage in the Chronicle which one would have thought every one knew by heart, as it is in most school histories of England. The Chronicler, describing Domesday, tells us that William's statistics, as may be seen by the Exon Domesday, were so minute that "there was not an ox or a cow or a swine, but he put it down in his writ." This runs, in Mr. Planché's version, "so that not a rood of land, nor a living soul, nor a pig could escape his clutches, if upon any pretence whatever he thought fit to take possession of them." The inference would seem to be that Mr. Planché holds that oxen and pretonce whatever he thought fit to take possession of them." The inference would seem to be that Mr. Planché holds that oxen and cows have living souls, but that pigs have not. It would have been well too if Mr. Planché had taken a little pains to get up the most obvious facts in geography. What are we to say to a man who, writing about the Conqueror and his companions, confounds Le Mans and Nantes? It is actually so; in describing the campaign by which Robert became possessed for a moment of the Cenomannian country and city, Mr. Planché carries him to Nantes, instead of to the city which he was striving to get possession of. The confusion between Le Mans and Mantes is as old as the false Ingulf; Mr. Planché or his printer has further improved the blunder by turning Mantes into Nantes.

Mr. Planché goes at some length through the great puzzle about those children of Matilda who were not children of William; but he really has nothing fresh to say about it. But he has no

but he really has nothing fresh to say about it. But he has no ground for trying to increase their number by a certain Richard ground for trying to increase their number by a certain Richard Guet, of whom nothing is known, save that he appears in the Bermondsey Annals as a benefactor of that monastery in the year 1008, and that he is described as a brother of the Countess of Warren. Of course this means the Countess of Warren at the time, the wife of the second William of Warren. But Mr. Planche, for a reason which may satisfy a herald, but which will hardly satisfy anybody clee, thinks that this must mean the elder Countess Gundrada, the daughter of Matilda, because the younger ought to have been described as "Countess of Warren and Surrey." We will meet Mr. Planche on his own ground, and confess our doubts whether Gundrada had any right to be called Countess at all. On one point we must specially ask Mr. Planche for his references. He talks twice, as if it was a thing that everybody insee and that there could be no doubt about, that Wather Cliffard and Hingh of Sciencey had a hand in the attempt of the Attheling Ether. she to gain the onewn after the death of Caust. As some Normains came with the Mahaling, the thing is just possible; only one would like to know how they escaped from the cintches of Harolf Marsdoot; but it is really too had to tell a tale of this kind of two perfectly well-ascertained persons, when there most certainly is not a word about it in any contemporary writer. He presently goes on to discuss a prodigious mare s-nest about what he calls the mysterious battle of Cardiff in 1074, in which Roger of Montgomery, Earl of Shrewsbury, is said to have been killed. The whole thing is pure fiction, and comes out of the untrustworthy Brut, the one published by the Camden Archwological Association. In the thoroughly trustworthy Association. In the thoroughly trustworthy Association. But Mr. Planché, who never seems to understand what is evidence and sind in the earlier Brust there is not a word about it. But Mr. Planché, who never seems to understand what is evidence and what is not, goes for his facts to some late Norman Chronicle and to some modern Welsh books. The whole thing is part of the legendary conquest of Glamorgan, and nothing else.

There are other things which we might point out, curiously illustrating the wholly different way in which these things look to a herald and to a critical historian. Mr. Planché has not only brought up the old scandal about the famous William Peverel of Nottingham and the Pank being a natural son of the Connector.

Nottingham and the Peak being a natural son of the Conqueror, but he has found out that Thomas of Bayeux, Archbishop of York, was another. About William Peverel there is no evidence, and Mr. Planché has no new evidence. He is simply very angry with Mr. Freeman for refusing to accept Glover and Camden as if they had been writers of the eleventh century. The honour in short of the craft, the glory of all the dragons and wyverns, is set at nought. "Though Mr. Freeman is not bound to helieve the herald, his uncorrelegated assertion to the contrary is elieve the hereld, his uncorroborated assertion to the contrary is of no greater value." And again, "I am unfortunate in being opposed in my opinion to two such great authorities [Mr. Freeman and Mr. Exton]; but until they produce something like evidence to support theirs, I cannot consent to surrender my own." Most becoming, if Mr. Freeman and Mr. Exton had put forth any opinion or made any assertion. But Mr. Freeman at least makes no assertion; he simply refuses to believe an assertion for which no evidence is quoted. We should not like to be tried for any crime in a court where Mr. Planché was judge or juror. Though the prosecutor should bring no evidence whatever of our guilt, yet we should not be acquitted unless we could curselves bring some posed in my opinion to two such prest authorities [Mr. Freeman should not be acquitted unless we could ourselves bring some evidence of our innocence

We have said that Mr. Planche brings no evidence about William Peverel, for we assume that no one will call it evidence that there is a charter of William Peverel to Lenton Priory in which he speaks of the souls of King William and Queen Matilda, but not of those of any other parents of his own. Others, William of Warren for instance and Ivo Taillebois, were equally undutiful. But Mr. Planché's argument, if it proved anything, would go rather to prove William Peverel to be a son of the Queen as much as of the King. In Mr. Planche's eyes it proves him entitled to the unique description of "nullus filius."

In the yet stronger story about Archbishop Thomas, Mr. Planché does bring something like evidence. That is to say, he quotes a charter, said to be at Ghent, in which the Archbishop signs himself, in the printed text of Vredius, "Thomas Archiepiscopus Regis filius." But the signatures to the charter are strongered that the signatures of the charter are strongered. and suspicious, and the best scholars hold that the name of the and suspicious, and the next scholars hold that the name of the King's son Robert, who does not otherwise appear, while William Rufus does, has dropped out before the words "filius Itegis." The parentage and history of the Archbishop are well known. He had travelled and studied in many lands and had held a high office in the church of Bayeux. To say nothing else, he is not likely to in the church of Bayeux. To say nothing else, he is not likely to have been the son of a father who was only forty-two or forty-three years old at the time of his consecration. Besides, it is not likely that a natural son of the King should be called "filius Hegis," once in his life and once only. About the bastards of Henry the First there is no mystery, though Mr. Planché, to be sure, blunders among them also, making the famous Robert Earl of Gloucester a son of Edith of Oily. "Robertus filius Edse" was another brother.

Mr. Planché in short is no critic; but his work would have been useful in a subsidiary way, if he had only given references for his statements about the lesser people concerned. As it is, the book is very nearly worthless.

BOSWELLIANA.

BOSWELL," says Dr. Rogers, the editor of the work before us,

kept in a portfolio a quantity of loose quarto sheets, inscribed on each page Boswellians. In certain of these sheets the pages are denoted by numerals in the ordinary fashion; another portion is numbered by the folios, while a further portion consists of loose leaves so distier-backs. The greater part of the entries are made so carefully as to justify the belief that the author intended to embody the whole in a volume of literary anecdotes.

This portfolio is now in the possession of Lord Houghton, by whom "it was lately handed to the Grampian Club, with a view to publication." Dr. Rogers, like his brother Scot, Mr. Main, whose abridgment or hash of Boswell's Johnson we criticized a few

2. Recomblisher: the Commonsplace Book of James Branch. With a Manusle and Annotations by the Rev. Chaffes Rogers, Ll.D., Historiographer of the Royal Historical Society, Fellow of the Society of Antiquaries of Scatland, and Corresponding Member of the Historical Swelety of New England; and Introductory Remarks by the Right Homographe Lord Bengham. London: Printed for the Grumpian Club. 1874.

months ago, only ventures to come before the public under the protection of an Englishman. What Mr. Lewes hid for Mr. Mein, Lord Houghton has done for Dr. Rogers. Can it be that the Scotch still have such an awe of Johnson that, even in desling with him indirectly through his biographer, they only feel themselves secure when under the wing of an Englishman? "Ev'n in our ashes live their wouted fires," the shade of Johnson might cry out. We could have wished that Lord Houghton had found an editor of his manuscripts of whom it could have been said, as it was said by Boswell of Malone, that he was Johnsonianisainus. Dr. Rogers has no doubt some special qualifications for the task he has taken in hand, and we can easily believe that Lord Houghton does not praise one part of the work too highly when he says, "Executed as it is by Dr. Rogers, it affords an interesting social picture of the Scotland of the day, and there are many families still living who will here gladly recognize and welcome the words and thoughts of their ancestors." recognize and welcome the words and thoughts of their ancestors While we fully sympathize with the pleasure which these families still living will find in seeing their ancestors in print, we must confess that we often find the words and thoughts very tedious and commonplace. Surely even a Scotchman can onjoy a good story without requiring to know the pedigree of every one mentioned in it. Here require these foot-notes, to 18. Rogers ought, if his countrymen require these foot-notes, to have made them somewhat answer in length to the marita of each story. A good joke might have justified a long note. But we must protest when a foot-note of about forty lines is given in explanation of such a story as the following:—"A very awkward fellow was dancing at the Edinburgh Assembly. Matthew Henderson said, 'He looks like a professor of dislocation."

If there are any of Mr. Henderson's family still living, they will learn that he was a native of Ayrshire, that he long resided in Edmburgh, where his society was much cherished, that he dined regularly at Fortune's Tavern, that he was one of Burns's chief associates, that he subscribed for four copies of the second edition of his poems, that he died in the summer of 1790, and that his of his poems, that he died in the summer of 1790, and that his memory was celebrated by the Ayrshire bard in an elegisc poem. Nay, moreover, if a copy cannot be got of that rare work, Burns's Poems, Mr. Henderson's family still living will have the molancholy satisfaction of reading in Dr. Rogers's note no less than twelve lines of the elegy. They can read also a quotation from one of the poet's letters, and another from a tract by the Lord Chief Commissioner Adams, which was printed at the Blair-Adam press in 1836. In a note to "a list of eminent Scotsmen" which is given in this tract, they will find mentioned "Matthew Henderson, at a future period distinguished by Burns." No one can doubt, considering the minuteness with which it has been executed, that "the historical and biographical amotation of these anecdotes has been a work requiring considerable local knowledge and antiquarian research." At the same time, if we were not utterly indifferent to the facts contained same time, if we were not atterly indifferent to the facts contained in three-tourths of the notes, we should be in some fear as to their accuracy, when we notice the odd blunders into which the author has more than once fallen when he has crossed the Tweed, Houghton certainly cannot be answerable for an excess of punctuation which appears in one passage in his Introductory Remarks. Perhaps, however, Dr. Rogers will charge the printer with the comma by which a certain Mr. Nassau, Senior would seem to be distinguished from a Mr. Nassau, Junior. It is strange, however, that an editor in correcting the proof-sheet should not, supposing he had the requisite knowledge, have detected a mistake so absurd as this. Be the fault whose it may, a man might be fully compe-tent to edita work of Hoswell's even if he had never heard the name of Mr. Nassau Senior. But the blunder, or rather the blunders, into which Dr. Rogers falls in a note he gives to the following story, show an ignorance which is the most extraordinary in a writer who is entitled "The Historiographer of the Royal Historical Society":—

, who translated Ariosto, had a dispute with Tom Wharton as to some passages of it. — knew the subject perfectly, but could not express himself. Wharton knew it very superficially, but wrote with case and vivacity. Johnson said "The one had ball without powder, and the other powder without ball."

Now any one who, without being Johnsonianissimus, might yet be at all events Johnsonianus, would at once that if in the Boswelliana the name is written Wharton, it is so written by mistake. It is very improbable, however, that floswell wrote Warton, "Wharton;" for a Scotchanan who does not orait the aspirate in words that begin with wh is by no means likely to have inserted one where it was not required. We cannot but suspect, therefore, that Dr. Rogers, knowing nothing of Thomas Warton, has thought he was more than justified in amending Bowell's spelling, and in converting Tom Warton into Tom Wharton. We will first quote the passage from Boswell, and then will give the Historiographer's learned note. Boswell says:—

Huggins, the translator of Ariosto, and Mr. Thomas Wixton, in the early part of his literary life, had a dispute concerning that poet, of whom Mr. Warton, in his Olservations on Spenser's Fairy Queen, gave nous account which Huggins attempted to answer with whilenes, and said, "I will militate no longer against his mentione". Huggins was master of the subject, but wasted expression. Mr. Warton's knowledge of it was then imperfect, but his manner lively and elegant. Johnson each, "It appears to me, that Huggins has ball without powder, and Warton powder without bell."

Dr. Rogers, evidently in entire ignorance of this passage, gives the following note:-

Thomas, Marquess of Wharton, a vigorous supporter of William of Orange, was, on supported by the peculiar manners, familially known as Tom Wharton. He remained in Tayour with William III., and held high offices

of state under Quan Anne and George I. He composed the celebrated "Lillibullero," and used to boast that he had sung a king out of three king-He died 12th April, 1713.

"Lilibulero," and and to boast that he had sung a king out of three kingdoms. He died 12th April, 1713.

Dr. Rogers, having first turned Tom Warton into the Marquis of Wharton, has then to account for the fact that so great a nobleman was called Tom. Utterly unaware that he was not born a marquis or even a lord, and that for the greater part of his life he was known as Mr. Thomas Wharton, he has to fall back on the hypothesis that if a nobleman is christened Thomas, pseuliarity of manners will lead to his being familiarly known as Tom. He crowns his mistakes by killing off the Marquis in 1713, though he lived, as he has just told us, to hold a high office of state under George I. If he is inaccurate about one great Minister of those days, we have no fault to find with what he tells us of a yet greater Minister. Though it scarcely bears on Boswell, except so far that Boswell was told by Dr. Barnard, who was told by Dr. Delany, who must have heard it from Swift, that Parnell had been drinking when Swift introduced him to Lord Oxford, yet Dr. Rogers is not incorrect when he writes in a note, "Robert Harley, Earl of Oxford, Lord High Treasurer, was a steady promoter of men of latters. His career forms an important part of the political history of England. He died 21st May, 1724."

Dr. Rogers charges Roswell, on the authority of Mr. Croker, with "omitting a conversation" that told against him. Johnson, as our readers will remember, was dining one day in a large company, when, as Boswell tells the story, "He repeated to us, in his forcible melodious manner, the concluding lines of the Danciad. While he was talking loudly in praise of those lines, one of the company ventured to say, 'Too fine for such a poem—a poem on what?' Johnson

melodious manner, the concluding lines of the Dunciad. While he was talking loudly in praise of those lines, one of the company ventured to say, 'Too fine for such a poem—a poem on what?' Johnson (with a disdainful look), 'Why, on dunces. It was worth while being a dunce then. Ah, sir, hadst thou lived in those days! It is not worth while being a dunce now, when there are no wits.'" Dr. Rogers gives a very inferior version of the same story, and charges Boswell with omission, though Mr. Forster in his Life of Goldsmith has pointed out, in reference to this same story, how often "the copyist gets himself quoted afterwards to corroborate or invalidate the only real authority." How unfamiliar is Dr. Rogers with his Boswell will be seen from the following fact. Many of the stories that are found among the Boswelliuma are given also in the stories that are found among the Boswelliana are given also in the Life of Johnson, as Dr. Rogers, whenever he is aware of it, is caroful in each case to inform his readers. Of the first twolve stories in the present collection that are common to both books, Dr. Rogers has only noted down two. We shall have done enough if we give one more instance of his unitness for his task when he was a which has read the gets outside of his local knowledge. Every one who has read the Life will remember how, when Boswell was on the eve of starting for Utrecht, he and Johnson spent a day together at Greenwich. Dr. Rogers thus gives his account of that celebrated day:—

"Come," said Johnson, "let us make a day of it; let us go down to Greenwich and dine, and talk of it fully, so that I shall say,---

On Thomes's bank in silent thought we stood, Where Greenwich smiles upon the silver flood,"

Where Greenwich smiles upon the silver nood."

The friends proceeded to Greenwich on Saturday, the 30th. They inspected the hospital, walked in the park, and returning to London by the river, closed the day's excursion by supping together at the "Turk's Head." During the evening Boswell entertained his Mentor by expatiating on the history of his house, and the extent and importance of the family estate. By Johnson no allusion was made to the ostensible purpose of the meeting; it was enough that on a day of the week when Boswell was likely to meet with bad counsellors, he and his purse were protected from their embrace.

In a note to the verses he says, "This account of the quotation from Johnson's poem of 'London' is contained in a letter addressed by Boswell to Sir D. Dalrymple. In the 'Life of Johnson' Boswell states that the quotation was made by himself." Boswell states no such thing. He says, "I was much pleased to find my self with Johnson at Greenwich, which he celebrates in his 'London' as a favourite scene. I had the poom in my pocket, and read the lines aloud with enthusiasm." He does not indeed mention in his Life, as he does in his letter, that two days before and read the lines aloud with enthusiasm." He does not indeed mention in his Life, as he does in his letter, that two days before Johnson had quoted these lines to him. But a writer is not to be charged with a falsehood—a falsehood too that could only have sprung from the most contemptible vanity—because he says that he read aloud a passage on Saturday which his friend had quoted on the previous Thursday. But the whole passage is as incorrect as the note. "By Johnson," says Dr. Rogers, "no allusion was made to the estensible purpose of the meeting." No allusion was made at the "Turk's Head," because "the estensible purpose of the meeting had been fulfilled at Greenwich. "I recollect," says Hoswell, "with admiration, an animating blaze of elequence, which roused every intellectual power in me to the highest pitch, but Hoswell, "with admiration, an animating blaze of eloquence, which roused every intellectual power in me to the highest pitch, but must have dazzled me so much that my memory could not preserve the substance of his discourse." What, by the way, does Ir. Rogers mean by "the day of the week when Boswell was likely to meet with bad counsellors"? He was certainly too fend of the bottle, and likely enough, "concluding," as he did, "the day at the 'Turk's Head' very socially," he may have drunk quite as much as was good for him; but as the Saturday half-holiday was anknown in his time, it is scarcely probable that Johnson on that day kept him with him with a view to protect him and his purse from the embrace of had counsellors. It was only, by the way, about a fortaight before this that Boswell, complaining to his friend Demoster that dri king port and sitting up late with Johnson affected my nerves for some time after," received the roply, "One had better be palsied at eighteen than not keep company with such a man."

It is difficult to conceive for what sor: of readers this lengthy

Memoir has been written. Who will care for a Life of Boswell th does not care for the Life of Johnson, and who that cares for the Life of Johnson will care to have it given in an abstract? We are willing to allow that there could be few harder teaks than to write a Memoir of Boswell. Wherever his life touched Johnson's so much is already known that his biographer might be fairly puzzled about the plan that he ought to pursue. The task would have been far easier no doubt if only "the Journal" had been preserved "in which," to quote Dr. Rogers, "he recorded the diurnal occurrences of his own life." Dr. Rogers does the best he can to supply the want of this diurnal journal by giving, wherever he has an opportunity, the briefest account of matters which in themselves are utterly unimportant. Boswell spent not a few Easters with Johnson, and often records the services they attended together. e Life of Johnson, and who th oes not care for th are utterly unimportant. Boswell spent not a few Easters with Johnson, and often records the services they attended together. There is nothing impertinent in these records; on the contrary, they generally introduce with propriety the conversation that took place on the way to or from church. But Dr. Hogers, writing as he does for Scotchmen, thinks no doubt that the chief matter is the fact that Boswell went regularly to church. On Good Friday 1774 he tells us "that they were present at three religious services." On Good Friday 1778 "they spent Good Friday together, Boswell accompanying the lexicographer [Dr. Rogers delights in calling Johnson the lexicographer] to morning and evening service in St. Clement's Church." In 1779 Boswell "spent Good Friday with Dr. Johnson, attending him at both diets (sic) of worship in St. Clement's Church." In 1779 Boswell "spent Good Friday with Lr. Johnson, attending him at both diets (sic) of worship in St. Clement's Church." The Good Friday of 1781 "was, as usual, spent with Dr. Johnson, the friends worshipping together in St. Clement's Church." Again, in 1783 "the friends worshipped together in St. Clement's Church on Good Friday." How disproportioned are these accounts of the religious observances of one day to the rest of the narrative will be seen when we state that to the entire history of the years between 1774 and 1783 not forty pages are given.

10r. Rogers's work might well be used as a model of paraphrasing

by those unfortunate tutors who have to prepare students for the Civil Service Examinations. He is describing, for instance, the poet Derrick, and says, "Introduced to Johnson, he obtained a share of the lexicographer's regard, but while entertaining affection for him as a man, the moralist reproved his muse and condemned his levity." The moralist had condemned his levity, as our roaders may remember, by saying, "Derrick may do very well as long as he can outrun his character, but the moment his character gets up with him it is all over." He had reproved his muse by replying, when he was asked "whether he reckoned Derrick or Smart the best poet?" "Sir, there is no settling the point of pre-

codency between a louse and a flea."

We have said nothing as yet about the collection of stories which Boswell made under the title of Boswelliana. On some future occasion we may hope to find an opportunity of considering these apart from their editor.

GABRIEL DENVER.

NOTHING would be easier than to treat this book from the purely ludicrous point of view. It abounds in crudities and extravagance; it frequently passes the narrow limits which divide the sublime from the ridiculous; and, in short, it has all the distinctive marks of the first production of a clever young man. It is highly probable that at some future time Mr. Madox Brown may himself look back with some amusement upon this, which we take to be his first literary venture; and he might then be inclined to forgive us if we had treated him rather harshly. If we had treated him rather harshly. However, the slashing style of criticism has gone rather out of date, and for sufficient reasons. If a man is simply a fool, it does very little good to proclaim that fact to the world at large, and it is not likely to do much good to him. We may doubt, indeed, whether genius has often been stamped out by hostile criticism. Most youthful geniuses have a sufficient stock of vanity to incline them rather to hug the character of martyr than to abandon their efforts to enlighten an unsuppreciative world. vanity to incine them rather to mug the character of martyr man to abandon their efforts to enlighten an unappreciative world. But mere ridicule is at best an infliction of some useless pain, and should be kept for its rightful uses. When a man of talent is actually misleading the public taste, and when his literary error is complicated by the moral defects of arrogance and aminimal the switch may apply the lead unreservedly in the hope cynicism, the critic may apply the lash unreservedly in the hope of reforming the criminal, or at least diminishing his following. We may possibly admit, moreover, that there are some kinds of stupidity so overweening and obtrusive that almost any weapons of assault are justifiable. Mr. Brown, however, does not come within any of these categories. His errors are obviously the errors of youth. His taste requires to be cultivated; but he has been honeatly aiming at a high result. Moreover, in spite of his faults, there are indications of power about his writing which call for lenient treatment. And therefore, though we cannot pass over his faults in silence, we desire to be understood as admitting that Gabriel Denver shows a promise of better things, and is not so absurd as some of our remarks may appear to imply.

The story is simple enough. There is no want of unity either of scenery or motive. We might describe it roughly by saying that Mr. Brown appears to have adopted Rochester, his first wife, and Jane Ryre, from Miss Broatb's first novel, set them affect together on the ocean, and involved them in a maiodramatic ad-We may possibly admit, moreover, that there are some kinds of

^{*} Gabriel Draines. By Oliver Madaz Browns. Landon t Smith, Elder, & Co. 1873.

venture after the manner of Mr. Charles Reade. The statement, however, would be inaccurate in many ways, though it serves to hit off some of the most prominent pseudiarities of the story. Mr. Brown does not possess Miss Broand's power of describing certain types of character; nor has he Mr. Charles Reade's psculiar realism. The events, extravagent enough in themselves, are generally set forth in a highflown poetical style which suggests that the author has been just reading Shelley's "Vision of the Sea." Storm and fire, and gorgeous sunsets, and blaxing tropical noons are described with considerable flow of language, and the sentiments of the actors are for the most part so highly pitched, that we rather wonder that they can preserve their sanity, as indeed some of them do not, to the end of the volume. The main facts can be briefly described, and they will show sufficiently what scope Mr. Brown has allowed himself, till we end by doubting whether we have been reading a romance or the description of a nightmare.

been reading a romance or the description of a nightmare.

Mr. Gahriel Denver is a young man left an orphan in Tasmania. The only other member of his family is his cousin, Miss Deborah Mallinson. Deborah has lived with him all his life, and after the death of his parents and his sister, she makes him an offer of marriage. Gabriel replies in the ordinary language of heroines, "I counct love you." Deborah does not care for such a trifle, and the young man finally surrenders at discretion. The unwilling victim is about to be led to the altar as helplessly as Captain Outtle, when the news comes that he has inherited an estate in England. He wishes immediately to start by a ship which is just sailing, but Deborah is much too keen to allow him to start alone. She takes her passage in the same ship, being thoroughly determined not to lose sight of him till the ceremony has been performed. "Some marriages," as Mr. Brown pathetically remarks, "are bitter, bitter mockeries!" However, there are a good many slips between the cup and the lip, and the affianced cousins are destined to experience the truth of this doctrine. Their only fellow-passenger is a young woman of exquisite beauty. Gabriel sees her as he is looking at the ship on the eve of his departure, and straightway falls in love with her as decidedly as Romeo fell in love with Juliet. Before he has even been able to speak to her his doom is fixed. He takes his second look at her through a telescope, as she is gazing from the deck:—

From that moment he knew that he loved her irrevocably. No merely human words could describe all the tunultuous longings and thoughts which thronged his brain; for there are some phases of human passion which, while they last, can never be described in mere words—only some of our most madly inspired musicians have been divinely gifted with power to eliminate and strike these chords; for which indeed their art seems the only possible utterance.

The three persons thus described are confined together on board ship for many weeks, for it is in the old days of slow passages. Their position, as may be supposed, becomes very disagreeable to one of the persons concerned. Gabriel is entirely absorbed in his passion. He is in the state irreverently described in modern alang as "spooning." He can think of nothing but the lovely Laura; he cannot even find time to say a word to the officers of the ship; still less does he speak to the gloomy Deborah, who looks on with unimaginable feelings at the treacherous youth from whom she has exterted a promise of marriage; he sits through the evenings by the side of Laura, who speedily returns his affections, and he even raves about her in his dreams. Within a week after they have sailed Deborah hears him saying aloud in his sleep, "Laura, Laura, I love you!" A more disagreeable incident occurs soon afterwards. Gabriel sees a dark figure on the deck one night, and instantly clasps her in his arms with enthusiastic passion. Unluckily the figure turns out to be Deborah, who proceeds to revile him in language more frequently heard upon the stage than in real life. "O God!" she exclaims, "after all I have done and suffered from you"—which, by the way, appears to be nothing more than forcing him to promise marriage—"to be kissed and embraced by mistake for another woman!" After two or three pages of raving, she adds that she has bitten her lips till her mouth was full of blood to restrain herself, but that she will have it out now. We may ask, parenthetically, whether anybody out of a novel ever did bite his or her lips till the blood came; we have tried the process in an experimental spirit, but have never succeeded in actually drawing blood. However, Miss Deborah would have done it if anybody ever could, judging by the spirit of her concluding remarks:—

"You can't and shan't get rid of me " [she exclaims]. "I swear you shall share all my sorrows to the last bitter, bitter dregs. I'll cling to you to the last hour of your existence, and make every day of your life as great a curse to you as you have made mine to me. Ah! you feel my words; but I'll make you wince still further yet, till you are as mad and wretched as you have made me, though you have some one to love you."

A great deal more of the same kind follows, and the lady nearly tempts the gentleman to throw her overboard and "stain his soul with murder as well as perjury." Gabriel, being a man of high principle, feels that there is really some force in the remonstrances addressed to him; and the situation is rapidly becoming unbearable. When a luckless young man is shut up with two such companions in a ship at sea, he is in a very awkward position; and it is hard to say what might have happened in real life. There can, however, be no doubt of what must happen in a fiction of this class. In fact, Milb Deborah follows the example of Mrs. Rochester under circumstances which make her performance much more disastrons. She sets fire to the ship, which, amongst its cargo, has a large supply of turpentine on board, and hums with fearful rapidity.

Then follows a description which, in suite of its pure absentity, is by no means wenting in power. All hinds of grotseque and horrible incidents occur; rets try to escape, and a soning is shrivelled up, and an albatross drops into the flames; the sailors ewear and struggle and perform acts of heroism. Ultimately, owing to a series of incidents on which we need not dwell, the hero and the two ladies find themselves adrift in a boat, without any kind of supplies, while the ship is speedily burnt before their eyes. It is unpleasant enough to be alone at sea with the lady you love and with another who is prepared to murder you and her out of jealousy, as must be admitted; but it is still more unpleasant to be exposed with the same two ladies in a small boat under a tropical sun with nothing to eat or drink. Poor Gabriel indeavous to make the best of a bad business, though perhaps he hardly shows that fertility of resource which would have distinguished one of Mr. Reade's heroes under similar circumstances. His most promising device is fishing with a crooked pin and a bit of string in the middle of the ocean. As might be expected, he does not catch anything, though his bait is a piece of cloth stained with his own blood. We regret to add that, though misfortune occasionally softens the heart, it does not produce any appreciable effect upon Miss Deborab. She continues to sulk as savagely as ever, and when she speaks at last, her remarks have a most unchristian and reprehensible character. The two lovers are protty much absorbed in each other's sufferings, and the sight of their misfortunes is apparently the only consolation of which Miss Deborah is sensible under her own.

And here perhaps it is as wall that we should conclude our account of the book. We will leave our readers to imagine a conclu-

And here perhaps it is as wall that we should conclude our account of the book. We will leave our readers to imagine a conclusion for themselves. If they are benevolent, they will probably hope that a ship picks up the outcasts before the worst happens, and that an eloquent missionary on board succeeds in converting Deborah and inducing her to confess and give her blessing to the marriage. If they are of sterner stuff, they will probably wish that the wicked may be punished, that Deborah may be driven out of the senses of which she made so bad a use, and that Gabries arony if the precedent of the Ancient Mariner were followed out, and supernatural machinery introduced to conclude the development of the precedent of the Ancient Mariner were followed out, and supernatural machinery introduced to conclude the development of the pict. There are simple-minded persons who cannot read a story with satisfaction when they know beforehand what is to be the nature of the catastrophe; and in consideration of their feelings we will not unveil the secret. To Mr. Brown, however, we must still say a word or two in conclusion. We began by saying that he showed some genuine power. Probably the quotations we have made will scarcely tend to persuade our readers that we were quite sincere in our complimenta. We must therefore explain, in justice to the author, that the power of which we spoke is to be found rather in his descriptions of natural scenery, which are generally good, and often very spirited, than in the speeches of his characters. They rant in language of which we can seldom approve, even partially; and we will therefore suggest to him that he would do well to remember that power is not shown in simply "piling up the agony" so decisively as in judicious self-restraint. The great writer can make the most commonplace objects pathetic or terrible; it is so far a proof of inferiority when a man is forced to strain his voice to the uttermost at every page and to keep his passion always at boiling point. If Miss Deborah had b

. TAYLOR'S ETRUSCAN RESEARCHES.

SOME mouths ago (May 3, 1873) we laid before our readers the grounds on which Lord Crawford rested his conclusion that the old Etruscan language was nothing more or less than a High Dutch dialect. Before him Dr. Donaldson had regarded it as a Low German idiom not improved by its contact with Umbrian, while Dr. Prichard had refused to allow that anything was tolerably well established with regard to it beyond its connexton with the Indo-European, or, as it is now called, the Aryan, family of languages. Professor Corusen's work on the subject still remains a promise for the future. In the meanwhile Mr. Taylor's volume comes to shatter even the more cautious hypothesis of Dr. Prichard.

^{*} Etruscan Researches. By Isaac Taylor, M.A. Author of "Words and Places." Jundou: Macmillans. 1874.

In such a controversy as this we must content ourselves with In such a controversy as this we must content ourselves with endeavouring to insure a fair hearing for all who may be entitled to be heard at all. That Lord Crawford had this title we were constrained to allow, slithough we expressed our misgivings that for not a few of his conclusions his arguments and evidence were perilously slender. He had done all perhaps that could be done to establish his hypothesis, and thus far his toil was by no means thrown away. It, after all his efforts, his conclusions should be a more complete justification for attempts to seek a solution of the mystery elsewhere.

That Lord Crawford's method did not take him back far enough is unfortunately only too plain. There might be danger in connecting the Etruscan Kahatial with the old German haftig; but it was clearly necessary to doal with a suffix which seemed to connect it still more closely with agglutinative dialects. The name Andas, said by Hesychias to be an Etruscan word, might be plausibly compared with the Latin ventus and the Teutonic wind: but the question to be first settled would be the measure in which Latin or Aryan words might or might not have found their way into a non-Latin or non-Aryan vocabulary, just as, on the other side, the assertion that ventus was a Latin word would stand or fall with the evidence which might prove the extent of importations into Latin from Etruscan. The present languages of the Persians and the Ottoman Turks have more than a sprinkling of Arabic and other foreign words; and any reasoning which should treat words so borrowed as belonging to Persian or to Camanli must necessarily be worthless. In short, it might be Osmanli must necessarily be worthloss. In short, it might be said that Lord Crawford's method, although fairly entitled to consideration, was defective; that, in seeking to recover the key to an extinct language, he should have begun with those words which no people ever borrows from another; that from these he should have advanced to the primary grammatical developments in pronouns and inflaxions; that all these should have been carefully compared and inflexions; that all these should have been carefully compared with the numerals, pronouns, and case-endings of other dialects or families of speech, and that no positive conclusions should be laid down until their affinity with some one or other of these should be estisfactorily ascertained; that, after laying this foundation, the next task would be the comparison of the names of gods or other beings worshipped by the one people with the gods of other nations—an inquiry bringing us into the regions of Comparative Mythology; that the next step should lead to the consideration of their habits, their laws, and their religion, and that lastly any peculiarities in the position or fortunes of the people in question should be sufficiently accounted for or explained.

Such a method would not only be more safe than that of Lord Crawford, but it could not fail to be infinitely more interesting; and the adoption of this method by Mr. Taylor would alone suffice to make his volume altogether more attractive. Indeed from first to last its interest never flags; and the reader as he closes the book will feel that, even if Mr. Taylor's conclusions cannot in every instance

feel that, even if Mr. Taylor's conclusions cannot in every instance be sustained, the conditions of the controversy have at the least been materially changed. If we take first the numerals, her may beyond all doubt say that the dialect which has tessures, he may deka belongs to the same family of languages with dialects which express the same numbers by petures, quatuur, fiduur, four and fier, by sex, six, and sechs, by dasan, decens, sehn, and ten. Happily the discovery of a pair of dice about five-and-twenty years ago in a tomb near Toscanella furnishes the means of a comparison which a tomb near Toscanella furnishes the means of a comparison which up to that time, in spite of inscriptions containing the written names for higher numbers, was wholly wanting. These dice, instead of the usual dots or pipe, displayed six monosyllabic words, the necessary conclusion being that these words demoted the numbers from one to six. The words were mach, thu, huth, ki, sai, and sa. A comparison of these numerals with those of Teutonic and Semitic dialects gave, in Mr. Taylor's opinion, no result at all; but he had no sconer passed the borders of Turanian speech than the darkness began to be dispelled. In seventeen of the Tatar dialects belonging to the Turkic family the word box-mach denotes a "finger," while in Lesghi the finger-mail is manch, in Burjit ko-mah-on. In Tungusic dialects the word assumes the forms unuk-kotscher and much-utshon, and in these dialects the numeral one is denoted by smukon, umukon, and two or dislects the numeral one is denoted by smuken, umuken, and two or three similar forms. In Lapp and Wogul the word for six is ket, in Hungarian it is hat, "a form which closely approximates to the Etruscan Auth."

As we are neither affirming nor denying his conclusions, it is unnecessary to follow Mr. Taylor further in this part of his task, and we turn to the more entertaining chapters on Etruscan and Latin mythology. It is impossible to deny the straightforwardness of the process which takes all the names of deities or objects of reverence found in the sepulchres or on the vases and mirrors of the Erruscans, and submits them impartially to a comparison with names belonging to the mythological systems of the surrounding nations. These beings may be distinguished at a glance in those groups, almost always beautiful, often most touching, which represent the parting of kinsfolk and friends. Some of them are winged, sont the parting of kinsfolk and friends. Some of them are winced, all are marked as wearing buskins. Among the most important of these beings are Kulmu, which, coming out of a temb with torch and spears, seems to represent the spirit of the grave; and Vanth, with a key or club, the angel of death or destruction. Taking these two at starting, Mr. Taylor proceeds to inquire whether in any known Aryan, Turanian, or Somitic language the word Kulmu denotes the grave, the word Vanth the power of death; and although the Aryan and Semitic dialects furnish no that he finds that in the old Finn mythology Kalma is the name

of the deity ruling over the grave and its inhabitants, the Kales speaking of the dead as those "who have disappeared in Kales In the speach of the modern Finns the same word has come denote the smell of a corpse. In Ostiak the word Kul me denote the smell of a corpes. In Ostiak the word Kul means death, and Kuly is a malignant deity worshipped in commuten with the grave. In Lapp the grave is Kalma, in Wogul Koloma, while the Turkish exhibits in Choul, with much the same meaning, a word more familiar to English ears. This, it must be admitted, looks like strong evidence. For Vanth Mr. Taylor holds that the Turkish dictionary furnishes a sufficient explanation. "In Turkish vans means ready to periah, and the substantive fona, roma, means destruction, annihilation, death; . . . in the Kot dialect fense means eahes; and in the so-called Yenissel-Ostiak sen means corrupt, rotten." However this may be, it seems clear that the Etruscan Vanth must be compared with the Latin ben means corrupt, rotten." However this may be, it seems clear that the Etruscan Vanth must be compared with the Latin vanus, possibly with the English mon, the Latin vanuscere certainly expressing a readiness to perial not less than the Turkish must. In other words, we have to face the questions how far Latin words may have been imported into Etruscan, or Etruscan words into Latin, or how far Etruscan and Latin, and if these, then Greek or English, or any other Aryan languages, may not possess common elements derived from the same source. Thus the matter to be determined is the vadical con-Thus the matter to be determined is the radical nexion of all the three great families of human speech; for if the connexion be established in the case of the Aryan and Turanian languages, it can scarcely be believed that the same commexion can

fail to be proved between these and the Semitic.

The passages in which Mr. Taylor touches on this subject are among the most interesting and certainly among the most important in his volume; but we cannot say that the points of likeness (whother accidental or not) are confined to those instances in which he fairly admits the resemblance, or in which he traces it to a deliberate borrowing of Latin words by the the faces. Thus, with some plausibility or even cogency, the name of the Boudiei, a Median tribe mentioned by Herodotus, is identified with the tribe names of the Vod and Wotiaks, and with the Hungarian town of Buda; while the name of the Mardians, another Median tribe, is connected with the Finn word mart or must, "men." It seems odt that the innic and Median names should answer to the Greek Boorog, the Ininic and Median names should answer to the Greek paors, in that the Lapp tjarrok, supposed to be found in the Etruscan Tarquin, and translated by the Latin "rigidus," should resemble the Teutonic stark; that the Turanian misur, the gods, should be so like the Aryan Esir. But although these instances may have escaped his notice, Mr. Taylor does not hesitate to face the question and to answer it as comparative mythologists have already answered questions relating to the affinities of Greeks, Hindus, Persians, and Englishmen. The Aryan numeral for 5, he asserts, corresponds to the Turanian numeral for 2, while the Aryan words for 2 and 10 are ultimately the same as the Turanian word for 5. "This," he adds, "would seem to indicate that the separation of the Aryan and Turanian families took place at a the separation of the Arvan and Turanian families took place at a period when the two words for hund and arm were already in existence, but before the art of numeration had been attained." The interest and importance of such discussions cannot be denied, but the dealing with them is rather too much like moving among quick-sands. We need feel little scruple in treating words like Lars, Lucumo, Ludus, Manes, Lares, and some others which the Romans themselves admitted or asserted to be Etruscan; nor, if the Turanian or Ugric origin of the latter be proved by the numerals, the pronouns, the case-endings, and the grammatical system generally, need we be surprised to learn that Lucumo, or rather the Etruscan Laukane, is simply the Tatar ulug-kan, the great prince or Grand need we be surprised to learn that Lucumo, or rather the Etruscan Laukane, is simply the Tatar ulug-kan, the great prince or Grand Cham—in short, the famous Hulagu-khan; that the Etruscan Lituus reappears in the Samojedic word for "crook," nidea, and that the supposed Latin famous is but the Latinised form of the Etruscan Vanth. But when we are told that the Etruscan Atr, a day, is the same word as the Tungus tyr-ya, a day, we may ask whether it is also to be connected with the Teutonic Tyr. Not less significant is the alleged connexion of the supposed Latin securis, an axe, with the Turanian root kes, a stone, and the Finnic kerveys, an axe, the first syllable linking it with the Chinese suh, or shih, a stone, the Tscherkes seh, a knife, the Mongol suce, an axe. If this he so, we are brought near, on the steppes of Tatary, not only to the Latin sacum, but to the old English sear. Sometimes, indeed, we are tempted to resist, as where old Charon, whom we have been in the habit of referring to the familiar Aryan root which has given us gaping resist, as where old Unaron, whom we have been in the hant of referring to the familiar Aryan root which has given us gaping chasms, is carried off bodily to Turanian soil; but we have some compensation in the statement, which we commend to Mr. Rawlinson's careful attention, that "the lada of the Syrian inscriptions . . . may possibly be an abraded form of the Etruscan lanthia." We are even more sorry, if so it must be, to part with the supposed Latin Minerva, in whom Professor Max Müller has discerned a luftier and more intellectual correction than in the the supposed Latin Minerva, in whom Professor Max Müller has discerned a loftier and more intellectual conception than in the Hellenic Athèné. "The usual pil-aller derivation from the Latin mens, although adopted both by Cox and Preller, must be summarily rejected by the instinct of every comparative mythologists" (136). It is not easy to see why an explanation given by Grimma long before it was adopted by any living mythologists should be thus summarily cast aside, so long as the close affinity of Latin with Greek be admitted, or until it be shown that there is stronger reason for eaching the origin of the name elsewhere. The case is altered if the fact be true that Monseva is a pure Union word, the first syllable Men denoting the aky, the second or meaning red, and the whole denoting the red heaven or the flavor.

On these philological and grammatical foundations Mr. Taylor rests the arguments which he carries through an axamination of the society, the laws, and religion of the Etruscans to the conclusion that their dominant tribes belonged to that portion of the Ugric stock which is now represented by the tribes of the Kot Yenissei, who not many years ago called themselves Assan or Assens, a name "which may probably be regarded as identical with the name (Rissans, which the Etruscan nation applied to themselves" (365). The conquered clan, he believes, belonged to the European or Finnic branch of the same stem; and thus in the far-North-East, the object of the mysterious veneration of the Etruscan augurs, he finds the early home of this wonderful people, whose genius, as he holds, has given birth to all the glories of the art of Christian Italy. With such problems as these to be taken up and solved, the interest attaching to mere records of birth and death, the staple of Etruscan inscriptions, must be at best secondary. But the language in which they are written is of infinite significance; and we look with impatience for a more thorough working of a field as full of interest as it is important. On these philological and grammatical foundations Mr. Taylor

ALBANY FONBLANGUE.*

TN this volume we have a brief memoir of Mr. Albany Fonblanque, L and a selection from his writings in the Examiner. Some of the latter are perhaps rather too small to be worth reproducing, and it would, we should have thought, have been well to reprint the essays entitled "England under Seven Administrations," which were published by the writer himself. Forbhanque's life was simple and unexciting, but his labours are identified with the political and literary history of his age. There was an individuality about his work which was very marked, and which made him known as a sort of personal acquaintance to many who were ignorant of his name. His pithy little articles were eagerly looked for every week, and exercised considerable influence; and they deserve to be re-

and exercised considerable influence; and they deserve to be remembered for their literary merit as well as for the light which they throw on the politics of the period.

Albany Fonblanque was the descendant of an old French Huguenot family, and did not forget his origin. His study was adorned with a framed parchment representing a genealogical tredating back five centuries, surrounded by an claborately emblazoned coat of arms, and further embellished in the margin with the quarterings of successive generations of Foublanques. His father obtained a royal licence to resume the original family name of De Grenier de Fonblanque, but his second son aloue availed hinself of this sanction. There was perhaps a trace of the Frenchman in the turn of Albany Fonblanque's wit and polished acrossm. His life was the uneventful life of a professional man of letters, who was also in a great degree an invalid. At every age he seems to have been sickly and suffering. A friend said to him one day, "I never saw you looking better or any other man looking worse than you do"; and he said of himself in cold weather, "Given aix drops of blood in a man's veins, how warm would he be with the glass below zero?" In fact, as he used to remark, he never could realize what people meant by saying that they were "quite well." He was intended for the army—the Engineers— "quite well." He was intended for the army—the Engineers—but his health broke down at the outset. He next studied for the Bar, but although he valued the principles he had no taste for the practice of the law. The retired and sedentary occupation of a practice of the law. The retired and adjentary occupation of the practice of the law. The retired and adjentary occupation of pournalist suited him better. Indeed he appears to have been deficient in the robustness and physical energy which are essential to success in an active cureer. He was, fitted to be a spectator and critic rather than an actor. The only remarkable incident in his literary career was that it brought him to the verge of a duel with Lord Brougham. Fomblanque had written a review of Moore's Life of Sheridan, for which he was violently attacked in an article in the Edwards Review which he suspected to come in an article in the Edinburgh Review, which he suspected to come from the pen of Brougham. He called upon Brougham to say frankly whether or not he was his assailant. Brougham denied his right to put the question; other letters followed, and when Brougham complained that he had been insulted, Fonblanque at once offered him satisfaction. A duel was arranged; but it was averted by Brougham's second proposing an appeal to Lord Dudley as a common friend. Lord Dudley decided that "Mr. F. is not entitled to call upon Mr. B. to answer whether or not he is the author of a certain paper in the Edinburgh Review," insemuch as it was the case of one "anonymous writer animadverting on another, merely with a view to what he has written, and without the alightest reference, directly or by innucedo, to any particular

person."

Fonblanque made his mark in the periodical literature of the day almost at the first stroke; and, instead of having to seek employment, he was eagerly pressed for contributions. Bentham was auxious for some of his "inimitable profusions." Campbell the post begged him to belp the New Monthly, John Black wanted him for the Moraing Chronicle, and Stuart Mill and Bulwer Lytton were also among his suitors. He was, however, a slow, laborious, and extremely fastidious writer. It is said that he expended himself much in phrase, polishing and hardening elaborately, and it is evident from his style that he wanted sustained vigour. He had, as an admirer said, "strength, but not length; he had no "rush;" it was rather a series of brilliant leaps which told severely eather mind. He could do excellently well, but he could not do

The Life and Laboure of Albany Fundamene. Edited by his Kephew, rard Berrington de Fundamene. Landon: Bichard Bentley & Son. 1824.

much." Constant writing was painful and exhausting to Mile, and he did wisely therefore in limiting himself shiely to the Erominer. He was editor of their paper down to 1847, when he accepted the office of Statistical flecretary to the Board of Trade, but he continued to write for it for some years afterwards. Him articles were thoroughly original, both in shape and flavour. They were usually very short, and formed a setting either for a good story sptly introduced or for epigrams of his own. M. Van de Weyer once called him "the Paul Louis Courier of England," and his graceful yet pungent wit justified the parallel. In a notice of Ir. Followes, the proprietor of the Examiner, Fon-blanque described his politics as those of "an enlightened Radical Reformer; more than Whig, but short of Chartist"; and on another occasion he remarked of Lord Durham that he was "not a reformer of the Republican class, but occupied, as it were, the frontier line of Constitutional Reform." Either description would apply equally to Fonblanque himself. George Grote and John Stuart Mill were among his most intimate frienda, but he had no mind to be reckoned among the philosophical Radicala. On this point the writer of the present Memoir observes: point the writer of the present Memoir observes :-

Starting from the same point, these three men in time came to occupy a proning to position in the Radical party; but, although there was a perfect agreement in the abstract principles upon which their political erest was founded, the difference in the order of their minds and natures soon createst agreement in the abstract principles upon which their political creed was founded, the difference in the order of their minds and natures soon creatwas a marked divergence in practice. Evolbanque, thought thoroughly in carnest, was never an enthusiast. He was of the three the least theoretical, and, for that reason, perhaps, the most moderate in his views. Both Grote and Mill had an overweening admiration for a republican form of government, as the highest and purest of all political systems, and the one best calculated to ensure the true object of good government: the greatest happeness of the greatest number. Foulblanque, on the contrary, used to maintain that a form of government was the result, and not the cause, of national life, and that it mattered little whether the head of the State were called King or Freedent while the people were inspired with a spirit of freedenn and a love of liberty. Grote, even at the mature ago of lifty five, had so far retained his continual ardour as to feel elated by the mere fact of "living under a republic," when he visited France in 1849—a sensation which to Fentalisangue, whose mind was singularly unimpressonable to mare outward forms or names, must have been quite incomprehendible. Indeed, it may be said that, on this subject, Fonblanque's first start in political thought was identical with the stage which George Grote attained by slow and painful conviction, resulting from the experience of half a century. Grete says in 1869:—"I have outlived my fact in the efficacy of a republicua Government as a check upon the vulgar possions of the majority in a mation; a next recognize the fact that supreme power lodged in their hands may be exercised quite as mischievously as by a despette ruler like the first Napoleon."

It is difficult to give an adequate idea of the brightness and

It is difficult to give an adequate idea of the brightness and point of such writings as those of Fonblanquo by means of extracts. Much of their success of course depended upon their opportuneness at the moment, and occasionally the fun is rather over-elaborated and fine drawn. Yet there is enough salt in the dish to preserve its relish even now. A Lord Chancellor engaged in law reform is likened to a hare beating a drum:—

Once upon a time, at a fair, we saw a hare heating a drum. The dictress of the hare at a poternance so repugnant to its quiet, traid nature may easily be imagned. At the sound of every tap the hare received, but he persisted nevertheless; and, not sparing himself long raits of the drum new and then, which seemed as nothing less than death to his nature, be yet held on till the conclusion of his ill-allotted part. No creature but a hare could do the thing of which it was so intensely straid.

The absurdly minute and circumstantial accounts of the Duke of Wellington's personal habits which appeared in the newspapers when he took office in 1828 furnished a tempting subject for carica-

The Duke of Wellington generally rises at about eight. Before he gets out of bed he commonly pulls off his nighterp. . . . The Duke of Wellington's pockets are in the skirts of his cont, and the holes perpendicular. He wears false horizontal haps, which have gives the world an erroneous opinion of their position. The Duke of Wellington drinks ten for breakfast, which he sweetens with white sugar and corrects with cream. He commonly stirs fabe horizontal imps, which have given the world an erroneous opinion of their position. The Puke of Wellington drinks test for breakfast, which he sweetens with white rugar and corrects with cream. He commonly stirs the finid two or three times with a spaon before he raises it to his lips. The Puke of Wellington cuts toast and hatter, cold ham, tongue, forks, beef, or eggs, and sometimes both meat and eggs; the eggs are generally those of the common domestic fowl. ... Hefore the Duke goes on, he has he and gloves brought him by a servant. The Puke of Wellington always puts his last on his head and the gloves on his hands. The Puke's delly manner of mounting his horse is the same that it was on the morning of the glorious battle of Waterloo. His Grace first takes the rein in his left hand, which he lays on the horse's manne; he then puts his left foot in the stirrup, and with a spring brings his body up, and his right leg over the body of the animal by the way of the tail, and thus places himself in the saddle; he then drops his right foot into the stirrup, puts his horse to a walk, and seldon falls off, being an admirable equestrian. When acquaintanees and friends salute the Duke in the streak, such is his affaililly that he either hows, touches his hat, or recognizes their civility in some way or other. The Duke of Wellington very commonly says, "How are you?"—"Ho a time day"—"How dive do?"—and makes frequent and various remains on the weather, and the dust or the mud, as it may be..... In the House of Lords the Duke's manner of proceeding is this; he walks up to the five-place, turns his back to it, separates the skirts of his cont, tossing them over the description delicate. The characteristic of the Duke's oratory is a brevity the next thing to allence.

An article on the election of Louis Napoleon to be President of th An article on the election of Louis Napoleon to be President of the French Republic is a very good example of Fonblanque's style. He begins with the story of a traveller asking his way in the United States, who was told that there were two reads, both of which were described in great detail, with the final semant that one was a good deal longer than the other. "Why did you not say so at first?" asked the traveller. "Why," answered Jonathan, "I guess the shorter or longer makes little odds, for whichever you take you will very soon begin to wish you had taken the other." This, it is saggested, is very much the case with the choice of rulers before France: rulers before France:-

Piscing a Napalson at the head of a republic seems much the same sort

of operation as putting an extinguisher on the top of a candle. It is literally the capital doom of the institution. The poor Republic, like Gay's cucumber, having been prepared and dreased with all care, is no seems finished them it is thrown away. As the one fault of Orlando's horse was that he was dead, so the one fault of the French Republic is that there are no Republicans to give life to it. Cavaignac was indeed one, but to have made him President would have alarmingly diminished the number of the commonwealth citizens. Such a man cannot be spared from the ranks; for not having enough to mount sentry, it would never do to make one of the scanty band generalismo.

France has been like that celebrated young man of Ballynacrasy, who wanted a wife to make him unasy. She wanted a republic to make her uneasy, and it has answered to her desire most completely. It is another version of the fable of the Old Man and Death: she has called for a Republic, the Republic has appeared, and its looks have been liked so ill that the invoker has explained that the summons was simply to adjust the burden of the bundle of sticks.

It is hard to rail against the caprices, more seeming than real, of the French choice. We must not get into a rage with the nature of things, as did Sir Joseph Banks when he boiled fleas, and was wroth that they did not bear out a theory by turning red—"Fleas are not lobsters, d— their eyes." The French have not turned red in the hot water of the election. Cavaignac would have been the choice of true Republicans; Napoleon is the choice of a people whose wishes are for anything but what is established.

Here are some of Fonblanque's stories taken at random. An

Here are some of Fonblanque's stories taken at random. An Irish lady was constantly taxing the abilities of her carpenter for the production of effects above the reach of mortal hammer and saw, and when the mechanic begged her opinion as to the mode of realizing her conceptions, the answer was always "Somehow, by means of a screw." This is told à propos of the Repeal agitation, and might equally be applied to Home Rule. Mehemet Ali asked a Frenchman to explain what a Republic was. "If Egypt were a Republic," was the answer, "you would be the people, and the people would be the Pashs." Mehemet said he did not find that he had any taste for a Republic. A provincial antiquery went to visit Hicke's Hall. A hundred miles off everybody could tell him about Hicke's Hall. They knew where it was, what it was like, and all about it. But as the traveller got nearer, his information became less and less positive, and when two or three miles off no one knew it, or could say or conceive anything about it. A young Pickle dropped his drumstick into a well. He had a shrewd suspicion nobody would take the trouble to get it out; so he laid hold of all the plate he could find and threw it after the drumstick. The alarm was raised that the plate was nissing; little mester thought he saw something shining at the bottom of the well; ladders were got, and as the plate was fished up, the youngster called out, "John, as you are down there, you may as well bring up my drumstick!" When Calonne asked Vestris his terms for an engagement at the Theatre Royal, the dancer modestly demanded a hundred thousand francs a year. The Minister exclaimed against such an exorbitant demand, and remarked that the King did not pay his Marshals at so high a rate. To which Vestris replied, "Cela meet bien indifferent. Vous direz alors à sa Majesté qu'elle n'a que faire danser sea marchaux." A Sootchman stoutly maintained that the vines of his native land produced the best grapes in the world, adding, however, "But I must premise I like the grapes a wee sour.

NEW EDITIONS OF ARISTOPHANES.

TO renew an acquaintance with Aristophanes is a luxury denied by the nature of the case to those who have never had the chance of knowing him. But this class, as well as that which has had the advantage of a liberal education and wishes to revive its intimacy with an old friend, has readier means than heretofore of enjoying a taste of his lively comedy and sprightly caricature, through the multiplication of good translations of the best plays, and the excellent editions which have recently appeared of separate dramas. It is, indeed, not beyond the bounds of possibility that, thanks to these and similar helps, the present generation may take part in discussions of the relative merits of the Ackarnians and the Proce, the Ways and the Clouds, instituted by pessons having as little Greek at command as Shakspeare had, and that it may no longer be essential to an intelligent knowledge of Attic comedy to have mastered the adversaria of Dobree, or to have at the finger-ends the criticisms and emendations of Dindorf.

Dindorf.

This state of things it is but just to refer to its true cause; and we hold that, along with such fosterers of a taste for this form of Attic salt as Hookham Frere, Thomas Mitchell, and, to judge from his two translations, Mr. B. Rogers, the preparation for school and college purposes of succinctly noted and elucidated Greek texts is entitled to the credit of making Aristophanes popular beyond the wont of former years. Two creditable samples lie before us. Mr. Green, an ex-Cambridge tutor, and a Rugby assistant-master, has added to the four or five plays which he had already edited for the Catena Classicorum, a handy and useful school edition of the Peace of Aristophanes; and Mr. F. Paley—having conquered, so to speak, the worlds of Æschylus, Euripides, Honser, and Hesiod—has now planted his foot on the fron-

tier of Aristophanes, selecting for its first impress this same play of the *Peace*, which he rates as a higher specimen of the genius of the great Attic comedy-writer than do most of his fellows and contemporaries. Both scholars aim rather at supplying the needs of tiros than at so complete a critical apparatus as Dr. Hubert Holden, whose edition of Aristophanes we noticed two or three years ago; but neither fails to give his readers a clear account of the chief various readings and emondations, generally with a brevity consistent with the size of his volume. Between the two every facility is afforded to the young Greek-scholar of arriving at an estimate for himself of the relative merits of the *Peace*.

For our own part, though we do not think the play so well sustained throughout as the Cloude, Frogs, Knights, or one or two others, we cannot subscribe to the verdict of Mr. Rogers, who calls the Peace tame and un-Aristophanic, or Mr. Green, who says that the plot is awkward. The best answer to the former would be to hold up his scholarly translation, which is so lively yet so literal as to console for the loss which literature sustains in the fragmentary and unfinished condition of Mr. Holcham Frere's treatment of the same play. But, as meeting Mr. Green's depreciation, we may point to Mr. Paley's sketch of the plot in the preface, which passes in review the scenes wherein Trygsus scales Olympus on a dung-beetle to find only the gods messenger, Hermes, at home, and assist at the pounding of the Hellenic cities in a huge morter by the war-god (Polemos); and where Hermes, after pocketing a bribe from Trygsus, assists the chorus of Attic farmers to recover Peace from the durance into which she has been cast. When her rescue is effected, and she reappears with her maids of honour, Opora and Theoria, there is some exquisite funning on the part of the Attic adventurer into the heavens, and a political expecition by Hermes of the causes of the war, not unflike, as Mr. Paley observes, the \$\tilde{\rho}\eta vices on the same subject in the Acharnians. A capital dialogue succeeds between Peace, Hermes, and Trygreus, as to the causes of her discontent and temporary disappearance, and then comes the Parabasis, partly \$\tilde{\rho}\eta vices on the same subject in the Acharnians. A capital dialogue succeeds between Peace, Hermes, and Trygreus is to marry Opora, the sacrifice and the consecration of the statue of Peace are enlivened by the introduction of a seer, with the character and influence of Cleon. When it is settled that Trygsus is to marry Opora, the sacrifice and the consecration of the statue of Peace are enlivened by the introduction of a seer, with martial sympathies, whose greed and impudence mark him as "the

between the contending parties which Cleon, in the view of Aristophanes, was very much to blame for not healing.

One of the novelties of Mr. Paley's edition is his suggestion in the preface and in a note on v. 224 that the upper part of the arnoh was used not unfrequently for acting whenever the top of a house, a city wall, an acropolis, the sky, or a high rock had to be represented. This hypothesis, he shows, would suit the opening scene of the Agamemnon, as well as well-known scenes in the Orestes, Medea, and Phornisse; and it would doubtless supply a clue to much of the stage directions and stage contrivances in the Peace in reference to the relative positions of Trygreus aloft, and Peace buried in the cave down on the stage. Mr. Green and Mr. Rogers take the cave where Peace was concealed to have been on the upper platform; but Mr. Paley points out insuperable difficulties in this surmise. He believes that an access to the upper platform was afforded by a concealed staircase, not unlike the rood-stairs of our old churches; and that by these Trygreus descended, at v. 825, to the tiring of his legs, when, as we know, from 721, his beetle did not supply him with the means of backcarriage. The heap of stones, under which the goddess Peace is supposed to lie, may be compared, says Mr. Paley on 224, with the mounds in the Perse and Cheephors of Æschylus; and he considers the dialogue held aloft to refer to the stage below, where it speaks of the durpor fact, on a level with the chorus and the haulers and tuggers at the ropes. There can be no doubt that this hypothesis of a higher and lower level of the stage, which is countenanced in the second introduction to the drama in the words, it is examinated to be very helpful in the understanding of divers seems of Attic tragedy and comedy, though we do not remember to have seen it propounded in any account of the Greek theatres.

To turn to the interpretation of the dialogues and chorus of the drama as supplied by Mr. Paley and Mr. Green, we should my

^{*} The Peace of Aristophones. A Revised Text, with English Notes and a Preface. By F. A. Paley, M.A. Cambridge: Delghton & Hell. London: Rell & Daldy.

Tas Petre of Aristophenes. Edited by W. C. Green, M.A., late Fellow of Hing's Callege, Cambridge. London: Longmans & Co.

that the young student of Aristophanes is in excellent hands under their guidance. Mr. Green has abated very much the fancy for constant parallelism of the Aristophanic pures which characterized his contributions to the Cutena Classicorum, and while he evinces ripe and good scholarship, he is not always, we think, so disposed to be hypercritical as Mr. Paley. In the description, for example, of the dung-bestle at his mesh, in v. 34—

उत्ताक सर्वेदानामें, παραβαλών τους γομφίους

Mr. Paley hesitates to connect mapasialism with malaurric, because it is uncertain whether mapasially, like mossischi, was technically used of athletes. We agree with Mr. Green that the point of the line consists in this very connexion. The beetle "falls on vigorously with his grinders as a wrestler does with his arms," and we should go a step further than Mr. Green in punctuating the line, so as to show the maps monoderias

ώστερ παλαιστής παραβαλών—τούς γομφίους.

It is searcely needful to say that this figure, where an unexpected word finishes a line and fills up the space, which seemed to demand another word in sound and length, is very common in Aristophanes, and by no means least so in the Peace, where in v. 73, for the Ætmæn pony, which we were expecting, comes in the Alreador εάνθαρος, or Ætnæan beetle, as a surprise. v. 123 Trygœus promises his daughters

Κολλύραν μεγαλήν και κόνδυλον όψον ἐπ' αὐτῷ-

A.e. a big bun and a fisticuff for a relish to eat it with (Paley), or as Green neatly translates, "a cake and a cuff to season it withal"; and in v. 378 Trygeus, in mock piteousness, invokes Hermes, not as just before, πρὸς τῶν θιῶν, "by the gods," but rather πρὸς τῶν κριῶν—h.e. by the presents of meat wherewith he had bribed the god. In the fine scene where the war-god is mixing the olio, or hash, or salad, of the Greek States, an example of this device has accumingly meaned both Mr. Green and Mr. of this device has seemingly escaped both Mr. Green and Mr. Paley. Riot, or sudemic, the war-god's lacquey, is sent off in quest of a pestle for Sparta, when Cleen, the most natural pestle that could be thought of, was missed from Athens. It is a critical moment for the Peace party; and Trygueus urges on the spectators that if any of them are initiated in the mysteries of Samothrace:—

νου έστιν εδξασθαι καλών άποστραφήναι του μετιώντος τώ ποδέ

But if any amongst you here have been initiated In Samothrace, let them say their prayers immediately For a mischief to overtake the messenger.—HOOKHAM FRERE.

Here the editors we are discussing concur in interpreting ἀποστραφήναι in a technical sense, like διαστραφήναι, of dislocation, and it will be seen that Frere agrees with them, though his translation is not so pronounced as to pledge him to an exact interpretation. We must own to a decided preference for the rendering of Rogers:-

And if there's here a man initiate In Samothrace, 'tis now the hour to pray For the averting of—the variet's feet.

Certainly this resort to the maph moodonian artiflee must be allowed to be infinitely comic and Aristophanic.

Just below the verse which we first mentioned, as to the beetle feeding, occurs another likening of him to

oi re exorvia τὰ παχία συμβάλλοντις είς τὰς ὑλεάδας (36-7),

which Mr. Green takes to mean that the bottle was working himself which Mr. Green takes to mean that the boetle was working himself round, head, hands, and all, in stooping to gorge the meas out of the trough "like those who make the larger ropes for ships." Mr. Paley takes exception to this translation, saying that rate δλεάσιν would be expected in such a collocation. He would render the words "like sailors who coil those thick ropes into the merchant vessels." With all deference to his opinion, we should take the use of σχοινιστημβολείς given by Mr. Green (though it would be more satisfactory with the measure cited) for ropernakers, as confirmatory of the with the passage cited) for ropemakers, as confirmatory of the simpler interpretation, which is also adopted by Mr. Itogers, who

For all the world like those who plait and weav Those great thick ropes to tow the barges with.

In vv. 479-80 occurs s difficulty which has been felt by many critics and commentators, where, in the pulling-match to get Peace out of her cave, Flormes takes exception to Trygssua's observation, that the Leconians pull lustily :-

άρ' οἰσθ' ὅτοι γ' αἰτῶν ἰχονται τοῦ ξύλου, μόνοι προθυμοῦντ' · ἀλλ' ὁ χαλαιὸς αὐα ἰᾶ

a passage taken by many to distinguish between the makers of warlike weapons and agricultural implements, though the distinction fails, seeing that there is metal in both. Mr. Green sides with the scholiast's reference of ξύλου to the prison pillory, though the does scholiast's reference of the view to the prison pillory, though he does not endorse the view of the commentator who takes increase reference of the commentator who takes increase reference to mean "are made fast in the pillory," which would require reference to mean "those who are connected with the prison pillory," i.e., "the kinsmen of the prisoners"; and that then one not take the prisoners of antithesis for the opposers of peace, "the brazen-fetter-forgers" as a class, who were disposed to leave the prisoners of Spacteria still in bonds, whereas the relatives of the prisoners, the best blood of Lacedemon, would pull with their might, and instify their seal as well as their designation, forther ferrors reference than Mr. Creen's, objects that the former part of this explanter than Mr. Green's, objects that the former part of this explanter

nation is a little far-fetched, though he finds a parallel for Jacobatible "to be fast to the wood." If, however, the alternative lies
between a contrast of the trades of war and peace and Mr. Green's
ingenious theory, we are disposed to accept the latter.

But if the question is that of nest and exact translation, is must
be owned that Mr. Paley is seldom or never untrust worthy. It is
interesting to supplement and clucidate by his exactness the more
spiritual translation, where it is vouchasfed, of Hookham Frere.
For example, where the latter gives the gist of Mercury's account
of the results of the Megarean decree:

(Verpladowing all the land with marky clouds and menuldaring resk.

Overshadowing all the land with smoky clouds and smouthering reek, Dark'ning all our cheerful days and drawing tears from every cheek; Till the figs, the vines, and olives, and the very jugs and jars Bounced about and broke each other, as associates in the wars

we might not quite realize what was meant, but for Paley's explanation of the allusion to the smashing of wine-jars by rolling against each other in the hostile raids. "When once," runs his translation, "the poor vines had crackled in the general blaze, and wine-crock struck had kicked back in anger against crock, there was no one then left to stop it, and this dear goddess got more and more out of our sight." The passage, it must be allowed, becomes more intelligible in the press.

more out of our eight. The passage, it must be allowed, economic more intelligible in the prose.

Before finishing our remarks—in which it is difficult to do two good scholars anything like full justice—we must just quote from Mr. Rogers a capital bit of translation from a later portion of the play, both because it seems to justify Mr. Paley's estimate of the Peace as a lively comedy, and because two or three bits of it are well illustrated by Mr. Paley and Mr. Green. It is where Trygaeus on returning home is interrogated by his servant as to the upper

regions:

regions:—
Serv. What, master, you returned? Tryo. So I'm informed.
Serv. What have you got? Tryo. Got? pain in both my lege.
Fsith, it's a rare long way. Serv. Nay, tell me. Tryo. What?
Serv. Did you see any wandering in the air
Beside yourself? Tryo. No, nothing much to speak of—
Two or three souls of dithyramble pacts.
Serv. Thou fish't true what people say alout it,
That when we die, we straightway turn to stars.
Tryo. O yes, it is. Serv. And who's the star there now?
Tryo. Ion of Chios, who on earth composed
"Swate morning, starre," and when he came there all
At once addressed him as "Swate Mornin' Starre,"
Serv. And did you learn about those falling stars;
Which sparkle as they run? Tryo. Yes; those are some
Of the rich stars, returning home from supper
Lanterns in hand, and in the lanterns fire.—Vv. 325-41.
The ἀναβολαl, which are rendered odes in the seventh line,

The dvaßoλal, which are rendered odes in the seventh line, are identified by Paley with the "long rambling odes" which correspond to preludes on the lute before the song commences; and his equivalent for the big compound irdanpannpannxirous, in the next verse, is almost as good as Mr. Roger's. It is "sunlit-mist-ical-air-swimming-nothings." With the query of the servant as to mortals turning into stars after death, the same editor compares very mortals turning into stars after death, the same editor compares very appositely Itomeo and Juliet, iii. 2, init., and Mr. Green gives a good and simple account of Ion of Chios, and the allusion to him and his ode in vv. 11, 12. Mr. Paley, however, is assuredly right in saying that kai rig larve derift vive means, as Rogers gives it, "and who's the star there now?" i.s. one of the recently dead, and not, as Mr. Green would explain "Pray, then, who is a star? Give us a specimen."

Both of these editions have their special merits, and it would be hard to pronounce between them. Those will be fortunate who have the one to compare with the other, and if they have also Mr. Rogers's translation at hand, we promise them that the labour will be lightened and the aleasure enhanced.

be lightened and the pleasure enhanced.

TAKEN AT THE FLOOD.

MISS BRADDON has gone back to her old hunting-grounds, and in Taken at the Flood has given us a series of crimes and psychological monstrosities sufficient to stock a small circulating library. For the heroine we have the well-known pale-faced, redhaired girl with strong passions and no conscience, to whom the lust of the eyes and the pride of life are more than fidelity or love, and who is willing to sell herself to secure the first, while determined not to lose the pleasures which would have come from the last. She is a woman, however, so bold in resolve, so fertile in resources, and so weak in the presence of danger and Nemesis, that we scarcely know how to catalogue her—whether as a strong-minded Messalina or an impressionable Magdalen, being crafty, subtle, and cruel as Vivien for the one part, heart-stricken and

repentant as Guinevere for the other.

The hero is a person to the full as composite. He is the soul The hero is a person to the full as composite. He is the soul of honour, and is said to have the brave man's quality of self-control; but he is no more fixed in purpose than the vane on the housetop, and suffers himself to be blown about now by passion, now by remove, defying the deman one day, and the next putting his neck under the cloven hoof abjectly enough. A character with two or three master passions of equal strength is a difficult thing to describe with success, especially when, without apparent cause, now one rules all the rest, and then again is deposed for another to take the lead. How are

* Taken at the Flood. A Rovel. By the Author of "Lady Audiey's Secret," &c. &c. &c., g vols. London: Maxwell & Co. 1874.

The to accept Mdmind Standen? A gentleman and the "only son of his mother," he loves a pretty girl below his own aphage, because the has fine types, a fair complexion, and red-gold hair. At the very height and in the sweetest moment of his young love, "as feet with the standard tree, he was compelled to confess to himself, in the course of that self-examination to which all thoughtful men submit their motives, that it was Sylvia's face that had bewitched him. Of her mind he knew very little, beyond the one fact that she loved him, and knowing that, he seemed to knew all that was needful." And yet, had Edmund been really as thoughtful and high-minded as Miss Braddon would have us believe, he would have questioned the wisdom of his decision more gravely than he did, and would have probably heaitated before wishing to make his wife of a woman for whom he had manifestly. he did, and would have probably hesitated before wishing to make his wife of a woman for whom he had manifestly only that kind of love which men give to their mistresses. But if he is inharmonious with himself in the beginning of the book, what shall we say of him as the story goes on? How can we characterize that dishonourable infidelity of this man of thought and purpose, that been yielding to an ignoble passion of one to whom love was said to mean something higher than semanlity and purer than selfishness? Let authors give us their views on the force of physical love if they like, but let them be taken for what they are worth, and the foeling for what it is. It is necessary to protest against this as the love by which a noble-minded man is governed, and also against such a portrait as that of Edmund Standen altogether. Presented to us as estimable and loyal, he is simply a weak and sensual a oundred; and Miss Braddon disguises nothing of the motives which make and relies tradition discusses nothing of the motives which has been him break faith with Eighter Rochdale when he meets Sylvia again, and when he finds it "hard to keep the break on passion." though he "stands like a rock, looking straight before him with a cold, steady gaze, ordering his heart to be still, that heart whose passionate beating belies his outward calm." As the interview goes on, and Sylvia jeers alliteratively at Esther as "that prim pattern of provincial perfection," Edmund placks up manliness enough to say, "Spare your sneers against my future wife, Lady Perriam. Yes, I am going to marry Miss Rochetale, and if I am not as happy with her as I once hoped to be with you, it will be my folly, and no missing grace or charm in my wife that will be to blame." On which Sylvia makes a speech, and the marrylew

She stretched out her arm, with a gesture of dismissal. Till this moment Edmund had stood by the ivy-wreathed railings of the Perrana tends, fixed, immovable, sturdily battling with that demon of weak and foolish love which bade him cast truth, honour, loyalty to the winds, and cleep this talse idol to his breast. But now, as she retreated from him, showly in the moonlight—a phantom-like figure gliding out of his reach—the del folly mustered him, the passion he had nover conquered once more enslayed him. He stretched out his arms—three cager steps brought him to her side—and once again she was held to his heart—held as if never more to be set free.

"Leave you, forget you, go back to another woman! No. Sylvia, you know I cannot do that. You knew that, when you lured me here to night you would have me at your feet. I have come back to you not. You have called me back. You would have it so, for good or evit. I am dishesenred, parjured, weakest and worst among men, but I am yours, and your only?"

"Can it be that Miss Braddon has discovered nothing better in

Oan it be that Miss Braddon has discovered nothing better in Oan it be that Miss Braddon has discovered nothing better in life than weakness to sense and faithlessness to honour, and so gives us a man who yields thus tamely to his senses and is so has a traitor to his honour as merely one among thousands like to him and no worse than his neighbours? This is the real immorality of those authors who take an ignoble view of human nature. Small danger lies in the description of violent sense. nature. Small danger has in the description of violent sensa-tional crimes, which we presume no one in his senses would take as a pattern to go by; but when falsehood, treachery, sensuality, and selfishness are depicted as part of the natural order of things, inhorn circumstances of humanity, common to all alike, and seen as often in the good as the bad, then harm of the worst kind is done to the weak and impressionable, and the work is as

dangerous as its teaching is untrue.

dangerous as its teaching is untrue.

Taken at the Flood indeed has very few green spots to delight the believer in human nature. All the leading characters are more or less bad or weak, and the few good people fitting ghost-like through the pages are not lovesble. Sylvia herself is of Lady Audley's type, a woman without a conscience, afraid of poverty more than of crime, and preferring jewelry and silk gowns to morality and love. Her father, who is the village schoolmaster when the story opens, is a broken-down gambler, a man in hiding for some crime committed in his capacity of manager in a commercial house, the head of which condense the fraud by seducing mercial house, the head of which condened the fraud by seducing the defrauder's wife. So at least we make out from the conversation that takes place between James Carew and his beggar conversation that takes place between James Carew and his beggar wife when the latter comes for food and shelter to the cuttage, and the two talk together of the past as no people off the stage ever do talk, for the purpose of letting the reader know how things had gone. This wife herself is a poor weak miserable sinner, who becomes her daughter's trembling tool, and said in the substitution of the light life Alphan for his dead brother Mondred substitution of the living Sir Aubrey for his dead brother Mordred, by which Sylvia is (apparently) free to enjoy life in her own way, and marry Edmund Standen at last. Shadrach Bain, the sunily and marry Edmund Standen at last. Shadrach Bain, the family lawyer, is a villain of the conventional kind, crafty, degged, implemble, resolute; a man of fiery passions and iron will, to whom mething comes amiss by which he can gratify the one and exercise that other. Sir Aubrey Perriam, who marries the lowly-living his in such undignified haste, is an old miser who has neither ballits nor the knowledge of his class; and his brother Moralita marries the knowledge of his class; and his brother Moralita marries catalogues of books. As for Edmund young man of honour and nobility, he is to be first efforts of his beautiful Delilah; his

Mined but perfectly correct fance, Esther Rochdale, is a very feely defined portrait all through, good if one will, but colour-like shd wanting individuality; and the same may be said of Mrs. Standen, who is, if anything, more blustering than steadfast, and threatens penalties which she never means to carry into execution. A few pale shadowy silhountree make up the rest of the dramatic matter. persone; but those of whom we have spoken are the chief actors, and we cannot compliment the society in which they wove their plots and lived their questionable lives.

The story is of course a story of crime and mystery. In the beginning Sylvia is in love with and secretly engaged to Edmund Standen. This is an immense success for the penniless daughter of the village schoolmaster, whose income is forty pounds a year, with house rent, coals, and candles; though Mrs. Standen, when she hears of it, threatens to disinherit her son if he persists in s and his his mad desire, and to leave him to his own resource love. Meanwhile Sir Aubrey comes on the scene, and man with this fair-faced young woman in a manner suggestive of softening of the brain more than of anything else. Sylvia flings the blocker lure. He has been obliged Meanwhile Sir Aubrey comes on the scene, and falls in love Edmund to the winds for this higher lure. He has been obliged to go to Demorara, so that she is free to act for her own advantage; and she marries Sir Aubrey Perriam as the best thing she can do. The old man holds her close, and does not treat her with the liberality she expected; on which she gets tired of him, and, utilizing the paralysis and semi-imbecility into which he falls, drogs him, drugged, into Mordred's chamber, when Mordred dies, and she buries the brother as her husband. She has not however got rid of all her difficulties; for, though we are told in p. 287 of the second volume that, "in the event of his death happening before the majority of his eldest son, Sir Aubrey left his wife guardian of the infant," yet in p. 302 we find that "the Court of Chancery had made him "—i.s. Shadrach Bain, the family lawyer of the Perriams, whose main ambition in life seems to be to hear himself called squire—"guardian of the infant heir according to the oxpress wish of Sir Aubrey, as recorded in his will"; and it is precisely this Mr. Shadrach Bain who, having so much power already over her, is determined to be her husband, or, as events turn, already over her, is determined to be her husband, or, as events turn, her destroyer. Bold in plot and resolute in deed, Lady Perrian has no command over her facial muscles. She shows Mr. Bain that some mystery is connected with her husband's sudden death, and the strict seclusion in which she keeps the 50-called Mordred since that death. Mr. Bain, with his suspicions wide awake, offers her marriage, not sorry for the hold he imagines he has over her. For her answer she first of all puts "Mordred" into a private hunatic asylum kept by one Joseph Ledlamb, another scoundrel without a soul to be saved—a tremendons error in indoment, by the out a soul to be saved—a tremendous error in judgment, by the by, seeing that it was Mr. Bain himself who had recommended that continuen, which gives him a clue casy enough to follow-then takes refuge in flight, and is on the point of committing bigamy with Edmund Standen when the ceremony is interrupted bigamy with Edmund Standen when the ceremony is interrupted by the lawyer in the good old melodramatic fashion, just at the nick of time, and Lady Perriam is saved one crime on the list. Shadrach Bain carries off the disappointed but still believing lover to the "Arbour," Mr. Ledlamb's sordid and remote asylum, to uncerth the mystery if there is one, or to prove the lawyer a defamer if there is not. The sequel comes easy. Sir Aubrev is discovered, and Lady Perriam takes once more to flight, falls ill abroad, is found by Edmund, tenderly nursed, comes to her senses just before she dies, repents, is reconciled, and finally "living and dying lips met in the last hiss of a love that had been fatal." Mrs. Carow, alias Carier, alias Carford—her real name—also falls ill and dies, having first written a detailed account of how the plot of substitution grew and was a detailed account of how the plot of substitution grew and was worked, in a manner as little to the life as was her conversation at the cottage with her husband. After Sylvia's death and their last kiss, Edward of course has a fever in his turn, is nursed by his mother and Esther, recovers, falls in love again with Esther, proposes, is accepted; and all ends happily, with, we may presume, a recurrence to former habits when the two "read Schiller together, to the disgust of Mrs. Standen and Ellen, to whose ears the gutturals of that grand Sclavonic tongue were unatterably burbarous." With which novel fact in philology we take our leave of Miss Braddon's last pot-pourri of unlikely crime, crooked morality, and forced similes—as when she speaks of the "pale son-green parasitical growth, which was born of the salt breeze that swept over that tranquil valley, as if Amphitrite herself had wreathed her wet arms around those rugged old trunks and simples "gold however to be speaked the pietro of her lete month. branches": glad, however, to be spared the picty of her late mood, and to know that things might have been worse than they are. The state of the s

'OHUROH AND STATE IN GERMANY.

STEP by step the German Government, or Prince • BISMARCK as guiding and representing it, has moved on in the conflict with the Church of Rome, until a series of measures has been passed which, if mere human laws made by heretics can master the spirit of the Papacy, ought to produce the desired effect. The first step taken was to sketch out the system which it was thought desirable to set up; and of this system the three essential points were the banishment of the Jesuits and of those special agents of Rome who were supposed to be most zealous in the work of alienating the faithful from allegiance to their temporal sovereign, the rendering amenable to the civil power of local spiritual authorities suspected of disaffection, and the compulsory training of priests in lay institutions. The next step was to visit with fine and imprisonment bishops and other prominent ecclesiastics who disregarded the provisions of the new system. The Prussian Government, which has not the slightest notion of striking with a gloved hand or of making itself in the least pleasant to any one, has fined and imprisoned bishops so vigorously that, if a strong wholesome warning had been all that was wanted, no one could doubt that such a warning had been given. But it was found that this was not by any means enough. The bishops were shut up, but they were still on the spot, and administered the affairs of their dioceses, and were and administered the affairs of their dioceses, and were looked on as its spiritual heads, very much as if they had not been shut up. They were merely badly-used officials. Prince Bismarck was obliged to go further, unless he was content to see himself and his plans openly beaten and baffled. He resolved that the offending ecclesinstics should be got rid of. But it was not enough to drive them out of Prussia. They might go to some neighbouring spot in Germany, and be nearly as troublesome as ever. The German Diet was therefore invited to come to the aid of the Chancellon, and it was by no means reluctant to do so. A Bill was introduced and passed a reluctant to do so. A Bill was introduced and passed a few weeks ago, by which any clergyman who has exercised authority, or affected to exercise authority, in connexion with an office from which he has been legally dismissed, or any bishop illegally exercising his functions after sentence against him in a proper Court, may be removed from his ordinary place of residence and interned and put under police supervision in a new place of residence assigned to him, or sent into exile out of Germany.

The offender is size to be stripped of his rights of citizenship, and he cannot regain them without the previous sanction of the Federal Council. This is certainly one way of cutting the knot. Offending bishops will thus be got rid of. They will be sent into exile or put in some safe, quiet, and we may guess Protestant, place where with a vigilent, relice may guess Protestant place, where, with a vigilant police to watch over them, it may be confidently expected that they will not do much harm. They may also at the option of the Government be sent out of Germany altogether. But it is not easy to see where they are to go, unless indeed they come here. Somewintimation was given that Lansmburg was to be made a centre of clarical intrigue, but Prince Business ordered his obedient journals to stake very broadly that Lansmburg had better not try the y proadly that Luxemburg had better not try the ent. Austria and Beigium would be most reluctant themselves up in an ecclesiastical quarrel with the entire if they desired to do so; and certainly chovernment is not in a position to shelter the dis Prince Bushack will himself not with to get impression with neighbouring Powers about his

deposed bishops, he will probably keep them in Germany, on the general principle of washing his dirty linen at home; and interning is perhaps as efficacious a mode of keeping a troublesome person quiet as could be devised.

But when the effenders have been got rid of, what is to happen to the spheres of spiritual authority thus bereft of their presiding care? There must necessarily be partial priests to carry on the daily work of the communion. There priests to carry on the daily work of the communion. Theremust be some competent persons to baptize, to marry, and to bury. If possible, there must be new bishops appointed in place of the offending ones who have been deposed. But a diocese can go on without a bishop much longer and better than a parish can go on without its priest. Babies will be born and people will die, and human nature will make people marry, or wish to marry, whatever statesmen and priests may do or however much they may quarrel. Prince BISMARCK thinks he has devised, and the Prussian Parliament has sanctioned, a scheme for providing parishes with ment has sanctioned, a scheme for providing parishes with ment has sanctioned, a scheme for providing parishes with priests. Either the patron will present a new priest of the stamp which the State approves, or he will not. If he does, nothing could be better. There will be a priest provided without delay or inconvenience, and the parish may be supposed to be as happy as over. But if the patron declines to present, then, after a certain delay, the congregation is to do his work for him, and in all cases where there is no patron, the congregation is to be allowed to act at once. The the congregation is to be allowed to act at once. The Burgomaster of the town, or the Landrath of the country, at the request of at least ten male members of the congregation, of independent means, is to summon a meeting of all the male members of the congregation, and the majority of votes at this meeting is to determine who the new incumbent is to be. If there is a parish where ten men of independent means are not to be found who care about having a priest, then the new law is silent as to what is to happen. Arrangements for letting the poor have the gospel preached to them are out of Prince BISMARCK'S province, but if ten men who are tolerably well off want a priest, he is willing to recognize that the desire for a priest is, under such circumstances, worth noticing. To improvise a bishop in the same casy way is not feasible. Even Prince BISMARCK allows that he cannot reasible. Even Prince BISMARCK allows that he cannot make bishops. But he can put a considerable amount of pressure on those whose interest it is to get a bishop made. If a bishop of the right stamp, a safe, prudent, inoffensive man with a proper indisposition to be interned, and full of fidelity to the King, is established in the office vacated by an improper and interned man having been expelled from it, everything will go on as smoothly as could be wished. But, if a fixed time goes by without any such desirable appointment having been made, then a lay commissary is to take possession of all property belonging to or administered by the see, and to manage it exactly as he pleases, subject only to the control of the governor of the province. Prince Bismarck's Bill originally contained a clause providing that, if those whose business it was to take steps for the appointment of a new bishop neglected their duty, the pay they receive from the State should be stopped until they came to a better frame of mind. This provision was struck out in the Chamber, and Prince Bismarck was willing to let the point stand over. But his journals have given their occlesiastical enemies to understand that the stopping of subaries in such a case is a rod which Prince Bismarck still has in reserve for them. make bishops. But he can put a considerable amount of

has in reserve for them.

Whether this scheme will practically work to which few persons not having a profound made knowledge of German social and policionals.

opinion. It is not, however, fair to say laws are adjuncts to the old which might in spared. They flow necessarily from whate n as the FALK laws, if the FALK laws were to be made effectual. If parishes are to have their priests taken from them, they must be furnished somebow with new pricets. If bishops of the wrong sort are to be kept from meddling, bishops of the right sort must be procured by making it the interest of those who can get bishops appointed to have the sees filled. The measures of Prince BISMARCK are child's play compared with the measures by the Research of the property of the procure of the pro which ELIZABETH and her advisers converted a nation of half-hearted Catholics into a nation of half-hearted Protestants; and if Catholic Prussia now is at all in the same temper and position as Catholic England was in the time of ELIZABETH, Prince BISMARCK may succeed in establishing a form of the Catholic religion which shall be in Imrmony with that subordination of the Church to the State which is directly opposed to every modern development of Catholicism. But there can be no mistake about the issue. The ten males of comfortable means who summon a meeting. and the majority of the congregation who elect a priest, and the priest who when so elected accepts an incumbency, will all have shaken off everything beyond a nominal connexion with Rome. They will all be doing something of which their infallible guide in faith and morals will tell them that he and Henven strongly disapprove. If the warnings and threatenings which he will be sure to offer them with inexhaustible liberality do not excite any real remorse or terror in their minds—if they do not think he is so very infallible after all, or if they believe him to be at once infallible and mistaken, which experience shows to be not at all an impossible state of mind-they will fall in with Prince BISMARCK's views, and every year will tend to build up more forcibly a religious system which will be Roman Catholic only in name. No one can say that such a result is not possible. For, if German Catholics hold theoretically that the authority of the Church is supreme, they also hold that the authority of the State is equal, or perhaps greater. In quiet times it is possible and convenient to accept in a suspensive and indefinite manner, as equally valid, two propositions which are logically contradictory. But now the inhabitants of Catholic parishes in Prussia will have to abandon this pleasant neutrality, and to determine whether they mean that the State should be above the Church or the Church above the State. That anything like all those concorned should act in the same way is in the highest degree unlikely. There will be at least a few who will obey the State at all hazards, and a few who will obey the Church. But the question is, which course the bulk of Prussian Catholies will choose, and the issue is now so clearly defined that the result cannot remain very long doubtful.

FARMERS AND LABOURERS.

THE strike of the labourers in Suffolk continues, not withstanding the ovils which it inflicts on both trues. Mr. Monier and Mr. Dixon, who have within best intentions undertaken to negotiate better the employers and the workmen, are too strong plodged to the cause of Unions to command the cordence of the farmers. The Duke of RUTLAND, on the Jur hand, notwithstanding the benevolence of his in ations, began his efforts to effect a compromise he simple-minded assumption that the disputants on the side were wholly in the wrong. There is still reach to fear that the result of the struggle will be detenined by greater or less ability to pareist rather than by rument or sentiment. It is at last admitted that the Miles of the Union which provoked the contest were in the highest degree dictatorial and oppressive. The managers of the Union would not object to modify their more offensive laws for the purpose of relieving their friends from sive laws for the purpose of relieving their friends from the heavy burden of maintaining the labourers in idloness. The farmers naturally reply that their objection is not so much to any special rules as to the power which is exercised by strangers of controlling the men in their employ. At a late meeting of the London abottors of the quarrel, the Chairman asserted, that no strike had been ordered during the present year in Specials, except in two or three parishes. The farmers, were not obtuse enough to be balled by a transparent contribution for heating them, in decail. It had been intended that the great them in decails the purposites contributing to the maintenance of fractions of their body which might, according to an organized plan, successively strike for higher wages. Nothing could be more justifiable than the determination to anticipate the designs of the Union managers by a general suspension of labour. The fact that more than a thousand men have since been kept from starving by the funds applicable to the war with the farmers sufficiently proves the formidable character of the combination among the labourers and their allies. The men who have been locked out would, if they had chained in work, scarcely have felt the burden of supporting the small number of their companions who would from time to time have thrown up their employment.

All impartial bystanders are convinced that at the commencement of the lock-out the farmers selected a wrong issue. It is perfectly intelligible that they should have preferred to deal directly with the cause of the quarrel instead of contining themselves to the immediate provocation. They knew that the partial strike had been instigated as part of a general plan of attack by strangers, and they consequently held themselves justified in demanding that their labourers should renounce their allogiance to the Union. Their error consisted in the denial of a right which in theory cannot be disputed, although it is for the most part vexatiously exercised. Familiabourers are as fully entitled as artisans to form combinations amongst themselves for the purpose of obtaining either a rise of wages or any other object which they think desirable. Their empleyers would probably not have questioned the right to form a local Union if the labourers had not placed themselves under the control of a contral and distant Council. Maturer reflection would have convinced the farmers that the right of local combination involves an unlimited discretion as right of local combination involves an unlimited discretion as to the mode by which it may be rendered most effective. A similar question was raised on a larger scale during the long struggle of the English and Irish Roman Catholics for toleration and equality. Their opponents, while they professed to acknowledge the perfect freedom of religious opinion, still contended that the subjects of a foreign spiritual head were not entitled to the full privileges of loyal Englishmen. It was at last found necessary to consent to the indigenous the conditions on which alone politic sent to the indispensable conditions on which alone political equality could be accepted. The Saffolk farmers regard Mr. Arch and the Learnington Union with as strong repugnance as if they had to deal with an Œcumenical Council or an infallible Pope; but the right of union includes the right of submission to discipline and to external authority. The strongest reason for acquiescence in an unwelcome conclusion is the impossibility of permanent If the labourers voluntarily place thomselves resistance. under arbitrary government, a denial of their right to obey is a violation of natural freedom.

A few labourers who had been locked ont in Lincolnshire have been allowed to return to their work without surrendering their cards or certificates of Union membership. The farmers, having for the time defeated the attempt to extort an irrette of wages, at o probably unwilling to onter it o more serious struggle. The one test in Suffolk is into a more serious struggle. more obstinate; and the employers have thus fer shown no Maposition to yield. The Union lenders watch with visible uneasiness the heavy drain of several hundred pounds a week on their funds. They profess their readiness to withdraw any claim which may have been made for an increase of wages; and they cannot be expected to abandon the main object of contention. Both parties might perhaps be well advised in consenting to a trace or tacit compromise by which the real cause of dispute might be temperarily evaded. Many precedents might be found of wars undertaken for a special purpose, and ultimessly terminated, through the exhaustion of one or both beligerents, by treaties in which no reference was made to the cease of quarrel. The league of the Continental Rowers against Hingland towards the end of the American war was formed for the avowed purpose of altering the maritime lawy yet at the goueral peace in 1783 no concession was made to the universal demand, nor was any mention made of the question in the treaties. The Suffolk farmers have to a limited on tent succeeded: in obtaining worksnesson: their own terms, and they have also provided themselves with the meens of dispensing in a certain degree with hind-labours; but in the approaching amount in continuance of the last out will the apprenent general inconvenience, and many y will cause great less and inconvenience, and many y will must be enciuse to remain their extinctly counse of a tions. The startly resolution with subject the flucture subcredits their coverants with subject to great an

some impression on their usen; and their fidelity to the common cause may perhaps suggest the thought that the up into discordant fractions. If Marting abourers in their turn are searcely exceeding their right in silowing themselves to be raised by a majority. It may be doubted whether any body of manufacturing employers has exhibited the firmness of the Suffolk farmers.

If rural agitation becomes general and chronic, the presperity and improvement of agriculture may be soriunity impaired. Outlivation has become more scientific and more productive in proportion to the amount of capital applied to the land by considerable employers of labour. In some parts of Flanders, and perhaps in other Continental districts of limited extent, the gross produce of the soil is greater than in the most fertile parts of Hinghand; but it is obtained at a far houser cost of labour. The best tillage and the finest stock are to be found on large farms, from the same causes which enable great capitalists to defeat their competitors in manufacturing industry. The modern dectrine that men work better on higher wages has not been confirmed by the recent experience of ironmasters and coalowners; but perhaps large farmers might reconcile thomselves to a certain advance of wages if only they were sure of retaining the control of their own business. The crops, the soil, and the seasons will not conform themselves to the rules of Trade Unions. If colliers think fit to remain idle half the week, the consumer is the principal sufferer; but horses must be fed at the regular hours, and crops must be cut and harvested when they are ready. The grievance which the farmers in Suffelk attempted to redress by the look-out was real and genuine, for the enforcement of the Union rules might at any time have involved them in grave disaster. The remedy which they proposed was simple, and it would have been effective, if unluckily it had not been both unjust and unattainable. It may be hoped that after the close of the dispute the Union managers will be less exorbitant in their claims, and that the labourers will hesitate to renew a contest in which they have found that victory is not easily secured. The philanthropic anatours who at first denounced the conduct of the farmers have lately suspended their gratuitous exhortations; nor have the landowners who have watched the struggle with profound anxiety as yet found opportunities of interfering with effect. Much to the credit of both parties to the dispute, a friendly feeling still exists between the employers and their former workmen. Both have the complacent conviction that they are respectively in the right, and each party hopes to succeed by greater endurance.

MARSHAL MACMAHON AND M. THIERS.

THE Ministerial crisis in France lost all its interest when it passed out of the hands of the politicians. Statesmen even of the meanest type must have some theory as to how they propose to deal with public affairs, but General DE Cresey has taken office merely as Marshal MacMatton's aide-de-camp, and nothing need be expected from him beyond such routine measures as are needed to keep the machine of administration in working order. seems to be quite clear whether this curious innovation upon the ordinary modes of appointing Ministers does or does not mark a change of policy on the part of Marshal MacManon. It is perfectly consistent with either supposition. The Marshal was greatly and naturally annoyed by the refusal of one party leader after another to help him out of the difficulty in which the defeat and resignation of the Duke of BROSLER had placed him, and he may either have determined to deal for the future with men whose notions of discipline have a more soldierly colour, or may have done so in this particular instance in order to gain time to construct a Ministry after a more orthodox pattern. Even if the latter view of his intention was the true one at the moment of its being formed, it is by no means certain that it will remain the true one. Down to this time Marshal MacManon has played the part of Constitutional President, but now that he has been driven to make himself in some cort a personal ruler, he may find unexpected charms in his new character. His position has a good deal changed since he took office a year ago. He was then the nomines of a powerful and apparently compact majority, and in the first instance to seems to have had no other conception of his duty than to do what the majority bade him. Now, by the vote of the 19th of November, he holds his power independently of the majority which appointed

If March up into discordant fractions. a Republican, his course would be clear. solve the Assembly with or without its own in the latter case would ask from the new Chamber the condonation of his irregular action which he would usdoubtedly obtain. But, as it happens, Marsial Mac-Maron is in no sense a Ropublicau, and if a Republican Assembly were now elected he would perhaps insist on resigning. He may think that this would be so injurious to the true interests of France that patriotism as well as ambition demands the retention of the existing Assembly, not as being useful in itself, but as filling a place which might otherwise be occupied by some more mischiovens body. In this case Marshal MacManon's Government must romain personal, whether he wishes it or not. No combination of parties in the Assembly can claim any real power. The Conservative majority which in October had nearly agreed upon a Restoration, and in November was supposed to be agreed upon a Septennate, cannot approach the organization of its own incongruous handiwork without splitting up into as many parties as there are possible aspects of a seven years' Presidentship. The Republicans, thanks to M. There's personal influence, and to the general if not uniform prudence of the Radical leaders, are a fairly united party, but they do not command, and, unless partial elections multiply faster, are not soon likely to command, sufficient support to constitute a Ministry. Consequently Marshal MacManox must govern the country himself, or allow it to go ungoverned. some circumstances this might not be matter for much regret. It might be a real guin to France to have order preserved, and the Conservatism of a great part of the nation humoured, under Republican forms. The dread of Republican violence which has had so large a share in former counter-revolutions might thus be allayed, and the solution which M. Theres did so much to recommend to the nation might be finally accepted. But the election in the Nièvre suggests serious doubts whether this gradual and penceful conversion of Franco into a Republic is likely to go on under the present Government. The MINISTER of the INTERIOR has denied the vernment. The Minister of the Interior has denied the statement that M. DE BOURGOING received official support, and if the candidate spoke the truth when he said that Marshal MacManon felt an interest in his success, he Marshal Machianon left an interest in the success, and had probably secured the Marshal's good will by mis-representing what his success would mean. It is not unlikely, however, that the Bompartist candidate may have received some incidental help from the Bompartist. uniyors whom the Duke of Bacatte was obliged to nominate for want of any one more to his mind. It was pointed out when the Mayors' Bill was under discussion that the Minister's choice virtually lay between Republicans and Bonapartists, since it was only those that had any official experience. When the Dake determined to get rid of the mayors appointed by M. GAMBETTA and M. THERS, he was obliged to go back to mayors who had been appointed under the Empire.

But the real lesson of Sunday's election goes much deeper than the appointment of mayors. It seems to show that the French people are getting weary of an inter-They want a settled Government; they want fixed institutions; they want some assurance that politi-cally to-morrow shall be as to-day; they want relief from the prospect now held out to them of seven years of uncertainty ending in an eighth year of pensible civil strife. They would gladly seek this deliverance at the hands of the Republic, but unfortunately the Republic cannot be peaceably established unless it is established by the powers that be, or unless the powers that be consent to submit their title to the verdict of a general election. Probably, if the Fronch nation could be consulted at this moment, the choice of an immense majority would be the Republic of M. Turks with Marshal MacManon as its first President—Republican institutions administered by a very strong and very resolute Executive. But if Marshal MacManon will be no party to this combination & is not so certain that the Republican enthusiasm displayed in se many partial elections will last. The wish for a settled Government of some kind may prove stronger than the wish for a particular form of settled Government. It would have seemed inspossible three years ago that a department which has hitherto returned Republicans should now return an Imperialist an Imperialist, too, of a most pronounced and remistakable type, an Imperialist

who tells the electors that in voting for him they have been voting for the Empire, and who starts at once for Chislehurst to kiss the hands of the Imperial Prince on the occasion of his success. But time, and ignorance, and the conviction so deeply rooted in French minds that their misfortunes are caused by treachery have done much to mitigate the hatred which raged so fiercely after Sedan. Once grant that the French cause was deliberately be trayed, and it follows almost unavoidably that Napoleon III. was betrayed too. He had nothing to gain by defeat; on the contrary, he had staked all he had on victory. There was a difficulty at first in settling who had betrayed France if the Emperor had not done so; but this was entirely removed by the intervention of Bazaine. Few Frenchmen now think themselves bound to look any deeper into the causes of their disasters than the surrender of Metz; and as the tradition of Bazaine's crime grows and shapes itself, the errors of Napoleon III. become by comparison matter for pity rather than blame. If Marshal Macmauon will not have a hand in founding the Republic, he may—at least French electors may easily bring themselves to think so—have a hand in restoring the Empire; and in this way the establishment of a settled Government might be secured, though not on the terms which, if left to themselves, Frenchmen would most welcome.

This view of the temper of the nation is not really inconsistent with the view put out by M. Thiers in his reply to the Republican deputation from the Gironde. The persons to whom this speech was really addressed were the Conservatives of the Right Centre. M. Thiers reminds them that they have had the chance of setting up Constitutional Monarchy, and have found themselves unable to use it. He reminds them further that the desire of the country for a Republic has been unmistakably shown—the election for the Nièvre is only the second out of sixteen elections held since the 24th of May in which the Republican candidate has not been successful—so that they cannot build any hopes on the result of a dissolution. Lastly, he urges that, as a general election must be held some time or other, it had better be held now, since delay will only improve the prospects of the Radicals at the expense of those of the moderate Republicans. The return of M. DE Bourgoing invalidates none of these statements. It only gives ground for a fourth, that the remedy for a Radical triumph will be sought in the direction not of Constitutional or Legitimate Monarchy, but of an Imperialist Restoration. The Right Centre are strongly opposed to this last result, and this new evidence that it is likely to happen ought to give M. There's argument an additional claim on them. It is to be feared, however, that among M. There's many gifts there is not included the faculty of charming a wilfully deaf Orleanist.

M. VAN DE WEYER.

through life the most fortunate of men, fully accontinues for his success, and justified his reputation in the success, and justified his reputation in the success. You that taken a principal part in the success have mith antod considerable historical event, he collate the law mith antod considerable historical event, he collate the law mith antod considerable historical event, he collate the law mith antod considerable historical event, he collate the law mith the completeness of his strongistently declined to Helgium he had the law work by consenting to democratic revolutions, comoting the independence of neighbour which the law motion of furthering the cause of European settle is union, or of aggrandizing the ambitious Countries which had encouraged the first breach in the deemed all response to 1815. The union of the Low of Figure date under the House of Orange might have been

by the most statesmanlike conception of the Congress of thina, if only it had not been subsequently condemned by failure. From the time when the fall of Napoleon was seen to be approaching, some of the ablest politicians of England and of Germany busied themselves with various schemes for the creation of a State which might be strong enough to maintain independence on the Northern frontier of France. Before the recovery of Prussia from the catastrophe of 1806, it was thought possible to unite a part of North Germany with Holland and Belginm; but finally the more practicable project of a Kingdom of the Netherlands provailed. It is useless to inquire whether greater prudence and tast on the part of the reigning family and of their Dutch whether might have conciliated the good will of the Man DE Wan DE Weyer grew to manhood in the discontent against foreign rule; and he had

already made himself conspicuous in opposition to the Government when the French Revolution of 1830 rendered separation feasible. In the rupture with the Netherlands which immediately ensued, M. Van de Weyer displayed the energy and courage of a revolutionary leader; but it could scarcely have been then anticipated that he would from that time become the most adroit and prudent of diplomatists. Lord Palmerston was not to blame for disapproving of a revolution which had been effected under the auspices and for the apparent benefit of France. From the time when the rich inheritance of the medieval Earls of Flanders was absorbed in the dominions of Burgundy, Belgium, as a province of Burgundy, of Spain, of Austria, and of the French Empire, had never even aspired to a separate existence. The candidature of the Duke of Nemours for the crown of the new kingdom justified the suspicion of English statesmen, who gradually learned that M. Van de Weyer was as little inclined to union with France as with Holland. His sagacity and firmness contributed largely to the maintenance of a kingdom which now boasts a creditable history of more than forty years. Future experience must show whether it is possible for a minor State to retain permanent independence in the midst of the great military monarchies of the Continent. It is still allowable to regret the disruption of the Kingdom of the Netherlands, although during a long peace neither Holland nor Belgium has hitherto suffered material loss in consequence of separation.

Prince LEGPOLD, as soon as he was selected for the vacant throne, had the good sense to repose full confidence in M. VAN DE WEYER, who became one of the wisest and most trustworthy of his advisors and agents. The representation of the King of the Belgians in England was one of the most important of political offices; and after the accession of the QUEEN the family connexion and personal intimacy between the two Courts secured to M. VAN DE WEYER additional influence. As the trusted counsellor of a King who in course of time acquired a great reputation for political sagacity, he had sometimes an opportunity of exercising influence in European affairs. In the earlier part of his career M. VAN DE WEYER'S social popularity had some effect in removing the prejudices which had not unnaturally been entertained against a State resulting from a successful revolution. His connexion by marriage with a wealthy American family settled in England was practically equivalent to naturalization. Both in the time of Louis Philippe and after the re-establishment of the French Empire M. VAN DE WEYER'S vigilance was stimulated by frequent intrigues for the annexation of Belgium, and English statesmen know that his patriotic feeling coincided with their own settled policy. M. VAN DE WEYER had, in consequence of failing health, retired from office before M. Bunedetti's project of a treaty of annexation between France and Prussia was disclosed at the outbreak of the war of 1870; but probably he was not surprised by the designs of Napoleon III., whom he had uniformly distrusted.—His eloquent and indignant answer to farmers, having for the time on that Belgium methods are in Saffolk and disarm in the presence of French menaces and presence of F

and disarm in the presence of French menaces and pales had some time before given a merited rebuke to the apostle of peace. M. Van de Weyer was for a short time engaged as Minister in the domestic politics of his country; but the main business of his life was to secure Belgian independence by diplomatic action, and more especially by the cultivation of the English alliance. He was happily relieved from the painful duty of engaging in the chronic struggle of the clerical and Liberal factions, between which Belgian politicians are equally divided. His own inclinations were entirely opposed to the supremacy of the clergy, but he would have been too prudent to give his adversaries an excuse for seeking the patronage of a foreign Government. Although his long residence in England, and his education of his children as English subjects, must have given him a strong interest in the political controversies of his adopted country, his good sense and good taste prevented him from identifying himself with either party. His genuine patriotism as a Belgian fortunately never clashed with his attachment to English institutions.

If M. VAN DE WEYER'S thoughts had not been concentrated on public affairs, he might probably have attained a high literary reputation. His occasional writings were spirited and forcible, and he was an accomplished scholar. With the exception of Dean Millar, probably none of his contemporaries possessed so wide a knowledge both of the outsides of books and of their contents. He was at the same time a master of hibliography and an ansatzyonus

reader. In his youth he had been librarian of the public library of Brussets, where he had the opportunity of gratifying the love of books which afterwards led him to amass a wast collection of his own. His memory was surprising on many subjects, and especially in relation to books. When he had been for many years a resident in England the could frequently remember the bookcase and the shelf on which any ware or remarkable book was to be found at on which any rare or remarkable book was to be found at Brassels. His conversation was rich in aneodotes both of that he had read and of what he had seen. As a boy he had ridden over the field of Waterloo the day after the battle, when his political feelings were, probably under the influence of his family, already hostile to French domination. Before he was thirty he had taken a conspicuous part in great affairs, and he had earned the right of access to the best society of Europe, which he was fully qualified to adorn. There was nothing in his manner of the stiffness or shyness of the newcomer into an unaccustomed social sphere. Like all persons who have a natural aptitude for conversation, he delighted in social intercourse; and his diplomatic position, backed by an ample fortune, enabled him to gratify his tastes to the utmost. M. VAN DE WEYER's name will be familiarly recollected by the present generation; and perhaps his memory may be preserved as that of a chief founder of Belgian independence. If the work to which all his efforts were devoted is unluckily destined to collapse, the Belgian Revolution of 1830 may probably subside into the number of obscure events and abortive enterprises. In any case it will have been something to give a respectable State the opportunity of existing in prosperity and freedom for half a century, while many of the Crowns of Europe have in the interval rolled in the dust. There is perhaps something factitious in the existence of a kingdom which shares none of the sacrifices or responsibilities of material greatness. Small States are now more insecure than at any former period in history, for the same reason which has made handlooms and small farms obsolete in England. There was a time when Ghent or Bruges could with its wealth and its armed population defy a tyrannical sovereign or a foreign invader, but at present Belgium would be incapable of offering an unaided resistance to France or Germany. M. VAN DE WEYER did much to ensure the fair trial of an experiment which has thus far been successful. If Belgian independence ultimately proves to have been impossible, the fault will not have lain with a firm and sagacious patriot

ELECTION PETITIONS.

THE city of Galway has emulated the county in furnishing a leading acres in that L ing a leading case in that part of election law which refers to intimidation. Mr. Justice Kroch laid down with unmistakable distinctness the general proposition that spiritual intimidation will make an election void. Theoretically, the arguments that spiritual intimidation is not intimidation at all in a sense known to law are not without considerable weight. Practically, the interference of the priests in an Irish election does produce such an effect that the voters cannot be said to vote freely when it is applied to them. But the law cannot reach the milder and gentler forms of spiritual intimidation. If a pricet in a gentle, unobtrusive manner called at one cottage after another and stated that in his opinion every elector who voted for a particular candidate would suffer appropriate tortures in a future world, it may be reasonably doubted whether any judge would hold such interference to be a ground for avoiding the election. The interfering priest must do much more than this in order to vacate the seat of the candidate for whom he has successfully worked. In the case of the Galway county election the interference of the priests had reached the point of denunciations and harangues from the altar. In one way this is doing nothing more than to damn in a lump those who go estray; and if a priest has a right to threaten one man with spiritual penalties, he does not seem to be doing anything very different when he scatters his curses over a dosen heads at a time. But Mr. Justice KROOH thought that to the Irish mind a denunciation from the alter was such an exceptionally dreadful thing that the priests who had recourse to it must be taken to have used so unfair a weapon of political war that an election should be declared void if won by these means. Logic will not help us to understand the distinction, and we must fall blick on the rough common sense which we are obliged to permit to guide us in so many of the difficulties of law.

1

When Mr. Justice Knoul pronounced that deministrate from the alter were not a permissible form of spiritual intimidation in election contests, moderate Roman Catholic laymen understood what he meant and thought he was right, and this is the best and perhaps only justification of his decision. He had got to apply common sense to a difficult matter, and this common sense was found to be in accordance with the common sense of people ordinarily regarded as sensible. Men who are capable of believing that an Irish priest knows so preciadly the conditions of happiness or unhappiness in a future world that he can say the one will be secured by voting for Captain Notan and the other by voting for Captain TRENOR, are not in the least fitted to have the suffrage at all. But unfortunately they have got it, and in a rather rough fashion a sort of remedy is worked out by laying down that these possessors of the secrets of the future may do this and may not do that, may curse delinquent votors quietly and may not curse them openly. In the same way the recent German ecclesiastical laws have provided that the priests may excommunicate sinners in a gentlemanly and domestic manner, but must not hurt the feelings of the sinners by giving publicity to the action that it is thought nocessary to take. A man who believes that his priest can affect his condition in a future state in the most awful manner, but does not mind so long as what is done to his detriment is done in a gentlemanly way, is no doubt in a very singular state of mind. But the law must adapt itself to facts, and has to deal with all sorts of illogical reasoners and half-believers, and thus denunciations from the altar may be practically, as Mr. Justice Kroon hold. a good ground for avoiding an election.

In the election at the beginning of this year the candidates befriended by the priests carried the county with such case that there was no occasion for illegal practices. But Mr. O'DONNELL, the clerical candidate for the city, was beaten by a large impority, and two candidates directly opposed to the priests and their party were returned. It so happened that one of the successful candidates bad actually succeeded to a peerage when he was elected, and a new election became necessary. Mr. O'Donnelli was quite ready to stand another contest, and this time he managed to defeat a candidate who would in other days have been, from family connexious and property, a most formidable opponent. But it was precisely because he was in this way associated with the landowners of the county, who had excited the wrath of the priests by supporting Captain There is the write of the press by supporting Captern There is the former county election, that Mr. Joyce was thought peculiarly worth beating. The priests set to work to beat him. They were, however, careful not to lose the benefit of the warning which Mr. Justice Kroun had given them. They knew what practices he had declared to be unlawful, and they carefully abstrained from them; and the Bishop who had been especially affected by the indement given in the case of the county election was the judgment given in the case of the county election was particularly careful not to seem to have anything ostensibly to do with the election. But the priests once more burnt their fingers. They understood a little election law, but not enough. They kept silent at the altar, but they rashly imagined that it would do no harm if they headed bands of uproarious friends on the day of polling and threatened voters coming to give their votes whom they thought likely to go the wrong way. They so far succeeded as to induce many voters to abstain, and their candidate was accordingly returned with great triumph. They also indulged in a little byplay. A priest, with the help of the Bishop, wrote a most scurrilous letter to Mr. Joyce, and they patronized the issue of placards in which the name of Mr. Joyce was associated with the hated name of Mr. Justice Krook But it was not by errors of this sort that they did their candidate any real harm. priest may be scurrilous and mendacious and yet Lot affect an election. He is only exercising the right of a Britis | 4 subject to exhibit such qualities as he considers will best win the admiration and support of those who know and love him most. But when the priests headed mobs at a moment when the poll was actually going on they ran a risk which it is curious that they did not foresee. They will know better for the future. They have learnt a new lesson as to what they may not do. But it can scarcely be said that, so far as political influence goes, the warnings they receive do them much harm. Irish electors seem to regard these interferences of law against spiritual coercion as ressons why they should love spiritual coercion more than ever; and perhaps nothing could suit the priests better

great acumen to guess that for priests to encourage mobs on the day of the election to intimidate opponents was an illegal practice. But when it is said that the priests did not know enough election law, it must be owned that, except in very plain cases, no one can pretend to know enough election law. It is entirely impossible to tell beforehand what practices a judge will overlook and what he will condemn. By degrees, no doubt, something like a body of election law will be framed. But at present the judge is obliged to look mainly at the facts before him, and to form an opinion about them without laying down any principle that will be a guide to another judge sitting at another place. Mr. Justice Mellor has confirmed the election of Mr. Cross for Bolton, whose seat was attacked on two grounds besides that of bribery, which was scarcely attempted to be proved. The personation agents for Mr. Caoss had invented a device, by gumming pieces of paper into the register, and then tearing them off and sending them to friends outside, by which it became known, or it was at least intended to become known, who had voted. The practice was very reprehensible, but in the opinion of Mr. Justice Mellou it only exposed those engaged in it to penalties, and did not affect the election. In the same way he held that a lotter signed by the agents of the sitting member and addressed to voters might expose those agents personally to the penalties for bribery, and yet that the letter was not an act of bribery sufficient to unseat the member. It is evidently one of the nicest and most difficult questions of election law, whether an illegal act performed in the interest of the candidate by an indisputable agent of the candidate may yet be so wholly personal to the agent that its illegality does not affect the result of the election. The shades of agency in elections are so subtle that no one can say in what way very doubtful cases will strike the mind of an election judge, and to this extent the law must of course remain uncertain. There will always again be some difference of opinion among judges as to how far acts done at some former time and tending to influence the electors are connected with the particular election in question. At Windsor Mr. Gardner was declared by the judge to have given presents and festivities to the electors with a view of winning popularity at the next election, whenever it took place. But his seat was not forfeited, because no election happened to take place until long after these gifts had been made. Colonel DRAKIN, on the other hand, was unseated for having given his tenants permission to shoot rubbits on his ostate three weeks before the time when an election took place. These decisions are not really conflicting. A man may strive to win popularity by gifts, and to provoke fear by turning out tenants disposed to vote against him, and he may act avowedly in the hope that he will thus be returned as member for the borough where he is operating. The only thing is, that he must be lucky enough not to be surprised by a sudden dissolution while his operations are going on. But if he has guined the popularity he seeks, or made himself sufficiently terrible, at a date clearly anteredent to the particular election at which his operations bear fruit, and he is returned, then his seat is safe. Not so if the same operation had been carried on just before the time when an election takes place. This is the law so far as these two decisions can be said to have established it; but it is obvious that most difficult questions might arise as to the length of time which must have chapsed to make gifts and acts of intimidation innocuous on the part of section who an sholong makes it known that he will be candidate when an election commerce. Each election alge will have his own views on such a point, and bilicensic on this head, as also on that of agency, there will dways be an uncertainty in the law, and no one can tell precisely beforehand what it is legal or illegal to do.

· FAMINE AND FINANCE IN INDIA.

THERE is an evident disposition on the part of some of the Knglish newspapers in India to make light of the famine in Bengal. This may in part be attributed to a matural reaction against the sensational etatements of the Friend of Ladio and the Times Correspondent. These matherships would probably may that they had represented

than to have an election petition decided against them and the coming scarsity in the strongest possible colours because their nomine e.

It might certainly have seemed that it did not require other means, and that, without rousing the English public, the requisite amount of pressure would not be exercised on the Government of India by the Home Government. It is not our business to discuss the allowable limits of conscious exaggeration in a good cause, but it is unfortunate when this exaggeration involves attacks upon persons whose official position obliges them to tell the truth. So far as the telegrams which used to startle the English pullio merely overstated the probable demand for food, no harm was done; but when, in order to sustain these over-statements, the policy of the Vicenov had to be censured, there was injustice as well as exaggeration, and even a pious motive cannot excuse this. The Indian newspapers which take the opposite view of the facts have allowed themselves to go equally far in the other direction. Happily they have no influence on the action of Government, and as Sir RIGHARD TEMPLE has himself gone over the ground, it cannot be of much avail to accure him that the distress which he has seen with his own eyes has no existence in fact. But to treat the famine as only a rather worse scarcity than common, and to ridicule the Vigeroy's proparations as a more burdening of the Indian taxpayer for the gratification of a sentimental public in England, may do a good deal of incidental mischief in districts lying remote from the scene of actual distress. It will not modify the action of the Government, but it will help to make that action unpopular when the time comes

for paying the bill. The true explanation of any discrepancy which may hereafter be found to exist between the preparations to meet the need and the need itself seems to be that it was not possible to ascertain at first whether the famine would be equally severe in all the districts in which scarcity was known to be inevitable, or whether it would be very much worse in some districts than in others. The determination of this fact depended upon data which were not to be had at the time when the Vicknoy had to make his plans. For example, the Fifteenth Special Narrative describes the results of the rubbee, or spring harvest, as exceedingly different in different districts. South of the Ganges the yield has been much beyond expectation. In Sarun the was greatly injured by hail. In part of Champarun there had been as good as no spring harvest at all. On the other hand, in the districts where the mohwatee grows the crop this year has been singularly full and abundant, "forming a most material addition to the food supply of "the poorer classes." These variations must make a considerable difference in the strain to which the relief system will be subjected, and if they could have been exactly foreseen, it might have been possible to reduce the preparations in proportion. But in dealing duce the preparations in proportion. But in dealing with unknown quantities such as weather and harvests, the Government of India had to make its choice between preparing for the worst and assuming the best. It very properly took the former course, and thereby earned the hestility of a class of journals which, if the preparations had fallen short of the need, would have been busy in denouncing the Viceboy's wicked parsimony. In England the disposition to underrate the extent of the Viceboy's preparations was increased by the accidental circumstance that in Tirhoot, where the stress of the famine was first felt and continues to be felt most severely, the transport arrangements were not finished in time, and the famine got a little ahead in consequence. That accidental start has now been made up, and to all appearance the Government will be perfectly able to beer all the pressure that can be put on it. Down to the middle of April the supplies of grain in the local markets were in most districts sufficient to meet the demand - in other words, the famine was till a famine of money wherewith to buy food, not a famine of food with Private trade was still regung grain into Behar at the rate of more than ten thousand tons a week. In the North of Chumparun and in Tirhoot distress was on the increase, and the number of persons resorting to the relief-works was daily becoming larger. But the arrangements for dealing with these growing numbers were more than keeping pace with their increase; and what three weaks before had been "hungry mobe clamorous for "relief" were "by degrees being transformed into organized "gangs of werkpeople." The village system to which Sir Grongs Carresta attached so much importance was being rapidly extended, and in this tray the Bengal Governshop expected to avoid overcrawding on the larger mademanical

dangers usining from the meaning of large and annual ageable bodies of labourems. In the Patna division, however, comparing Tirhost, the meaning, and Saran, the estimeter of distress at the worst season, farmed by Sir Ragnam Teners, premised to be even more then relised. In the fortuight ending the 16th of April the number of labourems on the relief-works was 806,878, against 539,353, in the previous fortuight. But against this must be set the facts that in the Bhagulpore division the distress promises to be considerably less than Sir Ragnam predicted that the famine would altogether get the better of the Government, it promises to be somewhat less than the estimate.

less than the estimate. The details of the Indian Budget which have now come te hand have an interest only second to the details of the famine organization. It is to them that we must look for security against future calamities of the same sort. The estimated cost of the famine is six and a half millions, without reckoning the indirect cost in the shape of diminished revenue. "If," says the resolution shape of diminished revenue. "If," says the resolution of the Government of India, "the occurrence of serious " deficiency in the food supplies of the people depended "upon causes so rare as the potato disease which pro-duced the Irish famine . . . the necessary funds might "legitimately be raised by least if the ordinary resources "of the State should prove insufficient. Unfortu-"nately, drought, which is the cause of all serious "and extensive famines in India, cannot be regarded as an "extraordinary visitation." Within ten years there have been famines in Orissa, in the North-West provinces and Rajhpootana, and in Belar and Bongal. Consequently loans cannot be safely depended on to meet future charges arising from this cause. There is no room for talking about spreading the cost of a famine over more than one generation, when each generation may look to having to hear the cost of nine famines to its own share. In future, therefore, it will be necessary that " besides a fair surplus of income "over ordinary expenditure, such a margin should be " provided in addition in ordinary times as shall constitute " a reasonable provision for meeting occasional expenditure " upon famines." There must be, in short, two surpluses; an ordinary surplus for guarding against unforeseen disan ordinary surplus for guarding against unforcescen disasters, and a famino surplus for guarding against forcescen disasters. But while thus resolving to be beforehand with the consequences of famine, the Government of India is also determined to be beforehand with its causes. "A general review is now being made of "the whole of Her Majerty's dominions in India as " regards liability to famine, from the want either of works "of irrigation or of means of communication"; and as soon as this is completed the Government will consider " how far it may be desirable to accelerate the construc-"tion of reproductive public works; and if so, how the necessary funds shall be provided." Upon the first of these heads there cannot, we conceive, be much question. If it is assertained that, by the construction of certain public works, British India can be virtually secured against famine, these works cannot be too quickly carried out. To delay the execution would not be merely to sacrifice higher considerations to economy, it would be to sacrifice economy itself. The cost of making irrigation-works and railways wherever they are held to be required for the prevention of famine will be so large that it must be defrayed by loan; and if, in order to spread the issue of this loan over a number of years, several famines have to be encountered which might have been avoided by issning it at once, the result will be to saddle the Government with fresh expenditure out of income at quickly recurring intervals in addition to the permanent expenditure to be provided for by horrowing. This result of delay is too ohvious to escape notice, and it may therefore be confidently expected that, as soon as the survey of the wants of the country in respect of irrigation and com-munication and the estimates of the cost of meeting these wants are completed, money will be borrowed to an amount which will admit of the works being executed with the shortest possible delay.

A MINISTER OF PUBLIC INSTRUCTION.

THE DIRD HAMPTON'S specifi in favour of the appointalcolour of a Minister of Endië Instruction afforded as curious illustration of the common belief in the power of words, or rather of titles. Even in the wording of bishops, the priests, and Mr. O'Kreven.

his proposal Lord Hangron was open to criticism; for, if such a functionary were required, he ought to be called Minister of Education, and not to borrow he designation from France. The Duke of Etchnone, stimulated into unwonted vivacity by contrast with Lord Hampton's solemn gravity, properly replied that he was himself already Minister of Education, and that he had no desire to be reduced, in the discharge of his duties affecting the discases of cattle to the condition of a firstaffecting the diseases of cattle, to the condition of a first-class votorinary surgeon. Those who hold the opinion of Lord Hangton can scarcely deny that the Department of Education is almost superfluously rich in officers. Among the Duke of RICHMOND'S producessors have been Lord LANSDOWNE, Lord RUSSELL, Lord GRANVILLE, and Lord RIFON; and the recently created office of Vice-Presi-LANSDOWNE, Lord RUSSELL, Lord GRANVILLE, NEW RIFON; and the recently created office of Vice-President has been held by Mr. Lowe, Mr. BRUCN, and Mr. FORSTER. It may be doubted whether the ordinary members of the Committee of Privy Council add much to the efficiency of the department. The Dake of Richmonn's statement that he profits by the advice of Lord Salisbury and Mr. Harry has an official and conventional sound. India and the army probably leave little time for attention to the representations of School Bourds, If the President of the Council is at any time unwilling on unable to superintend the details of education, the proper remedy is retiroment or transfer of office, rather than the creation of a new administrative Board. The popular assumption that the President of the Council must be a peer is entirely inacourate. In Lord ABLEDKER'S Government, Lord John Russkil was at one time President of the Council and leader of the House of Commons. Any other commoner would be equally capable of holding the office; nor is there any reason why the Vice-President, like several Under-Secretaries of State, should not occupy a seat in the House of Lords. Lord Grasville incidentally suggested that an existing anomaly would be abuted by the revival of the office of Lord High Treasurer, instead of the arrangement by which the Prime Minister is merely a member of a Commission. The dignity of Lord President has accidentally survived, while the Treasury, like the Admiralty, has been put in commission, and consequently the head of the Government. has no precedence except that of a Privy Councillor. It is more convenient to find new duties for old offices than to multiply departments as the functions of government become more complicated.

No practical weight attaches to the complaint that there is a difficulty in defining the respective responsibilities of the President and Vice-President of Council. In theory the chief of a department is exclusively responsible; and if his subordinates happen to be abler or more active than himself, the efficiency of administration is not impaired. For the most part responsibility means nothing but the duty of answering questions which may from time to time be put in either House of Parliament. The business of a Government office is conducted on the same principles with the business of a great industrial or communical undertaking, in which every man does the work for which he is best fitted. A Bailway Company is controlled sometimes by the chairman, sometimes by the secretary, the manager, or the solicitor, on a principle of intural selection or unconscious competition. It is idle to maintain that the Vice-President of the Council proponderates over his chief morely because he moves the Estimates for Education in the House of Commons. The work of the department is distributed according to arrangement or understanding between the President of the Council and his colleague. Mr. FORSTER and Lord RIFOR happened to be personal friends; and Mr. Fourter had accepted the Vice-Presidency for a special purpose with the rank of Cabinet Minister. The Elementary Education Bill would not have been more easily passed, and the quarrels about the 25th Clause would have been norther more nor less bitter, if Mr. FORSTER had called himself Minister of Bila. The celebrated Minuster of Public Instruction who located that all the schoolboys in France were construing the same Latin sentence at the same moment may perhaps have found sufficient occupation in enforcing a happy uniformity of studies. To the simpler task of controlling parish schools and Government grants the Duke of RICHMOND, with the aid of Lord SANDON, ought not to be unequal. The Dake of RICHMOND appropriately asked, whether Lord Haspron's Minister of Instruction v as to extend his supervision to Instant. The Commissioners of Education in that country, have smugh to do with the

Lord Granville showed good sense in objecting to an increase in the number of great public departments. It is highly desirable to restrict the number of the Cabinet; and Mr. Diseaell has received just credit for discountenancing the system of providing for the greatest possible number of partisans by making them Ministers of the first rank. Twenty or twenty-five years ago demands were frequently made for the creation of new offices; and the President of the Poor Law Board, though his duties were wholly administrative, was often admitted to the Cabinet. No advantage resulted from the experiment, though it is convenient that the secondary Ministers should have seats in Parliament. Proposals have sometimes been made for the appointment of a Minister of Agriculture and Commerce, although the President of the Board of Trade has no important duties to discharge. In the last Conservative Government the President of the Board of Trude was a Cabinet Minister, because he happened to be also Duke of RICHMOND. Mr. BRIGHT, who succeeded to the office, was a more considerable party leader; but he never troubled himself with the details of administration. Mr. Chichester Fortescre had earned repose by his exertions in promoting Irish legislation, and he had already attained Cabinet rank. A President of the Board of Trade who is not in the Cabinet is perfectly competent to send inspectors to report on railway accidents. When he attempts independent interference, he generally finds that he has either failed or produced mischief. When pending controversies are settled, the President and the Vice-President of the Council will have little to do except to exercise a general superintendence over the permanent Secretary and his colleagues. Grants must be given to schools according to certain rules which will have been definitively settled. There is no more prevalent or more flagrant error than the belief that legislation, which is only required at long intervals, is the proper business of a Minister. The discretion of the Secretaries of State is so wide, and relates to matters so important, that they necessarily belong to the Cabinet. In general, it would be well to exclude the representatives of the Local Government Board and the Board of Trade, the Postmaster-General, the Irish Secretary, and the Vice-President of the Council.

It is strange that a Parliamentary and official veteran can be found to dilate seriously on the advantages of general education. The hereties who accretly dissent from the popular doctrine are careful to keep their persently to themselves. Eating and drinking matter for more than reading and writing; but no demand has been made for the appointment of a Minister of Food, except, included as the appointment of a minister of Food, except, included as the appointment of a minister of Food, except, included as the appointment of a minister of Food, except, included as the appointment of a minister of Food, except, included as the appointment of a minister of Food, except, included as the appointment of a minister of Food, except, included as the appointment of a minister of Food, except, included as the appointment of a minister of Food, except, included as the appointment of a minister of Food, except, included as the appointment of a minister of Food, except, included as the appointment of a minister of Food, except, included as the appointment of a minister of Food, except, included as the appointment of a minister of Food, except, included as the appointment of a minister of Food, except, included as the appointment of a minister of Food, except, including the appointment of a minister of Food, except, included the appointment of a minister of Food, except, included the appointment of a minister of the appointment of a indeed, so far as nutriment depends on agriculture. In all branches of administration, the need of superintendence by a Cabinet Minister depends not on the magnitude of the objects to be attained, but on the nature of the duties which are to be discharged. The Foreign Secretary has in ordinary times little to do, but he may at has in ordinary times little to do, but he may at any moment have occasion to take a step which ultimately involves the issue of peace and war. The regulation of the force of the army and navy and the control of the policy of India cannot be entrusted to subordinates. The Home Secretary is practically at the head of all domestic administration. A Minister of Instice after the spacement of a code and the of Justice, after the enactment of a code and the organization of a complete judicial system, could only appoint judges as they are appointed now, and then sit still while they discharged their duties. A Minister of Education will find ten years hance that School Boards are Education will find ten years hence that School Boards are or are not universally established, and that conscientious and sectarian squabbles have, as it may be hoped, settled themselves. He will then, through secretaries and clerks who will have little need to consult their chief, distribute the Government grant to those who have complied with fixed conditions. The President of the Council will be at leisure for his veterinary and official functions, and the Vice-President will subside into an Under-Secretary, like his analogous predecessor, the Vice-President of the Board of Trade. Mr. Forster, in carrying his great measure, has left an easy task to future Ministers of Education Education.

THE two great ecclesiastical Parliaments of Scotland burgh. The grey old palace at the fort of the Canongate

for a brief period of mild splendour, and the society of the Northern capital is gently exhibited by the Lord High Commissioner's levées and dinner-parties. His Lordship, His Lordship, as representing the Queen, holds regal state at Holyrood, and an excert of dragoons clatters behind his chariot as be drives to and from the hall of the Assembly. He has a drives to and from the hall of the Assembly. He has a purse-bearer, in black velvet, with a bag-wig and a sword; and a pair of little pages, in red coats, knee-breeches, and white wigs, to stand behind his chair and carry his pocket-handkerchief. He sits on a throne overlooking the Assembly, with the Moderator below him, and is of course an object of intense interest to the ladies, who form a considerable part of the audience. When he has anything to say to the Assembly, he addresses the members as "Right "Honourable and Right Reverend." It is of course the Assembly of the Established Church which this brilliant luminary gilds with his beams. In a hall close by sits Assembly of the Established Church which has a Moderator in a Court-suit like the other Moderator, its variegated beds of millinery, and all other Moderator, its variegated beds or minimery, and the forms and ceremonies of the rival Assembly, with just one important exception. There is no Lord High Commissioner to call the members "Right Reverend and Right" there are no little pages or dragoons. The "Honourable," there are no little pages or dragoons. The Free Church holds, however, that, if it has no Lord High Commissioner to sit on a throne above its Moderator, that is not its fault. He ought to be there, and would be welcome if he came, and theoretically a place is still kept for him in case he should drop in. The Free Church, in short, regards itself as the true Church of Scotland, and the Established Church as a false Jacob which has deluded the State and stolen the birthright of the firstborn. separating from the Establishment, the Free Church did not renounce its claim to be identified with the State, and at different times there have been rumours that it was not unwilling to be reconciled. The mind, or perhaps we should say the heart, of the Free Church has, however, been agitated on another side. Attempts have been made to patch up a marriage between the Free Church and the United Presbyterian, or, as it is familiarly known in Scotland, the U.P., Church. The United Presbyterians adhere to the voluntary principle, and demand that all Churches should be separated from the State, which is, of course, a very plain and consistent proposition. The Free Church clings to the opposite principle, but gets nothing by it. It is in favour of an Establishment, only it holds that it ought itself to be the Establishment, and that the Church which at present occupies that position has no right to it. Unfortunately, there is no prospect that its adhesion to this principle will bring about the application of it which it desires, and consequently a considerable section of its members appear to doubt whether it might not be as well to drop it altogether.

The Free Church is thus, as it were, in a tender flutter between two sweethearts. It looks fondly back upon the State, and yet it is not insensible to the charms of the United Presbyterians. The proposed abolition of patronage has added still further to its embarrassments, inasmuch as it practically concedes the very point upon which the Free Church quarrelled with the State. The founders of the Free Church declared that they could not remain in the Establishment if patronage were upheld; but, if patronage is to be abolished, there is no longer any reason for secession. It is obvious, therefore, that the abolition of patronage will be, in effect, the abolition of the Free Church in its present form. It may retain its name and its independent organization, but the ground on which it has hitherto stood will have been cut away from it, and it must invent some new raison d'être. The Free Church Assembly is evidently aware of the necessity of providing for this contingency, and an influential member has given notice of a series of resolutions to the effect that the Assembly is very glad to find that the Government has at last discovered its mistake, but that it thinks it highly unbecoming that the Free Church should not have been taken any notice of in the matter, and that, even if all been taken any notice of in the matter, and that, even if all difficulties with regard to patronage can be got over, there are "weighty considerations which must enter into the "determination of the expediency and propriety of renewing two great ecclesiastical Parliaments of Scotland are fust now holding their annual meetings in Edinth Phe grey old palace at the fort of the Canongate are ward up from its dreams of the remantic past that all imitations are sparious. In effect, the meetings

Commence of the second

of these resolutions would seem to be that the Free Church has no objection whatever to be put in the place of the Church of Scotland—a place which it has persistently claimed as its own—but that it very much objects to be absorbed by its rival; and that it is quite prepared, if its old quarrel is put an end to, to invent a new one. It in cossible that, if it were left to the great body of the laity, they would be quite content that the two Churches should be united; but there is a practical difficulty here which seems to have been rather overlooked. The great object of the Free Church has been of course to compete with the Established Church, and it has accordingly planted churches all over the country, and enlisted a large body of ministers, schoolmasters, precentors, pew-openers, and in short all the rank and file of a sectarian army. All this machinery has been provided on the theory that it was necessary to say the morals from a false Church that the morals from a false Church that the morals from a false Church that the says the morals from a false Church that the sail her than save the people from a false Church; but what will be the use of it when there is no longer any difference between the one Church and the other? There may be room for the Franch and the other? for the Free Church as an antidote to a poisonous Establishment, but is there any need for a double dose of precisely the same sort of physic? This is a question on which the interest of the practitioners will erhaps outweigh the choice of the patients. In some of the larger towns both Churches might find enough to do, but in a great many parts of Scotland there would be two ministers and two churches where only one was wanted. It will be seen, therefore, that the great obstacle to reconciliation turns on the disposal of duplicate apparatus. The Free Church is, in fact, pretty much in the position of an agitating League which has been unfortunately successful in carrying its Bill, and finds that there is no longer any excuse for soliciting subscriptions. There is no alternative but to disband the staff or start a new cry.

The kind of business which comes before the two Assemblies is pretty much the same, but the Free Church, as is perhaps natural, appears to be more disposed than the Established to sensational views and violent remedies. The drinking habits of the Scotch people are still, it seems, a great stumbling-block in the way of both Churches. In the Free Assembly an elder from Kinmundy made some starting statements. He had heard, he said, "that even in fash-"ionable shops in Regent Street, London, luncheon-lears "were provided, at which brandy, wine, porter, and ale "were served, free of charge, to the ladies who went there "to do shopping." And he had "further been told that he would be astonished to hear the names of members "of Parliament who had gone down to their work "in the House considerably the worse of stimulants"—a statement which, oddly enough, was received with "ap"plause." It might have been suggested to the worthy
elder that, even if there was no mistake about his facts, the Free Church has apparently a sufficiently hard task in ondeavouring to check intemperance at its own doors without troubling itself about members of Parliament and ladies in London. In another case, the Assembly had to exert its authority in order to prevent some fanatics at Inverness from enforcing a rule of their own invention—that no brewer is morally fit to be an elder. A member remarked that JOHN KNOX, in the First Book of Discipline, laid it down that ministers were entitled to an allowance for beer; but no one seems to have had the courage to remark that it would perhaps be well for Scotland if the people drank more beer and less whisky. If the rule were applied to brewers, it would have to be extended to distillers, and the members of the Assembly might then have found themselves bound in consistency to forswear their toddy. Yet the motion for exclusion seems to have had many supporters. The incident is remarkable only as an all attention of the temper of the Free Church. The Estaillustration of the temper of the Free Church. blished Church is equally distressed about intemperance, but is disposed to deal with it in a more reasonable spirit. If there were no other difficulties in the way of amalgamation, the keen and aggressive sectarianism of the Free Church would probably prove a source of fresh divisions.

CONSTITUTIONALS.

THE substantive "constitutional," though perhaps not as yet received in our dictionaries, is well understood to signify a sacred observance which to some persons is almost as accessary as attendance muon divine service. We suspect that the name had its origin at the Universities, and probably at Cambridge. In that most mathematical of towns the normal day's work of the rightness student included as hour or two's tramp along one of the

cheerful high roads which radiate from a common or lines in a geometrical diagram. The very names which have been conferred upon them by popular usage indicate the tamper of mind in which they are generally trodden. The "senior wrangler's walk," the "parallelogram," and—must significant, but to the general public most mysterious of titles—the "ydx," are descriptive of the paths themselves and of the pursons who use them. Many are the weary students who have tramped their daily allow-ance of exercise along roads of which we hope it is not offensive to say that they are amongst the ugliest in the Queen's offensive to say that they are amongst the ughest in the Queen's dominions, and who have been vexed even in their hours of relaxition by a dismal dance through their brains of grim mathematical symbols. Even if they perform their treadmill round in pairs, the conversation of the sufferers turns upon the differential calculus, or at most condescends to an estimate of the chances of the coming tripos. And yet we have no doubt that the "constitutional" even of the most stremous student is of essential service to him, though some more exciting recreation would mosservice to him, though some more exciting recreation would probably do him more good by more thoroughly distracting his mind. By the man engaged in professional pursuits in London the want is still more deeply felt. The difficulty of taking any agreeable exercise is exceedingly great. A few virtuous persons may keep down the girth of their waistcoats by some kind of gymnastic exercises or by a morning ride. But the majority are content with such physical labour as is necessary to take them from their houses to their chambers, and which may perhaps amount to four or five miles walking in a day. A man who has been previously accus-tomed to some athletic sport finds this allowance insufficient, and not unfrequently suffers in health from his enforced deprivation. Its will probably supplement his daily round by an occasional march into the country, and the best mode of combining pissaure with exercise in such performances deserves some consideration.

As London grows, the difficulty of finding anything like a satisfactory walk becomes daily greater. The suburban region which, not many years ago, could still show charming specimens of Evaluit country is believed with a region when he about the

of English country, is being rapidly swallowed up by a locast-like invasion of semi-detached villas. Nothing can be imagined more depressing to the soul of man than this kind of compromise, which too often combines the evils of town and country. It has neither the liveliness which delighted Johnson at Charing Cross, nor the charm of solitude. The houses have all the appearance of awkward cockneys who have settled themselves amongst fields by some accident, but have not acquired the habits of country life. They are as little in harmony with the scenery as Mr. Cook's tourists with an Alpine valley. To walk for miles through rows of such dwelling-places is to suffer from a waking nightmare. We would suggest, for example, to anybody who likes to try the experiment, to start from Hyde Park Corner and walk through Kensington to Hammersmith, Kew, Brentford, and Hounslow. He will pass through a street—for with few intervals it is little olse—some ten miles in length, composed almost exclusively of mean houses, with scarcely a scrap of garden, which for all practical purposes might as well be within hearing of Bow bells. Let him then remember that he might have walked for an equal distance in the opposite direction and have met with nothing more cheering to the lover of scenery. He will begin to think of London as of some monstrous polyp, or as resembling Hugo's picuere, stretching out its gigantic arms over green fields, durkening the sky, befouling streams, and extending the reign of all that is hideous and squalid. Our ancestors were grumbling two or three centuries ago over the monstrous growth of London, and old Cobbett was never tired of denouncing the "wen." What would they have never tired of denouncing the "wen." What would they have thought could they have been transported to the present day, and what will be the late of our descendants if the process continues till the advanced guard of the army of houses has crept to Windsor, or perhaps to Brighton !

or perhaps to Brighton?

A good many problems might be suggested by a social philosopher in view of this portentous phenomenon; but for our immediate purpose it is enough to ask what is the best mode of temporary escape from this devouring monster. We are confined to London throughout the week, and it is part of our religion to make a London Sunday as dismal as possible. Luckily there are still railways which enable us to get a few hours smidst pure air still railways which enable us to get a lew house sunist pure air and pleasant sights; and luckily, too, the neighbourhood of London is by no means barren of places where those simple enjoyments are still easily attainable. There are heaths and commons within a short distance from which the old rustic deities have not yet been exorcised. We may fear that a worse time will come. There are enthusiasts who propose to improve those waste places which have hitherto escaped the advances of civilization. Some of our reformers would be capable of seizing upon Wimbledon Common, reformers would be capable of seizing upon Wimbledon Common, and cutting it up into small lots in order to try the experiment of peasant proprietorship. They consider it to be a crying avil that there is still uncultivated land within a day's journey of London, and look forward to a time when every rood of ground will maintain its man; or when, in other words, England will be a gigantic chessboard, with every square applied to the most prostic of purposes. Such theirists have luckly not yet come into power: and we would hope that as the world becomes more civilized the real value of our still unspellt apaces will become more highly appreciated. Every increase of great towns increases the value to their inhabitants of those parts, of the island where one can breathe uncontaminated air, and walk without treading upon one's neighbours' toes. If the necessity had been apparent to our sincestors, we may fancy that the metropolis would have grown.

up within reach of the English lakes or the Welsh hills, which hardly be made accessible to a busy man until the flying muchine has been brought to perfection. As it is, however, the present generation can manage pretty well. The counties round London are not to be reckened as amongst the most beautiful parts of English scenery, but they have beauties of their own, some of which, indeed, have been made even too familiar by the industry of our artists. We are perhaps a little bit tired of views from the Surrey bills and of reaches of the Thames. And yet both of those favourite haunts are too delicious to be spoilt by familiarity. The Thames is not quite so long as the Mississippi nor so imposing as the Rhine. The weirs are less impressive than Niagara, and the stream in its lower reaches has an unpleasant reading, and the stream in its lower reaches has an unpleasant tendency to run dry or to expose banks of very dombtful composition. But there is no stream in the world on which the pleasure of indolent floating can be enjoyed in greater perfection; and a march along the banks from Windsor to Henley takes one through scenery as soothing and refreshing as can easily be found in any country. This, indeed, is the special charm of English country. It is liable to many objections; it is deficient in sunlight, its leafures are apt to be petty, and it errs by axcessive neatness. The hedgenows which we admire in detail cut it un unpleasantly for hedgerows which we admire in detail cut it up unpleasantly for artistic purposes, and hinder us from receiving the impression of the grand sweeps of hill and plain more common on the Continent. But, on the other hand, it has the charm derived from the abundant manifestations of the unintercupted calm of centuries. Mr. Tennyson has very properly admitted an English vignette into the pictures preserved in the Palace of Art; one of them represents

an English home; gray twilight poured On dewy pastures, dewy trees, Hofter than sleep; all things in order stored A haunt of saicient peace.

It is precisely such scenes which refresh the soul of the weary ceckney during his brief period of escape from London worries. The wilder spaces which intervene and enable one to get one's feet off the turnpike read are not large enough to produce the sense of wildness characteristic of a Scotch moor or an American forest; but they male an admirable setting for the more highly caltivated regions. The whole of England, it is sometimes said by complimentary foreigners, is a garden; but in Bucon's ideal garden six acres out of the thirty were to be allotted to "a heath or desert." It was to be "framed as much as might be to a garden six acres out of the thirty were to be allotted to "a heath or desert." It was to be "framed as much as might be to a natural wildness"; and to include thickets of sweetbriar and honeysuckle, with "little haps in the nature of molehills," set with wild thyme, pinks, violets, strawberries, cowslips, and daisies. In our national garden, therefore, we do well to preserve a proper admixture of country still in the rough, though everywhere informingled with spaces of elaborate cultivation. An admirable specimen of such judicious wilderness may be found by the tourist who walks from Windsor past the Virginia Water, and then, after a short divergence to the west, strikes the Chobham ridges, and follows them to the Flor's Back. strikes the Chobham ridges, and follows them to the Hog's Back. Then he may either cross heaths to the Devil's Punchbowl—the devil being an admirable landscape gardener—or follow the line of chall hills along the Hog's Back to Box Hill, and as far as he pleases into Kent. There is scarcely a more levely walk to be found in England than along the not very mountainous ridge between thilltford and Dorking or Leatherhead. Fine woods, and corse-covered commons with soft turf, are admirably intermingled with lovely views over the rich country which stretches to Leith Hill and Black Down. Such a walk is within an easy day's journey from London, and not only exercises the muscles, but lays up a series of pictures of which it is pleasant to recall the reality in the midst of our smoke-hegrimed atmosphere. With a little energy it is possible to take a day's holiday in regions perhaps more t is possible to take a day's holiday in regions perhaps more beautiful and strangely neglected by many lovers of the picturesque. The New Forest is still an admirable specimen of the scenery in which Englishmen have a traditional pleasure. Forests, generally speaking, may be prenounced to be a delusion. The prime val forest of America, now that the Red Indian and the backwoodsman have protty much retired into Cooper's novels, is rather suggestive of lumber than of romantic associations. The trees may be useful for commercial purposes, but they are not arranged for the enjoyment of landscape-painters. Forests on the Continent are for the most part collections of tall sticks which are obviously folled at regular intervals, and have nothing impressive are obviously felled at regular intervals, and have nothing impressive about them except their extent. But in the New Forest one may still lose opeself for hours amongst noble groups of cake and beeches most picturesquely arranged, with broad open glades, and not so much choked by undergrowth as to conceal the noble proportions of the momerchs of the forest. It is true that of late years an economical Government has out down some of those grand true to substitute miserable plantations of larch and pine. But as yet to substitute miserable plantations of larch and pine. But as yet the mischief has left enough of the genuine forest to be infinitely the mischief has left enough of the genuine forest to be infinitely delightful to the tourist, and even to justify allusions, if he be so disposed, to the times of Robin Hood, and remarks about Enfus and the respectable Purkess who cerried his body to Windhester We have even heard a traveller on the neighbourse railway who pointed to the place where, as he said, Robinson Grasco shot Wet Tyler. Perhaps, however, at it heart to take warning from this sight perversion of history, and to abstale from matigass applications. From a purely artistic point of view, the forest is still ment beautiful, and a day's journey from Landon would give a sufficient glimps of its beauty to method. It is proportions. But we are weardering from our making. It is

walking is one of the healthiest and most shightful of a a doctrine which is prescribed by many medical and a ties, may find shundant temptations within a mode from London, and gain relief for the soles of feet wearied by incessant trampings along street pavements, and for lungs increased by thick deposits of the omnipresent "blacks."

THE RIVAL CHURCH BILLS.

CHEMICS are multiplying for the regulation, so called, of divine worship, with which the general reform of the Licelesinstical Judicature has got mixed up, even if it does not succeed in swallowing the smaller and more temporary movement. The Archbishops first Bill, to be sure, exists only for purposes of comparison; but the amended form of the same project exists to be considered in Committee on the 4th of June. Then there are papers of amendments on it by Lords Solborne and Shaftesbury, so completely charging its character as in each case to amount toka new Bill: while the Duke of Mariborough and Lord Limerick content pletely changing its character as in each case to amount to a new Bill; while the Duke of Marlborough and Lord Limerick content themselves with following the lines of the existing Bill, and themselvas with lonewing the lines of the axisting last, and, the Convocations of Canterbury and York in their respective criticisms on the Archbishops' two proposals adventure a strong preference for the reform and strengthening of the existing Consispreference for the reform and strengthening of the existing Consistory Court; and Mr. Holt has come forward in the House of Commons with his bid in the shape of the "Ecclesiastical Offences" and the "Acts of Uniformity Amendment" Bills, which are now standing for second reading on an impossible night, with the obvious intention of ambashing behind the Archbishops' Bills.

As the second edition of the archiepiscopal proposal substantially agrees with the first draft, it will be the most convenient course to give a brief summary of the latter, pointing out as we proceed the features in which the later differs from the former Bill.

The preliminary objections to the measure as a whole are, as we have had occasion to point out, that while it professes to be a general measure for the regulation of divine worship, it is in reality intended to strike at one class of persons who may be offenders equally with, but are certainly not more so than, other parties in the Church; and that in the desire to come down with a decisive blow, it does not scruple to add a third and novel episcopal tribunal to the two concurrent jurisdictions of the old Consistory Court and of the newer Court of the diocesan created by the Church Discipline Act of 1840, with which the administration of spiritual suits is already encumbered. These two features are reproduced in the second Bill, although, bered. These two features are reproduced in the second Bill, although, as we shall see, the composition of the tribunal created under it is assimilated to the Consistory Court. The preumble of both Bills is the same, reciting that "it is expedient that in certain cases further regulations should be made for the administration of the laws relating to the performance of divine service"; and after some short provisions we reach the seventh clause, "interpretation of terms." In this, according to both editions, we find that the term Church means any "cathodral or other church, chapel, or other place of common worship, in which the Book of Common Prayer or any part thereof is required by law to be used." When we consider the sharp and summary nature of the jurisdiction proposed to be created, the intentional exclusion from this definition of any exceptional place of worship will not escape notice. The inclusion of cathedrals within the scope of the measure is a provision which tional place of worship will not escape notice. The inclusion of cathedrals within the scope of the measure is a provision which will not bear examination. We may remark that by a later clause in the amended Bill college chapels, University churches, and the chapels of three public schools are exempted, which makes the retention of the cathedrals even more indefensible. "Incumbent" means the "person or persons in holy orders legally responsible for the due performance of divine service in any church, or of the order for the burial of the dead in any burial-ground"; while "Parish" means "any parish" or so forth "over which any incumbent has the exclusive cure of souls"—a definition which either annula the whole Bill or else establishes that the which any incumbent has the exclusive cure of souls —a definition which either annuls the whole Bill or else establishes that the bishep has no cure of souls within his own diorese. We must rather fully set out the definition of parishioner, or our readers will hardly appreciate the voke under which it is sought to place the clergy of the English Church. Both editions define him to be a "male person of full age," and require a "solemn" declaration on his part that he is a member of the Church of England as by law established, of which declaration and of the definition involved in it he is himself to be the judge. Both then combine to provide in identical language that this male person, to be a parishioner, "either has, and for one year annat, before taking any proceedings under this Act, have badd his usual place of abode in the parish within which the church is situate, or for the use of which the burial ground is legally provided, to which the representation relates, or, if not readent as aforesaid, is evener or temant of lands or tenements in the said parish." The words which we have put into italics hardly require comment. The idea of making any non-resident landowner or tenant, however small his material interest may be, an "aggrieved parish oner" for the purpose of persecuting any clergyman with whom he has never personally had anything to do, and without any the poor sateguard of that year's qualification required for the resident, is one to which the trust Parliament will not fer a moment listen, although it that twice commended stead to the fatherly intelligence of sure shall pasture. After this At his answeratively small lister, although it that the clause that it less in all the material interest will be the salvent of anyther with the clause of the particles of the last the clause of the last in all the salvent of the particles of the last the clause of the last o

that there is not the alightest attempt made to define the social status of these parishiosem. They med not be householders, they need not even be ledgers. Provided they have but lived in the that there is not the angular three med not even be ledgers. Provided they have but lived in the parish for a twelvements; purpors, octors; tapaters, and were are parish for a twelvements; purpors, octors; tapaters, and were are parish for a twelvements; purpors, octors; tapaters, and were are parish for a twelvements; purpors, octors; to be accepted as information the against the parish priest from whose ministrations they may be habitally absent. Indeed, we are not certain, considering the very comprehensive definition both of Church and of parishioners; that persons in a mod-under not less than a twelvementh's sentence might not have catablished a right to lay an information against the chaplain, and, as we shall see, to carry it under the against the craphine, and, as we said see, to carry it indered amended Bill up to the archbishop in case the bishop should be so uncivil as to disregard it.

The 8th Clause, which follows, shows the use to which the parishioner is to be put. By both editions the archdeacen or the

rural'dean—by the first any parishioner, and by the second a church-warden or any three parishioners—may lay an information before the

(1) That in such church any alteration in or addition to the fabric, ornaments, or furniture thereof, has been made without a faculty from the ordinary authorizing or confirming such alteration or addition, or that any decoration forbidden by law has been introduced into such church; or (2) That the incumbent has used or permitted to be used in such church or burial-ground any unlawful ornament of the minister of the church; or (3) That the incumbent has failed to observe the directions contained in the Book of Common Prayer relating to the performance, in such church or burial-ground, of the services, rites, and ceremonies ordered by the said leak, or has made, or permitted to be made, any unlawful addition to, alteration of, or omission from, such services, rites, and eccemonics.

It will be noted that no limit of time is provided for in any of these clauses. The addition to the fabric may have been a chancel constructed five or twenty-tive years since, and by some preceding incumbent; the failure in observing the directions of the Prayer-Rook may be of a dozen years standing; but the delator's hands are not on that account to be stayed.

The following clauses in the original draft give the bishop, " if he think fit," the power to consider such reference to him within three months, with the help of the three assessors who appeared in the absence and unsatisfactory Church Discipline Act of 1840, one of whom is to be a lawyer of a certain standing, another a dean, archdeacon, or chancellor, and the third any one whom the bishop The amended Hill extends the period to six months, and substitutes the chancellor of the diocese, or in case he be not a lawyer, some barrieter of not less than ten years' standing for the assessors. This is almost the only point on which we can honestly say that we think the newer project an improvement upon the first draft. But this slight amelioration is more than counterbalanced by a this slight amelioration is more than counterbalasced by a vary monatrous new provision, which is embodied in the 17th Clause of the second Bill. Our readers will not have overhoded the words "if he think fit." These enable the bishop to get rid of frivolous charges, though they will not cure the publicity and the scandal, the misery and trouble, which that process of delation must occasion, even though the information should be nipped in the bud; for it is not to be supposed that such informers as the Bill will latch will not take near to repulsive their achievement at the case. not take care to proclaim their achievements through local papers and at pot-house meetings, sevoured with plentiful abuse of the laise prelate who has shown his complicity with the ritualistic priest. But the second Bill takes care to punish the peace-making bishop for his common sense. The diocessus who dares to "decide not to proceed to consider the representation" must "state in writing his reasons for such decision," and present the same within fourteen resease to consider the representation mass some in within fourteen days to such publicana, keepers of worse houses, or whoever else the three parishioners may be; and these worthies have the right within a mouth to send it on with the representation to the archbishop, who may, if he thinks fit, hear and consider the case with the help of his vicer-peneral; while, if he does not so think, neither he nor the bistor-well have any power of making the delators senart, to the the bishop will have any power of making the delators emert, to the cost of even a single farthing, for what may very likely be an act of indecent insolence. If the bishops by their assent; or even their allence, in the House of Lards, acquiesce in this public humiliation so thoughtfully proposed for them by their matropolitans, they will go far to show that the remnant of discretion still reserved for them in the Hill is not in very safe hands.

Het we must have on to the remnant which is the first we must have on to the remaining the delators emert, to the

But we must harry on to the procedure which is to rule the diocean Star Chamber when the suit goes on. In both editions the informer and the incumbent are to have a pitiful twenty-one days' notice, and the latter is to receive a copy of the representa-tions, while eight by the first, and founteen days by the second: Bill (with a power of enlargement) is the inadequate time given to the incumbent to transmit his answer to the bishop. Whose we remainless how much is involved in armaging; a good defence, how many comultations with attorneys or counsel, how much deference to the convenience of witnesses, the underrans of an paltry a concession of time will be apparent. But if in the mean-while no answer is transmitted as to the tenth of any statement; shall; be deemed to be true." It would have seemed the most incredibles. days' notice, and the latter is to receive a copy of the rep while no answer is transmissing as to any sense. It would have seemed the most incredible be deemed to be true." It would have seemed the most incredible thing in the world that nearly thirty linglish continues of education, into whom some elementary principles of law as well-associated in the world have dead to protion, into whom some elementary principles of law as well-as-ofjustice may be supposed to have entered, would have dared to propuse a tradition to their countrymen containing such a provision.
One thing more incredible has, however, come to light—that after
the outery with which this suggestion has been met the bishops
almost have repeated it in their second disaft. We need headly note
that are provided is coming respectability and responsibility on the paroff the informance by requiring preliminary separation assumes asthe contains the exchangement midd. Five thins dillow in both drafts which are nearly the same (except that the first Bill gives a loophole not found in the second for a hearing in commend), directing the parties to appear in poreons or by crumanly or attorney, and for witnesses to be put on oath, which rather rather than assumed observed the new parent in the parties of the new parent in the parties to appear in poreons, or by crumanly or attorney, and for witnesses to be put on oath, which rather than the parties to appear in poreons, or by crumanly on attorney, and for which is a parties to appear in poreons, or by crumanly or attorney. militate against the assumed chaspuces of the new parcedure; not that we at all impute this as a defect, believing as we do that cheap law may often prove had law. The decision, if against the incumbent, is enforced by monition, as to which we shall have something more to say. The second Hill at this point beings in a new prevision enabling the bishops, on the application of either party, and with security for costs, to state a case in writing on any question of law which may have arisen for the consideration of Her Majesty's Court of Appeal, which is to hear and determine it, while it lave down that there shall be no appeal from the independ of the bishop mean any question of law as declared by Judgment of the bishon upon any question of law so declared by Her Majesty's Court of Appeal. We respectfully ask why the Bill manifests so great a judous of a free and full appeal? Provisious for quesi-appeals, which namely involve questions of law, have a plausible appearance; in practice, however, they may often shut out important facts.

In both Bills the bishop has the power of ordering costs, with no provision for their taxation by competent persons. The 15th Clause in both forms gives an appeal not only to the incumbent but also to the prosecutor; although the Archbishop in his speech reserved the privilege for the insumbent. This must be transmitted fourteen days after the service of a monition to the Archbishop, who may at his own pleasure either leave it in the Provincial Court or send it on to the Queen in Council. We ask why the provincial judge in to be alternatively a personage or a dummy at the arbitrary will of the Archbishop. In any case no new avidence is admissible on the appeal save with express permission; so that if from modesty, or poverty, or ignerance of law the prosecuted incumbent has not made the best use of the very five days concaded to him before the discessar trial, he may be kept under a perpetual disad-

We cannot do justice to a clause which is the 16th in the first and the 17th in the second Bill without quoting it in full: -- A bishop shall, by a writing under his hand and seal, direct that, for the reason stated in such writing, the execution of such monition shall be stayed until such appeal shall have been heard and datur-mined." The Archbishop called this provision with to the tail monition shall be in force pending any appeal therefrom, unless the mined. The Archibenop called this provision vital to the Bill, and defended it by reference to the procedure of the Court of Chancery. But there is no analogy between the two cases, or rather they proceed on directly opposite principles. It would be highly inconvenient for property to be continually changing hands. It would be equally insonvenient for the forms of any Church to be perpetually changing, as would be the case if any practice were to be at down by monition and then restored upon appeal, and still more if any article of furniture -- a reredon for instanceavere to be incred. out by the bishop and brought in by the Court of Appeal. Ilvides, this provision in the hands of a bishop whose opinions were stronger than his instincts of equity would be an effectual instrument for worrying out whatever happened to irritate him in the conduct of divine service throughout his diocese. He has only to go on suspending, with the consciousness that, though his suspensions may severally be overruled, they will in the hump be successful in making the obnoxious procedure practically impossible.

We now reach the meet penal provisions. The incussiont has

We now reach the most penal provisions. The incussiont has to return an answer showing compliance with the monition, and then by the original 18th, and now 19th, Clause, if it shall be shown that the incumbent has not obeyed the monition, even if appealed against, he shall be inhibited, and amerced to pay for his substitute, for three months, and for as much longer time as he refuses to comply. This inhibition by the first draft was just entially lifelong, but on Lord Shattesbury's raising the cry of the patron, it was in the second edition provided that when three years had run out the living should become years, such that forfeiture of the living should also follow upon a second inhibition as to the same matters within three years. The patron is specially forbidden to re-present the percent clerk to the same living, a provision which we should suppose would be pseudiarly grateful both to squire and to parish when the man happened to be a conscientious, hard-working, and inoffemive parson con-demined upon some matter on which he was unable to comply, common upon wome mirror on which he was unable to comply, in simply because the series of truth made suffering preferable to acquiescence. In the original Hill the whole clorical income was to have been forfeited; and the residue devoted to "such other ecclesiastical purposes connected with the parish as the bishop may direct; but hard Shaftesbury's ridicula has extinguished this Draconian provisions.

The 19th, new 20th, Clause drags all the cathedrels, without distinction as to their origin and several constitutions, into the clutches of the Bill, and allows the delator to be "the dean, predistributes of the Bill, and allows the delator to be "the dean, predistributes; chancellor, or treasurer; or one of the canona residentiary,
prehendaries, or honovery canona thereof"; and the persons or pursons complained of shall be the "person or persons legally responsible for the custody of this fairis or the performance of divine
the for the case may be." It must not be forgotten that the
linearity canona, and to a great emery the prehendaries, are, or
may be, the mass creatures of the bishop, while the Bill allows him,
by combinate with any one of these people, to force a quarrel
upon the dam or any, the massing carry it up to the final stage
of destruction. Lord Shallohery has assessed in investing out
of this chance a grotunge allocation to the repair of the fairly of

the fine extorted from the recalcitrant capitular. visions to which we think it necessary to call attention are substitution of registered letters for personal service, and the selection of that lightly-worked person, the Lord Chancellor, as the approver of the rules and orders which the two Archbishops are instructed

to frame.

Lord Selborne's proposed amendments are so extensive as virtually to amount to a competing Bill. He explains their principle by importing into his preamble an extract from the prefatory "declaration" at the beginning of the Prayer-Book, which orders the "parties" who "doubt or obscurely take anything," "always" to "resort to the bishop of the diocese, who by his discretion shall take orders for the quieting and appeasing of the same, so that the same order be not contrary to anything contained in the said book," with a further resort to the Archbishop. In compliance with his reading of this direction, Lord Selborne strikes out of the Hill all the contentious machinery referring to the hearing by the diocesan, and allows the bishop to issue mero motu a monition to any incumbent in his diocese "giving such directions as to such bishop may seem in his diocese "giving such directions as to such bishop may seem proper to ensure the due order of the Church of England," or to prohibit what may seem to him contrary to law. This monition prohibit what may seem to him contrary to law. This monition is to have the force of law unless the incumbent shall within fouris to have the force of law unless the incumbent shall within four-teen days express to the bishop his belief that such directions are "contrary to law," which will enable him to obtain a hearing before the Archbishop's Court or the Court of Final Appeal; although the question is "to be heard and determined by such Court as a matter of inquiry, upon the question of law only," and no evidence is to be admitted without leave of the Court, except the monition and the incumbent's answer. Lord Selborne, we need hardly say, strikes out the Cathedral clause. There is a printal facie simplicity and "fatherliness" about Lord Selborne's proposal which may in the present distress commend it to the Church in preference to the Archbishops' more elaborate measure of pains and penalties. But bishops' more elaborate measure of pains and penalties. But if it is looked into, it will be found to be equally revolutionary and despotic, though not in exactly the same way. It may be described as putting the power of the bishop off the equilibrium by depriving it on the one side of constitutional checks and on the other of constitutional safeguards. As bishops now are they would still be, though in a deteriorated form, under the Archbishops' Bill—they are constitutional persons ruling through their courts. Under Lord Schorne's amendment any bishop would, according to his temperament, be a nullity or an autocrat. If he were scrupulous or timid, he would find himself deprived of all coercive power, while his monitions were being always carried up to a secular court in London. But if he were possessed of a conscience more clerical than legal, he would at once assert the most monstrous despotism by flooding his diocese with ecclessatical monitions to any number of clergymen on any number of subjects, however frivolous, on which he happened to have any fancy. Some might appeal and some might not; and though one separate appeal would potentially correct might not; and though one separate appeal would potentially correct all the monitions, it would only do so, according to Lord Selborne's Clauses, on successive applications to the appellate jurisdiction of the other admonished clergymen. Besides, there would be a risk of the most vexatious monitions holding good simply because the higher jurisdiction would not care to trouble itself with such minuties. We have heard, for instance, of a Northern diocese in which the accelesiatical authorities have taken on themselves to interfere with the appellate of states when which the Lord's table is interfers with the number of steps upon which the Lord's table is in new churches allowed to be elevated. Anyhow the meddlesome diocesan has only to be frequently letting loose his flights of monitions, and he may be pretty sure to have his own way at last

by strength of pure vexation.

Lord Shaftesbury's amendments are likewise of such a nature as to amount to an alternative Bill. Their main feature is the substitution of an Ecclesiastical Judge, with 4,000% a year, for the Dean of Arches and the Judge of the Provincial Court of York, nean of Arches and the Judge of the Provincial Court of York, and the option given to the party prosecuted to have the case heard by the bishop without appeal, or by this judge with an appeal to the Supreme Court. By a separate amendment he provides for the bishop calling upon the complainant to find security.

Mr. Holt's "Ecclesiastical Offences Bill" has at all events the purity of talling ith own story. It selects for its score "rites comp

Mr. Holt's "Ecclesiastical Offences Bill" has at all events the merit of telling its own story. It selects for its scope "rites, ceremonies, ornaments, furniture, and other articles, the use or practice or introduction whereof shall have been decided to be unlawful" by a Superior Court, the Queen in Council, and the Provincial Court, and against which decision no appeal should be pending, and it lets loose any churchwarden or householder to drive the judgment home. Within three months after the rite has been practised, or three years after the ornament has been introduced, the informer is to file his affidavit, with one backer, if churchwarden, or two if parishioner, and then, passing over the bishon, and wardon, or two if parishioner, and then, passing over the bishop, and throwing discretion to the winds, the chancellor of the diocese must issue his prohibitory monition. The victim is allowed twenty-one days to file a counter-affidavit that he believes he has a good defence, and then the cause must at once be sent to the a good defence, and then the cause must at once be sent to the Provincial Court; otherwise he must make a declaration on eath that he will desist, and the chancellor may further sentence him to pay smart money, up to the sum of ten pounds, to the discontented and pious informer. Failing affidavit or declaration on outl. the victim is to be suspended for three months: a second affence involving suspension for twelve months, and a third deprivation and suspension for three years. Mr. Holt's second "Acts of Uniformity Amendment" Bill furbishes up the rusty penalties of those acts by conforming them to his own not very marciful previsions. There is a business-like precision about these measures.

which seems at first sight to recommend them in preference to the Archbishops' Bill; but a very superficial examination will show how really monstrous they are in their conception. The cruelty of the two alternatives, of a trial which means bankruptcy and rum to most clergymen, or a declaration on eath based upon a vindictive principle, is too obvious to need to be pointed out. Beyond these obvious objections there are deeper anomalies behind. The intention of their authors is, of course, to construct an exceptional machinery to enforce the recent judgments of Judicial Committees, especially those in Martin v. Mackonochie and Hebbert v. Purchas, which mainly conduced last year to the unregretted abolition for ecclesiastical suits of that revived High Commission Court; but they could not for very shame recapitulate the particular decisions on which their hopes were fixed, and they had, therefore, to employ the more general forms which we have quoted, under which such practices as enlivening the service by hymms at which seems at first sight to recommend them in prefere under which such practices as enlivening the service by hymns at any place except just after the Third Collect, and wearing that very innocent and usual ornament which High Churchmen call very innocent and usual ornament which High Churchmen call stole, and Low Churchmen scarf, are unlawful, with deprivation as the result of the third hymn or the third scarf. But these words carry with them a prospective force, and it would be therefore open to any malignant busybody, if Mr. Holt's Bills passed, to get a judgment on some rubric which was as plain in its language as it was obsolete—the rubric, for instance, which makes a preliminary notice indispensable on the part of the communicant—and then to mulow this decision as an angine of compared approvement. Put average notice indispensable on the part of the communicant—and then to employ this decision as an engine of general annoyance. But even stranger results might follow. The judgments which are most dear to the heart of the Church Association are not, except in Mr. Holt's eyes, irreversible. The latest and most precious of all, that which affected Mr. Purchas, is at this moment on its trial in more than one direction. The Bishop of Lincoln believes that it will be reversed as to the minister's dress, and roaffirmed as to his position in the Communion service. Other authorities, such as Sir John Taylor Coleridge, have not scrupled to express their belief that the latter decision must also collapse. Supposing then Mr. Holt's first Bill to become law, and the Bishop's prediction to come true, we should find the Low Churchmen harrying the High Churchmen as to the point of the compass towards which they wished to look in the most solemn portion of the Sunday's worship, and the High Churchmen retaliating upon the Low Churchmen for their defective garb at the same point. But if Sir John Coleridge were to prove the truer prophet, then the scourge so cunningly devised by prove the truer prophet, then the scourge so cunningly devised by the Church Association would have passed into the hands of their foes, and the backs on which it would fall would be their own.

foes, and the backs on which it would fall would be their own.

The consideration which most strongly forces itself upon us on reviewing this bewildering multiplicity of suggestions for meeting a very delicate question, is the impossibility of satisfactorily dealing with them during the short time which still remains for the present Session. Except in the most general manner, they have not even been discussed in either House of Parliament, and yet we have reached that which in ordinary years is the third and last division of the Session; while even Bills promoted, as these are not, by the Government, are clamorously contending for their share of by the Government, are clamorously contending for their share of the little remaining time. The difficulty is aggravated by the proposed legislation taking in two subjects which need not have been considered together, except for episcopal blundering. The reform of the Ecclesiastical Courts is a very important matter; so is the regulation of divine worship; each is important enough to engage the undivided attention of Church legislators; and therefore the two have been virtually mixed together, and presented to Parliament to swallow, with little more argument than such as the brigand manages to cram into his nistol's mouth.

Parliament to swallow, with little more argument than such as the brigand manages to cram into his pistol's mouth.

The one consideration in choosing between the different suggestions for reforming procedure, which ought not to be neglected, is which is most likely to secure the largest amount of willing obedience, and on this point there can be little doubt that, whether the feeling is to be called sentimentality, or constitutional instinct, the clergy would rather be ruled in the first instance by reformed Consistory Courts, simply because they would represent the old ecclesiastical machinery. As to the regulation of divine the old ecclesiastical machinery. As to the regulation of divine worship, the concordat on which we have had to comment is now a more tangible reality than it was a few weeks since. ollergymen whose proceedings are supposed to have fostered archi-epiacopal activity are said to be reviewing their position with eyes that reach beyond their own vestries as they never did before; while the claim for some form of higher ceremonial, regulated with while the claim for some form of higher ceremonial, regulated with consideration to the feelings of the Church parties, has been put forward by persons whose position and antecedents would make it impossible for even the Rock to abuse them as ritualists. Many things, in short, concur to prove that a conciliatory settlement is more than possible if only precipitate and penal legislation can be avoided. If that is still forced on, the various powers which the Archbishops have put into action must by dynamic necessity energize, and with results which may be beyond the power of prelatic management to arrest. The Session will close in a few weeks, and immediate legislation means hot haste and ill blood; accepting the autumn for negotiation may lead to a statesmanlike and friendly solution.

TITLES.

IN the latter part of Mr. Bryce's account of Iceland in the Cornhill Magazine he gives a curious picture of a state of society in which men who are perfectly divilized in their thoughts and manners live in a physical condition not much above that of

sevages. And one feature of very primitive life they still keep in all its fulness. They have hardly any surnames, and they have no titles. A man is simply Sigurd; if you wish to distinguish him from some other Sigurd, he is simply Sigurd Magnusson. If you go to a house, and wish to see its mistress, you sat for nobody but plain Ingeliong; or, if you wish to be formal, you do not call her Lady or Mrs., but only Ingeliong Sigurdsdottir. For in Ispland, as in old Rome, a married woman is known by her father's name; she cannot take the surname of her husband, because he has no surname for her to take. In all this we are carried back to the days when the smallest man in Athens or Rome could not call Perikles or Crear anything but Perikles or Crear—nay more, when he could not call Agarists or Julia anything but Agarists or Julia. At Rome, to be sure, there were little delicacies about the use of premomen, nomen, and coonomen: while Parikles rists or Julia. At Rome, to be sure, there were little delicacies about the use of prenomen, nomen, and cognomen; while Perikles could be nothing but Perikles in the mouth of anybody, he whom the outer world called Casar would be known to an inner circle as Calus. So in the Universities a man is spoken to from the first moment of introduction by his cognomen, allowing for a few exceptional cases in which, owing to some special charm either in the man himself or in his pronound, the pronound is used instead. But Greeks, Romans, Icelanders, and undergraduates all agree in calling a man by nothing but one or other of his real names. Even calling a man by nothing but one or other of his real names. Even in Iceland there are respectful ways of marking official rank, as when a man speaks to the Governor or the Bishop, but there is nothing like our fashion of putting a handle to the name of every-body. We use this last phrase of set purpose; people constantly say that such a man has got a title, that he has got a "handle to his name," when he is made anything which gives him a right to be called Sir or Lord. Grave heraldic authorities who write peerages and books of landed gentry, and people who write letters to explain how, though they are not peers, they are still noblemen, draw a distinction between "titled" and "untitled" nobility, or gentry, or whatever word they choose to express that foreign men, draw a distinction between "titled" and "untitled" nobility, or gentry, or whatever word they choose to express that foreign thing which the law of England has always so unkindly refused to acknowledge. When people say that the new lord or baronet or knight has got a "title," or a "handle," they forget that he has been called by a "title," or a "handle," ever since the first time that his nurse spoke of him as "Master Tommy," or perhaps more familiarly as "Master Poppet." We are so much in the habit of giving everybody titles, just as we are so much in the habit of talking in prose, that we have got to be as unconscious of the one process as of the other. We are so constantly in the habit of giving everybody the titles of Mr., Mrs., Miss, or Master, that we forget that all these are titles, and we fancy that no one bears a title but those who are called Lord, Lady, or Sir. In fact, the a title but those who are called Lord, Lady, or Sir. In fact, the smaller everyday titles are more strictly and purely titles than the others, because they are mere titles, while the others are in most cases titles and something more. Duke, Earl, Bishop, are not mere titles; they wear badges of actual rank; they are originally, and still to some extent, descriptions of office. But we call people Mr. and Mrs., not to express rank or office, but simply to avoid what passes for the undue familiarity of calling them, in Greek or Icelandic fashion, simple John and Mary. The custom undoubtedly came in through the use of official descriptions. A man was called John the Farl, or Peter the Bishop, or anything else, greater or smaller, to mark him off from those Johns or Peters who held some other office or no office at all. The official description easily slides into the title used, not merely to describe office, a title but those who are called Lord, Lady, or Sir. In fact, the who held some other office or no office at all. The official description easily slides into the title used, not merely to describe office, but to express respect. But, as long as the description marks out any definite office, or even any definite rank, it is not a mere title; it really serves to point out what the man is, and not merely to avoid the necessity of calling him by his simple Christian or surname. If John Churchill is Duke of Marlborough, we call him. John name. If John Churchill is Duke of Mariborough, we call him Duke of Mariborough, not merely to avoid calling him John Churchill, but to express the fact that he is Duke of Mariborough. But if John Churchill is nothing but John Churchill, and we call him Mr. John Churchill, we do so, not to express any fact at all, but merely to avoid the seeming rudeness of calling him simply John Churchill. Thus the Icelander recognizes the official rank of the Governor and the Bishop, only he differs from us in holding that plain Sigurd and Ingebiorg have no need to be called anything but Sigurd and Ingebiorg.

of the Governor and the Bishop, only he differs from us in holding that plain Sigurd and Ingebiorg have no need to be called anything but Sigurd and Ingebiorg.

In this way it is plain that the "untitled classes" are really those who are most truly titled, those to whom titles are most habitually given simply as titles and for no other reason. All Europe, except the happy Icelanders, conforms to the fashion, and there seems no great likelihood that the rest of Europe will go back to the simpler practice of one unsophisticated island. How deeply embedded the practice is in all modern habits of thought is shown by the fact that when the first French Republicans determined to sholish titles, all that they did was to sholish the eld titles, and to invent a new title of their own. When a man was called Citisen Roland, it was no less a title—than if he had been called Duke of Montmorency. A man was not to be called Monsieur, but he was to be called Citoyen; but Offore expressed, just as much as Monsieur, the feeling which distinguishes all of us from the Greek, the Roman, and the Icelander, the shrinking from calling a man by his name and nothing else. It never came into the head of an Athenian or a Roman to speak of a man as Citizen Perikles, or Citizen Cessar, though there would weally have been more sense in so doing than there was among the French Republicans, for no Athenian or Roman had declared that all men were equal, and the title of Citizen might have expressed the very wide distinction leaves the member of the ruling commonwealth and the member of the ruling commonwealth and the member of

any of the inferior classes, from the more slave up to the Latin or the Platsian. And even in those cases where intimate friendship the Plataian. And even in those cases where intimate friendship or any other ground causes men to speak of one another simply by their names, it is only done privately and among equals. The man whom we speak to as Smith becomes Mr. Smith in a speech or an article, and in the like sort the undergraduate, to whom Smith is Smith from the very beginning, speaks of Mr. Smith either to his tutor or to his scout. Thus, even when we go furthest in dropping titles, we do not dare to drop them altogether; we have not got back to the stage of talking of Perikles and Sigurd at all times and to all persons. There is indeed one exception, though not in our own country. He who finds himself reviewed in a German periodical enjoys the privilege of being praised or blamed by his simple aurname and nothing else. And it might be well to set up an loweroteria, an interchange of privilege, in this matter. If for no other cause, yet for this, that, as the German and the Englishman, if they try their hand at as the German and the Englishman, if they try their hand at any kind of title, are sure to miscall one another, a good deal of inaccuracy is saved if they agree to call one another by no title

at all.

There is something in our received system of titles, great and small, which seems very puzzling to men of all other nations. The Barenet or Knight and the Esquire seem very mysterious beings. It is strange that the title of "Sir," in its origin so purely French, should have become in its use so purely English that no Frenchman can understand it. We suspect that what makes our titles so puzzling to Frenchmen is their variety. An Englishman's description may begin in twenty different ways; a Frenchman's description always begins in one way. An Englishman may be Lord, Sir, Colonel, Ductor, plain "Mr."; a Frenchman is always "Monsieur." He may be plain letter "M.," or he may be "M. le Duc; "but he is "M." in every case. Then the Esquire outrages the feelings of the whole human race by sticking his title after his name instead of before it. This no foreigner can allow. A Frenchman must indeed be familiar with English ways to keep himself from putting "M. John Smith, Esq." You may write down your description in full in your own hand, but the "M." is sure to appear in the address of the letter which your foreign friend writes to you. His feeling is, "Yous êtes trop modeste," as an Englishman is sometimes told when he begs earnestly not to be called "Milord." The truth is that the style of the Esquire is altogether anomalous. It is stuck after the name and not before, hence the state of the structure of the letter the name and not before, because the really at the letter the name and not before, the content of the letter the name and not before, the content of the letter the name and not before, the content of the letter the name and not before, the content of the letter the name and not before, the content of the letter which your foreign friend alter the name and not before, the content of the letter which your foreign friend alter the name and not before, the content of the letter which your foreign friend alter the name and not before the content of the letter which your foreign friend and the letter which called "Milord." The truth is that the style of the Faquire is altogether anomalous. It is stuck after the name and not before, because it is not really a title, but a description. A. B. is described as Esquire, as another man may be described as Knight, Clork—anything down to Labourer. The description of "A.B., Esquire," is, in fact, the remnant of the oldest formula of all, "Cnut Cyning," "Harold Eorl," and the like, which survives, or did survive a few years back, when visitors to Blenheim are called on to look at the portrait and exploits of "John Duke." By some odd fresk, this kind of description goes on in any mention of an Esquire which is yoars back, when visitors to Blenheim are called on to look at the portrait and exploits of "John Duke." By some odd freak, this kind of description goes on in any mention of an Esquire which is in the least degree formal, though colloquially he is spoken of by the "Mr.," which it would be thought disrespectful to put on the outside of a letter. The peasant who talks about Squire Tomkins is far more consistent. Then again this description of "Esquire," a mere description and no title, is, oddly enough, just the thing which a man avoids calling himself. It has an odd look when a sheriff, signing an official paper, signs "A. B., Esquire," and it has an odd sound when a magistrate qualifying describes himself as "A. B., Esquire." Whether a Sheriff who is a Baronet should sign himself, as he commonly does, "Sir A. B., Baronet," we doubt, Should he not rather sign himself "A. B., Baronet," as his description, and wait for other people to give him the title of Sir?

Should be not rather sign himself "A.B., Baronet," as his description, and wait for other people to give him the title of Sir?

Besides the substantive title or description, there is the honorary adjective and the honorary periphrasis. These are much older than mere titles; they are as old as Homer. What our modern rules have done is simply to stiflen them, so that everybody knows exactly which to apply to everybody. But it is odd how the substantives and adjectives got confounded, as if they were things of the same kind which excluded one another. It is now thought vulgar to call a privy councillor or a peer's son "Hon." or "Right Hon. A. B., Esquire." It was the right thing early in the last century. And the older usage was more rational. A peer's son is an Esquire, "Esquire" is therefore his proper description; he is also entitled to the complimentary adjective "Honourable." The substantive and the adjective in no way exclude one another. One might make "Esquire" is therefore his proper description; he is also entitled to the complimentary adjective "Honourable." The substantive and the adjective in no way exclude one another. One might make a long list of usages in the way of titles which are abourd and ungrammatical; as, for instance, the last new piece of affectation, "The Reverend the Honourable A. B.," which seems to have just displaced "The Honourable and Reverend A. B.," which is grammatical and intelligible. But it is enough to point out the crowning abourdity of such phrases as "Her Majesty," "Her Majesty the Queen," and the like. They are vulgar corruptions of the fine old formula "the Queen's Majesty." When the King, Prince, Duka, or other exalted person has once been described, at is some and grammar to go on speaking of "his Majesty," "his Highness," his Grace"; but it is clearly ungrammatical to talk of "his Majesty" when nothing has gone before for "his" to refer to. And "Her Majesty the Queen," can all the heralds in the land parse these words? When Charles the First greeted Land on his highest promotion with the words "My Lord's Grace of Canterbury, you are welcome," he spoke the King's English; but "His Grace the Archbishop of Canterbury" is simple gibberial.

From these difficulties, and from these courtly vulgariums, men were of old free at Athers, and they are still free in Iceland.

OXFORD DIGGINGS.

IT appears that a number of enthusiastic young gentlemen at Oxford have been induced by Mr. Ruskin's eloquent exhortations to go forth with spades in their hands and dig. Some irreverent persons have dared to laugh at the diggers, and it has preverent persons have dared to laugh at the diggers, and it has become a subject of serious controversy in the newspapers whether the diggers really ought to be laughed at. Mr. Ruskin, it seems, has an abhorrence of ordinary athletic sports, on the ground that they are not what the political reconomists whom he abominates would call productive. Cricketers, boating-men, jumpers, or runners, may be themselves all the better for their exercises, but nobody else is. Their labour leads to nothing. When a game at cricket is over there is nothing to show for it but contusions. The rowing-men do not take advantage of their opportunities of catching fish, except it be the advantage of their opportunities of catching fish, except it be the technical "crab," or even of carrying parcels in their boats. Thus tochnical "crab," or oven of carrying parcels in their boats. Thus there is a vast waste of physical power. It may be true that the young men are stronger and healthier in consequence of exercising themselves in this manner, but could they not get equally good exercise in some other way which would also be of advantage to society? This is Mr. Ruskin's idea. He wishes to introduce a new torm of athletics which shall not only improve the frames of the workers, but leave behind it some tangible result of labour. He has upget the worker of Orfined to targible result of labour. the youth of Oxford to try the useful spade instead of the idle our and barren but. "Drain a single cottage," he says, "repair a single village byway, make good a single garden wall, make pleasant with flowers one widow's plot, and your muscles will be more strong and your heart more light than had all your leisure hours been spent in costly games or yet more hurtful anusements." It is obvious that there is here a wide field of usefulness, and that meaning the description of the desired to the side of the an oarnest undergraduate might find many things to do besides those which Mr. Ruskin has enumerated. He might take care of the village pump, or wash the villagers' babies, or take a turn for the male villager in the field while the weary peasant refreshed himself with beer and skittles. Professor Acland, who has come forward as the champion of the movement during Mr. Ruskin's absence in Italy, asks whether the young men who have taken this advice are likely to be "worse Englishmen for their cheery, almost playful, help to agricultural labourers." There is certainly no reason to suppose that it will do the young men any moral harm, but to suppose that it will do the young men any moral harm, but it is very possible that it may be injurious to them physically, and it may be doubted whether it is likely to do the labourers much good. "Playful lielp" is apt to be an embarmssment rather than an assistance. Hinckeey, a village about a mile from Oxford, has, it seems, been selected for the exercises of this band of amateur agricultural labourers, and their first piece of work has been to "mend the muddy approaches of some humble dwellings of the poor." This has in the first instance, perhaps necessarily, caused the production of more mud; and the result, so far as it has gone, has been profably described as "a very tarly imitation of a budlythe production of more mud; and the result, so are no it need going has been profanely described as "a very ugly imitation of a badly-made railway outling." One of the diggers has retorted that this is only a proof of the ignorance of a critic who does not know the difference between unfinished and finished work. When the road relationship is the contraction of the critic who does not know the difference between unfinished and finished work. is only a proof of the ignorance of a critic who does not know the difference between unfinished and finished work. When the read is completed he is sure it will be lovely, and we hope so too. This writer also gives a more precise account of the undertaking. "A country read," he says, "very steep and full of ruts, crosses a green," which, we fancy, is not an isolated phenomenon in England. "The read is almost impresable in winter, and is dangerous even in summer, in consequence of several deep holes close to the edge. The farmers are unable to mend it; the operations of the Local Board do not extend to it. Accordingly a party of Oxford men, graduates and undergraduates, devote an hour or two every afternoon to mending the read." It will occur to many persons that there is a great deal to be done in this country which farmers and others do not choose to do, and from which local Boards turn away their do not choose to do, and from which local Boards turn away their eyes, and that undergraduates will not have time for much clee if they mean to fill up all these deficiencies. Another correspondent, who is also friendly to the digrees, admits that "the road leads nowhere except to a farm-house, and the farmer alone, who used to bully people off the road, will benefit by the improvements.

Everybody must respect the motives which have led the diggers to set to work at Hincksey, but there is some room for doubt as to their wisdom. It is of course an excellent thing that had reads should everywhere be turned into good reads, but it is another question by whom this should be done. It is not at all certain that Oxford scholars will do this kind of work well, and we should not be at all surprised to hear that their attempt to combine playfulness and benevolence had led to the making of a read the back of which will be broken by the first heavy min. "One of the Diggers"—and we must say we prefer a "Digger" to the serious prin who carries his seriousness to the extent of signing himself. One who has Dug"—asserts that he and his friends "can swing a pick with any navyy in the three kingdoms," and that the labourers who watch their operations are amazed at their provess. If this is the case, the next thing will probably be the interrestion of the Labourers Union to punish the interlopers who have committed the unperdonable crime of working as hard as they can. It is obvious that the Oxford enthusiasts are simply doing for nothing what the landouts or farmers ought to pay the labourers for doing, and it will perhaps be news for the labourers that they are expected to be grateful for having work and pay the labourers for doing, and it will perhaps be news for the labourers that they are expected to be grateful for having work and pay the labourers for doing, and it will perhaps be news for the labourers that they are expected to be grateful for having work and pay the labourers for doing; and it will perhaps be news for the labourers to make the order; and it can hadly be or the good of the community that the person or pursons responsible for this duty should be relieved from it. The property across which the road passes will no doubt

be increased in value if the enertions of the young gestlement of Oxford result in the improvement of the communications and drainage; so that, besides depriving the agricultural laboursers whom they wish to befriend of a job, they will probably be the means of providing a pretext for raising the rents. Of course if nobody can be compelled to keep the road in deserts order, it may be desirable that somebody should see: to it, but even then the Oxford men would contribute much pages effectually to the happiness of Hincksey if they subscribed a sufficient sum to get the work done, and distributed the money among the labourers. The labourers would thus get both a road and more money, and the road would almost certainly be much better constructed and not so likely to give way in the back. There is another point which should not be passed over. If Dr. Acland is seriously of opinion that the making of roads is work of the kind which any rational being would select for the purpose-of improving his sanitary condition, he must have some very peculiar ideas of what is good for the human body. Disging involves continuous stooping, and a strain on the muscles of the chest which does not tend to expand them, as rowing dose, but rather to contract them; and in addition there is the tramping: about in wet mud. The sort of youths who are most likely to take to this sort of missionary labour are weak, consumptive lads, whose sensibility is morbidly in excess of their physical strength, and in that case the consequences can hardly fail to be disastrons. We do not say that digging is, in itself, absolutely unhealthy. A man who has to get a living for himself and his family, and who cannot get it otherwise than by such work, must be content to dig, and possibly will be not much the worse for it. Insthe same way, work in a cotton-mill is not perhaps an unhealthy occupation, but it would scarcely be recommended to any one as an exercise expressly for the benefit of his health. Howing, riding, and oricket are, when not carried to exc

We come then to this, that, if the object of the diggers is to serve the villagers, they are taking a very roundsbout and uncertain read to that end, and would find it much easier and simpler to pay competent workmen to do whatever may require to be done. On the other hand, digging is by no means an appropriate labour for students, and is more likely to do them, harm than good. If the making of this read were a work very argently requiring to be done, and if there were absolutely no other way of getting it done except by the students undertaking it with their own hands, they might very well do so. But this is not the case here, and the only question to be decided is whether this sort of exercise is as wholesome and suitable as the familiar sports. We do not think any reasonable person can pretend to say that it is. The argument that rowing and cricketing are a waste of power because they produce no results is easily disposed off. They yield sufficient results if they provide insalthy gynnastic-training for those who engage in them. It is no doubt particely true that a great deal too much time and attention is given to these sports, but within reasonable limits nothing can be better to young men, and there is the experience of successive generations to apply the same rule to mentalus he does to physical armusements, he would find himself cut off from many innocent and whelesome-enjoyments. He would hardly venture to lay it down that to make now that it will not only do himself good) but will produce some direct, immediate, and targible boselt to other people. He would probably reply that a man who was thus engaged in doing himself good was in effect really doing a good turn to the world also, inasmuch as he was fitting himself to be of more service to it when occasion arose. The same thing may be said of hysical exercise. There may be nothing to exclude specially with a gertianal of our young men in town have turned coachmen, and have the planear of this kind is apt to be rather recides and unbusinessilies and t

Bild discussing the production have of Mi Greene Middle Misting at play we had consoler to speak of the evilarithic matter system, powers prevalentest this matter. Here aliantities distributed and less the consoler to the

discussed to London pulses many plays were gardene given with discussed an environment of Franch acting of every national and the Thilties Franch, an imagent and massession of the displick public. It has become an appeal rule that every Franch actor, if not first-rate, at least some his basiness thereughly, and that any Franch company are public of doing justice to any play. The theory that the Franch a mation have greater natural talents for acting than the Enghany or may not be true; it is certain, however, that they are the many new greater news at the certain, however, that they are the stage of the country or many new to the certain, however, that they are the stage of the country of the powers. The secret of a great encellence of the Country of the training, while some powers of the real being actors of first success, as we have before now id, many in great measures, as what the powers in great measures as the powers. second also first-rate powers. Their aucces, as we have before now said, was: in great measure ewing to the perfect harmony of their performances. The unpleasant effect of the want of this harmony, is evident enough in the representation at the Princess's of To Spains, a play to which no less than eighty-six rehearsals were devected in Paris by a company well accustomed to play into each other's hands; and which was here produced after as few rehearsals are generally thought sufficient for the dignity and worth of an Evident deeper and worth or an existence of the contraction English drama. It is yet more evident, however, in the case of Ou-ne desire pus area famour, one of the most perfect of Alfred de Museute dramatic works. Of the artists who represented the characters in this play on a former occasion Mile. Favart alone pears again. Then the play might have been compared to a sture of rare beauty both of subject and of skill in execution. Now it may be likened to the same picture with all the figures except one blurred and blotted more or less. And the distortion e other figures cannot but detract immensely from the value of that which is untouched.

Alfred de Musset's plays are little fitted to bear any but the most skilful and finished handling. They are unique, and belong to no school. Consequently it is not possible for an actor to interpret their characters by the light of past experience in other characters. Every one of them, subordinate or important, is marked by:a special individuality. In most plays a stereotyped representation of the less prominent characters is sufficient to produce a respectable effect; in these the introduction of one such onage is eaough to mar the excellence of all the rest. When it is only one personage who is properly understood, and the significance of all the others is missed, the result is yet more discordant. The brilliancy and wit both of disloque and situation in these plays require a most delicate tsuch; if they are grasped but the least bit too long or too heavily their brightness is dulled, their beauty destroyed. Alfred do Musset's comedies contain much of the spirit of Circek tragedy, although it may sound like catching at a paradox to say and it rule comeny there is an undersurrent of pathos, in the spacet's this pathos exists, sud is generally conveyed in the spacethes of a half-despairing lover. The sparkle of the country is unsurpassed; it is conveyed in few words, but every word is clearged with meaning. The brevity with which a vast amount of charged with meaning. The brevity with which a vast amount attack and experience is expressed is one of the author's most arriving possiliarities. The truths seen by the satirist are restriking posmisarities. The truths seen by the satirist are vealed to the reader as if by a succession of lightning flushes. this bright comedy there is a dark background of tracedy, which While the persons of ems yet darker by the force of contract. the drama are love-making, flirting, quarrelling, one sees a grim Fate, resistless and relentless, advancing gradually upon them, until it grasps and enshrouds these. The chief instrument in the working out of this destruction is generally a woman of complex character, which is revealed, not by elaborate descriptions given by third persons, as in M. Feuillet's Sphina, but by means of a short speech or two, in which she unconsciously lays here the workings of her heart and mind. Such a woman as this is Camille in On no badino pus avec l'amour.

The play opens with the return home of Perdican, a young igneur, whose father desires to marry him to his niece Camille, who has just come from the convent to pay a visit to her uncle and to meet Perdican. The cousins were always inremided for each other; they were lovers as buy and girl; both Perdican and his father then look forward with delight to the servival of Camille. When she comes, however, it appears that she has formed the fasolution of renouncing the world and becoming a nun. In the accord act Perdican attempts vainly to alter resolution, and failing, delivers a fine tirule against the evils of convent life, and finally consoles himself, and at the same time revenges himself on Camille, by making violent love to Rosette, a village girl, her foster-eister, and taking care that Camille shall overbear him. In the third act Camille in her turn repays Perdican in his own coin by inducing him to confess his real love for her, and then discovering Rosette, who has been concealed behind a entrin, and has fainted on hearing Perdican's perfidy. Once more Perdican owns his love for Resette, and his firm intention of marrying her; once more he and Camille meet and finally confess their real love for each other in a seene which is so beautiful in itself, and such a good specimen of De Musest's manner, that we are tempted to quote part of it:-

Princes. Instance que nom nomment nom nous aimens. Quel nonge avons mens fait, Camille? Quelles values paroles, quelles misérables feiles out nemé comme un vent finante entre nous dans? Lequel de nons a maié tromper l'antre? Hélas l'este vienst ellemène un al pénille rêve l'poèrquel essors y méler les notres ? «O men Dien, le bonheur est une perse dans cet chan d'ici has id!Tu nous!Tavais danse, pêcheur edente, en l'Essais siré pour nous des projende es de l'alème, est dente de projende es de l'alème, est dessinable joyan; summent, comme des melants que manuel est mentionable pour nous des melants que manuel est mentionable pour nous des melants que manuel est mentionable pour nous des melants que manuel mentionable pour nous des melants que mentions que les melants que melant de la laboration de la laboration

cour. Ce bien qui nous regardo so a t'aime ; il y a quinze ans qu'il le sait.

At this moment a cry of despair is heard outside from Resette; an inexplicable terror seizes both Perdican and Camille. Neither is willing to po into the gallery where Resette has been concessed. Finally Camille, gathering her courage together, enters it Perdican left alone falls horror-struck on his knees and utters a prayer for forgiveness and a promise of reparation, which is cant short by Camille's reappearance. "Eh bien! Camille, qu'vest-il?" asks Perdican. "Elle est morte! Adieu, Perdican!" replics Camille.and rushes out. asks Perdican. "Elle Camille, and rushes out.

Such is the main outline of the story, which is filled in with wonderful touches of character and entire, in On we begins pas neer l'amour. The character of Camille affords many opportue. tunities for the exercise of Mile. Favari's dramatic power. cold prim reserve of the girl fresh from the convent was well marked in the first set; and the gradual theorie, of this in the second set, under the influence partly of jealousy, partly of a more gentle emotion, was represented with a skill which only innate power and careful training can give. Speaking of Alle. Favart on a former occasion we pointed out that she excels in depicting scornful passion. An opportunity for showing how finely she can do this is afforded to hor by the scene in which she quessine Perficen as to the inconstancy of man. The surdonic tone in which she asks "Combien de fois un homete homme peut-il simer?" was, if given with too much weight and severity, yet forcibly executed. If we were to find a fault in Mile. Favarts conception of the character, it would be that she gave too much weight to it throughout. Camille's unpleasantly ironical utterances spring from the ill-balanced reflections of a girl fresh from the convent, who imagines that she knows human nature and its ways, while she is in reality quite ignorant of them. The solumnity with which Mile. Payart at times invests them gives them an air of being the deliberately evil notions of a woman of the world. In the last act solomnity is in its right place, and here Mile. Favart's powers found a fine occasion for their exercise. The rapidly varying emotions which pass through Camilles mind as she thinks she has lost or regained Perdican, culminating in a burst of passionate despair at the foot of a pricedicu, were all given with as much delicacy as force. The great effect of the play occurs at the conclusion, in the saidon blaze of the tragedy which has been smouldering all through. Camille shudders and starts up as she hears Resette's cry outside; then she clings to Perdican in terror: she looks with expectant horior to the door of the gallery where Rosetto has been convenied. Finding Perdiena as much overcome by terror as herself, and loss able to contend with it, ahe nerves herself and rushes into the pullery, determined to know the worst, and end their arony of ignorant fear. In a few minutes she appears again at the door of the gallery, and, catching at the door-post as if for support, looks at Perdican with haggard, despairing eyes. "Un'vsa-t-il, Camille?" he make tromblingly. "Elle est morte!" she replies, and rushes as if flying from the horror behind her across the room. ble clipus for a moment to the door on the opposite side, and then, with "Adiau, Perdican!" she vanishes. The amount of meaning which the actress throws into these few words and actions is remarkable. As Camille disappears, she leaves upon the spectator the impression that she has gone to be haunted by a life-long remorse. This scene was very fine; but it was noteworthy how much of its effect was lost by its being represented by one only of its original creators. It must be said for M. Billant, who emayed perhaps no more can be expected from a player who had to replace perhaps the first artist of this age. The absence of M. Delaminay reminded the spectator how greatly the trapedy of the scene had been intensified by the power which he three into large the power which he three large transfer has been intensified by the power which he three large large transfer. been intensified by the power which he threw into Perdican's terrified prayer while Camille is in the gallery. Few who saw the piece played by M. Dehaumay and Mile. Favart will forget the dreamy picture upon which the enriain descended of Perdican cowering, pale, and breathless with terror, against the wall, as Camille fled from the place.

In some respects it was more satisfactory to see Mile. Favart in La said de Mai than in On no bedieve pas cover Enseur. This poem, like La nuit d'Octobre, consists of a dialogue between the Muse and the post, but the post in this has very little to say, so little that even if ill delivered it could hardly said the offset of the Muse's speeches. The Muse of course

spul the effect of the Mineo's speeches. The Muse of course gives no opportunity to the actress for the representation of quick emotion or the play of character, but it allieds her an second for fine declamation, of which she fully availed herself. Her speeches are charged with the tendor melanchely, the regret that life should be so sad, the wall for the suffer-ing that posts must sudure, which its Musset loved to sing; the skilledly measured suddeness and slow granden of Mile. leavart's tomes were well swited to do justice to the heauty of the post's verse, and they statuesque appearance harmonized well with the selemnity of the Mosce walls and gestures. This parm gave more idea of Mile, Favert's power than anything class which she has done on this ownsion. These must always be much to admire in her acting; but from a variety of causes, which we have already apoken of, her solitary appearance reminds the spectator, even while he most admires her talents, of how much her performance loses from the absence of fitting support,

PROPOSED AMENDMENTS OF THE LICENSING BILL

WE are told by Mr. Leird and other persons whose opinions W E are told by Mr. Laird and other persons whose opinions are entitled to respect, that the possibility of a return to the opening of public-houses in Liverpool before 7 a.m. ought to be contemplated with regret. It is stated to be most important that a mechanic should commence his day's duty without having recourse to stimulants in the shape of spirits or beer; and this is alleged as a sufficient reason why all places where spirits or beer are sold should be closed until after the day's work has begun. The effect of legislating in the spirit of Mr. Laird and his allies would be to prevent some persons from eating in order that other persons may not drink. Let us remember that the class whom we commonly call publicans are legally designated "licensed victuallers," and that the supply of breakfast to mechanics on the way to daily work would be part of their proper business. Even as reggeds married workmen, convenience and perhaps economy would regerds married workmen, convenience and perhaps economy would dictate that one person should prepare breakfast for many, instead of requiring every wife to bestir herself to supply her husband's of requiring every wife to bestir herself to supply her husband's need. There would be saving of the wife's labour, and of fire and light; and it deserves notice that among foreign nations, who are more thrifty than we are, the practice of taking meals at public places prevails more largely than with us. Besides, there are the unmarried men who must probably get breakfast at some public place or go without. It appears, therefore, likely that there would be a large demand for early breakfast-houses, and in fact such demand exists. It seems rather hard upon the publican to forbid him to enter into this trade, especially as we used to hear from Lord Aberdare laudations of some foreign system under which beer, spirits, toa, and coffee would all be sold as part of the same business. Lord Aberdare laudations of some foreign system under which beer, spirits, toa, and coffee would all be sold as part of the same business. Suppose, however, that the publican is excluded, and that this branch of his legitimate business is placed in other hands. Will anything be gained to the cause of sobriety by that? A refreshment-house which does not sell beer or spirits may be opened at 4 A.M. Such a house would supply tea or coffee, and although we decline to believe that beer at breakfast is pernicious, yet it is not necessary. Unfortunately, however, it has been found that coffee-houses carry on at night an illicit trade in spirits, and on this ground Mr. Cross proposes to compel them to close at the same hour as publichouses. It seems a logical consequence that they ought to remain closed till the same hour in the morning.

houses. It seems a logical consequence that they ought to remain closed till the same hour in the morning.

Another point on which Mr. Laird and others insist is that the beer-houses should be allowed to open and close at the same hours as the public-houses. It has been suggested that this demand for equality is favoured by the brewers who are largely interested in beer-houses, but whether this be so or not, we think that the question should be viewed as one of public convenience simply, as we are not aware that the beer-house keepers have any right to this aguality of hours which is claimed for them. Mr. Cross proposes we are not aware that the beer-house keepers have any right to this equality of hours which is claimed for them. Mr. Cross proposes to allow public-houses in the metropolis to keep open for half an hour later than beer-houses; and among the reasons which to our mind justify this proposal, we shall venture, at the risk of shocking some worthy persons, to place this—that public-houses sell spirits as well as beer. The beer-houses have always hitherto been placed upon a different feature for the public houses. spirits as well as beer. The beer-houses have always hitherto been placed upon a different footing from the public-houses as regards hours, and we do not see why they may not remain so, if the police authorities consider that that would be the most convenient arrangement for supplying the admitted wants of the metropolis. In discussing this question of the hour of closing, it appears sometimes to be assumed that the publican or beer-house keeper is bound to keep his house open during the hours allowed by law. He is doubtless compelled by record to his own interest to keep open as long as his pelled by regard to his own interest to keep open as long as his neighbours, but we are not aware that he is under any legal obligation to do so. An innkeeper is bound to afford reasonable accommodation to travellers at any hour of the day or night, and it has been said that the later the hour the more imperative is this duty. He would be liable to action or indictment for breach of this duty, but it is difficult to see how he could be compelled to keep open his house for the accommodation of such of his neighbours as dosire to drink therein, or could be punished for shutting it up. The general Licensing Act of 1828 imposed penalties for offences against the tenour of the licence, and the licence provided offences against the tenour of the licence, and the licence provided that the holder of it should not keep open his house except for the reception of travellers, nor permit any beer or other excisable liquor to be conveyed from his premises during the usual hours of Divine Service on Sundays, Christmas Day, and Good Friday, and should maintain good order and rule therein. By the Metropolitan Police Act of 1839, publicans were forbidden to open their houses for the sale of liquor on Sundays before t P.M., and thus they were required to close at 12 o'clock on Saturday night. This was the condition of things under which Thackersy wrote of the "back kitchen" and other haunts of convivial Londoners during the small hours of the morning. A barrister or journalist living in the Temple went to a ball or party, and on his way home he dropped into the "back kitchen," where other barristers and journalist were engaged on chops, stout, and songs, or conversation. All, or nearly all, men of this class have now their club, and thus the extinction of the fires of "back kitchens" has been endured with an equanisality which a loquacious and influential section of society an equanisalty which a loquacious and influential section of society

might not otherwise have shown. The Act of 1864 prohibited publicans in the metropolis and certain boroughs from opening might not otherwise have shown. The Act of 1804 problems publicans in the metropolis and certain boroughs from opening their houses between I and 4 A.M., and the Act of 1872 extended the prohibition from midnight to 5 A.M. Such has been the progress of restriction as regards public-houses. But beer-houses were restricted from the first. The Act of 1830, by which the blesting of "the new beer-shops" was originally conferred upon the nation, required that these shops should be closed from 10 P.M. to 4 A.M. The Act of 1840 fixed the hours of closing at 12 P.M. to 5 A.M. in the metropolis, and The P.M. to 5 A.M. in provincial towns; and this Act remained in force up to the passing of the Act of 1872. Thus it appears that the beer-houses have always been under more stringent regulations than the public-houses, and it is difficult to see any injustice in their so continuing. They pay Excise duty only for the sale of beer, whereas the publican pays for spirits and for wine also, if he sells it. As regards both classes of houses, there is nothing that we can discover to prevent their being closed at such hours as the keepers of them may think convenient.

A long list has been published of proposed amendments to Mr. Cross's Bill, of which the most important are those which relate to the hours of opening and closing. Taking first the metropolis, we think the hours named in the Bill ought to be maintained. They are on week days, for public-houses, from half-an-hour after midnight to 5 A M. and for hear-houses, from half-an-hour after midnight to 5 A M.

we think the hours named in the Bill ought to be maintained. They are on week days, for public-houses, from half-an-hour after midnight to 5 A.M., and for beer-houses from midnight to 5 A.M.. We think it would be an improvement to make the closing hour for public-houses I A.M., as it used to be, and to trust to the inducement offered by the "early closing" section, and to the known disposition of the trade for closing as early as may be consistent with public convenience. We may remark that the words of the "early closing" section, "desirous of obtaining the privilege of closing premises at an earlier hour than usual," have perhaps given rise to the notion that a publican is obliged by law to keep open to the hour at which he is required to close, but we can discover no other foundation for it. As regards the large provincial towns, the hours named in the Bill are for public-houses II.30 P.M. to 6 A.M., and for beer-houses II F.M. to 6 A.M. The chief opposition to the Bill has arisen upon this clause. Under the Act of 1872 the closing hour in the towns is now usually II, and strong objections have been urged against the proposed addition of half an hour, while we have not seen any very now usually 11, and strong objections have been urged against the proposed addition of half an hour, while we have not seen any very distinct statement of special needs which require that addition to be made. It appears probable that the House in Committee will adopt 11 o'clock as the closing hour for public-houses, and if that be done, it appears hardly worth while to alter the hour which Mr. Cross has proposed for beer-houses. Thus in the large provincial towns the hour of closing for all houses would be 11 o'clock. towns the hour of closing for all houses would be 11 o'clock. As regards the time of opening we have no sympathy with Mr. Laird's proposal to make it 7 o'clock, and we think the reasons by which he supports the proposal "fudge." We hold that licensed victuallers ought to be allowed and encouraged to provide breakfasts for working-men at 6 or even at 5 o'clock. The best argument for early hours at night holds good for early hours in the morning. At this season many kinds of work might well begin at 5 o'clock, and work cannot usefully be long continued without food. In small towns and in the country the hours named in the fill are for public-houses 11 F.M. to 6 A.M. In all towns of more than 2,500 inhabitants, the hours are for beer-houses 11 F.M. to 6 A.M. In the public-houses II P.M. to 6 A.M. In all towns of more than 2,500 inhabitants, the hours are for beer-houses II P.M. to 6 A.M. In the country the hours are for beer-houses IO P.M. to 6 A.M. To these hours we see no objection, nor are they likely to be very strongly assailed except by the devotees of uniformity for all houses. On Sundays all houses everywhere will be closed up to half after noon or I P.M., and from 2.30 or 3 to 6 P.M. In the metropolis the hour of final closing will be for all houses II P.M. In the large and small towns and in the country the hour will be for all houses IO P.M. These arrangements are not likely to be much contested except by those who desire to close all liquorshops on Sunday altogether. We do not think that the hours of opening on Sunday ought to be further restricted. Indeed, we opening on Sunday ought to be further restricted. Indeed, we should have preferred the opening hour to be 5 o'clock, as it was before the Act of 1872, but we do not recommend that that which has been settled should be changed without strong necessity. By the Bill a "bond-fide traveller" must have come three miles and have three miles to return. We protest against Mr. Melly's proposal to increase the distance to five miles. Mr. Pease proposes to abolish the grocers' wine licences altogether, but his amendment has no change of being carried has no chance of being carried.

SHIPWRECKED SEAMEN.

SHIPWRECKED SEAMEN.

TEW charitable Associations exert themselves for an object more genuinely national than the Shipwrecked Mariners' Society, which held its annual meeting the other day. As England lives and thrives by the sea, it is only fair that she should do her utmost for those who suffer by it, and the Shipwrecked Mariners' Society does all it can for seafaring people, not only by succouring those who are in distress, but by inculcating on them the forethought in which they are proverhially deficient. It halps seamen and fishermen in the most effectual way by persuading them to help themselves. It induces them to contribute a small sum regularly that they may have a claim on the Society in the when they fall into misfortune. The result is that seame and fishermen figure among the contributors to its sevenue to the amount of upwards of 7,0004; while, on the other hand, the same

persons have been repeatedly assisted in the course of the same among, without laying themselves under electronymeny chilipations to any one. Receipts from various sources have brought the Bociety's income for the past year up to 40,7324, enabling it to increase its ontgoings and extend the uphers of its usefulness in new directions. Bhipwrecked seamen, as its title imports, are taken charge of, relieved, and sent back to their homes. The widows of members who die a natural death, as well as of those who have periabed by accident, are pensioned: orphans and destitute parents bers who die a natural death, as well as of those who have perial of by accident, are pensioned; orphans and destitute parents are gared for. Fishermen who have lost boats, nets, or clothes, receive assistance according to a fixed scale. Medals and sums of money are awarded to those who have saved lives from shipwreck at sea and abroad. In short, the Society seems to distribute its funds on principles which are at once liberal and judicious; and, were its existence and its purposes made more generally known, we cannot doubt that its means of usefulness would expand in proportion.

in proportion. In some ways our sailors are far better cared for than they used to be, and they pureue their dangerous calling under less hazardous conditions. It reads like a romance, for instance, when go back to the cruises of those cockleshells of a few tons burden in which the early pioneers of Arctic navigation pursued their daring researches among the icebergs and ice-flows of the Polar sens. Nor were those who went on mercantile veyages to more genial latitudes very much better off. Their vessels were infinitely more roomy, but they were scarcely the safer on that account; and, indeed, their extraordinarily substantial build had special dangers of its own. Certainly there was no chance of a broad-bottomed, wall-sided, Dutch-built vessel espaizing in a storm on a tempestuous sea, like one of our crank modern narrow-waisted screws, constructed with a special view to their speed and carrying capacity. But in those old-lashioned galleons the crew was almost helpless when a gale was blowing on to a lee shore, and the currents were setting in the same direction. If no anchorage was to be found, or if the anchora did not hold, the only hope of safety was in a sudden change of the wind. And, once drifting in on the shore, the chances were much more against one than they are now. Even on our English coasts there were none of those modern appliances on our ranging coasts there were none of those modern appliances to be looked for which nowadays bridge the gulf between the beach and the breaking ship. There were no lifeboats, no tag steamers, no recket-apparatus to send out a life-line. In some places, on the contrary, where the narrow seas were most perilous, the inhabitants regarded all the waifs thrown up by the wayss as their legitimate perquisites, and men who eked out their living by wrecking tried to lure vessels to their fate. On the Cornish and the Welsh coasts, and round great part of Ireland, it was a common practice to respond to signals of distress by a murderous display of false lights. On the rockbound shores of Brittany the rude peasants showed exceptional astuteness in that way; they would attach the delusive light to the horns of an ox, and they wing the animal's head to its furneless drive the along the animal's head to its furneless drive the along the animal's head to its furneless drive the along the animal's head to its furneless drive its along the animal's head to its furneless drive its along the animal's head to its furneless drive its along the animal's head to its furneless drive its along the animal's head to its furneless the same than the same tying the animal's head to its fore-leg, drive it slong the edge of the cliff. The light jerking up and down looked like a vessel rising and falling in the waves; the crew of the ship in distress fancied they had plenty of sea room when they were actually close in shore; and never discovered their mistake till they were shuttered to fragments on the rocks. Where these horrible practices prevailed the sailor might save himself the trouble of making a struggle for oxistence. If he did by any chance find his way through the breakers, he was probably knocked at once on the head by way of disposing effectually of his right of property in the jetsam that was cast up with him; and even if the inhospitable natives did not go quite so far as that, immemorial superstition forbade their giving assistance

to a drowning man.

If such was the welcome that perishing sailors had to look forward to on the coasts of the most civilized countries of Europe, it may be imagined that they were no better off among savages and semi-civilized races. If a castaway comes ashore in these days almost anywhere in the habitable globe, he has a fair chance of receiving tolerable treatment, now that we have colonized whole continents which were then in the hands of the barbarous aborigines, and We have bribed or that civilization has its outposts everywhere. terrified half-avego potentates into understanding that it pays them to imitate us in our humane tenderness for human life. Formerly, the most powerful nations of the West were only known in Eastern and Southern seas as trading adventurers, feeling their way on sufference. They had not set out on their careers of conquest, and colonization was quite in its infancy. A trading vessel was safe so long as her formidable armament could defend here but when some mishen resulting her benedicing as release. vessel was also so long as her formidable arinament could defend her; but when some mishap paralysed her broadsides, or when her crew were parted from their arms, her rich contents became an irresistible temptation. The helpless crew were either massacred to a man, or, more probably, sold into slavery. Slavery was the fate that followed on any casualty occurring even so near home as the southern shores of the Mediterranean. To pay the ransoms of all the luckless victims who were pining away in the hagging of the different Parhary States would have To pay the ransome of all the luckless victims who were pining away in the bagnios of the different Barbary States would have exhausted the funds of say number of benevolent Societies. Even where the native population were not pirates and manustealers by profession, it was but seldom that the victims who escaped immediate death were within reach of communication with any representatives of their countrymen. There were no consuls and vice-consuls, no agents of Lloyd's, officially housed to offer them protection. The missionary had not yet gone abroad to Australasia and the uttermost isles of the Facilie, and castaways in those outlying lastitudes were killed efficient for the kitchen. Buildes, navigation then was neces-

earlly much more deagurous than it is now. Chierts were used accessively inaccurate; lighthouses few and dinity lighted. To this day we continually hear of well-found steamers country to grief on the most familiar of the great count highways and at the very mouths of harbours that are everyday places of call. At that time clumsy sailing ships had to go groping their way through unknown waters studded takeny with submerged reefs, among treacherous currents and sandbanks that were continually changing. The most dangerous shocks and headlands had to be passed, if possible, in broad daylight, and if you lay to or were unhappily becalmed, it was at the imminent risk of being boarded by pirates. Now that so vast an amount of valuable property is afloat, lighthouses have been multiplied everywhere by way of assurance, and they are built in neighbourhoods so lonely and inhospitable that one marvels who can be found bold or reckless enough to undertake the charge of them. A letter in or reckless enough to undertake the charge of them. A letter in the Times of Monday last shows significantly enough how carefully by comparison the safety of ships is now cared for in this respect. The letter told the story of an uttack by robbers on the Englishman who keeps a lighthouse in the Malay Peninsula. The broadless that he and his native assistants had just more weather that knowledge that he and his native assistants had just received their small monthly pay was enough to tempt the cupidity of his pira-tical neighbours; nor is it difficult to imagine what would become of sailors who might be cast on the shore there for want of a light to warn them away.

But if in some respects scamen run much less risk than they

used to do, in other ways there is more scope than ever for the active philanthropy of a benevolent Society. Flaving increased enormously in numbers, they are exposed to a new class of dangers. Commercial competition grows keener every year, and men's lives consequently are less considered than they used to be. The annual wreck registers with their wreck charts show how many disasters still happen annually on our coasts. We know how many venerable ships are affect in the coasting trade that should long ago have been sent to the shipbreaker's yard. Every gale strews par-ticular sandbanks and stretches of coast with its clusters of wrecks. Collisions are infinitely more frequent than they were, and no wender. In spite of lights and fog-horns, and all ordinary and extraordinary precautions, it is difficult to see how collisions are to be avoided, considering the crowds of shipping continually passing and repassing in certain narrow waters. No are our great ocean steamers nuch safer when they have plenty of sea-room, running against time and each other as they do, in defiance of the weather, along frequented routes. We build far larger vessels for the foreign trade trequented routes. We build far larger vessels for the foreign trace than we used to build; but safety does not always keep pace with tonnage, and our long, low, crank steamers are terribly liable to accident. We have taken to stowing eargo, too, in a reckless way such as no onewould have dreamed of in the days of the old sailing-vessels which could never make even an approximate calculation of the precise time could never make even an approximate calculation of the procee time of arrival at their destination. Now we load our screw colliers down to the water-line, or hamper the decks of our Channel or Baltic steamers on the presumption that they will make the run from port to port without having the ill-luck to be caught in a storm. Occasionally, however, the storm will come, and the pitcher that has gone often with impunity to the well will at last be broken to shivers. One thing to be said is, that in cases of capsize like these few shipwrecked seamen come to shore; and all that is left for the benevolent Societies is to look after the widows and the ornhans. But, in one way or another, it will be admitted and the orphans. But, in one way or another, it will be admitted that there is an ever-increasing field for charitable exertion in this direction.

THE THEATRES.

THE success of a dramatic version of Ought We to Visit Her? has encouraged an attempt to bring another novel by the same author, Mrs. Edwards, upon the stage. But it is doubtful whether Archic Lovell will equal its predecessor's popularity. Interest depends less upon what the heroine says than upon what she does. There are none of those smart speeches to which Miss Hodson lent so much piquancy in the former part, and it is difficult to construct an interesting play out of the simple fact that a young lady outrages propriety by taking a trip with a gentleman in a Channel steamer. Mr. Burnand, who dramatized this novel, has in a Channel steamer. Mr. Burnand, who dramatized this novel, has doubtless exercised a sound discretion in not taking any more of it, and he has made perhaps the best use possible of that which he has taken. Major Seton, the middle-aged lover of the girl Archie, has seen her during the unlawful excursion, and has been shocked, but marries her. That is all, except the squabbles of a doctor and his wife, which merely extend the play to the requisite length. The character of Archie, as drawn by the novelist, is well suited. Miss Holgan, but unfasturately the scenes which as more to Miss Hodson, but unfortunately the scenes which are most effective in the novel cannot be, or at least are not, transferred to the stage. It must be added that the character of Gerald Durant is difficult to act. He is in danger either to be vulgarised or to become a mere stick. A few years ago this story would have been seized upon for the sake of the sensational incidents it contains, but happily popular taste has in that respect changed. If we cannot bestow any higher praise on Mr. Burnand, we may at least remark with satisfaction that he has spared us a suicide and a

remark with satisfaction that he has spared us a suicide and a criminal inquiry before a magistrate.

A decided success has been obtained at the Court Theatre by Mr. Frank Marshall's Brighton. The fun of this piece helps off agreeably the heavy splendour of the following piece, Calypno, and pathaps "the art of lave" is about equally explained and illustrated in both of them. Without inquiring whe her Mr. Marshall

contrived the incidents of his play, we may give him entire credit for the dialogue. Not only is Mr. Robert Sackett in love with three ladies and corresponding with a fourth, but he declares his passion for each in appropriate and varied terms, so as to produce upon the hearer, and doubtless upon himself, a momentary impression of his sincerity. He declares "that he never loved till now" in a tone which inspires the belief which he evidently feels, now" in a tone which inspires the belief which he evidently feels, and although there is something violent and grotesque in the number and rapidity of the conquests which his heart suffers, yet the substance of his character is true to nature, and examples are not rare of men with whom a second pretty face is a certain cure for a passion for a first. Indeed the manager of the Court Theatre might claim to have comprised not only the art of love, but the remedy for love, within its programme. Three ladies meet in the Aquarium at Brighton, and have a little confidential chat, as ladies will, about their lovers. Each lady is nearly persuaded to tell to the others the full name of the "Robert" whom she loves, but, happily a revelation which would have spoiled the play is prevented. One of these ladies has been corresponding under the name of "Rosebud," with a "Humming-bird," who turns out to be the Robert whom she believes to be her own. This discovery might be awkward, but each pretends to have known the other's might be awkward, but each pretends to have known the other niight be awkward, but each pretends to have known the others handwriting all the time; so Effic is convinced of her Robert's constancy, and Robert is more entirely devoted to Effic than ever he had been before. Almost the next moment after this delightful and satisfactory explanation he meets Virginia, and his rapture at the sight of that charming girl is so manifest and spontaneous that jealousy and vanity combined could demand no more. Then there is the lovely widow, Mrs. Alston, whom to see is to adore. He adjures his friend, Jack Benedict, to exert himself to remove the abstractes to the processition of this new and therepubly compine adjures his friend, Jack Benedict, to exert himself to remove all obstacles to the prosecution of this new and thoroughly genuine attachment. The widow is still slightly the favourite when he meets in the streets of Brighton an adventure which instals a now charmer in his heart. A pair of carriage-horses are restive; he checks them, and a young and fair lady who occupied the carriage falls senseless into his arms. She is soon—too soon—removed by her hasband and her son, and there remain to him memory and hope. "Sweet," stys the post, "as kisses by hopeless tancy feigned on lips that are for others." But Robert Sackett's fancy is not hopeless. He resigns the widow to his friend, Jack Benedict; tells Effic that he is gone to Liverpool on business, and Virginia that Effict that he is gone to Liverpool on business, and Virginia that he is detained in Leeds by sickness, and devotes his whole attention to contriving a repetition of the kisses, without troubling himself to inquire whether the lips may not be appropriated. Ultimately, while shooting and apparently posching, in a wood, he meets this lady, who has come with her husband and son to a picnic. While he is improving the occasion other members of the party, including liffle and Virginia, appear. He is arrested for posching, and having with difficulty escaped imprisonment, receives challenges on behalf of all the ladies to whom he has paid his transient attentions. Even the widow insists that his friend Jack Benedict shall challenge him. Then all the ladies come to him to provent the duels they have instigated. He discovers that Efficialone has any desire to save his life, and he conceives, as the curtain falls, a bolief, which we must suppose to be unalterable, that Efficis the only woman he ever loved. This lively bustling play is fairly acted all round, and although the materials are farcical, it is written in a style which entitles it to be called a comedy. It is so full of genuine fun as to make the after-piece, Calippo, appear a tame affair. But this perhaps was intended to appeal primarily not to the car but to the eye, and thus it may be hoped that both classes of patrons of the theatre will be pleased.

It is difficult to understand why such a piece as Mont Illanc should be produced at the Haymarket Theatre, or indeed at any theatre at all. The idea of adopting Le Voyage de M. Perrichon to the English stage was not particularly brilliant; and we are bound to say that any English dramatist could have produced as dull a piece as this, which has been accepted by Mr. Buckstone without French assistance. The characters and incidents are utterly commonplace, and the views of Mont Blanc and representations of tourist life at Chamonni would be a fair shilling's-worth at a panerams. We should not greatly complain of this at any other theatre, but we cannot help remembering that the Haymarket has always hitherto been tolerably independent of the vulgar artifices of what is called realism. At the same time, a manager cannot obtain good plays by wishing for them, and it has happened lately that neither known nor unknown dramatists have been successful at the Haymarket. It need not be said that Mr. Buckstone is entirely successful in representing a London tradeeman on his travels who desires to affix on the summit of Mont Blanc a pictorial advertisement like those which adorn our railway stations. Mr. Ohirpey, oil and Italian warehouseman, of St. Mary Axe, is of course accompanied by his wife and daughter, and it is equally of course that the young lady finds admirers among her travelling countrymen. Mountaineering, which has been attacked and defended on various grounds, ought, we think, to be regarded by practical minds as an advantageous substitute for balls and parties. In the first place, the air of a mountain is undeniably better than that of a ball-room; and, further, some precisions object to dancing, but climbing and riding penies would be permitted by the most severe moralist. If the circumstances are specially favourable to firstation, that cannot be helped. As Mr. Climbir works in one of his best burleagues.

On mentain-tope the air is hear, And must exhibite air is hear, And must exhibite above to not mean In moments less chiting. It might be interesting to obtain a return of the number of matches among middle-class English people that have been made in Switzerland during the last twenty years. The cort of eduration that is likely to promote these matches would be agreeable to the pupil, give little trouble to the governess, and could not be objected to by parents of the most rigid principles. It would consist mainly in encouraging girls in every way to use their hands, feet, and lungs. Miss Chirpey, the heroine of Mont Blance, talks of riding to hounds, and is otherwise "fast" in conversation, but that is a mere accessory of the character. It is shown by this play that the opportunities of fliration are great at Chamouni, greater at the Grands Mulets, and greatest in ascending to the summit. But of two ladies and three gentlemen who carry on the love-making of the piece only one of each reaches the top, and the gentleman not only speaks out under the influence of the mountain air, but sticks to what he has said when he returns to the "sober plain" of Chamouni. The moral of this is that both sexes should cultivate athletics in youth sufficiently to take part in such Swiss excursions as are only fatiguing and not dangerous; and a play which teaches such an agreeable lesson may be forgiven for being occasionally tedious. In our grandmothers time the bodily training of girls was viawed exclusively with reference to the ball-room. In our time it has or ought to have regard to summer visits to the mountains, and this extension of scope is an unquestionable benefit. Even that much-enduring creature, the governess or companion, might improve her worldly condition by developing her walking and climbing powers. Manuma will doubtless ascend as high as she can on the same principle of duty as causes her to sit out the longest ball at which her daughter has partners. But still it may be convenient to possess the service of a deputy who will preserve propriety without overstraining vigilance. In the play, indeed, the heiress goes to the summit and th

RACING MATTERS.

THE spring campaign at Newmarket, which began so miserably, improved as it went on, and ended in a manner that could not fail to be satisfactory to those who enjoy racing on the finest raceourse in the world. There was a genuine flavour of old Newmarket in the programmes, which averaged eight races a day, and included a fair sprinkling of matches; and there was no lack of interest from first to hast in the events which were decided. The very first race of the meeting, for the Spring Two-Year-Old Stakes, produced a most exciting finish between Harewood and Madame Toto, and a most unexpected decision from the judge, who gave his verdict in favour of the former, contrary to the opinion of nine-tenths of the spectators, who thought that M. Lefevre's filly had won easily. A long experience of Newmarket enables us to declure our belief that the judge is always right, and that nine-tenths of the spectators are frequently wrong. By the way, is it not rather against the proper order of events for the two-year-old to be christened Madame, and the three-year-old Miss? But, in truth, much as we are indebted to the distinguished French sportsman who so liberally patronizes the English Turf, we cannot altogether compliment him on his choice of names. It is not that the French language is inadequate to supply a momenclature, for M. Lefevre's eminent predecessor, Count de Lagrange, was very happy in his selections. But Fille du Ciel sounds very tame after Fille de l'Air, and John is a poor exchange for Gladiateur. To return to Newmarket, the Spring Handicap fell to the uncertain King George, Trombone again carrying the French colours into the anenviable position of second. Cohham, Azales, and Tomplar ran in the race, but their day seems to have gone by. M. Lefevre made up for losing the first two races by winning the next two, with Regal and Hero, the latter a remarkably fine-looking son of Gladiateur. In this last race Ladylove was boaten quite as easily by Hero as by Chaplet at the First Spring Meeting. The Newmarkst Two-Yea

ding dong finish between Telescope and Heatheren, the former was, both house having had quite enough of it, but Strutheren remning the more ungenerously of the two. Telescope seemed by no means to relish the hard ground, and his lags will hardly allow him to be freely used till rain has fellen. The Ditch Mile Handisap brought out a superior field, including Andred, King Lad, Maid of Perth, Drummond, and the Vertunna filly. A splendid struggle between Andred and King Lad resulted in favour of the latter, who was receiving a year and seven pounds from Lord Falmouth's house, by a neck. The distance not being considered far enough for King Lad, his chance was but lightly esteemed, and though excuses for besten horses are generally untenable, we think that if the race were run over again King Lud would have to be content with second place. Anyhow the performance of Andred was one of great merit, and naturally strengthened the position was one of great merit, and naturally strengthened the position of Lord Falmouth's Derby candidates. Andred was never in such rare form as at the present time, and his services as a trial horse will be invaluable.

Proceedings on the second day opened with a match over the Proceedings on the second day opened with a match over the Cesarewitch Course between Oxonian and Trout, the latter recaiving 3 st. A two-mile course is far beyond the compass of Oxonian, if there were anything against him that could gallop at a fair pace; and Trout must be a wretched animal indeed, for Oxonian was so dead beat at the end of his journey that he could hardly get past the winning-post, which, however, he just managed to reach a bare half-length in front of his opponent. The Atlantic Stakes, with a liberal addition of 200 sovs., fell easily to Trombone; and then in the Derby Trial Plate, to which the Jockey Club contributed a similar sum, M. Lefèvre achieved another and an unexpected victory. Thorn and Boulet, running at weight for age. pected victory. Thorn and Boulet, running at weight for age, were the only competitors for this race, which is run over the last mile and a half of the Cesarewitch Course, and both horses looked well, though Thorn's public credentials were far superior to those of Boulet. The son of Monarque, however, is evidently a rare stayer, for he fought out every inch of the way, and though Thorn clearly had the advantage of him in speed, when it came to the final touch he could not shake him off, and was benton by a board. Mr. Sayila won the magaziding way for the county of the magaziding way for the magaziding way. head. Mr. Savile won the succeeding race for two-year-olds with a son of Parmesan and Moleskin, but the form was far from good, for Merry Bells, who could not get anywhere near Chaplet and Ladylove at the First Spring Meeting, finished little more than a neck behind the winner on this occasion. Yet one more struggle between Prince Charlie and Blenheim followed, but this time the issue was never in doubt, for the son of Blair Athol won in the commonest of centers. We must confess that we were misled what seemed to us the close race between the pair at the First Spring Meeting, and that we were altegether wrong in suggesting that Blenheim might some day turn the tables on Prince Charlie. They may run together as often as they please; but we will have nothing more to do with Henham. The racing on the concluding day of the meeting was well sustained, though the concluding day of the inecting was well sustained, though the three matches call for no remark, except that Balfe, an oddlynamed son of Plandit, bids fair to be a useful horse to Prince Soltykoff. The unhappy Cachmere, again burdened with a 5-lbs. penalty, was brought out for the Exhing Two-Yoar-Old Plate, and was besten, after a good race, by Ludy Glenorchy, who carried a similar usualty. Strukhover reportill more at them on the first and was besten, after a good race, by Lady Genorchy, who carried a similar penalty. Strathavon ran still worse than on the first day, and inished last of all; but Cachinere improved on the form she exhibited in the Two-Year-Old Plate, the half-mile course being evidently more to her taste than the five furlongs of the Rous course. The Flying Handicap was won in a center by Bank Note -late Faraday. King George, Requesort, and Philomela were behind him, but the son of Lecturer took it into his head to run straight on this occasion, and his lenient weight brought him run straight on this occasion, and his seniont weight brought mon-home an easy winner. We may remark, in conclusion, with great satisfaction, that no less than 2,000 sovs, were added by the Jockey Club at the Second Spring Meeting, and that the improved sport during the week was not a little due to this display of a more spirited policy on the part of the authorities at headquarters—a policy which, if persevered in, cannot fail in time to restore racing at Newmarket to that position which it should fittly occupy.

The Betting Bill has passed through both Houses, and ro auxious was the Lord Chamberlain that the operations of the Tarf advertisers should not be continued for another season that he carried an amendment for the Bill to take effect from July 1874, instead of May 1875, as had been originally proposed. Thus easily has been accomplished a salutary, if small, piece of reform, which during the five years of the late Administration was in vain pressed on the notice of Government. The Goodwood Meeting, pressed on the notice of Government. The Goodwood steering, then, will be the last at which the public will be implored to make their fortunes by following infallible moduses and achemies combinations which reduce winning to a matter of absolute certainty. Henceforth people who want to bet on horse-races will be able to gratify their taste as easily as before; but people who do not want to bet will not be systematically guiled and beguiled into betting by fallacious advertisement.

Again to the company of the c into betting by fallacious advertisements. It is said that the Act will be easily evaded. Well, most Acts of Parliament are evaded; for it is almost impossible to frame a law in which are evaded; for it is almost impossible to frame a law in which human ingensity will not discover some loophole. Still we have considerable hopes that this Act will be so far successful as largely to diminish the supply of victims on which the Turi advertisement rely to recoup them for their snormous outlay in laborations. As that supply falls off the operations designed to meet it will become of negacity more and more restricted, until at length the whole Lusiness may die a natural death. However much the Act may be evaded, of one thing we are certain,

that if only the advertisiments to cluded from the columns of our m

cluded from the columns of our mawayapers, the commission agents and tipelers may locate themselves in Paris, or whom they quant, but will soon find that their encupation no longer page.

The subject of Queen's Plates has already attended the whention of the new Parliament; but it was treated in a desnitory and informal manner, and the real merits of the question were bardly touched. Some one got up and proposed that the small sum hitherty granted for Queen's Plates in Iroland should be withdrawn. Thereupon a succession of Irish members rushed into the free with their characteristic energy. Irishmen may detest England, but they have a great affection for English money, and show extraordinary temacity in attacking to it when good luck sends it within their grasp. tenacity in sticking to it when good luck sends it within their grasp. Yet the arguments by which the grant for Queen's Plates was supported were remarkable for their inconclusiveness. One member expetiated on the merits of Irish steeplechasing—as if Queen's Plates had anything to do with cross-country racing; another spoke highly of Irish hunters, a valuable class of horses undoubtedly, but, equally with steeplechasers, removed from the opportunities of competition for Queen's Plates. A third appeared to be utterly unaware of the difference between flat-racing and steeplechasing, or between Punchestown races and the Curragh races. A fourth approved of racing because pretty women came to see it, but a fifth immediately get up to affirm that pretty women never went to flat races in Ireland, but only cared for jumping. The discussion, lively if not edifying, was wound up by an Irish member asserting that Scotland could not produce a race worth going to see, and a Scotch member retorting that there was always a Scotch horse in the Derby, if indeed a Scotch horse did not generally win it. In the end Ireland kept her fifteen hundred pounds for Queen's Plates as a matter of course, and we do not grudge the money. Nevertheas a matter of course, and we do not grudge the money. Neverthe-less, the real objection to the grant was never brought forward. The objection is not to a monetary grant in support of racing, but The objection is not to a monetary grant in support or racing, but to the money being thrown away; and, practically speaking, the money voted for Queen's Plates, whother in England, Iraland, or Scotland, is now thrown away. Queen's Plates are altogether out of date, and the races for them are little more than a farce. If public money is to be contributed for the encouragement of racing, it should surely be bestowed not on races that are out of date, but on races that stand high in popular estimation at the present time. We have not the slightest wish that the Parliamentary recognition of racing should be withthat the Parliamentary recognition of racing should be withdrawn; we only wish that the few thousands a year new distributed in the most unprofitable manner in aid of a class of races fallen into neglect should be differently applied. There might be one or two weight-for-age races over a mile and a hulf course, with a thousand sovereigns added to each; or a similar bonus might be added to a great two-year-old race in the autumn, and to a fouryear-old race, and to an autumn race for three-year-old filles—the Cale being, for obvious reasons, no trial whatever of their real strength. When the vote comes on for Queen's Plates in England, thas being, for covering accounty of the possible that the subject may be again montioned; and, if is possible that the subject may be again montioned; and, if so, we hope that some practical suggestions will be made as to the best method of applying the money, regard being had to the real interests of racing, and its present circumstances.

REVIEWS.

MOTLEY'S LIFE OF BARNEVELD.

(First Notice.)

THE very first thing which must strike every reader of Mr. Mother's new volumes is that they are not what they call wives. They contain a record of the death of John of Barnethemsolves. veid, nobly told, in Mr. Motley's very best manner, but they do not contain a record of his life. Barneveld lived seventy-two years, and the two volumes of his life and Poath contain the history of the last ten of them only. It is in no way wonderful that it should the hast ten of them only. It is into way wondering that it another he so. Mr. Mothey has written the history of the other sixty-two years already. It would be hard to write the History of the United Netherlands, during the time which has formed the subject of Mr. Mothey's works, without writing the Life of John of Barneveld; and it would be hard to write the Life of John of Barneveld without writing the History of the United Netherlands. The great Advocate was so bound up with everything that went on, not only in his own country, but one might almost say throughout Europe, for so many years, that it would be hard to write his Life spart from the general history. What Mr. Motley has done is to write ten years of Netherland history, to call it the Life and Death of John of Barneveld, and therefore to tell the latest events of the life of Barneveld at greater length than he most likely would have done if the book had been stered as the fifth and math volumes of the listory of the United Notherlands. Through a great part of the second volume the book does read like a Life of Harneveld. He who had always been an important figure new becomes the central figure; and, when we came to his trial and death, he absorbe our whole interest. Indeed, to make this latter past dramatically complete, the Life of Harneville is, so to speak, southqued after his death in the personal fortunes of his friends and family, during several years of which

^{*} The Life and Beatle of John of Barneneld, Advance of Helland, with view of the Primary Channi and Mountails of the Thirty Years War. By the Lothrop Matley, D.C.L., LLD. a vols. Loudon: Murray. 1874.

Mr. Motley does not give us the public history. But during the whole of the first volume and a great part of the second, we hear no more of Barneveld than we should hear in a History which did not bear his name; though of course, in a History which did not bear his name; though of course, in the case of a man of Barneveld's special eminence, that is a great deal. This, we think, is a fault in Mr. Motley's plan. He tells us, at the beginning of his prefere: his preface :-

These volumes make a separate work in themselves. They form also the atural sequel to the other histories already published by the Author, as cell as the necessary introduction to that concluding portion of his labours thich he has always desired to lay before the public; a History of the Thirty

which he has Years' War.

Years War.

But they are not a separate work; a Life of Barneveld cannot begin in 1600. They are the natural sequel to what has gone before; but they are less skilfully contrived as an introduction to what is coming. The book goes on for some way simply as a part of Mr. Motley's History; at a certain point the fate of Barneveld becomes so absorbing that the general history is forgotten in the personal history of him and of those who are immediately connected with him. nocted with him.

But our fault-finding must not go to any great extent beyond the plan of the work. In its execution we have Mr. Motley at his best. His style in his later volumes lost a good deal of the ex-travagance with which he set out, though he still has not wholly lost his fancy for odd expressions, small jokes, attempted sarcasms, and that kind of emphasis which is supposed to come from a succession of short paragraphs. We have still a great deal too much of this, though it is remarkable how much less than usual we have in the narrative of the trial and death of Barneveld. Mr. Mothey in the narrative of the trial and death of Barneveld. Mr. Motley seems to have felt that he had here got upon a subject too great for tricks of style, and this part of his story is all the better for their being away. Through all this part of the book there is hardly any trace of them, except the short paragraphs, and they sometimes are not amiss. We find that, like most other things, though they may easily be abused, there is a place for them. We have seldom read anything with more sustained interest than the whole account of the account and presents of the Advector, and the rest of the of the execution and process of the Advocate; and the rest of the book, though of course not kept up to the same pitch, is no unworthy companion of this grand picture. It is of course not free from those mannerisms of Mr. Motley's of which we complain, but perhaps Mr. Motley is not to be had without them, and we would certainly rather have him with them than not have him at all. We must complain however of the great number of small grammatical inaccuracies, whether they are due to Mr. Motley himself or to some careless transcriber or printer. We mean this kind of thing—"The conference between the King and Sully and between both and Francis Acresans, Ambassador of the States, were of almost daily occurrence." "Hugo Grotius was one of the great lights of the age and which shone to all time." "Bernevold had almost the Populie in the great and when the provide here in his team." lights of the age and which shone to all time." "Barnevold had rocked the Republic in its cradle and ever borne her in his heart." Nor should Mr. Motley say that Barnevold and his kinsfolk were "accused of every imaginable and unimaginable crime, of murder, incest, robbery, bastardy, fraud, forgery, blasphemy." It is not easy to see how bastardy is a crime on the part of the bastard. Mr. Motley's subject takes in the greater part of the Twelve and Truce between Spain and the revolted Netherlands, including the events which led to the Thirty Years' War. It is a time which carries the reader over most parts of Western Europe;

ing the events which led to the Thirty Years' War. It is a time which carries the reader over most parts of Western Europe; Spain, less in itself than as represented by the obedient Netherlands, England, France, Germany, all have their share in it. Mr. Motley leads us about very carefully through the various wars and negotiations in different parts, till towards the end he seems to forget, and his readers are strongly tempted to forget with him, the general fate of Europe in the personal fate of John of Barneveld. We begin with the strange complications which surrounded the latter years of Henry the Fourth, the dispute about the Duchies of Julich, Cleve, and Berg—a subject not very attractive in itself, but which got mixed up with many of the causes of much greater events. And smong its —a subject not very attractive in itself, but which got mixed up with many of the causes of much greater events. And among its results we may be inclined, as we look at the modern map of Europe, to say that not the least has been the establishment of the House of Brandenburg on the western border of Germany, just when it was about to extend itself beyond its eastern border by the union of the Prussian Duchy with the Electorate. We are led through the shiftings of the various crowns belonging to the German branch of the House of Austria till we come to the election of Frederic the Elector Palatine to the crown of Bohemia. election of Frederic the Elector Palatine to the crown of Bohemia, and the election at the same moment of Ferdinand the Second as and the election at the same moment of Ferdinand the Second as Emperor. The execution of Barneveld took place during the interregnum of the Empire, between the death of Matthias and the election of Ferdinand. The general story which Mr. Motley is to go on with in future volumes thus breaks off at the very beginning of the Thirty Years' War, or rather it is swallowed up by the overwhelming interest of the internal affairs of the United Provinces. Now that the Commonwealth is enjoying the repose of the Twelve Years' Truce, the two men who had both served her so well in their several lines during the time of warfare, the great soldier and the great magistrate and diplomatist, the Stadholder and the Advocate, Maurice of Nassau and John of Oldenbarneveld, gradually fall asunder from their old friendship. We believe that Mr. Motley is right in laying the whole blame of the separation and all that came of it on Maurice. Maurice may have been misled as to some parts of Barneveld's conduct, and Harneveld in his long astendancy over the Commonwealth may possibly have shown something of an overhearing assaunar, though there is certainly no sign that he ever

showed anything of the kind towards the Prises. But nothing is more certain than that the conduct of Mauries throughout was violent and illegal; while Barneveld was entrapped, imprisoned, and at last put to death, not only without the proof of any crime, but without any definite crime being charged against him, and that by a tribunal devised for the purpose by an assembly which had no jurisdiction over him. The constitutional questions involved in the whole story, questions of special interest for an American writer, we shall discuss presently. It is enough to say now that Barneveld was accused and beheaded—it cannot be said that he was in any leval sense tried—by judges commissioned by the States was in any legal sense tried—by judges commissioned by the States-General, whereas his real sovereigns were the States of his own Province of Holland. He was put to death too on a vague string of charges which were not proved, and none of which, if proved, could have been a capital offence. His enemies charged him, the strongest asserter of the liberties of the Provinces, the man whom Mr. Marker does not expulse to call the Foundate of the Roughlie. strongest asserter of the liberties of the Provinces, the man whom Mr. Motley does not scruple to call the Founder of the Republic, with being in the pay of Spain. But they did not dare to put this charge into a formal shape, even when Barneveld had to answer their accusation all by himself, without books, counsel, or witnesses. The utmost that any fair opponent of Barneveld could have said was, what may doubtless be said of any statesman, that there were those in the Commonwealth who may have thought another policy better than his. Every English Prime Minister, every American President, has had opponents who disapproved of some part of his political conduct; but it would have been hard measure to send any of them to the block without proof of any crime, and by the sentence of an illegal tribunal. The main avowed ground of dispute arose out of the theological controversy between the Remonstrants and the Contra-remonstrants, in other words, between the strants and the Contra-remonstrants, in other words, between the Arminians and the Calvinists; but it was mixed up with other questions, as, for instance, that of the great commercial companies. Barneveld favoured the East India Company and the extension of the trade of the Provinces in the regions where they founded so magnificent a colonial dominion; but he discouraged the West India Company, which was apt to be perverted into schemes of buccaneering against the Spanish partial partian, he time of truce. Without being a fierce theological partian, he schemes of buccaneering against the Spanish settlements in time of truce. Without being a fierce theological partisan, he took the Arminian side against the intolerant Calvinists, and opposed the calling of a National Synod—the famous Synod of Dort, which was going on at the time of the process against Barneveld, and about which we might have expected Mr. Motley to tell us something more—on the ground that by the Articles of Union each province had the right to settle its own ecclesiastical affairs. Above all, he stood in the way of the illegal and violent courses of Maurice. And for all this he was sentenced to die by judges who did not venture to bring a single definite criminal charge against him. When Barneveld was sentenced to death, one yet more famous, Grotius, was sentenced in imprisonment for life, and escaped from his continement by the well-known stratagem of his wife, who placed the Arminian himself in the chest which professed to contain only Arminian books. It is a sad wind-up to the story that the sons of John of Oldenbarneveld, like the sons of Simon of Montfort, showed themselves unworthy of their father. Their unsuccessful conspiracy against the life of Maurice had, as it could have, no other effect than to bring discredit on themselves and their party, and even on the memory of their father, and to make the power of Maurice stronger than ever.

Bevides the Stadholdes and the Adversar. Mr. Matter has athered.

Besides the Stadholder and the Advocate, Mr. Motley has other figures in other lands to set before us. Chief among them are those two very opposite figures, the two royal allies of the Republic those two very opposite figures, the two royal allies of the Republic at the time when the History opens—James of England and Henry of France. Mr. Motley takes special delight in sneering at the British Solomon. Nor do we wonder at his so doing. James, with his head full of Spanish marriages for his sons, was to the United Provinces an ally worse than an enemy. Nor can anything be worse from any point of view than his interference with the theological disputes of an independent people, especially when it took the form of suggesting that Vorstius should be burned. It should be remembered that the last two burnings of heretics in England happened in his reign, a fact which Mr. Motley seems to have forgotten when he says, not in his best style, that "the day for such festivities was gone by." Yet he had himself recorded the fact in an earlier passage (i. 55), making James himself, somewhat strangely, "sentence Hartholomew Legate to be burned alive." But surely Mr. Motley fails to hit off the peculiarities of a very strange character when he says of James:—

He was a man of unquestionable erudition, of powers of mind above the average, while the absolute deformity of his moral constitution made him incapable of thinking, feeling, or acting rightly on any vital subject, by any accident or on any occasion. If there were one thing that he thoroughly hated in the world, it was the Reformed religion.

hated in the world, it was the Reformed religion.

This last saying of course depends on the sense given to the words "reformed religion;" for James, from his own position, could be as fierce against Papists as against Puritans, though certainly his position was not the same as that of the theologians of the Netherlands. But we must protest against such mere blurring of the picture as to say that James was "incapable of thinking, feeling, or acting rightly on any vital subject, by any accident or on any occasion." Surely the most characteristic thing about James the First is that he commonly had the intellectual sharpness to see what was the right thing—at least from his own position—to do, though he seldom had the moral strength to do it. And the character of James is hardly consistent with Mr. Motley's own remarks in the same volume (ii. 50), where, after resording a box-

vereation between James and the Notherlands Amhaesador Caron, he thus peniments:---

Thus apole James, like a wise and thoughtful sovereign interested in the welfare of his subjects and allies, with enlightened ideas for the time upon public economy. It is difficult, in the man conversing thus amicably and scrainly with the Dutch ambassador, to realize the shrill pedant shriking against Vorstius, the crappious coursels of Carre and Steomes, the fawning solicitor of Spanish marriages, the "pepperer" and hangman of Puritans, the butt and dupe of Gondemar and Spinols.

Of James's personal character Mr. Motley always implies the very worst, in which we may say that he is borne out by Mrs. Hutchinson. The strange thing in the whole business is the favour in which Buckingham stood at once with James and with Charles. Mr. Motley by the way should not call James "King of Britain," nor make him feel any kind of emotions either of love or hatred to an imaginary body called "the Parliament of Great Britain."

The other King with whom the United Provinces had much to be at the beginning of Mr. Motley's present story, is Hannett be Equal to

The other King with whom the United Provinces had much to do, at the beginning of Mr. Motley's presentatory, is Henry the Fourth of France. He is certainly a very different King from James and Mr. Motley delights to make the most of the difference. But certainly at this stage, just at the end of his life, we see Henry at his worst, in the character of the "old adulterer that do teth." Things do seem to have come to a pass when a chief element in the politics of Europe is the passion of a King in his declining years for a girl whom he has married to his own nephew in the deliberate hope of seducing her. The flight and wanderings of the Prince of Condé and his wife, with Henry's perpetual demands for their return, fill up a large part of Mr. Motley's first volume. Still, with all this, we see the difference between Henry the Great, even in this state of mind, and those who came after him, his widow and the Concini. Mr. Motley is fond of dwelling on this gap in French history, when Henry was gone and when Richelieu had not yet come. The Provinces certainly found the difference; at the Same time, the Minister of France, the "faithful and energetic Du Maurier," as Mr. Motley calls him, stands out honourably, as pleading to the last for the life of Barneveld.

We mean to come back to Mr. Motley's work in order, as we

We mean to come back to Mr. Motley's work in order, as we have already said, to look more specially at the constitutional points raised by the trial and execution of Barneveld. Meanwhile we can recommend the whole narrative of his trial and death and of the imprisonment and escape of Grotius as one which has been seldom surpassed in absorbing interest.

KHIVA AND TURKESTAN.*

And the verdict of the press in the celebrated suit of the three Khanates of Central Asia recast the Emperor of All three Khanates of Central Asia recast the Emperor of All three Khanates. The translator gives no clue to his author. We can only surmise that the latter may have been officially guided or inspired, but we are not left in any doubt as to the precise object of the book. It is twofold. The writer has collected various details about the climate, resources, population, and manners and customs of Turkomans and Khanas, and he has maited us to consider the Central Asian question from a Russian or Caucarsian point of view. The work is, in fact, a somewhat incongruous mixture of the discoveries of the traveller and the pleas of the pointician. We shall treat them separately, and take the latter first. The writer has no hesitation in speaking his mind plainly about Russian progress in those regions. And, concisely put, the arguments in appeal may be stated as follows:—There has been progress, but no encroachment. Ambition has no bearing on the subject. There is no wish for the extension of frontiers, or for the acquisition of a population in a low state of barbarism, unavapathetic, nomad, difficult to control, and impervious to sound advice. But the "force of events," we are reminded, is "ever superior to the power of man." The necessity of self-defence, commercial interests, the rapacities of the Kirghiz, the stupid fanaticism of "the half-avage Khan," and the bigotry of Kokand and Bokhara are principally, if not entirely, to blame. Nor are such distant potentistes as the Chinese and the Japanese wholly exempt from censure. They have been guilty of that "first activity which radical reforms draw after them." It is really high time for Russia to be up and watchful when she has on her borders millions of rabid onthusiasts, and, a little further off, other millions who have acquired "all the recent European inventions in civilization and the art of war." Then, again, Russia heredi has not been quite blameless.

* Khing and Turketon. Translated from the Russian by Captain E. Spalding, F.R.G.S. London: Chaptain & Hall. 1874.

oddest way. It is ungenerous for M. Vambery to decision, for the Indian press to carp and criticies, or for members of Parliament to ask troublesome questions; Ressis has got, as the great Caniferer all along saw she must get, from the Volga and the Curaft to the Sea of Aral; and she has crossed from that set to Klaiva, because the Khivam would commence hostilities. It follows, therefore, that at some future day "closer relations" will exist "between ourselves and that part of Central Asia lying between the English suscessions in Indian

therefore, that at some future day "closer relations" will exist therefore, that at some future day "closer relations" will exist the tween ourselves and that part of Central Asis lying between the English possessions in India and our present frontier line."

We are quite ready to receive the above arguments as dictated by perfect sincerity and good faith, and to grant that a Russian general may be a more useful member of society than a higher twent who impress increase the state of the receive that a state of the receive the same of the receive that a state of the receive the same of the receiver the same of the receiver the same of the receiver the same of general may be a more useful member of society than a higher or tyrant who impales innocent travellers, and calmly receives sacks full of the heads of his enemies. Macaulay wrote of our early times that it was "better that men should be governed by privat-craft than by brute violence; by such a prelate as Duncan than by such a warrior as Penda." We may fairly reverse this sentence in the case of Central Asia, and say that we prefer the ascendency of General Kaufman to that of a bigot like Naar Ullah. It is sight to add that the author research to mather means now right to add that the author resorts to neither meases nor reproach. But Russia must have an "excellent frontier." Her trade has to be developed. Her dependent Kirghix and her friendly Turkomans ought to be protected. Robbers and raidlers cannot be allowed to intercept caravans and despoil pious Hadjis. The Khan of Khiva should be taught manners, nor can England. be allowed a preponderance of influence in those regions. In short, whether the aim be to abolish slavery, or to introduce order and security, or to encourage trade, Russia's obvious destiny impels her forward, perhaps against her will. There is, we admit, something in the plea that it cannot lie in the mouth of a nation called from a security involves on the continuous of the Mustine called from a sea-girt kingdom on the confines of the Northern Ocean to the government of a splendid Empire in the tropica, to object to the just retribution which a great ruler is forced to inflict when his subjects have been drugged across dreary to inflict when his subjects have been dragged across dreary steppes at the tails of horses, or when his legates have been thwarted, deceived, and defied. But there is surely an obvious distinction between the ceaseless progress of Russia southwards and the consolidation of the British Empire in the limits of India. The harriers of our advance have been marked out by physical obstacles quite as much as by policy or self-restraint; the Himalayas are far stronger than despatches, treaties, or speeches in Parliament. It is eighteen years since any material addition was made to our Indian possessions. The Russian apologist talks about our "campaigns in Cashmere and Bhootan." Now the negrossions of the Deb and Dhurm Raisa in the latter kingdom the aggressions of the Deb and Dhurm Rajas in the latter kingdom were punished by the permanent loss of a mere strip of land at the foot of the hills termed the Doars, and by the retention of three small forts necessary to command the passes into the mountains. In fact, the Vicerov of the day, Lord Lawrence, had simply to withhold from the Bhootan Doars the payment which we had been making for some years, and, in Indian parlance, to convert a rent-priving into a rent-free tonure. As regards Cashmere, the only invasion we know of has been that of summer tourists fleening from the last of the plains or of spectamen against a "annex" where the least of the plains, or of sportsmen anxious to "annex" pheasure or woodcocks. But there is no serious physical obstach to Russic short of the Hindu Kush, and no one special point at which a new political and national system arises, and where progress would mean invasion, and sdvancement a total change of policy. Thing is a family likeness between all those Khore and Amiss. would mean invasion, and advancement a total change of policy. There is a family likeness between all these Khans and Amirs. In India, too, a Raja or a Nawab has only to govern with some show of decency and his lot is secure. No rival will be allowed to pick a quarrel with him. He is allowed to drill his miniature army, he is invited to imitate our legislative and executive machinery, and he is assumed of important forms. cutive machinery, and he is assured of immunity from foreign attack without additional taxation or tribute. Should be outrage public opinion by revolting cruelty, reckless expenditure, or gross profligacy, his dominions will be sequestered for a time, or be entrusted to some less unworthy member of the family. But what parallel can be found to this in the attitude of Russia to Khiva or Samarcand? We do not complain of the purport of this book. It contains no menaces. It hurls no defined at the India or the Foreign Office. It only puts forward a claim to a fair hearing, But we do deny the aptness of a parallel between one Power which for thirty years has not claimed a foot of land beyond the gates of India, and another which, on its own showing, might be compelled to interfere with Maimana or Kunduz, or might treat the paragraph of the Hari Rud wa in the paragraph with the Attachment of the Hari Rud wa in the paragraph with the Attachment of the Hari Rud wa in the paragraph with the Attachment of the Hari Rud wa in the paragraph with the Attachment of the Hari Rud was in the paragraph with the Attachment of the Hari Rud was in the paragraph with the Attachment of the Hari Rud was in the paragraph. waters of the Hari Rud as in the same category with the Attrok or the Oxus.

We turn to the details of Eastern life collected by the author. They have not the picturesque colouring and the keen penetration into Asiatic motives and mysteries which lond such a charm to the perilous adventures of M. Vambéry. But nothing comes amiss, even at second-hand, concerning countries so remote from the best of the civilized tourist as the gardens of Khiva and the steppes of Turkestan. We like to know how these people live; what they eat and drink; when they marry; and how they are buried. The Turkoman lives coarsely, but pientifully. His food is bread with garlic. Occasionally he indulges in a fatted sheep, which is cut up and stewed down into a thick broth. We must, however, profess our inability to understand a statement that even the skin of the sheep is eaten after being "put acide for some days, in order that it may acquire the taste of the pheasant," after which it is easily divested of wools Fossibly this may be the Russian way of saying that meat and sheepshine with flesh sticking to them are hung up until they become as high as over-kept game. Very strong tobacco is brought from Bokhara, for the Turkoman is a constant

smoker. The condition of the women does not appear so much one of degradation or seclusion as of continuous labour. While the men pasture the flocks, prepare the sheepskins, or safly forth en forays, the females spin, dye, grind corn, and make carpets of a paculiar pattern handed down in each family, through generations, as its own. The great vice of these nomads appears to be an inveterate propensity for appropriation. All the members of a family rob each other, but immunity on discovery does not extend to robberies effected by a stranger. The latter, if captured, is said to be at the disposal of the injured owner, and to be dishonoured in his own family: though we must incline to the belief that the to be at the disposal of the injured owner, and to be dishonoured in his own family; though we must incline to the belief that the disgrace attaches not to the act, but to the discovery. Considerable freedom is allowed to the women, and marriage is not hastened improperly as in other Oriental countries, but takes place at sixteen or seventeen. The negotiations before the ceremony, the higgling about payment of dowry or price, the presents, the mock raid when the bride is captured by the friends of the bridegroom amidst shouts and the discharge of firearms, the occasional race on horselack by the newly-married couple, are all described in terms not very dissimilar to those employed by M. Vambéry. It is just, however, to say that full credit is given to the accomplished Hungarian on these topics. At page 96 there is an elaborate description of the travelling musician under the title the accomplished Hungarian on these topies. At page 96 there is an elaborate description of the travelling musician under the title of barshi. This personage we take to be the bakshi or trombadour mentioned by Vambéry as enlivening the winter evenings with his lays, while the howling of the tempest on the steppe outside serves as an accompaniment. The Russian author tells us that this strolling minstrel wears a fashionable head-dress and exquisitely made boots, has the privilege of keeping his hosts waiting for dinner, takes a naponechalantly when he ought to sing for the amusement of his after tainers, and is everywhere as welcome as the bare-footed friar nonchalantly when he ought to sing for the anusement of his entertainers, and is everywhere as welcome as the bare-footed friar who formed the subject of Scott's ballad in *Iemhoe*. The Turkoman never dances. He sings, listens to musicians and storytellers, and occasionally plays at chess. He seems also to practise wrestling; for so at least do we interpret the "single combat" organized under the superintendence of one of the elders, in which the competitors generally "seize each other by the loins, and the presidents reward the victor with a piece of white or coloured stuff." He is, moreover, called Puhlwan or athless. stuff." He is, moreover, called Puhlwan or athlete. Horses, as it may be readily conceived, are treated with much care and affection by tribes dependent on these animals for plunder or for safety. They are fed on chopped straw and barley and, summer and winter, are tethered in the open air. With the exception of scrofula and leprosy, the Turkomans enjoy immunity from disease and lead healthy lives; but we fear that it will be very hard to impress on such natives the merest varnish of civilization, or to compel them to observe external decencies and proprieties. To the stories of cruelties inflicted on captives and slaves we can add nothing by way of extenuation or comment. The barbarity is the stories of criedities innected on captives and slaves we can find nothing by way of extenuation or comment. The barbarity is unrelenting, deliberate, and well proved; and if a Russian general or ambassador could sweep these pirates from the desert tracks, or deet caravans, and send back crowds of luckless Persians to their homes in the neighbourhood of Meshed, we believe that even M. Vambéry might admit that the Northern ascendency had its good points. Nothing need be said against the establishment of three or four forts on the eastern shores of the Caspian, a fact which is not formed by the vertice as an assument for the sequentity. which is put forward by the writer as an argument for the security which is put forward by the writer as an argument for the sociality of the navigation, coupled with the odd announcement that at the southernmost post of Ashurada "there is even a church." An Englishman similarly situated, we may observe, would probably have added that the new station, besides a fort and a building "used for divine service, but not consecrated." "boasted." of a racecourse, a cricket-ground, a subscription swimming-bath, and an ice-club.

We should be glad of more full and definite information as to an old course of the Oxus, which is said by the Khivans to have once flowed into the Caspian Sea. Vambery talks about some old channels of this river, but the book before us states that the direction of the stream was altered by a former sovereign of Kharizme, who excavated canals on the right bank for purposes of irrigation, and gradually draw the water away, until in time the main channel followed the lesser cuts, and passed into the Sea of Aral. The climate of Khiva is unde up of a short and severe winter, an early spring, and a long summer with oppressive heat and clouds of dust. The women appear to have a worse time of it than their sisters in the stoppes of the desent. They not only sew, spin, and cook, but rake the gardens, handle the plough, and thresh the produce of the field. We rather demur to the statement that "no particular affection exists between parents and children," merely because sous have been known to beat their mothers, or because terms of abuse are freely bandied about between the children of both sexes and their parents. The occasional use of domestic Billinggate in the East is quite compatible with lively feelings of affection, and even with strong and lasting attachment. The agricultural industry of the Khivans is not only constant, but skilful and even progressive. They seem perfectly well acquainted with the merits of liquid manure, with a minute system of irrigation, and with the use of some hydraulic machinery. Wheat and rice, millet and barley, peas and paics, reward their toil. They also grow such higher kinds of produce as cotton, tobacco, madder, and hemp. Their gardens abound with aprinots, plants, passes and their canals; and the Khiwan selection and poster like the edges of their canals; and the Reisen and Tustish poster like the edges of their canals; and the Reisen and Tustish poster like the edges of their canals; and the Reisen and Tustish poster like the edges of their canals; and the Reisen and Tustish post

**

produces two breeds of sheep, the Kinghis and the Bokharian; three distinct breeds of horses, and camels with one hump. The horned cattle are weak and diminutive, but these defects, which are attributed to a deficiency of pasture, might probably be remedied if means were taken to improve the breed, and if, as we suspect, milch kine were not used in ploughing. Some very arid parts of India produce cattle which for size and symmetry would not appear to great disadvantage beside Ayrshire or Devonshire cows.

We have no space for further analysis or comment. The book is welcome, not only because it is knwful to learn from rivals and possible neighbours, but because it is in some sense a national exposition of points in dispute. We may not accept the force of all the arguments, and may think that some plain language on our part would do harm. We must again arge that the compact British Empire, with its mass of tributaries who owe allegiance to the Queen, who take the advice and hope for the countenance of the Viceroy, and who are secure against annexation, has no real analogy to a vast despotism fortifying posts on great inland seas, and sending military and political expeditions half across Asia against nomads and bigots. But the tone of the work, if not calculated to hull political vigilance, is not of a nature to offend insular prejudice or self-love, and, as the translator reminds us that there are two sides to a question in a case of national rivalry and disagreement, Russia's view of her own position and prospects ought to be received without violent outery and discussed with moderation.

CHERUBINI.

THE revolution, or rather the transformation, which Cherubini and the great masters of the French school effected in the domain of nuisic can only be understood by the light of the stormy period of political change to which it presents a singular counterpart. In 1789, as in politics, so in music, a new spirit was rising. In both there was a worn-out system to be upset. The stave and voluptuous music of the Italiau school could no longer satisfy a society sluben to the foundation of cits faith and organization. The whole of the music of the eighteenth century must naturally have appeared cold and languid to men whose minds were profoundly moved with troubles and wars. Their art aspirations found a vent in the aubstitution of music of a more stirring and dramatic kind for the flowing melodies and classical conventionalities which had suited an ago of luxurious repose. Cherubini struck the keynote which suited this new mood. What is needed for the pictures of dramatic music is larger frames, including more figures, more possionate and moving song, more sharply-marked rhythms, greater fulness in the vocal musses, and more sonorous brilliancy in the instrumentation. All these qualities are to be found in Lodouska and Les Deux Journées, and Cherubini may be regarded not only as the founder of modern French opera, but also as the musician who, after Mozart, has exerted the greatest influence on the subsequent tendency of the art. The German sympathies of Cherubini, the German thoroughness of his work, might be regarded as internal evidence that in the new style which he introduced into France he followed not so much his own inspiration as the teachings of his illustrious predecessor. The author of this book does well to point out by a reference to dates that this was, as a matter of history, not the case. Lodoiska, Cherubini's first great opera, was produced in the summer of 1791, and it was not until two years later that Franco was produced in Paris; and not until two years ther that Franco was produced in Paris; and

to the imporious demands of a new era.

The most remarkable feature in the artistic career of Cherubini is its singularly protracted activity. Measured by English chronology, his life roughly spans the interval which dividus the reign of George II, from that of Victoria; and during fifty years of this period he was prominently before the public as a composer. Received with favour by Marie Antoinette at the concerts at Varnailles, he lived to receive the cross of a Commander of the Legion of Honour from the hands of the Citizen King. The author of a successful opers in the twentieth year of his age, he lived to compose in his seventy-seventh year that grand Requiem in D minor of which Mendelsohn writes in 1848 in terms of the warnest administion. To this length of days be over his fame, for his ganine was one which developed alouely. Had be

[&]quot; The Life of Charalini. By Edward Bellatin. Landett, Burns, Oates, & Co. 1974.

died before quitting Italy for Paria, he would have left but an obscure name in the catalogue of numicians. He might be remembered as the componer of a classical opera which achieved a transient success, and as the interpolator of numerous airs in the mow forgotten operas of Passielle and Chaureau. Had he, like Mourt, died at thirty-five, he would have bequeathed to posterity a very incomplete monument of his powers. His two greatest operas were not composed until he had reached the period of middle age, and that the maturity which they exhibit was prolonged almost to the close of his life is attested by the series of contributions to ecclesiastical music which culminated in the Requiem to which we have already referred. Lodoska, the first of his French operas, was, it is true, composed while he was still comparatively young. Brought out in 1791 about a month after the King's flight to Varennes, it was performed two hundred times in one year, during the stormiest period of the French Revolution. This extraordinary run at such a time is a proof that the new music not merely hit the popular taste of the day, but could thrill the sympathies of audiences at white heat with political excitement. The fact may well awaken curiosity about the work; and one is tempted to ask why, with so remarkable a history, it remains unheard and unknown in a capital like London, with pretensions to be musical, and in an age of professed zent for musical revivals. The appreciation which Les Deux Journées met with two years ago at her Majesty's Opera, and which may be measured by its single performance, is not encouraging. Lodoska, we fear, will be left to repose, for a long while to come, on the shelves of the musical library, while the car of the onlightened amateur is vexed threadbare Travistos.

The two most interesting episodes in the life of Cherubini are his connexion with the infant Conservatoire and his passages of arms with Napoleon. The history of the famous Paris training school for music is curious. If one were asked to assign at a venture a date for its origin, one would probably refer it to one of venture a date for its origin, one would probably refer it to one of two periods; either that carlier period when the fine arts enjoyed the magnificent patronage of the Great Louis, or that later one when the victorious Napoleon nimed at making his capital, in culture as well as in politics, the centre of the European system. of the National Guard of Paris, collected together forty-five nunsicians as a nucleus for the performance of the nunsic of the National Guard of Paris, collected together forty-five nunsicians as a nucleus for the performance of the nunsic of the Guard. In the following year the numicipality took this body under their charge, and raised the number of musicians to seventy. By his zoal Sarretto came more immediately under notice of the Government, and in November 1793 a decree of the Convention created a National Institute of Music, consisting of 115 artists and 600 students, "for the purpose of celebrating musically the national festivals." By a law of the 16th Thermidor nusically the national festivals." By a law of the 16th Thermider in the Third Year of the Republic, the music of the National Guard was suppressed, and a Conservatoire of Music was established, with Sarrette at the head as director, assisted by five inspectors, of whom Cherubini was one, charged with the special duty of teaching counterpoint. Twenty-seven years later, in the state of Charles Y. he was sare intend distinctor with a collection of S X., he was appointed director with a salary of reign of Charle cight thousand francs. It was under his rule that the Conservatoire rose to its present high position. He engaged the services of the best men in the various branches of the musical art. His spirit communicated itself to masters and pupils. Strictures, punctuality, and a minute attention to details were the chief features of his management. If his pupils were unpunctual, he lost his temper at once. It is said that when the Marquis de lauriston, Minister of the Royal Household, came to distribute prizes and was rather than the formulation of the control of th late, Cherubini greeted him with " Vons arrivez bion tard, monseigneur." He was never seen to laugh or smile at his intorcourse with his pupils. Asked whether he was satisfied, on one occasion with his pupils. Asked whether he was satisfied, on the occasion when unusual pains had been taken with the rehearsal of a piece, he replied, characteristically, "Pès que je ne dis rien, c'est que je suis content." An amusing story is told by Berlioz, in his Manoirs, of his first interview with Cherubini. In order to make the intercourse between the students of both sexes impossible outside the surveillance of the professors, the Director had given orders that the men chould enter at one door and the women at another. In betaking himself to the library one morning, Rerlioz, ignorant of the moral decree which had been just promulgated, entered by the feminine door, and was arriving at the library, when a servant stopped him and bade him return and enter over again by the masculine gate. On his refusal, the servant reported the breach of discipline to the Director, who shortly appeared in a towering passion upon the scene. "Ah, ah, ah," he exclaimed, with his Italian accent, "c'est vous qui entrez par la porte que que que ze ne veux pas passer." The new student explained that he had not known of the regulation, and would conform to it in future. Cherubini, however, was not to be appeased, and proceeded, to the consternation of the assistants, to pursue the refrectory pupil round the table, appetting stools and deaks, until at last Hericz heat a retrest, crying out with a burst of laughter, "You shall have neither me nor my name, and I will soon return here to study Glück's scores." Yet, in spite of his hambness, Cherubini was not appender. He was not above encouraging the afforts of youth. A child of great premise was brought by his father as an applicant for diminsion to the Conservatoire. "I do not put infants out to store," was the raply of the stern Director. As a final chance, the child was placed before a pieno and told to play, and not be stop in one any one should enter the room. Cherubini, on finishuline gate. On his refusal, the servant reported the breach of

ing the round of the chasses, actured the room, and struck by the talent of the young performen, set down and listoned attentively. Unable at last to control his admiration, he exclaimed, "Bravo, my little friend! but why are you here, and what can I do for you?" "A thing that is very easy," was the reply; "put me into the Conservatoire." "It's a thing done," said Cheruhini; "you are one of us." Though merciless in a criticism, Cheruhini's solmow-ledged popularity among his pupils is not surprising when his unaffected modesty about himself is remambered. At a concert at which he was present, when a piece of Heatheven was followed by an overture of his own, he remarked quits naturally, "I am now going to appear a very small boy."

The somewhat acrimonious relations between Cherubini and Napoleon exhibit both characters in an interesting light. If the sturdiness with which he maintained his views on art is honourable to the composer, the Emperor is entitled to the credit of perfect sincerity in his antipathy to them. The strong preference of the latter for music of the laties school was quite genuine, and was due probably to early prepossessions rather than to any personal dislike of Chernbini. According to one rather funciful theory, Napoleon disliked the new music because, having been developed in the first days of the Revolution, it bere the impress of a certain Republican austerity which he desired to qualicate. a certain Republican austerity which he desired to evaluate. Anxious to extinguish in the French people all excitement opposed to his own particular aims, he favoured the soft and snave molodies of Paisiello and Zingarelli as useful political sodatives. The musical prejudice of the great Emperor admits of a much more simple explanation. He regarded the full instrumentation which Cherubini brought into vogue as noisy, and it disturbed instead of soothing him. The composer himself hit the mark when, in answer to the then First Consul's strictures, he replied, "You like music which does not stop you from thinking of State afficire." When the Consular Chapel was re-established after the Concordat, Nacoleon refused to appoint Cherubini, designating him ironically Napoleon refused to appoint Cherubini, designating him ironically as Monsieur Cherubin, to indicate that he was not worthy of being deemed an Italian composer. Mortified by the slights which he received at Paris, Cherubini accepted an invitation to visit Visnus in 1805. In this new scene he was destined to have an unexpected encounter with his Imperial critic. The fortune of war brought Napoleon as a conqueror to the Austrian capital. Hearing of Cherubini's presence in the city, the Emperor sent for him, and asked him to direct his concerts during his residence at Schonbrunn. At each concert lively discussions on music arose. Napoleon was ancry that the orchestra was so noisy; and to remedy this, Cherubini ordered every passage to be executed pianosimo. This unwonted complaisance was rewarded with a remedy this, Cherubini ordered every passage to be executed planessino. This unwented complaisance was rewarded with a glean of Court favour, the Emperor going so far as to express a desire that the composer would return to Paris. In answer to an inquiry about his new opera Faniska, Cherubini said bluntly, "This work will not please you." "And why not?" exclaimed Napoleon. "Hecause, ' said Charubini, quoting the expression which Napoleon had used in their interview at the Tuilerles five years before, "it has too much accompaniment." At the moment of his departure, aftersigning the Treaty of Presburg, Napoleon called for Cherubini, and pronouncing his name in the Italian, and not in the French fashion, invited bim to accompany him to Paos. But Cherubini French fashion, invited him to accompany him to Paris But Cherikini would not break his word with the Viennese, who expected at least one work from him, and he excused himself us well so he could. Had he returned with the Emperor be would probably have reriad in retained with the Emperor ne would promary have received the post of Court Musician, which was given to Paurinstead. No subsequent interview between Napoleon and our composer is recorded in this biography. Little communication passed between them during the remainder of the Emperor's reign. When the one-act opera of Pygmalion was produced anonymously by way of overcoming the Emperor's revision, Empoleon was affected to tears by a scena in it, and experty demanded the name of the composer. When told, he exhibited more surprise than of the composer. When told, he exhibited more surprise than satisfaction, but he sent Cherubini a sum of money, with n request that he would write the music for an ode on his approaching marriage with Mario Louise. Finally, when, at a civic fiete, a cautata of Cherubini's was performed in his pressure during the Hundred Days, he taidily consented to confer a mark of his favour on the composer by appointing him a Chevaller of the Legion of Honour. The distinction was bestewed however upon him not as a composer, but as leader of the band of the National Guard, and thus Napoleon still found means of showing his injustice towards Cherubini even in doing him on act of justice. With the restriction of the Bourboos the tide turned, and honours flowed in upon him from all sides in quick succession.

The catalogue of Cherubini's works appended to this biography is a noble monument, not only of his creative genius, but of his indefatigable industry. The source of this prolonged energy lay in a natural ardour for scientific research, which asserted itself even in his annuscements. Cherubini was artist, as the French say, to the tips of his fingers. His favourite recreations were drawing and botany, and when music was laid aside he would occupy himself eight hours a day in these studies. His exquisite organization as an artist, says Miel, would probably have made him a great painter, as it made him a great musicism. To the same temporament must be referred that nervous irritability which vented itself enduct. Our biographer quotes some instances of the bitterness of his tengae. Halfey once took him to hear one of his operas. At the end of the first set he asked his master how he liked it. Cherubini made no reply. After the second act Halfey repeated his question. Again no answer. "Your me me reponder point," exclaimed

Haldvy. "Que vous répondre?" was the reply; "voici deux heures que vous ne me dites rien." On another occasion a work, said to be Méhul's, was shown to him. "It is too bed to be Méhul's," said Cherubini at last. "It is mine," said his companion. "It is too good to be yours," was the cruel rejoinder. When some friends told him that they had not yet seen La Dame Blumche, Cherubini replied, "Perhaps you are waiting for her to change colour." In spite, however, of this propensity to sarcasm, and even rudeness, his nature was not unkindly. To his fellow-musicians he was nearly always well disposed. He treated them as brothers, and was singularly free from jealousy. His relations with Haydn, Beethoven, Spohr, Méhul, Lesueur, Boieldieu, Halévy, and others, testify to this point, and show that under a rough exterior Cherubini had a warm heart, and a deep sympathy with his fellow-labourers in the domain of music.

We cannot part from this work without commending the pains which the author has taken to collect materials for it, and the modesty with which it is written. In some particulars compres-

We cannot part from this work without commending the pains which the author has taken to collect materials for it, and the modesty with which it is written. In some particulars compression would be an advantage. There is rather a redundance of nusical criticism at second-hand; and detailed descriptions of operas and masses, with musical illustrations interpolated, instead of arresting attention, invite the reader to skip. But upon the whole this book shows much merit, and will be regarded even by the non-musical reader as a welcome contribution to biography.

BY SEA AND BY LAND.

THERE are certain books which have no claims to literary merit, and which do not atone for their defects of form by the the information convoyed, and which yet are more amusing than books which in most respects are altogether their superiors. Mr. Merewether's little book is an illustration of this statement; although we must say, in fairness to our readers, that to some tastes it may possibly appear insipid. Its merit lies simply in this, that it contains a quaint portrait of the author drawn by his own hand. We cannot call it an unconscious portruit; for Mr. Merewether is a professed hyperal and adopte the tops of a Merewether is a professed humourist, and adopts the tone of a Merewether is a professed humourist, and adopts the tone of a privileged jester. As might be expected, some of his fun is poor enough in print; though we have no doubt that it would be very amusing at the benchers' table. Of the rest of the book there is little to be said. It is merely another specimen of that literature of travels round the world which is already becoming tolerably voluninous. The trip from England through India to Australia and back by California is rapidly becoming as normar as the trip to Switzerland. In a few years we may sup-India to Australia and back by California is rapidly becoming as popular as the trip to Switzerland. In a few years we may suppose that the education of no young man will be considered complete until he has visited the Antipodes. The countries, however, which lie on the route, and which can be comfortably visited by a fat elderly gentleman with a bad leg—we should beg pardon for the personality, but we are simply following Mr. Merewether's own revelations of himself—anxious to have a good dinner every day, and bound to return within a fixed time, are already too familiar for much description. Poor Mr. Merewether did not succeed in even visiting the Yosemite Valley, and was confined to visiting the most obvious of the sightseer's shrines. Noither do his remarks on the political and social conditions of different countries strike us as very original or profound. He is kind enough to sum up for us as very original or profound. He is kind enough to sum up for us in his preface his opinions of Egypt, India, Ceylon, the Australian colonies, and the United States; and he is so much pleased with his own wisdom that the same remarks are given at rather greater length in the concluding chapter of the book. And yet with all remarks for Mr. Marwether we doubt whether his remarks are length in the concluding chapter of the book. And yet, with all respect for Mr. Merewether, we doubt whether his remarks are much more notable for their wisdom than for their novelty. It is really high time to suggest that a gentleman who has gone at full speed through San Francisco, the Salt Lake City, Chicago, and New York, is not thereby entitled to pronounce a general opinion upon the manners and customs of the Americans. Mr. Merewether informs us in a note that he entirely agrees with Mr. Merewether informs us in a note that he entirely agrees with Mr. Merswether informs us in a note that he entirely agrees with Mr. Barnum in the controversy as to American feelings about England which the great showman carried on with Mr. "Golding Smith." We may observe parenthetically that we do not feel sure whether this bit of spelling is a bond ride mistake, or the facetious plan adopted by Mr. Merewether as a sound English Tory for signifying his supreme indifference to the name, as well as to the opinions, of a Radical Professor. At any rate, the fact that he received a good many civilities from educated Americans is not in any way surprising, as indeed everybody knows that Americans can be as hospitable and agreeable as any people in the world. The surprise of Mr. Merewether at finding that he was not insulted by every one whom he met, and that it is not necessary for a traveller to be provided with a bowie-knife and a revolver in New York society, is merely interesting as testifying to the amazing vitality of the good old prejudices in certain quarters. Mr. Merewether, indeed, relates an anecdote which surprises us more than his accounts of civilities which he received. A stranger made some very insulting remarks to him about England in one of the surprise of the surp more than his accounts of civilities which he received. A stranger made some very insulting remarks to him about England in one of the railway cars, without the slightest provocation. Mr. Merewether obviously expected that such insults would be the rule instead of the exception, and was much surprised to find that the other passengers testified their diagnost at this piece of trutal behaviour. We should venture to guess that the insulter was a native of an island a good deal

nearer home, who was glad to find himself in a country where the Fenian is allowed to vent his feelings freely. The native American may dislike England and may even dislike Englishmen, but, as a rule, an Englishman in an American railway is not more likely to be wantonly insulted than an American in an English railway. However, we can only congratulate Mr. Merewether on having rubbed off some antiquated prejudices, and may pardon him if his surprise at discovering an American to be a tolerably civilized human being leads him even to some excess of commendation.

civilized human being leads him even to some excess of commondation.

The really amusing part of the book, however, is the description of Mr. Merewether himself. If anybody should wish to have a faithful portrait of the successful British barrister of the type popular amongst his fellows at circuit messes, he cannot do better than dip into a few of these pages. Mr. Merewether begins, with amiable frankness, by letting us into a few details of his pursonal history. At the close of 1871 he had been thirty years at the Parliamentary Bar, and had "earned a sufficient remuneration in that scantily paid branch of the profession." He was a widower, and the father of thirteen children. Amongst them were two lads, who had been sufficiently tunded at Winchester—Mr. Merewether pauses here to add his mite of admiration for the tunding system—and who had apparently acquired by the process a greater love of panses here to add his mite of admiration for the tunding system—and who had apparently acquired by the process a greater love of agricultural pursuits than of classical literature. Accordingly, Mr. Merewether sent them out to New Zealand to become sheep-farmers, and to take their share in founding the England of the Antipodes. Moreover, he had a married daughter in India, and brothers in India and Australia, and, this being so, he resolved to retire from practice and to pay a visit to the scattered members of his family circle. And here we may abserve that Mr. Moreoverther's family circle. And here we may observe that Mr. Merewether's career as a barrister, though it doubtless taught him the art of persuasion, does not appear to have conferred any high polish upon his style. We have certainly met with some most singular gram-matical formations in his narrative, such as it has not often been our lot to encounter. We give one specimen for the benefit of students of composition. "It has a tendency," he says—"it" being a jealousy between the different districts of New Zealand—"to create jealousy between the different districts of New Zealand—"to create an ill-feeling between the North and the South; and in the shuffling of the cards of the future, I can see this, as being a dependent of the republic, or whatever it turn into, of Melbourne, join it, and a separation from the North." Reporters of Mr. Merewether's speeches must have had some trouble in unravelling his queer sentences. One of his favourite forms of sentence is modelled on the celebrated saying of the judge about the convict to whom Providence had given strong less of sentence is modelled on the celebrated saying of the judge about the convict to whom Providence had given strong legs and arms, "instead of which" he went about stealing pigs. Thus, in the next paragraph to the above, we are told that "people read of Maori murders, and they confuse the whole of New Zealand with it." "I had expected to see more mountains," he says, in describing India, "and it had been tolerably so and treeful up to Jubbulpore." Tolerably what? But we should ask such questions in vain; and we must admit that Mr. Merewether succeeds in expressing his feelings on all essential matters pretty plainly. Indeed there is a characteristic flavour about this peculiar mode of utterance. Mr. Merewether gives us the impression of having been so jolted in railways, rolled about at sea, and discomposed by the bad cookery which is characteristic of the English-speaking races all over the world, that his ideas were a little confused at the time, and that his sentences naturally got into tangles. Indeed the time, and that his sentences naturally got into tangles. Indeed his complaints would be pathetic if he did not prefer to take the humorous view of them. He started from London a fine specimen of the solid British barrister, and though his troubles began at crossing the Channel, he recovered sufficiently to play a rubber for eight hours during his journey through Italy. Sufferings by sea gradually tamed his spirit. When we read his incessant lamentations over the miseries of them that go down to the sea in ships, we quite admire the heroism which led him round the world, and even quite admire the heroism which led him round the world, and even induced him to encounter eight weeks in a sailing-ship between New Zealand and California. We are glad to say that, in spite of these troubles, and of the boils which were brought on by them, he always seems to have preserved his appetite and his Toryism. His greatest pleasure in Bombay was in eating a fish called "pomfret" and prawn curry. He dwells fondly on the occasional cases where constructions that we weary traveller; and he succeeded, though with many lamentations, in consuming even the food cooked by a dirty Chinaman on board the British King. It is a sad reflection that the first meal consumed by the loyal Englishman on returning to his native land was nothing better Englishman on returning to his native land was nothing better than a piece of cold pie. In spite of bad food and the bites of mos-quitoes, in regard to which last it may be as well to say that Mr. quitoes, in regard to which last it may be as well to say that Mr. Merewether after much experience decides that acratching is better than itching, he was apparently always capable of cracking his jokes and airing his patriotic views. He talks of horses everywhere like a good country gentleman, and is prejudiced against mosques because they are called musjids, a name which reminds him of Sir Joseph Hawley's horse, "which gave me the only painful recollection out of thirty-eight Derby days." Visiting a high tower in India from which some people have committed suicide, it occurs to him that it would be as well if Mr. Arch and other popular lecturers would throw themselves off it. He evidently detests all philanthropists, and proposes that a war should be carried on in New Zealand for the reduction of the numbers of the matives. Any peg will serve on which he may the numbers of the natives. Any peg will serve on which he is fasten a gibe against the gentlemen whom he describes as "bol old Mundella, and silly Odger, and vacuous Potter, and win Arch"; and yet, to do him justice, he says that the assistance

these "idle and permicious" persons does not diminish his satisfac-tion at being in the same world with them; and we have little doubt that if he could meet the most redhot of demagogues little doubt that if he could meet the most redhot of demagogues who was ready to smoke a cigar or commence oysters in his company, he would very soon make up his mind that the devil is not so black as he is painted. Indeed, on his homeward voyage, Mr. Merewether fraternized with the great Barnum, found out that the showman was a thoroughly good fellow, and, after making him repeat one of his stories three times over, has written it down for the edification of the world. We cannot say that it strikes us as particularly amusing, and we will therefore refrain from quoting it. On the whole, we must confess that, if anybody liked to describe Mr. Merewether's book as not very wise, and to complain that the want of literary decorum is unpleasantly like buffconery, we could not dispute his opinion very successfully. But to argue such a point would be to take the whole affair too seriously; and we may be content to dismiss By Sea and by Land with the observation that it is a quaint illustration of the old saw which tells how a man may change his climate without losing any of his iddiosyncrasics.

CLAUDE MEADOWLEIGH.

MAPTAIN MONTAGUE, in his novel of Claude Meadowleigh, has made the same sort of mistake as the potter in Horace. He began by making a hero, but, as the story ran on, a villain came forth. Not that Captain Montague himself seems to be at all aware of what he has done. He apparently has very little suspicion that his hero, Captain Silver, or Jack Silver, as he is generally called, is a pitiful follow who deserves a horseipping much rather than the heroine's hand. If he has ever whipping much rather than the heroine's hand. If he has ever read Vanity Fair, all his sympathies must lie, we suppose, with George Osborne, who would have been a man after, if not his own, at all events his hero's, heart. We trust that there are but few officers in the army who, like Captain Silver, while they are engaged to be married to a poor girl, would at the same time seek the hand of a rich heiress. We trust that there are still fewer who would regard such conduct as leniently as the author of Canada Maadouleigh seems to do.

Caude Meadovietsh seems to do.

Captain Silver, when the story opens, is found in a state of considerable embarrasement. In the first place, he is in love with Alice Meadowleigh, the daughter of an old water-colour painter, and in the next place he is in debt. He was a poor man to begin with; but, strictly honourable though he was, he had nevertheless, through his utter ignorance of business, found himself a great deal in arrears in the accounts of the regimental canteon, which it had below the best of the regimental canteon, which it had fallen to his lot to keep. Each officer, when he gains the rank of captain, has " to take his turn at the helm every three months, and thus Jack Silver had come at last to stand upon the figurative grating, with his clumsy, unhandy hands on the spokes of the beer-engine, to guide the good ship Canteen across the troubled waters of retail trade." Before we have done with Captain Montague, we of retail trade. Delore we have done with Captain Montague, we shall have seen that, like most young authors, he delights in the figurative mode of writing, and, like them too, delights in what is beyond his skill to manage. A claim is made upon him by the browers to the regiment for more than two hundred pounds, and though he is quite sure that he has settled the account, he is not able an analysis the present. One of their collectors had better disto produce the receipt. One of their collectors had lately disappeared, and the Captain was not able to prove that he had paid over to him the money. Here alone, without the love story, we have a very good foundation for at least a volume and a half. Many an author out of a less embarrasment than that has spun out a very good tale. But Captain Montague is as rich in incidents as he is in figures of speech. Not far from the head-quarters of the regiment lived Mr. Meadowleigh the artist, who "now and then startled the Art World by some wonderful spark of genius, hastily designed, and hardly thought worthy of a better fate than the waste-basket by himself." An artist who hastily designs a spark, and then would throw it into the waste-basket among the papers, must be looked upon as a strange being indeed. If only the wonderful sparks that our novelists design could, with the papers on which they write, be thrown together, the effect might be uncommonly pleasing. A low-minded attorney, a friend of the artist's, is mean enough to suggest that, as Captain Silver has rather more than 2001, less than nothing in the world, his marriage with Alice ought to be put off for a year. Mr. Meadow-leigh, who could hardly bear the thought of parting with his daughter, jumps at the suggestion, and rejoices to think that "he has gained back his pet lamb to the fold for a season—the dreaded parting was put off—she was still to be under the shadow of his wings." Even in pastoral poetry we never came across a shepherd who had wings, or a pet lamb who went under the shadow of wings. So we are not surprised to learn that, "however pleasant the respite was to the shepherd, the pet lamb was hardly as thankful as she might have been." The Captain also, who must, we suppose, be looked upon as a wolf, or an eagle, was still less thankful, though his widowed mother, who had higher aims for her son, was only too well pleased. She at once determined to take him into society, in the hope that he might make some far better match. But he was not so easily catch, for "he had been trotted out before for the inspection of the contract of the fruits which such exercise produced." The here, as our spark, and then would throw it into the waste-basket among the

readers will notice, has here become a horse, the heroine still remaining a pet lamb, and a horse who has noticed that the accretion of trotting produces only withered frains. What he becomes at the end of the story we hardly know. It would seem to be something of iron, however, for he "takes the fair magnet, which attracted him, to his arms for ever."

But we are anticipating events, and must go back to the time of the pet lamb and the horse. The Captain begins to find that he is very poor, and to feel that "in the army, do what he would, whatever his talents, his inclinations, his ambition, there was always this wretched horizon of 'eleven shillings and sevenpence' per day—a poor dribbling Rubicon that he could not get across." Captain Montague may cell clayer shillings and acrossments per day an Montague may call eleven shillings and sevenpence per day an horizon or a Rubicon as he pleases, but even that gallant soldier Ancient Pistol, who "uttered as brave words at the bridge as you shall see in a summer's day," would scarcely have ventured in one and the same breath to make a soldier's pay the horizon that he could never reach, and the brook that he could never reach, and the brook that he could never what a But we will quote our author at greater length, to show wh rare jumble he can make, when he, with his hero, stands on what we may be allowed, with him, to call "a figurative grating":—

And then the sole companionship of men all embarked in the same boat, all their ideas trained up the same trellis, all imbued with the conviction that this boat was the true ark, and they the favoured few who might escape the universal doom of labour; mixing with such, soldiers, sous of soldiers, whose every thought centred in the regiment, and the pleasures which ever circled round so fine a pivot, it was natural enough that this truant should not stray long from the green pastures, or turn his prow for long from that golden strand where the dreamy syren-voices were ever floating, and their snow-white arms waving drowsy warning against profities wastes, the portion of the other toilers in the world's highroad.

What with the boat and the trellis, the true ark, and the pivot round which circled pleasures on which thoughts were centred, the truant from the green pastures, and the prow that he turns to a golden strand, the snow-white arms of voices, and the drowsy warnings that they wave, we feel hopelessly bewildered. Cast magnifique, no doubt—but it is not English. The hero gets introduced to a fox-hunting heiress, Janie Harkhollow, and though he receives from Alice several letters "overflowing with descriptive reminiscences of his own charms," which for some reason or other the author calls "pæans," at once begins a fresh course of love-making. This young lady had hair of ruddy gold, than which a heavy maroon-colouwed curtain was some shades darker, and from it there came "a glorious effect of light and shade, just as Reuben (sic) would have imagined or Titian have painted it." This young lady had already a lover—Sir Charles Bulstrover—but him she had steadily refused. Baronet though he was, he was no better off than the Captain, for "there were certain neverfailing nuisances that cropped up—daily gnat-bites which no amount of money, or the ministration of the most educated of valets, could save him from." He presently falls in love with Alice, or fancies he does, which is only natural, as Jack Silver fell in love with round which circled pleasures on which thoughts were centred, money, or the ministration of the most educated of valets, could save him from." He presently falls in love with Alice, or fancies he does, which is only natural, as Jack Silver fell in love with Janie, or fancied he had fallen. But yet Jack "looked upon Alice most undoubtedly and undeniably as his own private property, off whose grass all trespassors were to be warned." As the author had previously made his hero a horse, he may perhaps be excused for now turning his heroine into grass. Jack, taking advantage of some slanderous reports that had been spread, breaks off his engagement with Alice. She of course is heart-broken, for though she talks and writes alang, she is evidently meant by Cautain engagement with Airce. She of course is heart-broken, for though she talks and writes slang, she is evidently meant by Captain Montague to be a perfect heroine. However, in a few days she enters into a most lively flirtation with Sir Charles, whom she had met by chance on a Devonshire moor, when, heart-broken, she had gone with her father on a painting excursion. As he took leave of her the first day they met-

"Good-bys," he said, holding out his hand; "I shall come very soon."
"To-morrow?" she asked, her eyes sparkling with mischief,
"Yes, to-morrow, now I have your leave."
Then with her answer in his ears he get into the saidis and cantered off,
waving his hand to them, and looking back as long as they remained in

Jack, feeling that he is almost engaged to the fox-hunting hoiress, and sure of her fortune of 40,000l., begins once more to breathe freely in his regiment. The officers now notice the change in his manners, for "small straws make a great show in such sleepy little rivers as run through ordinary regimental life." The particular straw that made a great show at this present time was Jack's loss of the 2001. Sleepy though the river was on which this loss floated, yet five lines further down we are told "there were eddies floated, yet five lines further down we are told "there were eddles here, and rapids there, and rugged banks all around, and yet this straw escaped them, and still swam on." Before the end of the paragraph, while his loss still remains, we suppose, a straw yet, the lover has become "a fish steering along in open water, and ordering 'hot breakfasts,' instead of having his nose well inside the very furthest meshes of the net, and thinking himself lucky not to be on prison diet of bread and water." It is the first time, we should think, that even in the figurative style of writing a fish has been threatened to be punished with water. The officers of the regiment—we hope that Captain Montague's officers are as untrue to nature as his allegories—hearing of the great fortune that he is to marry, begin one and all, from the Colonel downwards, to treat him with a consideration which they had never shown before. But Jack does not take the advice of his friend and rival Sir Charles, who tells sim that, though "Janie goes steadily enough one way, you must keep a hand on the curb." In his confidence he sawers, "I think I know her pretty well by this time, thanks all the same, Bulstrover—it won't be my fault if she gets over the

^{*} Cleuds Mesdowiejs : Artist. By Captain W. E. Montagus. 3 vois.

traces," She does, however, get over the traces, though it does not much matter after all, for in the sud Jack marries Alice, and Charlie marries Janie, while the brewers' collector turns up, and

the receipt for the money is found.

Poor old Claude Meadowleigh could not bear up when it time came for the pet lamb to go away from under the wings of the time came for the pet lamb to go away from under the wings of the shepherd. Alice, we are told in a fine passage towards the close of the third volume, was "a plant, green and flourishing," to which "he supplied the sun and water and earth and dew"; next "she was stranded on a tropical abore," while he was "like a seaman cast away." Between them "there had grown a cloud. He was no longer first; there was some other giant in the way, and Alice had slipped away from him." Then, too, "he who had been the sun had sunk, and up above the sea-line, where the horizon met the sky, had risen up some spectre of a sun, inguilble to him, but which she worshipped." In his various characters of winged shepherd, gardener, castaway seaman, giant, and sun. shopherd, gardener, castaway seaman, giant, and sun,

He had tramped on bravely, fealing that the earth was round, as people told him, and that, however far he went, he must come back to the same place again. Yet here, all of a sudden, was the dreadful end; here was the edge—beyond it space, black and eternal; behind him all the fair scenery of his life—and allee, bright, sweet, loving Alice, like a shining matter, far out of hand across the gulf he could not cross.

Happily, "the world had managed to veneer him, as she does the roughest of her sons; and he bore up bravely, and gave no sign." Elo bore up only for a time, and at last, breaking down, afforded that drawn-out death-bed scone without which no novel is looked apon as complete.

PAVY ON FOOD AND DIETETICS.*

E have had latterly somewhat of a glut of books on food and work of Dr. Pavy upon this well-worked theme as uncalled for or superfluous. The boundless ramifications of the subject give scope for no less wide a variety of treatment, whilst the paramount importance attaching to it is a sufficient safeguard against satisty or exhaustion of interest on the part of the public. Dr. Pavy's work is especially marked by the breadth of his method of dreatment, and the practical applicability of all that he writes. Not content, like many writers, with putting forth some specific theory of nutrition, or stating his conclusions in terms too techor abstract for other than specially trained and initiated minds, he has made it his endeavour to present as a whole what philosophy has of late years added to our knowledge of alimentary matters, at the same time that he brings home the results to the use of every ordinary household. The compilation of the work has, he tells us, grown out of his previous treatise on Digestion : its Disorders and their Treatment : and, on the principle of prevention being better than cure, we may well feel additionally grateful for rules which may aid us to ward off at the outset a class of maladies the most distressing and the most difficult to cure. It may be long, even if ever the time come at all, before the principles of alimentation are reduced to anything like a science.

About the same date in all probability medicine itself will take its rises among the science.

Aleganyhile, each of these important place among the sciences. Aleanwhile, each of these important branches of physiology remaining more or less in the empirical stage, our gratitude is due to those who bring the light of observation and experiment to bear upon either the alimentary or the curative processes which affect the human organism, and control the superior science of the scien found thereupon sound and comprehensive rules for the practical regimen of life.

Recent views of the nature of matter and force have had their effect upon the physiology of food. If no new or definite light has been thrown upon the origin or the ultimate laws of life, the doctrines of the conservation of forces and of their equivalents of power as reducible to a common standard have been shown to be applicable to the organic equally with the inorganic world. Instead of some vague entity or power called vitality, or the vital principle, being conceived to determine or overvule the action or the functions of the living body, we get the conception of forces distinguishable from each other, but bound together by reciprocal relations, having their source in the great reservoir or storehouse of all force, and acting upon the individual organism through the medium of the matter corresponding in kind. Of all terrestrial forces the sum and centre is the sun. The force exerted or evolved in muscular action or in any other functional play of the animal frame has its immediate source in the material which has been supplied to the body in the form of food. Now it is from the supplied to the body in the form of food. Now it is from the vegetable world that all food primarily comes; and vegetable products are built up through the agency of the eun's rays, either directly acting upon the living growth, or stored appeard rendered latent in accumulations of previously living matter, just as our coalitedle represent a vast magazine of force drawn ages ago from the sun's beams, or as a bent crossbow, to use Er. Havy's happy metaphor, stores up the muscular action put forth in bending it. Upon the principle of the indestructibility of force, those forces which have been applied to the chamical disintegration of the also contained their combination to form the new registable compound. Associations in an enternal contained in such sompound in a latent state. By oxidation such

A President on Pond and Distains, Physiologically, and Plansportics, Physiology II. W. Payy, M.D., F.R.H., Pollow of the Heyral College stranger on Physiology at, Algeb Ragging to Character on Physiology at, Algeb Ragging to Character Shipping to Marshall. 1874.

force is set free in an active state in one or another form of me tation. Were but complete exidation to occur, the amount of energy emitted would form the exact equivalent to the solar force. But in the processes of animal life, although fully oridized compounds, like carbonic acid and water, are formed and Rischaugell, yet others, like urea, are expelled in an imperfectly oxidized state and carry with them a certain amount of latent or untillised force. and carry with them a certain amount of latent or unutilised force. An analogy is further to be traced between the animal system and the steam-engine. Both are media for converting latent into actual force; the body, according to Helmholtz, being twofold the more perfect of the two, in that only one-tenth of the force satisface by the combustion of fuel in the best steam-engine is realised as mechanical work, the rest escaping in heat, whereas the human body is capable of turning into the equivalent of work one-fifth of the power of its food. Air and food are the two factors concerned in the transmutation of chemical into other forms of force within the vital machine, it being through the interplay of changes between air and food that the manifestations of animal life, consisting of heat-production, muscular contraction, nervous (including mental) energy, and nutritive or formative, secretory and assimilative action arise. The eyesta, or substances dismissed from the system, are metamorphosed products of the ingesta, their elements system, are metamorphosed products of the ingesta, their elements being the same, but their torms of combination different, and the latent or potential force of the ingesta equals the force its valoped the body and disengaged by the various operations of life, plus the force escaping with the egesta.

What is required in food is matter that is succeptible of undergoing change in the system under the influence of the presence of

oxygen. Having led up to this simple generalisation from the elementary principles of physiology, Dr. Pavy goes on to discuss the formation of organic compounts, their constituents, and the combinations essential to the origination of food. It being only in a state of combination that the elements are of any service to us as food, it is not in their pure state that we have, from an alimentary point of view, to deal with them; nor have we to consider their action apart from the agency of the living organism, by means of which the combination constitutes an organic product. It is, indeed, the power to assimilate these elements so as to build them into fresh living matter that forms one of the main and distinctive processes or tests of the inveterious something we call life.

Distinguishing the alimentary substances or articles of food as supplied to us by nature from the alimentary principles or organic supplied to us by nature from the alimentary principles or organic products which may be resolved by analysis into a variety of definite compounds, Dr. Pavy proceeds to the scientific division and classification of the alimentary principles. Popularly and superficially the ingesta are spoken of as food and drink, the one supplying us with solid, the other with liquid diet. These terms, however, merely refer to the particular state in which an article happens to be presented for consumption. More correctly the material factors of high supplies of each supplied and air combining in the presents of evidation and some food and air, combining in the process of oxidation and con-sequently in force-production. Food really comprising both solid and liquid matter is physiologically divisible into organic and inorganic constituents; the inorganic consisting of water and various saline principles, the organic being in turn subdivided into com-pounds in which nitrogen forms a constituent and compounds from pounds in which nitrogen forms a constituent and compounds from which it is absent. The non-nitrogenous alimentary principles are composed of the three elements, carbon, oxygen, and nitrogen, variously united together; the nitrogenised compounds at the same time containing these three elements, but in addition nitrogen, together with sulphur, phosphorus, and other elements as well. Liebig's classification of those two broad groups of principles as contributing to quitedistinct purposes—the nitrogenized compounds, or plastic elements of nutrition, being appropriated to the growth and maintenance of the bests, the necessitive read a limbs asystem. and maintenance of the body, the non-nitrogenized simply serving for the purpose of exidation or as a source of heat, through the process of respiration—is set aside in part by Dr. Pavy. So is also that of Dr. Prout, which arranges feed under four groups of principles, the squeous, the saccharine, the eleganous, and the albuminous. It does not include suline matter, which is equally indispensable to nutrition. Our author's own classification is one subject involves no expression of almost and described involves. which involves no expression of physiological dostination, but is based strictly upon the chemical nature of the alimentary primeibased strictly upon the chemical insture of the alimentary primelyses. Asseming that food falls naturally into organic and inserganic divisions, he subdivides the organic into nitrogenous and non-nitrogenous, and considers the latter class as naturally and conveniently subdivisible into fats or hydro-carbons and tarbo-hydrates; the first of these consisting of methon and hydrogen, in combination with only a small measure of oxygen; the latter of earbon with oxygen and hydrogen always in relation to each other in the exact proportion to foun water. To the latter group belong such principles as staroh, sugar, gum, and some others. Alcohol occupies an exceptional place intermediate between the fats and surbo-hydrates; whilst other principles, as the regulable acids and pactin, or vegetable july, fournever-more oxidized compounds than the carbo-hydrates, containing a.e. a larger amount of caygen than is required for the conversion of their hydrogen into water. These principles, thing haddly of importance causagh, from an alimentary point of wise, to call for consideration mader a distinct head, are reserved by distinct the carbo-hydrates, mach to the conditions and are a distinct the carbo-hydrates, mach the face of the conditions and are a distinct the carbo-hydrates, mach to the carbo hydrates and the carbo-hydrates and the carbo hydrates and the carbo hydrates and the carb Pavy for discussion in sometion with the carbo-hydrates, such the foor divisions previously spoken of passing in them didn't

Although we live in an atmosphere of which about three-fourths main of skirogen, it is not from this monney in these monstimes

con held, that the nitrogen which enters so largely into the omposition of the animal body is supplied. Nor is it as an lement, but in a compound form, that it is absorbed into he system. Whilst there may be some nitrogenous matter thich has not as yet been specialized, the chemist recognizes everal well-defined compounds among the different articles of food, some characterized by yielding proteine when subjected to the action of an alkali and to heat, others allowing no proteine one given forth. The former constitute the albuminous group, he latter the colations. Proteins, first discovered by Mulder is eler the syr to be given forth. The former constitute the albuminous group, the latter the gelatinous. Proteine, first discovered by Mulder, is not to be considered as a substance or principle existing in the compounds from which it is to be obtained, but as a product of amical process to which these are subjected, or as serving to ogether certain important physiological principles. The link together certain important physiological principles. The various albuminous or proteine compounds, comprising albumen, fibrine, caseine, and their modifications, such as vitelline, globuline, syntonine, or muscle-fibre, distinguished by Liebig, besides the regetable forms in which these principles also occur, are analysed and described by Dr. Pavy in their relation to direction, to the passage through the state of albuminose preparatory to absorption, and to the ensuing process of alimentation, by way primarily of the development, and secondarily of the renovation, of the tissues. With the ultimate steps of this process we are sufficiently acquainted, but, as our author acknowledges, there is as yet much of mystery in the intermediate stages of metamorphosis. Instead of wandering further into the field of conjecture, he turns to the ends or purposes fulfilled by the nitrogenous principles as alimentary matter, their uses in relation to force-production, to heat-production. and as a source of fat, which recent experiments tend to prove directly referable to the nitrogenous constituents of food. Some remarks of importance are added upon the vexed question of the alimentary value of the gelatinous principles. While nitrogenous matter may be regarded as forming the essential basis of organic structures, it is the non-nitrogenous principles which supply the motive power. Nitrogenous alimentary results which supply the notive power. Nitrogenous alimentary matter may indeed, as Dr. Pavy is careful to lay down, contribute by exida-tion to the generation of the moving force; but he adduces evidence that this compound is disintegrated in the process of digestion, one portion containing the nitrogen which is eliminated as useless, the residuary non-nitrogenous portion being retained and utilized in force-production. On the other hand, as he subsequently shows more at length, non-nitrogenous matter may be applied to tissue formation, to the extent at least of being stored up for the purpose of subsequent production of force. In his careful analysis of the fats, or hydrocarbons, he upholds strongly, in opposition to hiebig, the doctrine of the generation of muscular and nervous force, not only by fat, but by other non-nitrogenous articles of food. Examina-tion of the outgoings from the system is brought to bear upon this question. The amount of carbonic acid exhaled has been shown by recent experiments, notably those of Dr. Edward Smith and Pettenkofer, to hold a direct proportion to the amount of work performed under various conditions of exertion, entitling us to ascribe to the exidation of hydro-carbonaceous matter the production of nervous and muscular power. The energy set free by chemical action system of equivalents established by Mr. Joule, a definite expression can be given to the amount of energy contained in various articles of food. It is the application of this areast minimum articles. gives to recent physiology its basis among the positive and almost among the exact sciences. And it is in the daborate and exhaustive way in which this method is applied to the analysis of ever class of food in general, and to each several article of diet, that the value of Dr. Pavy's work as a practical manual no less than a physiological treatise will be found to consist.

Into the details of this department of the work we have not space to enter more particularly. We can but testify in general terms to the unsparing industry bestowed upon the compilation of facts, and the ability with which reading and scientific thought are blended together to produce the valuable dietetic rules which are the practical result. The look forms a code of health no less than an epitome of physiological knowledge. What foods are wholesome and nutritious or the reverse, with the reason why, whether due to the substance itself or to individual conditions of health, age, or special temperament; what modes of cookery are the most appropriate, effective, or economical; what are the comparative effects of animal or vegetable diet, of alcoholic and other beverages; what are the exceptional rules of diet, befitting: climats, special work, or athletic training, will be found laid down in these pages with a fulness and accuracy of treatment to be seen in no other work of the sort. A special section is given to therapeutic dietetics, or the adjustment of food to disordered conditions of the body, corpulence, or wasts. For the diabetic in particular a dietary is provided which, whilst varied and liberal enough for most palates, will do much to allegistion, diarrhose, constipation, flatulence, and colle, dietatic treatment is prescribed which will obstate many a call for apotherary's stuff. The volume, in addition to acceptions index, closes with a suite of the dietaries in use at the principal hospitals and infirmarise of the metropolis and the

PHASES OF UNRELIEF.

E have seldom met with a worse-written or more thosessibly permissious book than this last performance of Dr. Havier, who tells us that he is a clerryman officiating in the finglish. Church, sometime Curate of St. Georga's, Campden Hill, Kensington. Its literary desserits the author must take the credit or, discredit of secing as clearly as we can do. "Adverse entires," have credit of secing as clearly as we can do. "Adverse entires," have called us, "might easily describe my present method as one of pate; selssors, and padding." Or again:—"Several of the chapters which succeed have already seen the light in the columns of newspapers—seme in Landon: daily papers, many of them in the Manchester Evening News, a few in the Scottish Guerdien, and others in a local journal which I have edited. Usged at least by inexorable time, and my publisher's call for more copy," I have written down the results of my coolesiatical wanderings, in the far countries where my observations were made, at less literally-racing the press to bring my work to its conclusion. Perhaps, when the nature of the work is considered, it will scarcely have, suffered by this rapid style of composition." Very probably not, we should say. The book is so theroughly vicious in what Garrick used to call the first conception, so faulty in plan and reckless in spirit, that mere slovenly defects of style and hap-hazard arrangement may very well be overlooked ands forgotten. Yet not many educated gentlemen—not many persons who could hold a pen at all—would like to publish such a sontance as the following, wherein is described a neighbourhood in the "far: country" of Hackney:—"Out of Goldsmith's Rew, which has slummy, just past the almahouses, turns a court which has almanuler still; and Perseverance Hall is slummiest of all" (yot, i.p. 352). We mot somewhere else in these volumes with the noun "slummirmes," to which these precious adjectives belong, but there is no index, and we have unluckily mislaid the reference.

It is, however, with Dr. Davies's matter, not his manner, that wer have chiefly to quarrel. He informs us that "during the progresses of these shouts through the proces I have found the heir of my, estermed publisher stand on end at the tremendous nature of some of the documents quoted." "Tremendous" the documents corof the documents quoted." tainly are not, if by that expression our author means formidable. We would rather call them blasphomous, soditions, base, abominable. It outrages every notion of common propriety that a Christian minister should send to the press such a sentence as the following: where the falsehood of the main proposition is hardly worth notice compared with the language in which it is enunciated: -- Celibacy, as recommended by the erring *** and Paul !-- the name and Paul "-the many which we do not choose to copy in such a context; being that which Dr. Davies professedly holds to be above every name. But, in truth there is much in these volumes which it can answer no. good purpose to dwell upon, and which a clergyman should be ashamed to reproduce as "curious and most psculing," as assers matter for amusement. Nor can we condemn too strongly Dr. Havies's own mode of speaking about sacred things. He ventures to set at the head of a long chapter in the second volume (in the hurry of consposition he has not even numbered his chapters) the running title. "Mt. Bradlaugh versus " "," where again the word omitted by "Mt. Bradlaugh versus " " "," where again the word emitted by us is one which it is simply indecent to place in such a connexion. Where much is so vile, it is a bold thing to declare the two chapters relating to Mr. Bradlaugh the vilest part of the book; but we confess to have read the damagegue's "Letter from a Freemason to the Prince of Wales" with some regret that the pillory is obsolete. Dr. Davies quotes it as a specimen of that the pillory is obsolete. Dr. Davies quotes it as a specimen of that the pillory is obsolete. The same wretched specimen it is; taking, credit to himself all the spelle for the emission of the same for credit to himself all the while for the omission of some few passages, which can scarcely be much more edious than others has retained. Of wit, humour, reason, common sense this abominable "Letter" contains not one seintille. It simply assalls with brutal innuendo one whose rank exposes him to insult without the possibility of reply. Yet even here, again, our clergyman exercises a certain reserve. There was exercises a certain reserve. clergyman exercises a certain reserve. There was one stronger expression still "of the final outcome of the dootrines held by Readlaugh," and that "not permed by him, but sold at his Leature Hall—and this I could not bring myself to quote" (Introduction, vol. ii. p. xix.) But then (vol. ii. p. 189) he does bring himself to manust the "racy pumphlot," as he is pleased to call it, and so to give it; such advertisement as he asset your. Of the aposite of ungood times. himself we are presented with a short autobiography, which is by no means void of instruction as tending to show how such characters. are formed, and such a career as his made pessible. Its concluding sentence might be madered with advantage by some of his following agitators, and displays a frank and independent spirit which cannot be a few and independent spirit which a few and independent spirit which a few and independent spirit which the few and independent spirit which a few soutened might be madered with advantage of sound of ma millioned agreed and displays a fruit and independent spirit which cannot but as far concillate respect:—" It hope that another year or two of hard work may enable me to fine myself from the debt-load which for some time has hung heavily about me." We only hope it may muty be such work as a second letter from "A. Bree and Accepted?

If is be saled whether, in publishing these heaty volumes, Rust Davies seems to have had in view the advancement of the cause of unbelief and immorality, one reply weald on the whole he in the negative. If he were judged by much there appears in his book, it would go hard, enough with him, and indeed we are very for from acquitting him of heavy blame, but we believe that in his case, as in so many of im, the quare charitable size is the time one.

[&]quot;Historodier Livedier ; ong Ricesenof Pres Thought in the Metropolis. By Rive, Charles Maurius Davies, D.D., Austhor of "Orthodox and Linestindes Livedies," Sec. 2004. Lordin: Timbry Brothers. 1874.

All that we know of him is of his own telling, and thus we gather that before "he was in full parochial work in a London curacy, and had to snatch rare intervals of leisure between frequent serious of the statement of the state and had to snatch rare intervals of leisure between frequent services on Sundays and week-days (vol. i. p. x.), he had frequented Cogers' Hall, by Fleet Street, when he was "a Slave of the Lamp on the London Press" (vol. ii. p. 264). Yet he must have graduated in some higher school than this—indeed he calls himself, or seems to call himself, "an old University man" (vol. i. p. 24)—for, in spite of his atrocious English, he has a nice ear for classical quantity, which was sorely tried by the pundits whom he wandered about to listen to, when they garnished their vapid discourses with source of the practical pratings about Æolus and Philemon and Oovid. So far as we can understand the matter. Dr. Davies has been nonsensical pratings about Æölus and Philemon and Oovid. So far as we can understand the matter, Dr. Davies has been carried away by the success of the two books which stand on his title-page as his recommendation, his Orthodox and Unorthodox London; especially of the latter, which in a jaunty, quaint, and garrulous way, introduced his readers to obscure sects of which most of them had never heard before, and undoubtedly possessed some merits which we very willingly recognized. It seems to have been his headlong speed to take the tide of popular favour at its flood that has led to the present worse than unfortunates publication. His own account of his motives runs, of course, somewhat otherwise. "The great advantage which I expect individually to gain by this examination of outlying forms of belief [or rather of unbelief] is the confirmation or modification of my own previous convictions" (Introduction, vol. it. p. vii.) We certainly think it would have been as well for Dr. Davies to have made up his mind on such points as the existvol. ii. p. vii.) Dr. Davies to l Dr. Davies to have made up his mind on such points as the exist-ence of a Supreme Being and the truth of the revelation contained in the Bible, before he became an ordained minister of Christ, or used the title, whencesoever derived, of doctor-that is, not learner, used the title, whencesover derived, of doctor—that is, not learner, but teacher—of divinity. Still, beyond all question, if Dr. Davies's faith be yet unsettled and his apprehension of religious truth be hazy, investigation as thorough and unshrinking as he pleases had better come late than never. Meanwhile, his only seemly course would lie in modest retirement and seasonable silence; he may fairly be expected to keep close shut the doors of his mouth until he has something to say for himself. What he actually does is widely different. About Ash Wednesday or St. Patrick's Day this year different. About Ash Wednesday or St. Patrick's Day this year he set out on his journey among the purlieus of heterodox I ondon; "heterodoxy" being separated by our author from "Unorthodoxy" by the nice distinction that the unorthodox consider themselves orthodox, whether they are so or not, whereas the heterodox "make no claim to orthodoxy whatever, but elect to be heretical, and would resent the imputation of doctrinal soundness as a personal affront" (vol. i. p. 1). We must decline to accompany our author on his self-imposed and unsavoury pilgrimage. From the "Independent Religious Reformers" who now occupy the place in Newman Street where Irving found refuge in his last sed London days, and whose reigning "Æölus," one Dr. Perfitt, illd se jactat in autd—from Mr. Voysey's Sunday Service in St. George's Hall, and a sermon by that gentleman ten pages long, headed Hall, and a sarmon by that gentleman ten pages long, headed the "Gospel of Hall Fire," whose very title, cries Dr. Davies, "is the "Gospel of Hell Fire," whose very title, cries Dr. Davies, "is an invention, and should have been patented" (vol. i. p. 290)—he passes on to the "United Secularists' Propagandist Society" in plebeian Hackney, or to the "Land and Labour League in White-cross Street, E.C.," whose "Address to the Working Men and Women" fills fifteen pages more; and a fearful tissue it is of folly and ignorance run mad, the abolition of landlords and the cancelling of the National Debt being among the most moderate of its demands. From the war against religion and public order the transition is easy to the attempt to destroy family life, by bringing down marriage to a temporary contract, reyocable

public order the transition is easy to the attempt to destroy family life, by bringing down marriage to a temporary contract, revocable at the mere will of both, or perhaps of only one, of the parties. Upon discussions of this nature we profer not to enter.

Again we appeal to Dr. Davies, What good can you expect a book like this to do? "It was incumbent on me," he replies, "to show how far the mischief has gone, and especially to illustrate forcibly the inevitable connexion between dogmatic atheism and political disaffection" (Introduction, vol. ii. p. xix.) But no same man ever doubted this connexion; and who that has lived in the world but half as long as Dr. Davies seems to have done is ignorant of the wide prevalence of infidelity among the alightly educated and discontented classes of the community, and was not prepared beforehand for all that he has told us and more? In any case, an inquiry of this kind should be conducted in a very different spirit from that in which Dr. Davies has entered upon it. It is a subject which, if treated at all, should be treated seriously and sadly, and not in sport. As to the pain and offence (which the quotations inserted in his volumes have given to the author (seed.), we wish we could discern in the work some traces of this feeling that might keep in countenance the professions of his Introduction. One of his two concluding chapters may possibly be intended as an antidots for much of the poison in the rest of the work. It is frankly admitted to be "that which is technically termed pedding" (seed.). The author has strolled into the "Victoria Institute" at the Adelphi, and finds himself face to face with Prebendary Row, who proceeds to read out an elaborate and forcible argument upon Atheism and Fantheism, upon Mr. Mill's Assabing apply and the Darwinian theory, having first put into the hands of every one present a proof copy of the lecture. This gift must fafty-six pages of his book, it would estis, to the extent of about tarse sheets and a half, his importunate publishe

Epilogue. Its title is "The Atheist's Funeral," and never was the blank despair of unbelief more touchingly portrayed:—

IN MEMORIAM.

"Gone before."

AUSTIN HOLYOAKE,

Died April 10th, 1874, Aged Forty-seven years.

This world is the nurse of all we know;
This world is the mother of all we feel;
And the coming of death is a fearful blow
To a brain unencompassed with nerves of steel.

The funeral ceremony at Highgate Cemetery well suited this invitation to attend it. The Burial Service, if such it should be called, was the composition of the deceased, a poor affected sentimental thing, almost boasting of and glorying over the mortality of the reasonable soul.

SONGS OF TWO WORLDS.

by "a New Writer," called forth favourable comments from several competent critics. It was not so much perhaps their own substantial excellence that commanded notice as the promise arising out of a union of rare culture with a fresh study of nature that gave assurance of future and riper products. Though, as it chanced, the volume was not reviewed in these columns, this was not because the poems failed to attract or arrest our attention, so much as because they appeared too slender for detailed criticism. In some of them the rhyme was woven with art and melody to represent the beautiful things of external life; others evinced a scholar's insight into deeper philosophies, and bespoke habitual converse with ancient and classic models. Those who read the first series—which the second instalment just published can hardly fail to recall to public attention—will remember the delicate and refined fancy which breathes in such love-songs as "Love's Mirror," the truth to nature hit in the reminiscence "By the Sea," the hardly less natural strains "On an old Minster," and the pathos and realism of such pieces as "In Trafalgar Square," "In Regent Street," and "The Young Mother." Perhaps the author's finest and strongest effort was the study of the human mind in its quest of truth and satisfaction, called "The Wandering Soul," a poem which surveyed in turn the various arts, philosophies, and religious of mankind, in a series of stanzas of which one alone, containing the poet's reforence to Socrates, will serve to exhibit the sterling quality of his muse:—

And that white soul, clothed with a satvr's form.

Which shone beneath the laurels day by day,
And, fired with burning faith in God and right,
Doubted men's doubts away.

But through all the writer's first published efforts one characteristic was conspicuous—namely, a healthy carnestness of thought and purpose, choosing fit themes and few, breaking out into song because the stirred spirit could not brook longer silence, and expanding itself in wholesome and generous sympathies with the highest human interests. We are glad to find that in our busy and practical age there is a sufficient number of readers susceptible of impressions from healthy poetry to have encouraged this "New Writer" to a second venture.

It is always interesting to glean internal evidence of a poets scope and motive; and in these new songs several pieces show that the author prefers the living present to the dead past for his theme and inspiration, sees his way clearer in the contemplation of the real and earnest than in the mazes of art and fancy, and, above all, holds that a singer is responsible for the moral tone of his lays. In his "Apology," after a passage of great beauty which pleads for the photographic delineation of nature and humanity as they are, instead of

Blue hills with adumbrations faint, Or misty aureoled saint,

he thus defines the office and ministry of a genuine " vates" by a subtle and truthful contrast:—

Dull creed of earthy souls! who tall That, be the song of heaven or hell, Who truly sings, sings well,

And with the same encomiums greet The satyr baring brutish feet, And pure child-angels sweet;

Whose praise in equal meed can share The Manad with distempered hair, The cold Madonna fair.

Great singers of the past! whose song Still streams down earthward pure and strong, Free from all stain of wrong;

Whose lives were chaquered, but whose verse The generations still rehearse; Yet never soul grew worse.

Towards the close of the same poem he indicates with still more distinctness his own poetical "platform," and also affords a clue to the title of his volumes, which represents, it seems, his twofold object of imaging the features of the world of to-day and reaching forward to the better world of to-morrow, in which latter he dreams

The race transfigured, wrong redressed, None worn with labout, nor oppressed, But posce for all, and rest.

" Sunge of Two Worlds. By a New Writer. London; Henry S. King & Co. 1879.

This "Apolegy" is a sufficient key to the poet's moral purpose, but criticism ought equally to commend the sensible and sober estimate of his vocation which he enunciates in a later poem, inscribed "A Remonstrance." What a flood of trash would be annually spared to the world could his weaker brethren be imbued with the lesson of its concluding stances, which we give as follows with a little needful difference of punctuation. Inveighing against trivial themes and creeping verse, he exclaims.

Grave error! since not all of life Is rhythmic; of: by level ways We walk; the sweet creative strife, The inspired hernic days, Are rare for all; no food for song Are common hours; and those who hold The gift, the inspiration strong More precious far than gold, Only when heart is fired and brain, And the soul spreads its soaring wing, Only when notier themes constrain, Should ever dare to sing.

Did we need other evidences of a sound poetic taste and faith to recommend our "New Writer," we might point to his warm championship of an "unknown poet," whom at an interval of two centuries he claims as of the same county and college with himself, Henry Vaughan the Silurist, the sweet "Swan of Usk." A year or two ago we reviewed Mr. Grosart's edition of Vaughan's works, and it is gratifying to find one more poet springing up who, in a stanza such as the following, appears to prefer Harry Vaughan to George Herbert:— Vaughan to George Herbert:-

One poet shall become a household name Into the nation's heart ingrown; One more than equal miss the meet of fame, And live and die unknown.

We are too grateful to the writer of this stanza for recalling those touching lines of Vaughan which begin "They are all gone into the world of light" to follow the clue which the context might afford to the name of a poet who at least admits that he is a Silurian. In earnestness, sweetness, and the gift of depicting nature, he may be pronounced even now a worthy disciple of his compating

Several of the shorter poems (such as "Comfort," "Good in Everything," and "Courage") are instinct with a noble purpose and a high ideal of life. In his love songs too, especially one at p. 7, there breathes that old chivalrous devotion to a mistress which was so conspicuous in our Sidneys and Wallers, albeit which was so conspicuous in our Sidneys and Wallers, albeit somewhat out of date in days when woman is disposed to assert her rights rather than to rest upon her privileges. Another song—so brief that we may quote it—has the true ring about it, and a touch of the same pathos and knight-errantry of tone which shone out now and then in the first series. It runs:—

Only a woman's hair, A fair lock severed and dead; But where is the maiden—where That delicate head? Perhaps she is rich and fair, Perhaps she is poor and worn, And 'twere better that one somewhere Ilad never been born. And the careless hand that threw That faded tress away— Ah! the false heart that once beat true, Ah! love flung away.

Another phase of this writer's carnestness is shown in his apparent Another phase of this writer's carnestness is shown in his apparent selection of the contemplation of the cloister as the theme of a poem antitled "For Life," a poem of which every word and verse is built up into harmonious and truthful completeness. A "Hymn in time of Idols" has something of the same spirit, though the subject is treated in a more speculative and less pictorial fashion. Elsewhere ("As in a Picture") it is developed into a mysticism which does not seem to us either natural or intelligible; but in another ("The Beginnings of Faith") we get, in measures reminding us of the sweet Siluriat, a renowed taste of the charm of the "Wandering Soul" above referred to:—

Fair more of support days.

Fair morn of summer days, Rich harvest eves that raise The soul and heart o'erburdened to an ecstasy of praise.

Low whispers, vague and strange, Which through our being do range, Breathing perpetual presage of some mighty coming change.

There in the soul do breed
Thoughts which at last shall lead
se clear, firm assurance of a satisfying cree

To some clear, firm assurance of a satisfying creed.

We must add, however, that the author's intensity of purpose sometimes betrays him into ultra-vehemence, when the image he would break is social or spolitical, rather than moral or religious. There is certainly a waste of white heat in the tirade against the "stockjobbers' madama," in the verses "In the Park."

We do not wonder that, having delivered himself of such a perfervid stansa as the 6th (p. 41), he is led by prickings of pascience to qualify it by others which indicate something like thward misgivings. On the other hand, the piece headed "Tolermor" bespeaks a less iconscilastic creed, and for such satirical abstoches as the "Professor," p. 159-61, there is the justification that it is good to be realously affected in a good matter.

We have not spoken of our author's powers of portraiture and description. One perfect picture, marginally amounted, so

to speak, in the speculations which it parenthetically calls forth from the writer, is the "Organ-boy," a poem which might have been suggested (we do not say that it was) by a note in Dean Merivale's Remons under the Engire (c. 51, p. 38). The Dean had been exploring a supposed battle-field of Caractacus. "On descending," he writes, "from the spot which I believed to be the scene of the celipse of British freedom, I found an Italian organ-boy making sport at an alchouse door to a group of Welsh peasants. I could not fail to moralize with Taoitus, Rebus humanis inest orbis quidam." It would be hard to convey the gist of the poem we refer to better than in the Dean's sentence. But we must leave room for at least one of the author's nature pictures. manis inest orbis quidam." It would be hard to convey the gist of the poem we refer to better than in the Dean's sentence. But we must leave room for at least one of the author's nature pictures, a province in which we are not sure that he is not stronger than in any other. Little bits of Kentish scenery in his balled of "Gilbert Becket" show this; so does an exquisite little diorams of the seasons, entitled "Revival"; and so again do bits of rural description, reminding us of Martial's gift that way, in a "Cynic's Day-Dream." But the most noteworthy poem of this kind in the present series is the "Ode on a Fair Spring Morning," which has somewhat of the charm and truth to nature of L'Allegro and Il Penseroso. As a whole, this ode is perhaps the nearest approach to a masterpiece in the collection before us. We can find no fault with it, unless it be a seeming violation of the unities in the mention of "gold gleams from rippling fields of ripening wheat" amidst the phenomena of a May morning; and we cannot find too much praise for the noble assertion of man's resurrection and renovation in p. 87. But we prefer to close with a bit of simple description: simple description:

There is a nameless air
Of sweet revival over all which fills
The earth and sky with life; and everywhere
Before the scarce seen sun begins to glow,
The birds awake which dumbered all night long,
And with a gush of song.
First doubting of their strain, then full and wide,
Raise their fresh hyuns thro' all the country side.
Already above the dewy clover
The soaring lark begins to hover
Over his mate's low nest;
And soon from childhood's early rest
In hall and cottage to the cassument rise
The little ones with their fresh morning eyes,
And see the tranquil Heaven's unclouded blue,
And since as yet no sight nor sound of toil
The fair-spread peaceful picture comes to soil,
Look from their young and steadfast eyes
With such an artiess sweet surprise
As Adam know when first on either hand
He saw the virgin landscapes of the morning land. There is a nameless air

UNDER THE LIMES.

A MONGST the multitude of ephomeral novels, of which each A MONGST the multitude of ephomeral novels, of which each generally drives its prodecessors from the mind of the reader, we remember with more than usual distinctness a story called Christina North. It was gracefully written and pervaded by a pleasing, though rather melancholy, sentiment. The author comes before us again with a book which shows the same qualities, comes before us again with a book which shows the same qualities, and which deserves therefore to be distinguished from the ordinary throng. To say that it is a powerful story, or that it is likely to be generally popular, would be rash; but it has at least a character of its own, and shows some serious purpose. The story may be priefly described by anying that it is one more variation upon the familiar theme of the Wahlverwandtschaften. The resemblance indeed to Goethe's great novel is of a very superficial kind. The proprieties are observed with the utmost punctuality; and the moral intended to be inculcated is such as might have been enforced from a pulpit by the most orthodox of preschers. The coincidence consists merely in this, that in Under the Limes, as in its predecessor, there are two pairs of lovers who have managed to arrange themselves in the wrong order; the who have managed to arrange themselves in the wrong order; the worldly young lady being engaged to the unworldly young gentleman, whilst the unworldly young lady receives an offer from the worldly young gentleman. The natural affinities then begin to operate, and various uncomfortable consequences result. Ultimately the and various uncomfortable consequences result. Ultimately the worldly youth dies after being converted to a sense of the weak-nesses which have marred his life. Indeed he is only half-worldly, and seems to be regarded by the author rather with pity than aversion. If is an indolent, delicate youth, who is not so much attracted by pomps and vanities as incapable of very decidedly making up his mind to adopt any particular line of conduct whatever. Indeed he has that kind of effectionacy which may be consequently taken in novels as a reconstruction. very decidedly making up his mind to adopt any particular line of conduct whatever. Indeed he has that kind of effeminacy which may be generally taken in novels as a prognostic of an early death. A thoroughly soft-handed youth, who goes to alsep in the afternoon and whose most energetic performance is an occasional game of croquet, resembles Goldamithia "lovely woman" in so far that his only way of touching our sympathice is to die gracefully. At one time, indeed, when we found him venturing to chaff the awkward and athletic clergyman who does his duty by the poor in an uncompromising spirit, we had hopes of him. We thought that he might be espable of interrupting the happiness of this rival shd giving eause for an action of breach of promise. We regretted to find that he was allowed to have good impulses, and even to set about draining his estates—the most unequivocal sign

* Under the Lines. By the Author of "Christine North." London:

of grace in the baronet of fiction-before he makes his exit under

of grace in the baronet of fiction—before he makes his exit under the ministrations of the stern, but forgiving, clergyman.

But this youth, who has too much of the girl about him to be quite interesting, is comparatively in the background. The main interest of the story is in the thoroughly worldly young lady and her serious lover. The author remarks, with a good deal of truth, and in a more satirical vein than is usual to her, that a man is always more or less surprised to hear that a lady is engaged to anybody but himself. We must confess that we sympathize with autorize not unfrequently. It is indeed a very trite about the surprise not unfrequently. the surprise not unfrequently. It is indeed a very trite observa-tion that marriages are too often arranged on apparently the most perverse principles. Few men will deny that their acquaint-ance generally marry the wrong people. It is only by a rare felicity that friendship is not to some extent interrupted by marriage; and the reason seems to be that the men whom one likes throw themselves away upon the most uninteresting women, always throw themselves away upon the most uninteresting women, whilst the feminine taste is so perverted as to prefer priggishness or sheer stupidity to virtues and talents by which one is oneself distinguished. There is room for many reflections upon the defective arrangements of society or of human nature which favour this unfortunate tendency. We are content at present to remark that it exists, and to appeal for contirmation to the personal experience of our readers. We therefore do not complain of the author because she brings about an engagement between a young man who has a high ambition as an artist and a strong desire to be faithful to his vocation, and a young lady who has hear plenty of be faithful to his vocation, and a young lady who has plenty of money, a great deal of beauty, and no particular ambition, except that of enjoying all the luxuries of life. If we said that such an arrangement was unnatural, we might be confronted by any number of decisive instances to the contrary. Undoubtedly any number of money here, intended contrary. any number of men who have intended at the age of five-andtwenty to scorn delights and live laborious days have consoled thomselves by the time they were thirty by sporting with the tangles of Newro's hair, especially when Neera is the only daughter of a rich banker. In one sense, however, we think that the author has made the process rather too easy, or perhaps we should rather say that she has scarcely done justice to the capabilities of the situation. The fact is, we suspect, that she has fallen into a common error. Novelists are a great deal too much given to taking fancies about their characters. They cannot represent their villains and their heroires with the true Shakspearian impartiality. their vinimis and their netonies with the true Shakaparan Impartiality. They are not content to make us hate their had characters, but they make the had characters simply hateful; and between these two methods there is a very vital difference. Shakapeare, for example, takes some trouble to make us see that Falstaff's life was radically unsatisfactory, and even provides him with an edifying death-bed; but he does not conceal the fact that Was Falstaff was a very delightful companion in his cups. If Dickens had dealt with a Falstaff, he would not have been content without saying at every other line, "See what a villain and a brute this is, and observe how heartily I disapprove of him." Now, to drop from great authors to the comparatively modest case before us, the author of *Under the Limes* is a great deal too angry with poor Henrietta Langel. Sho tolls us, it is true, that Miss Langel was charming, but her whole energy is devoted to showing us how thoroughly frivolous and heartless was Miss Langel's real character. The consequences is that we become unable to consequences in that we become unable to racter. The consequence is that we become unable to conceive how the admirable Mr. Viner should ever have fallen in love with hor. That such thirms become in made in the with hor. That such things happen in real life we have fully admitted. Nothing is more common than for men of genius to fall in love with mere dolls, and make shipwreek of their lives in consequence. But then the task of the novelist is not simply to re-produce the strange combinations which happen in real life, but to make them credible and intelligible to us. The contrast puzzles and interests us when it really happens; but in a work of art we should either see how it comes about, or at least have it turned to the best possible account.

Our own theory as to the love affair between Miss Langel

and Mr. Viner is extremely simple. She was a very pretty girl and he was an artist. She made an admirable figure in one of his paintings of an early Christian martyr, and he assumed, reasoning in an artistic fashion, that she must necessarily have had the qualities which were displayed by the early martyrs. This is the solution of the problem which is more or less indicated in the book; our complaint is that it is passed over rather too lightly. The peculiarity of the artistic temporament which gives rise to such delusions is an excellent temporament which gives rise to such delusions is an excellent subject for the novelist; and we can imagine a treatment of the story in which we should be forced to sympathize with the unstory in which we should be forced to sympathize with the unfortunate lover, distracted between the external charms of the lady and his gathering doubts as to the real depths of her nature. As it is, we have the whole case so very plainly put before us that we cannot help rather despising the man who is so easily imposed upon. We might almost fancy the story to have been written by Hose Anstie, the virtuous heroine. She would naturally take the view which commends itself to the author: She would see in poor Miss Langel nothing but a heartless flift; and would forget that, in attacking her rival, she was attacking the liver who fell so easy a victim to the rivel's arts. The layer himself, moreover, though not ill described, in scarcely adjusted for the situation in which he is placed. His is convey an attack appealing accessible to feminine filirations. His is no very called, self-sustained, and severe that we sourcely understand the weakness with which he gives up his art on the very first applicalet appealing accessible to ferminine flirtations. Ha is no very particle of the second that we scarcely understand the Disness Complete, Militon Rule. Most with which he gives up his art on the very first applica-

tion from his betrothed. The struggle should have lasted longer in order to make us understand the greatness of the sacrifice and sympathize with the man who falls into temptation. In short, the author shows some want of the dramatic insight which should enable her to picture the natural working of the passions whose existence she has suggested, and extract the greatest autount of existence she has suggesten, and extract the greatest angum of interest from the situation. Otherwise the book shows considerable talent. It is not perhaps very thrilling or dramatic; but the scenery is harmonious and delicately described; and the morality, if once or twice obtruded upon us rather more emphatically than we could wish, shows tenderness and delicately of feeling.

We will only add one criticism by way of conclusion. We

We will only add one criticism by way of conclusion. We are not quite sure how much blame belongs to us and how much to the author; but we have an uncomfortable feeling of vagueness as to the relationship of the persons chiefly concerned. When one of the heroes is introduced to us as "stepson to Hose's aunt," we have the sense of amoyance which is produced by the genealogical problem gratuitously suggested. We fancy for a moment that the persons are within fashibited degrees and then find that there two persons are within forbidden degrees, and then find that they are really not related to each other at all. Such matters are of no great importance, but it does contribute something to the comfort of a reader when they are smoothed down as neetly as poss

AMERICAN LITERATORE.

MR. CAMPBELL'S History of Nova Scotis * may not do full MR. CAMPBELL'S History of Nova Scotis "may not do fall justice to the natural interest of the subject, but it is rarely that a colonial history is sufficiently fall of matter to be really attractive to readers not directly interested in the colony itself; and this is especially the case with the minor maritime provinces of the Canadian Dominion. If, indeed, we could have the personal story of their earliest settlers—the adventures of the original discoverers, the difficulties, struggles, failures, and successes of those who first planted civilization and agriculture therein, and all that really constitutes the history of the plantation itself—we should no doubt find that the tamest and most companies of the possessions that British courses and enterprise itself—we should no doubt find that the tamest and most com-monplace of the possessions that British courage and enterprise have won for the British Empire had a tale worth telling. But of these things for the most part very imperfect, if any, records are preserved, and the substitutes are not satisfactory. The early history of the Northern coast provinces has none of the stirring interest given by religious or political enthusiasm to the ori-ginal settlements of the thirteen Colonies to the southward; it is one long record of petty frontier wars between France and England, often disgraced by savage cruelty and wanton devas-tation, interspersed with treaties of peace and restitutions so tation, interspersed with treaties of peace and restitutions so frequent that it is no easy matter to remember from chapter to chapter which territories are under our own control and which under the Bourbon flag. Nova Scotia, hko the rest, has been conquered, surrendered, and reconquered, and it was not till the Treaty of Utrecht that it came finally and permanently into British possession. At that time a considerable part of the province, known as Acadia, was occupied by French colonists, who received under the treaty the right to remain in enjoyment of all the privileges of British subjects, or to depart within two years with all their property. The great majority remained; but while they claimed the rights, they not unnaturally failed to imbibe the spirit, of Englishmen. They evaded for a long period the eath of allegiance; they gave assurances of their affectionate levalty to their former sovereign, and whenever there was danger of a French raid or invasion, their temper was a source of grave anxiety to the civil and military authorities responsible for the safety of the province. When at authorities responsible for the safety of the province. When a last they took the oath of allegiance, they did so with a reserve tion (expressed, understood, or mental, there is much dispute which) that they should not be called on to serve against Brance; that is to say, that, constituting, half the population, they should not help to defend their own homes and property or those of their neighbours against invasion. The fact that this kind of loyalty was tolerated for forty years is a sufficient proof of the indulgent spirit of the Government. But it could not go on for ever; and at last the option was enforced of allegiance or expulsion. refused the alternative of active levalty, and demanded permission to retire with their cattle and movemble property mission to retire with their cattle and movemble property into the French provinces—that is, to reinforce the enemy. This was refused; and as they still declined to accept the obligation of loyal subjects to defend their country against invasion, and showed that their sympathies were altogether on the side of the enemy, they were in 1755 removed to distant British colonies, and their property confiscated. The measurement are the property of the control of distant British colonies, and their property confiscated. The measure may have been excessive in severity, but, as the removal of their cattle and other property was impossible, and as their partially entitled them to compensation, it is difficult to see what milder proceeding would have meet the measure of the case. It is obvious that those Acadians who means to remain Branch subjects should have assuited the molves of the treaty option, and retired within the two years; men who had for ferry years accepted: British severeignty could hardly claims of the caption from the day of British severeignty could hardly claims of the caption from the day of British severeignty could hardly claims of the caption from the day of British subjects. The observation of the case is apparent in the moly

ignores, but implicitly denies, representing the entire measure as aurprise, instead of, as it was, the final step of a long asgotiation in which the Acadians were warned from the first of the consequences of obstinacy. Such is the one really striking incident of Nova Scotian history. In the War of Independence the Northern colonies remained loyal to Great British—a fact of which Mr. Campbell offers no explanation; and the only important effect of the American Revolution on Nova Scotia-was to introduce a large population of fugitive Loyallats, who gave her at once a great accession of strength and importance, and whose settlement added a new and very important element to the character of her people. The next interesting occurrence in the story is the initiation of the attempt at a Confederation of the Maritime Colonies, out of which the Canadian Dominion finally crose. Mr. Campbell's account of the vagaries of Mr. Howe and the Nova Scotian people on this subject is unfortunately as obscure and perplaxing as their own conduct—a serious drawback to the value of his work. The concluding chapters deal with the material resources of the colony; purporting to show that Nova Scotia has gold mines richer than those of Victoria, if properly worked, and coal-fields which might create another Lancashire if Mr. Levona's expectation of the speedy exhaustion of our English supply should be fulfilled.

Mr. Gideon Welles Scotestery of the Nervin the Administration

Mr. Gideon Welles, Secretary of the Navy in the Administration of Mr. Lincoln, has been moved to indignation by a funereal culogy of Mr. Seward, in which Mr. Adams appears to have implied that the Secretary of State was really the controlling and directing spirit of Mr. Lincoln's Government. The phrases quoted from Mr. Adams appear to us to convey an exaggerated idea of the powers of Mr. Seward. No doubt he was by far the ablest and most experienced member of the Government, while Mr. Lincoin's ignorance of everything necessary to the education of a stateaman or the practical direction of a national policy was as complete as that of any other Western (or English) farmer. But Mr. Lincoln had a strong will, and was in a position to make it prevail; and he had taken care to protect himself against Mr. Soward's ascendency by selecting other Ministers who were rivals or enemies to the Secretary of State. Among these was Mr. Welles, who delights in depreciating Mr. Seward, exposing his real or assumed errors, and, in particular, making it apparent that the two vital decisions of the Lincoln Government the determination to go to war with the seceded States, which at once drove all the Border States into open hostility, and the Emancipation Edict, which gave the lie to every pledge and profession of the Government and of Congress—were Mr. Lincoln's and his own. We can well believe it. It is not so easy to believe, nor is Mr. Welles so successful in showing, that Mr. Seward was as responsible as himself for the criminal folly of nurrous intertument outcomes on the Trent. As the author trips approving the piratical outrage on the Trent. As the author tries to extenuate his own recorded responsibility, we are the less inclined to accept his authority when he affirms and undeavours to aggravate Mr. Seward's. Our belief is that the latter saw the aggravate Mr. Seward's. Our belief is that the latter saw the error from the first moment, prepared for its repudiation, and, but for the wilfulness of his chief and colleagues, would have repudiated it at once, and thereby secured the good will and esteem of Great Britain. Mr. Welles publishes some other Cabinet secrets—among them, unconsciously, the fact that he was not in the secrets of the Government-and tries to establish, what remains as obscure as ever, that the promise not to attack Sunter, which was so scanda-lously violated, was made by Mr. Seward without authority, and was never avowed to Mr. Lincoln. It is clear that he knows no more about the matter than we do, and the inherent improbability of this suggestion, made years ago by Mr. Lincoln's apologists, remains as great as ever.

Mr. James Grant Wilson's Bisetches of Illustrious Soldiers † are lively and readable. Perhaps his judgment might have been more approved had be omitted General Scott, and even General Sherman; and certainly he would have shown better sense and taste if he had not complained of English writers for not recognizing that General Lee "fought om the wrong side." Are Americans really ignorant that most Maglishmen who knew anything of American affairs believed the South to be in the right? and have they forgotten that, until Mr. Lincoln forced a collision, most of themselves believed in the legality of secession? And a writer who makes a hero of Washington simply renders himself ridiculous when he talks in the style of a Nonjuror about "rebellion."

The Life of General Bayard † is not very full of incident, or of the higher kind of personal interest. Though a general officer in the great volunteer army of the Union, the subject of this biography was not twenty-nine when he was killed at Fredericksburg, and the latter part of his history is in the main a more fraction of the history of the Virginian war. He was a man of remarkable ability and soldierly spirit, but not of exhaustive information or profound thought, and the correspondence which fills

the greater part of this volume, and supplies material far the met, is, as might be expected from the age of the writer, commentified and dependent for interest entirely upon the subject content. The attraction for English readers is derived entirely from the Habitat throws on the life in which Hayard participated, first as a substitute throws on the life in which Hayard participated, first as a substitute throws on the life in which Hayard participated, first as a regiment encaused in the harassing and participated, first as regiment encaused in the harassing and promotions frontier service which till rid in was the sole employment of a military actuary to which the candidate for military hapones could ordinarily look forward. That the training at the Military College was severe, full of practical hardship, of vexatious restaints, and of extensive work, is the impression left on our mind by nearly every one of the many American military biographies we have read; and the impression is continued by Hayard's letters, though the high spirit, youthful vivasity, and physical vigour enabled him to maintain a thoroughly cheerful tone throughout, and never to show the slightest idea of flinching from his original resolution to go through the course. It is evident that many students became disquisted or disheartened, and abandoned the career which demanded so unpleasant an apprenticeship; and Bayard himself seems to have contemplated a speedy retirement from the army, and to have persisted rather from a manly resolution net" to abandon from more weariness a position obtained by attenuous exertions than from any real hope in the future of a life which legan in so unpromising a fashion. Circumstances determined his course; the actual career of a soldier and the seventurous life of a frontier post were better than West Point, and had not lost all their charms when the War of because gave supplyment of a frontier post were better than West Point, and had not lost all their charms when the War of the careasing gave smaller a

A new biography of Theodore Parker* of moderate bulk (speaking by comparison), and claiming to be authorized by his friends and family, is sure of readers; not the less that it is rather a record of the progress of Parker's mind and the growth of his ideas that of the outward incidents of a life whose ideas, after all, were its chief events and its sole memorials. It is not a work to be lightly skimmed, for only a close and careful scratiny will enable even a reader familiar with his style and his school to comprehend the often mystical notions of the great Transcendentalist. Its story, so far as it has one, is that of the progress of a profound, smalle, and acceptical spirit from what may be called orthodox limitarismism to views in which it is often difficult to recognize a clear hold of even the simplest principles of natural religion; its only external incidents are the consequences of such a progress on Parker's relations with the Church and with society. We need hardly say that the biographer's sympathics are all on one side; were he a caudid and impartial judge, he would hardly have been selected to write this volume, or would hardly have assumed the task.

We have to notice several works of more or less interest and importance upon the subject of education. First, there is the Third Annual Report of the Federal Commissioner of Education †—an officer whose duties appear to be limited to the collection, digestion, and submission to the Ministry of the Interior of all internation that may throw light on the condition of public instruction, and the educational status of the people. We cannot say that the latter duty seems, in the present volume, to be quite fairly fulfilled. It may be that, to American readers, the figures by themselves convey a correcter view of the case than they do at first eight to Europeans; for they are so ordered as to suggest to mindisaccustomed to English statistics an idea which would be wholly unfair to the people of the Union. For example, it appears that of inhabitants above ten vents of age, the Union counts 28 millions, of whom 54 millions are illiterate. This is a large proportion, apparently. But we have to remember that of these 28 millions about our-fourth are of foreign parentage, and more than one-fifth of foreign birth, all of whom belong to the loss educated classes of shape forth, all of whom belong to the loss educated classes of shape for those who have been brought up in the United States, and within reach of their school system, are unable to read or write. So again we are led to calculate—for the figures are imperfect—that the average attendance at school is about one-in three of the "children of school age." Bus, putting aside the fact that a large number of rural scholars attend only in the winter, because we are not clear-how the "average" is readonall, we find that the "children" in question include in a few cases all from investy-one years of age. Now we can well understant that a large majority of the lads from fifteen to twenty-one, and of the girls above auxum at the states of the parent to twenty-one, and of the

schooling, will begin ofter ex, or end before fifteen; so that the life of the "oblidies of school age" may represent the established of flourly every child in the Union for a period of four the five years. A total years expenditure of some twelve or thirteen millions sterling on education among a total resultation millions some Enve years. A total yearly expenditure of some twelve or mirreen stillions sterling on education among a total pepulation of about the aims number within the "school age" above mentioned, or 34 a year on each child in sverage attendance, does not seem to as unsatisfactory, especially in a country where attendance at what we should tall "public elementary schools" is so general, and whose educational endowments do necessary schools a year.

Whose educational endowments do indexiceed 600,000. a years, Next comes Dr. Northrop's indignant treatise against education should, the chief substance of which is a collection of newspaper articles and letters from heads of schools and colleges in the States, testifying against the habit of sending young Americans to Europe (chiefly Gerhany) for education. The witnesses do not seem able to deny the greates thoroughness and excellence of foreign interrection; but they complain that Americans educated abroad do not feel be true American pride in their country (i.e. are not given to "spread-eagleism"), are not hearty Republicans and haters of Monarchy (knowing a little more of the real state of the case than their home-tanght brethren), are indifferent to American politics, and, finally, do not make efficient teachers in American schools, because they cannot keep order among American hops. We can quite believe in all Dr. Northrop's evidence without boys. We can quite believe in all Dr. Northrop's evidence without pting his conclusion that a home education is best for the sons and daughters of cultivated American families.

Hampton and its Students † contains the records of the first, and perhaps the best, school established in Virginia, during and since perhaps the best, school established in Virginia, during and since the war, for negroes. The writers are of course eager advocates of emancipation and negro equality. But they testify unawares to the fact—to which evidence is borne in every quarter—that the negroes whe can be taught, managed, civilized, and induced to work well and steadily are those who were born and brought up in alayery, and that after a generation or two of freedom the black man is far below the level of the newly-emancipated slave.

Sex and Education 1 is a collection of the protests, mostly largery, off a number of the strong-minded sisterhood against the work of Dr. Clarke on the education of girls, which we lately noticed. Only one or two of the essays are of any value, and these renerally concede all that Dr. Clarke asserts—namely, that girls

generally concede all that Dr. Clarke asserts-namely, that girls generally concede all that Dr. Clarke asserts—namely, that girls ought not to be educated with or as boys—but insist, with much truth, that there are influences worse than those of hard schoolwork; that premature dissipation, novels, reveries, and unwholewome dress, turning a girl's mind in the wrong direction and injuring her physical health, are quite as mischievous as severe study, and that steady mental occupation is the best possible antidote to the tendency of American life to force young girls into premature womanhood. Perfectly true; but "who deniges of it?" Oestainly not Dr. Clarke.

The last of this class of books on our list, the Record of Mr. Alcott's School's, gives a detailed account of the processes by which, a generation ago, a teacher far in advance of his time sought not so much to impart information as to develop the intelligence and quicken the perceptions of children under his charge. Without agreeing with everything therein suggested, we cannot but think that every mother and every teacher of young children might profit by reading it.

What is Discovinism? || is the title of a brief treatise in which the writer strives to fix the doctrine against which he protests in a definite shape, as it is held by a large school of scientific men, if not certainly by Mr. Darwin and certainly not by Mr. men, if not certainly by Mr. Darwin and certainly not by Mr. Wallace; in the sense, namely, of a denial of creative intelligence and control in the process of development. This, he argues, and not the method of creative action, is the vital issue. He quotes Professir Owen as upholding the dectrine of creation by birth, as against that of fixity of species, while repudiating in the strongest terms the materialist theory of spontaneous, undirected development by accidental variation and natural selection. Parts of the argument are clearly and strongly put, but if Mr. Hodge had refrained from bringing into the controversy an authority altogether disregarded by his antagonists, he would have shown more discretion, and have kept, after all, more effectively to the real point.

GAMBETTA AT AUXERRE.

CAMBETTA has many enemies and few friends.

His sachies are to be found in every section of Paris society, and in almost every fraction of the Assembly. His friends are a few personal addrents who are never sure what he will do, and who are jealous of the private consolations which, rightly or wrongly, he is generally believed to have brought with him out of the disasters of 1870. But it must be owned that he alone among the Frenchmen of his generation knows what to do in furtherance of his of his generation knows what to do in furtherance of his views, and when to do it. The time, he considered, had come for him to make an appeal to France; but to make an appeal to France is as difficult a feat as any one could in the present state of things undertake to perform. He is a deputy, and may nominally say what he pleases in the Assembly; but it is only in the sense in which a man may say what he pleases in a bear-garden. He might of course get a deputation from French residents in the Lebanon or Japan to call on him, and give or promise him an inkstand, and then he could give them at least a possible inkstand's worth of political disquisition. Or he might write a letter to himself in his own newspaper. But he knows his country too well to adopt such But he knows his country too well to adopt such quiet machinery, and is aware that if he wants to make a sensation, he must begin with something sensational. To have spoken when he ought not to have spoken, to outwit the Government, and beard a Prefect were secsury theatrical strokes if he wished to arrest the attention of his countrymen. It happened that there was to be an agricultural banquet at Auxerre, in the department of the Yonne, and this seemed Auxers, in the department of the fonne, and this seemed to him to offer just the opportunity he wanted. No one would dream of the great Gambetra dropping down, as if out of his famous balloun, at a quiet little place like Auxerse, or of a banquet of farmers being turned into a vehicle for the exposition of the type principles of modern democracy. Auxerse had also two special recommendations. It was there that the late Empeace made one of his most characteristic speeches just before Sadowa introduced the care of his disasters; and as M Gambetra washed above characteristic speeches just before Sadowa introduced the era of his disasters; and as M. Gamberra wished, above all things, to speak his mind as to Imperialism, and as Anxerre had been made famous by having Imperialism presched and praised there by its illustrians champion, the effect would be striking if it were also made the scene of as hitter a demonstration against Imperialism as M. Gamberra could divise. At Auxeria it also happened that there reigned a Prefect who owed his first rise in the world to the Government of the 48s of September, and M. Gamberra rightly calculated that an official would be basily bewildered by the sudden appearance of one of the patrons he had thrown over. The miscrable Prefect telegraphed, in an agony of anxiety, to Paris for instructions; but, happily, the Marshal and the Ministry of the Extension were engaged in honouring with their presence a wedding dinner, and before they could be got to attend to pusing ada, who had hear comprise her day with mixing some one hispox or unhappy for life little things of the country. The florest world had been country for the little little things of the country. But, florest world had been country. The florest world had been country.

unless he had had something really to say when he proportunity. But he had things to say which France will find it highly worth while to think over carefully. He hid to sketch and, so far as possible, to determine the policy of the Republican party; and he had to give a distinct challenge to Imperialism, and toll the country that, it did not wish to fall into the hands of Bonapartist intriguers, it must frankly accept the Republic.

M. GAMBETTA, like many other men who have made their mark in the world, has two distinct sides to his character. He is at once prudent and unpulsive. He can be patient and vigilant, can slowly mature his ideas, and can wait inactive until the hour of action comes. This was the side of his nature which he showed in his sketch of the Republican programme. He is also vehement, passionate, a thoroughly good hater, in short, thu fou firster of Matures's well-known saying. This side of his nature he displayed when he came to his invective against the Impermists; and it certainly is an advantage that when man wants to give a warning he should be able to give it in very plain terms, and that when he wants to curse he should have a natural turn for strong language and a fine. command of expletives. His Republican programme was the embodiment of Republican good sense. His party has two great obstacles to encounter—the alarm it inspires and the elements of which it is composed. To persuade trance that the Republic is a safe, steady, prosaic, honourable form of government, and to persuade his party that it must abandon the attitude of a functical narrow-minded clique, were the two things which M. CIAMBETTA was aware that he had to do if he wished to achieve a real success. . He himself, some little time ago, had added to the alarm which the name and recollection of the Republic inspire by a statement that new couches sociales had been formed in France, the existence and importance of which must be recognized. Fresh from the memory of the Commune, France was perfectly ready to own that the existence of new couches sociales had been revealed to it, but it thought that to keep them down with bullet and bayonet was a much better way of treating them than to bestow on them an admiring recognition. M. Gamberra saw how desirable it was that its. should give a satisfactory meaning to his well-known words. To ignore them would be either to confess that he had been wrong in using them, or to incur the suspicion that he was keeping something back, and hid a Red Republicanism in reserve behind the rose-coloured Republicanism which he was expounding. In the most natural way possible, and as if no one ought ever to have misuaderstood him, he shized a meaning to his utterances about new couches sociales which was not only inoffensive but reassuring. In the last twenty years material prosperity has, he said, placed wealth, or something like wealth, in hands to which it was formerly a stranger. The number of petty landowners has increased, and those who now own small place of land are creased, and those who now own small plots of land are better off than their predecessors used to be. It was these excellent, thrifty, intelligent proprietors, these sales men of small means, whom he begged leave to designate as new conches, sociales; and what he understood by retognizing them was merely that they sliculd be allowed and encouraged to manage their own affails, instead of having everything tions for them by a despetic Government that would allow them to associate thinking was actively with the progress of the nation; and a finite of government that allowed this was rist one of which my house man need be discussed. But if the Republic is to the the Government was the Republic in to the the Government.

han the old Republican party, with its principles s and its blessed memories of 1793, and its cast-iron ns—everything, in fact, that M. Gambetta believed As all-sufficient when he was the hero of the Government of the 4th of September. It must become the party carrying on, and practically fitted to carry on, the daily government of a country which is ashamed of much in its past, and afraid of much in its future. It must welcome all who are willing to join it. As M. GAMBETTA lately said in the course of a funeral oration, it must recognize that even such poor creatures as noblemen ought not to be totally excluded from public life. M. GAMBETTA has even gone so far as to mention names, and has selected the Duke of ACDIFFER-PASQUIER as an instance of the sort of man who must be invited to help in guiding the fortunes of a Republic, if a Republic is to be firmly established. This is a very new style of language in the mouth of a Republican leader, but it is as wise as it is new, and nothing could more tend to establish and confirm the importance of M. GAMBETTA's political position than that he should have been the first to recognize and insist on the necessity of enlarging the bounds of the party to which he belongs.

When the Empiror was at Auxorre he informed his delighted heavers that he had a debt to pay to the department of the Youne, as it had been one of the first to give him its suffrage in 1848, because it knew that its interests were identified with those of the EMPRIOR. He further assured the inhabitants of Auxerre that in their midst be could breathe at ease, as it was among the laborious populations and rural districts that he found the true genius of France. M. Clambett's strove to impress on the audience at Auxerre which he had audaciously taken by storm, that if the inhabitants of Auxorre had enabled the EMPEROR to breathe at case, he certainly had not returned the compliment, and had left them to breathe in a very uneasy manner a 1870. Of course M. Gambetta was not likely to let the Empleok have all the morit of praising people who dwell in small towns and country districts; and it was by their virtues and intelligence that his new couches sociales had, in his opinion, descrived to be cordially and handsomely recognized. But it throws some light on the intelligence of the conches sociales and of the laborious populations in which the EMPEROR found the true genius of France, to discover that one of the main difficulties with which M. GAMBETTA has to contend is that Bonapartist agents have undertaken to persuade the French pensants that Sedan was fought and lost after the 4th of September, and that this crushing defeat was entirely due to the scandalous incompetence of the Republican Government. It is impossible for the Republicans to encounter the Imperialists with their own weapons, for this is the biggest lie that could be told; and so the Bonapartists have got possession of the field of mendacity, which in a struggle of French politicians is a matter of very great moment. Will the French peasants, then, M. Gamberra asks, listen to the truth ? This is his last hope, but he does not affect to conceal that he is very much alarmed. Everything else is impossible, as he truly says, except democratio Cosarism and the Republic; and he except democratic Clesarism and the Republic; and he knows that the decision will lie not so much with the nation as with the group of wavering politicians who form the two Centres, and especially the Right Centre, of the Assembly. Will there be a dissolution or an appeal to the people by a plebiscite? M. Gambetta sees that, according as Marshal MacMahon is pressed by those who have his ear, to take the cone or the other of these alternatives, the Republic or the Empire, will be the issue; and, while there is yet time, M. GAMBETTA raises his voice and loudly calls on his countrymen, and especially on those who used to oppose the Second Empire, in the name of political liberty, to realize how easily force and intrigue may win, and the country be handed over once more to the wire-pullers of a system which has, as M. GAMBETTA thinks, plunged it in ruin and disgrace.

MR. ANDERSON'S MOTION.

TR. ANDERSON on Tuesday last confused two or three distinct issues in his speech and motion on the claims of British subjects arising out of the American way. In a clear and able statement Mr. Bounce showed that certein claims against the United States are not berred by the Washington Treaty or by the proceedings of the Commission, and that Huglish subjects who suffered by the ages of the

Alabama and other Confederate cruisers have no claim for redress at the hands of their own Government. apparently still no sufficient ground for hoping to have heard the last of the unpalatable subject of the Treaty and the Arbitration; but persevering members of Parliament, such as Mr. Anderson, may reasonably be expected to abstain from giving an exaggerated scope to a pervense decision. The allegation that "Great Britain had been "adjudicated to have been in the wrong in permitting the "escape of the Alabama" is inaccurate, although ? is possible that the arbitrators might have invented a new doctrine of international law to the disadvantage of neutrals if the English negotiators of the Treaty had not supplied them with new rules which, by a strained interpretation, cuabled them to award damages to the United States. members of the Tribunal not unnaturally assumed that they were expected to decide against a litigant who had apparently taken pains to render an adverse verdict possible; but even at Teneva it would have been difficult to argue that a nation had been in the wrong because it had not conformed to rules which were invented several years after the date of the pretended offence. Mr. Anderson praised the late Government for its prudence in submitting to arbitration on the trite and paradoxical ground that there is more true courage in yielding than in fighting. If courage is suc-cessively used in opposite senses in the two members of an antithetic proposition, nothing is easier than to show that it is best proved by a display of timidity; but it is not worth while to revive an obsolete and disagrecable controversy. The Treaty and the Award made it necessary to compensate American citizens for losses suffered through the acts of Confederate cruisers. The damages were assessed on evidence presented by the United States; and they were paid to the Government, and not to private claimants. The right to compensation was founded exclusively on international law as it was laid down and applied by the Geneva Tribunal. Only the two contending Governments could be affected by the reference or the award.

English owners of eargoes destroyed by the Alabama can have no possible claim to compensation from their own They were neither directly nor indirectly Government. parties to the Washington Treaty, and payment of their losses would amount to an admission of the absurd and popular American statement that the Alchama was really an English cruiser. They might indeed have probably sustained a claim against the Confederacy, which would have been supported by the good offices of the English Government. According to the ancient maritime law, neutral goods in an enemy's ship were exempt from capture; and if Mr. Bounks is right in saying that the Confederate Government was not bound by the rules annexed to the Treaty of Paris, Captain SEMMES committed a wrongful act in destroying English cargoes. The English Government would be morally liable for injuries inflicted by its vessels of war on private traders; but, as Mr. Bourke said, it would be absurd that compensation should be granted at the public expense for losses suffered through burglary or piracy. Colonel Muns, in seconding Mr. Anderson's motion, urged the House to deal with the question as one rather of national justice and equity than of law; but neither the Government nor Parliament is morally justified in applying the national funds to gratuitous benevolence. Mr. Anderson, as if for the purpose of inviting defeat, had framed his motion in the most offensive terms, when he reforred to "individual subjects who had suffered a severe "loss through a national wrong." No national wrong had, in fact, been committed; and at the worst it could only have been perpetrated against the United States. The shippers of goods in American vessels knew the risks which they incurred, and they must be taken to have looked to the Confederate Government for compensation on account of any injury which might be inflicted by its craisers. debtor has unluckily failed and disappeared; and it is idle to attempt to fix the English Government with the liabilities of a State which never even obtained recognition. Neither Mr. Anderson nor Mr. Bourne explained the nature Neither Mr. Anderson nor Mr. Bounks explained the nature of the assurances which were supposed to have been given to the shippers by the able and experienced Consul at New York. Mr. Anomando may pechaps have informed these who consulted him that neutral goods were legally example from capture; but he certainly mover guaranteed the example characters of international law by the Confederate efficient. There are attle constanding claims which affine not, according to the terms of the Treaty, be presented to the Committees which and at Washington. If seems that in

e discussions preliminary to the Treaty the United States Commi test as a rebellion, although their own Government and their courts of justice had for three or four years recog-nized the existence of a state of civil war. The English Commissioners had for once sufficient firmness to resist a pretension which was uttorly inconsistent with the block. ades and captures instituted and effected by the American navy, and which implied that those who dealt with the Considerates as beligerents were consciously abetting robe on. Eventually, the question was evaded by a substitution of dates for definitions; and it seemed good to the representatives of the United States to assume that peace had been restored on the 9th of April, 1865, when General LEE surrendered. For purposes of domestic litigation, the Government of the United States fixed the 20th of August as the date of the end of the war, and it happened that between April and August several English subjects suffered loss through military operations. Under the terms of the Treaty all claims of the kind were rejected by the Washington Commission, and perhaps the framers of the Treaty had hoped that English sufferers would be absolutely deprived of redress. If such was their intention in fixing the premature date, they may perhaps be disappointed. It is evident that the Treaty and the awards can only operate as a bar to claims which were preferred, or which might have been preferred, to the Commission. All previous and subsequent claims retain any validity which they may have originally possessed, and the Presi-DENT of the United States has recommended the appointment of a Court or Commission for the determination of all claims of aliens on the United States for losses suffered during the Civil War, or, as General Grant calls it, the insurrection. In his Message the President expressly states that there are English claims arising after the date fixed by the Trenty, and that there are also claims advanced by citizens or subjects of other Powers. A Bill has been introduced into Congress in accordance with the PRESIDENT'S recommendations, and probably some measure of the kind will shortly be passed. It would have been more convenient to have brought all English claims before the Commission; but any court which may be established will probably be as favourable to suitors as the mixed Commission. Even if Congress should fail to establish a special Court for the purpose, the claims will survive; and they will be pressed by all usual methods on the attention of the Government of the United States.

One among three classes of claims which were discussed by Mr. Anderson is already disposed of. The Government of the United States has successfully objected to compensate either aliens or American citizens for losses of vessels caused by the acts of the Confederates. Mr. Amberson may perhaps be justified in contending that the American Government would be liable if it were right in describing the war as a rebellion; but, in fact, the Federal authorities were powerless to protect property in the Confederate States; and it is scarcely to be expected that they should adopt the liabilities of the hostile Govern-The Commission has affirmed the immunity of the Federal Government; and it is useless to attempt to reopen the question. The hardships suffered by a foreign resident in a country which becomes the seat of war may deserve abundant compassion, but they are sometimes irremediable. There is some hope of redress from an established Government which may in the course of military operations destroy the property of a foreigner, but the loss is necessarily final when the Government which is liable has itself ceased to exist. Whatever may be the marits of the controversy, the English Government is bound by the judgment of the Commission. If it proves to be true that public opinion in the United States inclines to compensation for losses suffered by loyal citizens in the Confederate States, it is perhaps harely possible that by a liberal construction aliens also may obtain a share of redress. Some recent visitors to America have persuaded themselves that the better part of the community now feels a kind of removae for the violence and sharp practice which characterized the Alabama litigation. It is even conenaracterized the Alabama litigation. It is even conjectured that, when a fature dispute arises, the people of the United States will exhibit a good will and generosity which will undoubtedly surprise their opponents. If rependence both exists, and takes the form of pecuniary little of the Andreson's clients tray perhaps, after all, clients tray perhaps, after all clients tray perhaps.

THE ARMY.

NOTHING can exceed the prudence, the one anxiety to avoid grand statements, and the towards their late opponents, which the leading members the present Cabinet have shown since their accession to office. But the minor mambers of the Ministry cannot so quickly adopt what seems to them a perfectly newfangled, about, and un-Conservative way of talking and seting. They remember how very few months it is since they were encouraged by the most ominent party authorities to declare that the wrotched Liberals had mismaniged everything and hurried the country to the dogs. Mr. WARD HURT had to be quietly recalled to his senses and disciplined into barmony with the rest of the Cabinet by Sir Starporn North-The IRISH SECRETARY had his fling at the Land and Church Acts, which his friends had denounced as measures of spoliation, only to find that he must learn to throw the veil of official reficence over his feelings, and accept all the acts of the late Government as the basis on which he was to stand. More recently, Lord Eusrage Curt, choused by a meeting held to celebrate a Conservative triumph, and socing none but honest Conservative faces round him, funcied that he might once more talk in the dear old Conservative strain. He is now in office as Surveyor-General of the Ordnance, and it was therefore with extreme pleasure that he could at once pitch into the Liberals and seem to spoak with peculiar and official authority, when he rowed that the legacy left by the Laboral party was simply appalling whether his eager hearers looked at the recruiting, the brigade depôt centres, or the reserves; but he begged his friends to believe that a good time had come at last, and that Mr. Hager was not the man to countenance daminy regiments or plantom reserves. A few days later the Duko of Riemess had to speak on a military question in the House of Lords, and the difference between the tone of the House of Lords, and the difference between the sold of the leader of the party and that of the subordinate was comically great. Mr. Hardy, he assured the House, was far too wise to make any rash changes; all he could be said to have done at present was to study the elements of his new business, and he did not know whother any or what changes might ultimately seem advisable to him.
That a Conservative official should really have to examine impartially and carefully what a Liberal official has done is naturally inconceivable to an impulsive aspirant, but it is forced on his leaders, and is willingly accepted by them as the first of their new duties. Cantion in upsetting any existing arrangements without weighing the consequences of the course taken is, indeed, the general tone of both Houses of Parliament as regards the army and many other matters. Mr. M'Cullian Tomess's motion for an address to the Crown praying that all officers forced to quit the service should be entitled to claim a court-martial before obeying met with no acceptance in the Commons. common sense argument was insuperable, that the highest authorities must be trusted not to do injustice, and that, if the army is to be in a sound state, there must be some way in which incompetent officers or men who are doing barm to the credit and character of a regiment should be quietly got rid of without scandal or exposure. The temper of the times is not one which leads men high in office to bear unjustly on individuals. A more remarkable instance of this could scarcely be found than in the appointment and proceedings of the Royal Commission which has been inquiring so long and so patiently into the alleged grievances of officers in connexion with the abolition of purchase. Every officer has been allowed to have his say, and to exercise his utmost ingenuity in devising some mode more or less plausible of showing that he will not get all the money he ought, or would reasonably like, to get; and the War Office has interfered but very slightly, and has allowed the military arguments to produce such impression as they were capable of producing on the minds of the lay arbiters of the pecuniary destinies of the officers.

The occasion which drew forth the Duke of RICHMON'S remarks about Mr. Handy was a speech in which Lord Sandhuner had spoken strongly against the present system of recruiting, and declared that in his opinion the only remody was to abandon direct recruiting for the army altogether, and recruit only for the Militia, trusting to the Militia for the necessary supply of men for the Line. As every speaker who followed Lord Sandhuner was unfavourable to his proposal, and as the balance of argument is, we think, strongly against it, there is no practical danger of its being adopted. But the reasons which induced Lord Sandhuner to come to his conclusious

are worth considering, as they are the reasons of a man who has seen much and varied service, who thinks for himself, and says what he means. The question of the supply of men for the army is one, he said, which must cause apprehension, if not alarm, to every man acquainted with the facts. The recruits who are now procured are very raw lads. They are so young, and so unformed, that for two years out of the six for which they arree to serve they are until for real work. In old days we agree to serve they are unfit for real work. In old days recruits of this stamp did indeed join the army, but they were swallowed up in the number of old seasoned soldiers. Now they will form one-third of the entire force. Lord Sand-nurra acknowledged that, so far as India went, they did no real harm. Recruits are not sent to India under twenty, and although they have then but a short time to serve, they still have as long to serve as it is practically found that men can serve in so exhausting a climate as India. But for the general purposes of the service the men entered much too young, and were released much too soon. It is true that the men released are supposed to form part of the Army Reserve, but the Army Reserve is at present something of a sham. If the men belonging to it are called out for training, they come or not as they please, and as a rule they do not please to come. As an instance of this, Lord SANDHURST mentioned that last year a body of 450 men were summoned to the Curragh, and out of that number only 50 obeyed the summons. The only way, he nrged, to get men better trained, more seasoned, and more zealous was to draw on the Militia for recruits. The Militia finds no difficulty in getting recruits, or in getting recruits of a tolerably good stamp; and if the best and most adventurous of those so obtained would but enlist for the army, the whole problem would be solved. Even now there is some disposition on the part of Militiamen to enlist, but it might be very much stimulated if the right means were taken. What Lord Sammuss understands by the right means may be expressed shortly by saying that the men must be bribed with sufficient liberality. They should get a bounty on collisting, and a higher rate of pay. This might be expensive, but at any rate the nation, which is willing to pay for an army, would then get one in reality, and not in name. If any means of supplementing recruiting through the Militia is to be adopted, it is, as Lord Sandhurst said, to be found in imitating in the army the institutions by which lads are trained for the navy; and as the result had been so favourable for the navy, the experiment might be tried for the army too. But this was only a minor detail. The real proposal which Lord Sandurst invited the Peers and the Government to consider was that the Militia should be used to feed the Line, and that thus the evils attending two systems of recruiting in the same districts might be stopped, and the army supplied with the stamp of men it really

Lord CARDWELL naturally tried to make the very best of the system for which he is responsible, and declared that Lord Sandhusse's statements were overcharged, and that the picture he gave of the state of the army was much blacker than it need be. But the Duke of CAMBRIDGE did not treat Lord Sandhurst's allegations in anything like the same way. He quite admitted that the recruits now obtained were not what could be wished, that they were very young, and that it is a matter for very serious reflection that when the new system is carried out these very raw recruits will form a much larger proportion of the whole force than used to be the case formerly. He also acknowledged that the men of the Army Reserve ought to be trained much more regularly than they are; and all he could say was that as men are now discharged from the army at a comparatively early age, and encouraged to embark in the various employments of civil life, it is very hard to get men to leave their employers to come to be trained, and equally hard to get the masters to employ men who may be required to absent themselves at an inconvenient time. But the Duke of CAMBRIDGE was as much convinced as everybody clse who took part in the debate that it will never do to look to the Militia as the sole source of recruits for the army. The men who are willing to serve in the Militia are, as a rule, quite a different class from those who are willing to serve in the Line, to be absent from their homes for years, and encounter the dangers of war and varying climate. There are many men who like a little soldiering, a few weeks of variety in a dull life every year, an opportunity of seeing friends and acquaintances, even the education of discipline and enforced obedience. But

they like this because they can get it near home, and know that it must come to an end within a short and defiaite time. Nothing again would tend to destroy the efficiency of a Militia regiment more inevitably, or to dishearten its officers, than if the best men were constantly bribed to leave it and seek service in the army. The Militia might thus easily cease to be efficient, and yet after all the supply of men might fall very short of what the army needs. Lord Sandhurst has therefore no prospect of seeing his suggestion adopted; but he nevertheless has done useful work in calling public attention to the weak point in our present system of keeping up the army. What is to be the remedy it is as yet too early to say. The Duke of Cambridge wisely said that we must go to work very slowly, and not bewilder recruits or those who think of becoming recruits by fresh changes, unless they are shown to be absolutely necessary. One thing, however, is obvious. If we have to make further changes, to strive to get a better class of men, and to offer them greater inducements to join and stay in the army, we must spend more money. Military reform, we are afraid, to be worth anything, means increased military expenditure.

SPAIN.

THE absurd story of a renewal of the Honenzollern candidature for the throne of Spain was probably suggested to an ingenious French journalist by the appointment of a German Minister to Madrid. It is possible that the nomination may have no importance; but if it implies a recognition of the Spanish Republic, or rather of the a recognition of the Spanish Republic, or rather of the Regency of Marshal Serrano, it is perhaps not unreasonable to infer that Prince Bismarck is influenced by some political motive. Up to the present time the German Government has, since the beginning of the French war in 1870, carefully abstained from interference in Spanish affairs. A naval officer who took possession of a Spanish ship which had been seized by the Carthagena rebels was presented disappeared and the sensedron was from that time promptly disavowed; and the squadron was from that time exclusively employed in protecting the lives and property of German subjects. Since it is quite certain that, not-withstanding the later fiction of a design to substitute Prince FREDERICK CHARLES for Prince LEOPOLD, Prince BISMARCK has no desire to try a second dynastic experiment, it has been conjectured that he may perhaps wish to obtain the aid of the Provisional Government of Spain in his designs against the Pope. Although diplomatic pressure might in some contingencies be used in connexion with the domestic struggle against Rome, it is difficult to understand how the German Government could derive any support from Spain. Marshal SERRANO and his colleagues are not unfriendly to the Church, which is threatened only by the Republican party. No moderate Government which is likely to be established at Madrid will add to its difficulties an unnecessary quarrel with the clergy, and the German Chancellor will certainly not ally himself with the extreme democratic faction. The difficulties of Serrano's Ministry, though they have been diminished by the recent successes in the North, are numerous and perplexing. The Carlists, though they have been compelled to abandon the siege of Bilbao, are still active in the field; and Marshal CONCHA has not been able to report any fresh victory since the return of SERRANO to Madrid. The pecuniary embarrassment is, as usual, hopeless; and the Government of Madrid has thought it necessary to warn the newspapers against publishing any criticisms on the financial proposals of the Government.

It may be assumed that an insurrection which has taken place in the province of Cadiz has been promoted by the extreme Republicans. No other faction, even if it were equally unscrupulous, has for the present any motive for appealing to force. The supporters of Don Alfonso, who may perhaps form a majority of the whole population, would prefer that their candidate should have time to attain full age; and they expect to accomplish their purpose by the aid of the chiefs of the army, though the latest rumour to the effect that Marshal Serrano had determined to summon the Cortes, and to proclaim the Prince under his own regency, is probably apocryphal. The Federal Republicans had no hesitation in profiting by the extreme need of the Government of their own choice to acquire local independence, although they were fully aware that they were a better excess for rebelling against the present Government.

from which they can expect neither sympathy nor favour; but, on the other hand, insurrection is now more dangerous than in the days of FIGUERAS and CASTELAR. The numbers and discipline of the army have been to a great extent restored, and Marshal Skenano may confidently rely on the fidelity of his troops. It might almost seem that the anarchists, who were last year accomplices of the Carlists, are now discoved to facilitate the restoration of Management at person of Don Alfonso. In Spain, as in France, the reputable Republic is constantly endangered by the unscasonable stray of the faction which takes Donald now disposed to facilitate the restoration of Monarchy in the gy of the faction which takes Republicanism in earnest. AB a speech by GAMBETTA, followed by the election of a demagogue for Paus, overthrew M. THIERS, and established Marshal MacMahon's Government, it is probable that one or two Federalist risings in Spanish towns might accelerate the probable fall of the Republic. When all the enemies of society call themselves Republicans, the respectable and timid part of the community are easily tempted to forget that there may be other Republicans who have no propen-sity to general plunder or bloodshed. There is fortunately nothing to fear for the tranquillity of Madrid. General Payia performed the valuable service of disarming the rabble which had been foolishly provided with weapons on the establishment of the Republic. The patriots who over-awed the Cortes, and who compelled Serrano to fly in disguise from the capital, are as malignant as formerly, but they are for the present powerless. A considerable part of the Northern Army accompanied or followed SERRANO to Madrid, and it is probable that Marshal Concua, who has now his headquarters at Vittoria, could despatch further reinforcements if they were required for the defence of

If temporary Governments, such as those which have for some time past existed in France and Spain, become common in Europe, it will perhaps be necessary to modify the rules which control diplomatic relations. The English Government, after the abdication of King AMADEO, declined to recognize the Republic, not on the ground of any objection to its political form, but because the new system was uncertain in duration and dubious in character. Government which was established by the Federal Ropublicans was soon succeeded by the popular dictatorship of Castelar, until the Cortes dismissed the Ministry, to be themselves immediately expelled by a judicious soldier. The Ministry which derived its title to power from the confidence of General Pavia afterwards assumed constituent authority by converting its chief into a President of the Republic. Marshal SERRANO may for the present fairly doom himself a legitimate ruler, as he possesses the confidence of the respectable classes and of the army; but no English Minister has yet been accredited to his Government. Mr. LAYARD, according to the custom in similar cases, continues to reside in Madrid, and to transact business more or less formally with the Ministers. If he were to resign his office, there might be some difficulty in appointing a successor without according formal recognition to an indefinite and temporary Government. It has nevertheless happened that on more than one occasion serious discussions have arisen between the English Government and successive Spanish Ministries. The correspondence on the capture and restoration of the Almanza and Vittoria ended in an amicable settlement. The graver controversy raised by the execution in Cuba of the prisoners taken on board the Virginius has not yet been brought to a conclusion. There could be no doubt that both Señor Castelar and his successors strongly disapproved of the conduct of the colonial authorities; nor could they, without compromising the national sovercignty, disclaim responsibility for the acts of their subordinates. The proceedings were in themselves absolutely indefensible in law and in morality, for the English sailors and passengers were free from complicity in the designs of the owners of the vessel; and the capture was effected beyond the limits of Spanish jurisdiction. The correspondence between the English and Spanish Governments is still incomplete. In March, Señor Sagasta excused himself from giving a definite answer to Mr.
LAYARD on the ground that the affair had occurred under a previous Administration, and that he had not yet had an opportunity of examining it with due deliberation. Two months later, Lord DERRY not unreasonably expressed a hope that, after the success which the forces of the Government had achieved in Biscay, an answer to the remon-tances of England would not be much further delayed.

English Government has from the first declined to dis-cuss the legality of the capture of the Virginius, which formed

the principal subject of the dispute between Spain and the United States. Lord Granville and his successor have confined themselves to the contention that the British subjects on board could in no case have become liable to capital punishment. Even if they had been piretes, a court-martial would not have been the proper tribunal to take cognizance of their crime, and it would be abourd to suggest that they were rebels against a Government with which they had no connexion. In this case the outrage on humanity was more criminal than the violation of international law. The procrastination of the Spanish Government can only be attributed either to an inveterate habit of delay, or to conscious inability to punish delinquents who are supported by the popular feeling of an insubordinate colony. It is possible that Marshal Serrano and his Ministers may be waiting to ascertain whether General CONCHA, now Captain-General of Cuba, is able to assert his anthority over the mutinous Volunteers. The civil war or insurrection seems to have lately become less formidable, and it is not known that any other rebel leader has succeeded to the position and influence of Caspedra. It is an embarrassing but indispensable duty to impress on the Spanish Government the necessity of satisfying just demands which have been preferred in the most friendly spirit. At the beginning of the dispute with the United States, Señor Castelan proposed that the whole matter should be referred to the arbitration of England. Lord Granville properly replied that the question was not such as could be decided by arbitration; and that, in any case, England as an offended party was disqualified for the part of arbitrator.

THE ARCHBISHOPS IN COMMITTEE.

THE surprises which the Angunismors have in store for their bowildered flocks will never cease. Their Bill has taken up exactly three debating nights in the House of Lords, and it has already gone through three transforma-tions in its essential features. On Thursday, under the bland chaperonage of Lord CAIRNS, the Archbishop of CANTERBURY and Lord SHAFTESBURY were made partners, and the Ecclesiastical Judge for all England, whom the latter has so long and hitherto so fruitlessly been re-commending for Parliamentary acceptance, stopped commending for Parliamentary acceptance, stopped bodily into the Bill. We cannot, however, say that the present arrangement was effected without some little hitches, which may as the measure advances show that to steal a march is never the highest, and often proves not to be the most successful, statesmanship. The Aremishers rushed into legislation in complete ignorance of the feelings of the institution over which they preside; they have discovered that they do not carry the Church with them, and their object has become to herry on their measure before they shall be compelled to own their error. The Archbishop of Youk for a few moments almost acted the part of candid friend towards his metamorphosed bantling. In its former shapes (he forgot to say how many they were) it had been a gentle, fatherly proposal for winning back stray sheep by sweet monitions and loving deprivations; it was now a fragmentary and incomplete measure of Church discipline, and he mally almost felt tempted to vote against it. As for the idea of paying the new Judge out of the funds of the Ecclesiastical Commission, the ARCHBISHOP'S heart bled for the poor incumbents who would be thereby muleted. Paid the Judge must be, but the payment must come from the nation, of which, as he forgot to say, those very incambonts are taxpayers.

But the most touching manifestation of feeling came from the Archbishop of Canterbury. Lord Salisbury had thrown out a hint that this new Judge might be appointed by the Crown, and not, as proposed by Lord Shartesbury, by the two Primates. Thereupon the Archbishop not only professed his steadfast adherence as a Churchman to old principles, but he became very tenderly solicitous for the consciences of the many clergymen of the land who might be scrupulous in taking their law from a Judge who did not owe his authority to an ecclesiastical source. Lord Bath rather aptly pointed out that similar feelings at some earlier stage of the Bill might have been more to the point.

There can be little doubt that a Provincial Judge after the model of the one described by Lord Shartesburk would be an important element in a complete reform of an ecclesiastical Judicatory. But the patched and re-

patched Bill of the Archberos is no such reform, and the accident of a good idea having been struck out in the course of debate gives another reason for a wise delay, by showing that principles which might underlie the change are not so difficult to find. In the meanwhile the Archberos are not yet out of the wood of the Committee. When it meets again it will have to decide whether the Bishop shall still have power to refuse entertaining frivolous saits. Lord Shapesber, in his profound distrust of all opiscopacy, abstract and concrete, says No; but here we must quite part company with kim. The discretion may or may not be indiscreetly or capriciously used; but it will be powerless for anything but to check litigation, and so privad facie can hardly fail to be beneficial. On the other hand, the question of the monition holding good pendente lite is yet unsettled, and as even according to Lord Shapesbury's edition of the Bill the grievance may arise after a decision of the Provincial Judge, which will be formally published as the Bishop's Judgment, we hope that it will not slip through.

that it will not slip through.

Lord Selicitie was slow to recognize that his project of governing the Church by spontaneous monitions from the Bishop's Palace had been demolished by Lord Cains, but we do not suppose that he will find many more discussion over a clause proposed by the Bishop

Theremonature to which the Chargellon has unof Petersonough, to which the Charcettok has unaccountably given his patronage. The Bishop seems to have been struck by the feeling which is growing up in every direction for a revision of the rubrics, and a measure of toleration for various schools of worship; and he proposes accordingly to discount it by singling out one practice—standing before the table at the Communion office—to which High Churchmen attach importance, and four or five others which are dear to the Low and the Broad parties, and, as Lord Caurs puts it, "neutralizing" them as to penal consequences. We are astonished that two men of such intellectual power as the CHANCELLOR and the Bishop of Peter-sonough could imagine that the powerful feelings which are necessarily generated where religious bodies in any considerable numbers discover a common need could be allayed by so restricted a compromise. I Besides, the practical working of the clause would be far from favourable to the very parties for whose benefit it is supposed to have been devised. The inclusion of a few exclusion of all other practices, and the Church Associ-ation would in all probability indemnify itself for the security which the High Churchmen enjoyed as to the position during the Communion service by attacking customs and decorations which have become generally acceptable with the national growth of artistic perceptions. After the Excter decision nothing is now really sufe which may possibly offend any Barrones. Besides, as the law now stands, the ultima ratio of threatened reprisals is a very wholesome rod in pickle; but the Bishop has so worded his exemptions as to relieve that which in a happior moment he himself dubbed the "Persecution Company, Limited," from even this fear. Lord Cains did not leave the subject without introducing a further element of confusion by voluntarily offering to throw the Athanasian Greed into the clause, and so stirring up again into fierce flame a controversy which had so recently and with so much difficulty been appeared. He justified his line by absolutely acouting the idea that there could be any revision of its own rubries and canons by the Church of England. "The idea that in our days it will be possible "to arrive at any alternative for a settlement (sic) of the "rubrics appears to me to be out of the range of pro"bability." To say this seems to us to be tantamount to saying that the Church of England is a dead Church. But, as saying that the United of England is a dead United. But, as we believe it to be a living Church, we must entirely disagree with the Lord Charcellor. Even the Archbishop of Carterbury was explicit in saying that, if the Crown gave its power to Convocation to undertake the task, he would himself heartily co-operate. Why not at heart try? The experiment will only cost the time of the active agents, and we cannot believe that it will be grudged.

M. LEDRU ROLLIN AND UNIVERSAL SUFFRAGE.

THE presorical failure of M. Ledru Rolling is on the whole an advantage for the Republican party in France. These were two kinds of success which is seemed.

possible that he might achieve. He inight have spoken with all his old fire and eloquence, and employed his undiminished powers to reproduce the Socialist enaggrenations with which his name has been especially associated. Or he might have spoken feebly, and yet shown that age had given him sense and calmassa, if it had deprived him of energy. In the former case, the damage done to the Republican cause would have been very great. Its one hope of victory lies in its maintaining that character for moderation which during the existence of the present Assembly it has on the whole borne. In the latter case there would have been an excuse for regarding M. LEDBU ROLLIN as the leader of the Left rather than M. GAMBETTA, and M. GAM-BETTA is sufficiently suspected by the extreme wing of his followers to render this a far from improbable event. The funatical Republicans have so far profited by experience that they are not likely to reject his guidance so long as to do so would be to inflict an obvious injury on the prospects of their party. But if they could have argued that M. Ledau Rollis is as prudent as M. Gamberta and at the same time a more genuine Radical, they might have ventured into open revolt. The speech actually made by M. Ledru Rollin disposes of both these hypotheses. It was very violent, but it was very weak. It showed no appreciation of the actual state of the question upon which it was delivered. There is a great deal to be said against the proposal to limit universal suffrage, but exceedingly little of it was said by M. LEDBE ROLLIN. In addressing a sovereign Assembly it is of no avail to deny its right to limit the franchise under which it has been elected. Universal suffrage cannot be more sacred than other primary constitutional facts, and if the Assembly is technically competent tutional facts, and if the Assembly is commeany competent to decide between Monarchy and the Republic, it must be competent to pass an electoral law. Indeed, on M. Leder Rollin's theory, there never can be a new electoral law after universal suffrage has once been established, because the general commission to pass laws for the good of the country under which every Legislative Assembly acts cannot authorize any limitation of the body by which the commission was originally given. We may even go further and say that on this principle no Reform Bill can ever be valid. If representatives elected under universal suffrage must not be parties to depriving those whom they represent of electoral power, the same rule will apply to representatives elected under a limited suffrage. But to double the numbers of a constituency is to deprive the old voters of electoral power quite as effectually as to reduce a constituency by half. Therefore, the existing franchise must never be modified, except on the improbable supposition that the holders of it directly instruct their representatives to alter it in this or that particular sense.

There was truth in what M. Ledeu Rollis said about the danger of re-establishing select and excluded classes of citizens, but it was too much mixed up with commonplace generalities to make any impression upon the Assembly. The deputies on whom this sort of reasoning might have some useful effect are the moderates of the Right Centre, but the doctrinaire Republicanism of M. Ledeu Rollin is so distasteful to them that the argument loses all its force when it comes from his lips. No man of any skill in Parliamentary strategy would have told the Orleanists, who, even in defeat, hold the balance between the two sides of the Chamber, that when the Monardhy of King Louis Philipps fell, "all France" declared that the Government of Contempt had fallen under the blows of the Revolution of Contempt." The Orleanists have every right to represent the Republicans with being the authors of much of the mischief that followed upon the Revolution of 1848. If they had only waited, they could in the end have forced Louis Philipps's Government to concede all the essentials of liberty, and France might have enjoyed under a Constitutional Monarchy that tranquil freedom which she is now striving against so much opposition to enjoy under a Constitutional Republic. The mistake of which the Orleanists have lately been guilty is that they do not see that the adjective in these two phrases is of more importance than the substantive, and that Constitutional Monarchy and the Constitutional Republic are really different forms of the same thing. In 1873 the Constitutional Republic was in possession of the field, and their two policy was to help in organising and consolidating it. But in 1848 the duty of the Republicans was equally plain. Constitutional Monarchy was to the field, and their two policy was to the field, and their two policy was to the field, and their two policy was to the field.

them to admit this openly; for Republicans, especially French Republicans, have to beer a burden of infallibility which, by preventing them from confessing a blunder, prevents their adversaries from forgetting that they have made one. But it was not necessary to reopen the subject. There is no immediate connexion between 1848 and 1874, and men who return to political life after an absence from it of at least a quarter of a century ought at least to let

bygones be bygones.
Times' Corr Times' Correspondent gives the substance of a speech delivered in the train by a hitherto silent deputy, for whom he predicts great success whenever he makes his appearance in the tribune. This gentleman considers that the prediction that revolt will follow upon the suppression of universal suffrage is a mere invention of Republicans and Imperialists, and that the best thing the Royalists can do is to prove by suppressing it that the nation cares nothing about universal suffrage. "The country desires no better than to be freed "from that responsible burden the universal vote." Certainly if any one has foretold that an insurrection will immediately follow upon the suppression of universal suffrage, there is every chance that he will be proved a false prophet. But this is not the form which the prediction has usually taken. There is very little doubt that so long as Marshal MacManon remains at the head of the Government and can count upon the support of the army the Assembly may limit the suffrage as it chooses without running any risk. But in the end there will come a time when the country, grown weary of a provisional order of things, or alarmed at the approaching restoration of a Legitimist and reactionary Monarchy, will once more be attracted by the vision of an orderly and prosperous democracy which will be held out to it by the partisans of the Empire. We, the Bonapartists say, can offer you overything that the Royalists offer, with universal suffrage into the barcain. Under no Governuniversal suffrage into the bargain. Under no Government was France ever more tranquil than under the Government of Napoleon III., and the secret of his success was that he showed no distrust of the French nation. There was a minority opposed to him, but its strength was accurately known, because, instead of constituting an unknown quantity, as under a restricted suffrage it must do, it was free to express itself at the poll, and could be told vote by vote. Under a Royalist Monarchy peaceful citizens will be continually anticipating insurrection. Under a Republic they will be continually in fear of licensed disorder. The Empire supplies a guarantee against the first in the breadth of its popular basis, and against the second in the traditional vigour of its administration. It can afford to be resolute, because it knows that it is popular. There is just that amount of truth in this way of putting the case which is needed to make the presentation plausible. The Bonapartists are obliged for consistency's sake to vote against the electoral law, but in their hearts they must be its warm friends. The nameless deputy quoted by the Times' Correspondent objects to universal suffrage because it is the embodiment of the "everlasting strife between him who has and him who has "not." But he who has not is not banished from the country when he is banished from the political system of the country. He remains within call, and it is to him that the invitation of the Imperialists will come with so much force. If there were no organized and unscrapulous party to bid for his support, the whole question of electoral reform might be argued from a different starting point, and worked out to a different conclusion. But the presonce of such a party is a fact which cannot be ignored in speculating upon French politics. Whatever happens, the Bonapartists upon French politics. Whatever happens, the Honspartists will be on the watch, standing ready to profit by every alip of their opponents, and to make use of every instrument which they may reject. To give them the restoration of universal suffrage by way of a bait to attract popular favour would be to put into their hands a weapon which, four-and-twenty years ago, they need with wonderful success, and which, for anything that appears to the contrary, may still be found to possess its old potency.

THE PROTECTION OF BRITISH SUBJECTS.

TIME date of protecting English anbjects in all parts of the world, and aspecially in impensionly similarly countries, is at the same time impensions and tumble.

only provoke retribution on special occasions. nary circumstances a traveller in Africa pursues his adventure at his own risk, and even remote Asiatic potestates have sometimes murdered Englishmen with impunity, Regular European Governments for the most part deal with foreigners on recognized principles, although it becomes from time to time necessary to remonstrate with Spain for unjustifiable severity inflicted on the orews of vessels suspected of snuggling. The half-civilized Republics of South America profess to observe the rules of international law; but the ignorance or violence of their official agenta has a constant tendency to provoke collisions. The outrage inflicted on an English Vice-Consul in Guatemals see to have been the act of a drunken rufflan, whom his superiors will not attempt to protect from the consequences of his conduct, though they are themselves primarily responsible for the opportunity which he derived from his official rank of perpetrating a monstrous out-The Government of Gautemala will probably be allowed to settle the matter by due compensation and by the punishment of the delinquent. At the same time, the comparatively respectable Government of Chili has blundered into a violation of the simplest rules of international law. The master of an English vessel partly named by a Chilian crew had incurred shipwrock, attended with loss of life, by, as it was alleged, overloading and unskilful seamanship. After an inquiry into the case, which resulted in an unfavourable judgment, Captain Hype sailed for England with a passport which authorized his departure, but on the arrival of the packet at another Chilian port, he was arrested and taken to prison on the charge of having caused the death of some of the seamen who had been lost. It is still uncertain whether he has been released, and whether the Chilian Government has tendered due apology and compensation. The English Minister to whom the matter had been properly referred by the Consul had shown due onergy in protesting against the progularity, and it may be hoped that demands which are demonstrably just will not fail to be conceded. Some Chilian newspapers have taken the opportunity to bluster about the dignity of an independent Republic, and the failure of the Spanish Government under O'Donnett to make any impression on the defences of Chili and Peru. It may be presumed that the Chilian Government will be more reasonable when it is satisfied that the action of the subordante authorities is wholly indefensible.

The dectrine that a merchant ship on the high seas is exclusively subject to its national jurisdiction has been again and again affirmed by competent tribunals, and by the general assent of Governments. Even if Captain Hype, instead of being merely charged with negligence or incompetence, had committed at sea any crime short of piracy, he would not have been liable to question in any foreign court. Only two or three months ago the Spanish Government surrendered the Deerland, which had been captured on the open sea with a cargo of military stores intended for the use of the Carlist insurgents. If the Carlists had been acknowledged as belligerents, and if a blockade of the Northern ports had been established, the seizure would have been lawful; and there is a certain anomaly in the immunity enjoyed by neutral vessels which are really acting as auxiliaries in a civil war. In a choice of ovils it has been thought desirable to limit as closely as possible the right of interference with foreign vessels; and it is evident that England, as the greatest maritime Power, would be interested in the extension rather than in the restriction of rights of scarch and seizure. The Spanish Government conceded with little hesitation the exclusive jurisdiction of the Government to which a vessel exclusive jurisdiction of the Government to which a vessel on the open sea belongs. The claim of the Republic of Chili to punish an English master of a vessel for alleged misconduct at sea is far less plausible than the capture of the Deerhound. The Liverpool Police Courts have repeatedly declined to take cognizance of complaints against American captains preferred by seamen. A failure of justice frequently occurs when offeness have been commissed at eas; but it is presumed that the national tribunals will in all cases he competent to discherge their detice. in all cases be competent to discharge their duties.

The propensity of subcasinate functionaries, and even of petty devernments, in outlying regions to infringe the privileges of English subjects may sometimes be attributed to pursuant or local judiculus, and not unfrequently to a false nation of diguity. It is said that the Company by which Captain Huss had been employed is disliked by

native shipowners, probably because its operations are skilful, successful, and profitable not only to the capitalists concurred, but to the country in which they conduct their operations. It must be pleasant to fasten on such a mis-fortune as the loss of an English vessel through mismanagement, and to exhibit the salutary rigour of the native judicial procedure; but the Chilian Court might as well inquire into the causes of a railway accident in England as into the supposed misconduct of an English master of a into the supposed misconduct of an English master of a vessel on the high sens. If, indeed, the ship had been sunk in Chilian waters, the local jurisdiction might possibly have attached. The allegation that the ship was improperly loaded in a Chilian port is too remote. No indictment has ever been preferred in an English Court against a foreign captain on the ground that his conduct in English waters may have contributed to the subsequent loss of his ship outside the jurisdiction. The circumstances of Captain Hype's case raise a presumption of official or judicial irregularity. The arroat which was arranged after a passport had been issued arrost which was arranged after a passport had been issued was probably procured through some indirect influence; or perhaps it may have been extorted by popular clamour. The plausible proposition that natives ought to be equal with foreigners before the lawmay have been hastily affirmed without regard to the condition that foreigners must in the first instance be within the jurisdiction. It is not perhaps at first sight obvious to the general understanding that a ship is a floating part of the country to which she bolongs. The fiction is suspended while a merchant vessel lies in a foreign port, or revive as soon as she recommences her voyage and gains an offing. The accidental presence of Chiling spilors on board the shipsy weeked presence of Chilian sailors on board the shipwrecked English vessel may perhaps have been supposed to affect the question of the criminal liability of the captain; but foreign sailors on board an English vessel are subject to English law, although they may possibly boat the same time within the jurisdiction of their own courts.

In the absence of special and local knowledge, it is impossible to appreciate the motives which may from time to time induce petty States to provoke little conflicts with foreign Powers. A President or a Minister in need of a revival of popularity cannot do better than in displaying his patriotism and his indifference to consequences, which can indeed always be averted by timely concession. It is well known in Chili as in other parts of the world that England greatly dislikes even the smallest quarrel if it can reasonably be avoided. It is not exactly, as warlike journalists hint, from four of Chili, but from unwillingness to resort to force, that the English Government will greatly prefer to obtain satisfaction by diplomatic methods. In the meantime the champions of the dignity of the Republic will be rowarded with the applause of their partisans, and the ultimate apology and the damages paid to the injured party will perhaps excite little attention. If the Governments of South American Republics attended exclusively to the interests of the communities which they represent, they would perhaps hesitate, not so much to offend foreign Powers, as to disturb the confidence of merchants and money-louders. The prosperity of the Spanish Republics depends largely on the resident English traders, and on the There is firms at home with which they are connected. also from time to time a loan to be negotiated on terms which are more or less easy in proportion to the character of each State for tranquillity and justice. The compousation which will be paid to Mr. MAGEE for the Guatemala outrage will probably come out of the pockets of the bondholders in the first instance, but it will hereafter increase the rate of interest on future loans. Prudent capitalists will not lend money, except at usurious rates, to States which persistently misunderstand the rules of international Collisions would be much more frequent if every dispute were referred to arbitration instead of being settled directly or indirectly by an appeal to force. The experience of Geneva has fortunately discredited the contrivance which had formerly been so much favoured by philanthro-pists. It will not be left to a Swiss arbitrator to rule that English Vice-Consuls ought to be flogged, or even that English captains ought to be tried by foreign courts for acts done on the high seas.

division has been taken on Mr. FORSTTH'S amendment. which would have made the hour 12 in the metropolis, and the amendment was rejected. We should feel no hesitation in deciding against Mr. FORSTTR's argument that "people could obtain within the theatres all the "refreshment they required." Already it may be suspected that some theatres are kept open mainly with a view to the sale of refreshments within their walls; and it is clearly not desirable to encourage a style of entertainment which degrades the drama into a mere stimula it to tippling. Again, Mr. FORSYTH proposed that the later hour should be allowed only within a limited area around Drury Lane, but this would not meet the demand which Mr. Locke preferred on behalf of the patrons of the transpontine theatres. Mr. Cross stated that since the Act of 1872 the number of "occasional licences" had largely increased, and we may be tolerably sure that it is inexpedient to maintain a law so stringent as to require perpetual exemptions. Mr. Cross further stated that "there was a good deal of illicit drinking going on in "London," and upon this point it may be supposed that the Home Secretary is well informed, particularly when his statement agrees with antecedent probability. But, after all, Parliament must place some confidence in Government, and when the Home Secretary declares that, being responsible for the peace of London, he could not recommend closing public-houses at 12 o'clock, there ought to be no further question about the matter. As regards uniformity of the closing hour for beer-houses and publichouses, that was chiefly a question for the police, and nouses, that was chiefly a question for the police, and if they see their way to grant it, nobody else is concerned to object. Sir W. V. HARCOURT, who affirmed in a former debute that Licensed Victuallers did not supply victuals, has, with a laudable desire for accurate information, employed persons to make inquiries, and he finds that "beds, chops, and steaks" are not to be procured at gin-palaces. If he had instructed his emissaries to seek "beds" at beer-houses the quest might perhaps have been successful. In tenth however the perhaps have been successful. In truth, however, the business of victualling is carried on by both classes of houses, and Mr. Menty stated that in a district well known to him some of the beer-houses are clubs of working-men which certainly deserve as much liberty as is allowed to public-houses.

As regards the hour of opening, it will be 5 o'clock in the metropolis, and for clock in towns generally and in the country. There is much to be said in favor of Mr. Sandrond's proposal to make the hour 5 o'click everywhere, and Mr. Cross seems to admit that a later hour can only be maintained with the mitigation of special licences at harvest-time and similar occasions, which we think objectionable. In connexion with this point we may mention the system of "allotments," which was formerly a favourite hobby of philanthropists. At this time of the year a man might work at his allotment for an hour or two before going to his regular employment, and if he desired to do this, he would find a pint of beer agreeable, and perhaps necessary, at 5 o'clock or earlier. Employers of labour will probably object to allotments and to early beer, but legislation cannot be conducted wholly from their point of view. Upon this question, however, it is desirable to look at facts, and therefore we will quote one or two cases which were actually submitted to magistrates at Brighton, and in which an extension of hours was asked for and refused. The keeper of a beer and coffee-house stated that he had had an average of one hundred customers between 5 and 6 o'clock, and that he always had hot coffee ready for them. Another man in the same busiready for them. ready for them. Another man in the same business stated that from fifty to sixty working-men sometimes came to him between 5 and 6 o'clock; some would take coffee, some tea, and some beer, and he always kept coffee, tea, and eatables ready. The holder of a wine and spirit licence wished to open, as he had been used to do, at 4 o'clock for the convenience of the market people, whose principal refreshment was tea and coffee. To these and other applications the same answer was returned, that the uniform hour of opening must in future be 6 o'clock. We mention these cases because the details of them happen to be before us, and they are probably fair THE LICENSING BILL.

THE LICENSING BILL.

THE LICENSING BILL.

The Licensing both public-houses and been houses are likely to be fixed at 12,30 in the metro-stroyed, particularly when we consider that wholesome polic, at in towns generally, and 10 in the country. A drinking water is immentably scarce. We would submit

that these cases show that paternal, or rather maternal, government has been carried far enough.

Much has been said about the use by the Hons Sucre-TARY of "confidential information," but we can easily under-stand that everybody has not the courage of the "borough "authority" of Bradford, who openly states that grocers' shops "afford facilities for secret drinking by females, who "have been known to obtain drink and have it charged "the groceries in their account." We should think that between grocers and "females" the "borough authority" who is known to have made this statement would have a who is known to have made this statement would have a lad time of it. Again, the "borough authority" of Bridgenorth states that spirit-drinking has increased, especially among the women, and this is possibly owing to the grocers. In the city of Chester there has been "some "little increase of quiet drinking." The Mayor of Coventry "is of opinion that females purchasing spirits should "not have less than a full bottle," and he evidently makes this suggestion in the interests of sobriety. He is under the impression (but in this he must be mistaken) that grocers retail as little as half a pint, "which appears to be an evil to the housewife when pur-"chasing her grocery for the week's consumption." The borough authority" of Deal has the audacity to assert that " women have been known to obtain spirits at the "grocer's and have it placed in account as grocery to de-ceive their husbands." Of course this sort of fraud could Of course this sort of fraud could be perpetrated more easily with half a pint than a quart. Another "borough authority" thinks that "grocers should "attend to their own trade." The Mayor of Dunstable thinks that many women would buy spirits at a grocer's who would not be seen entering a public-house. We are who would not be seen entering a public-house. We are glad to hear that in Exeter the lower classes generally prefer beer to spirits. The "borough authority" of Gateshead thinks that "females are much tempted" by spirit grocers generally, but in that borough only two shops of that class exist. From Halifax we are informed that spiritdrinking has increased; but the class of persons using grocers' shops would not be likely to frequent publicgrocers' houses. From Kendal it is reported that drinking amongst women has increased. From Liverpool a statement comes which for the size of the place is important. There has been a large increase in spirit-drinking, and this is partly due to the sale in grocers' shops and to the shortened hours on Sunday. There has been an increase since 1872 of fifty-five spirit-grocers, and the total number is now seventy-nine. We cannot help thinking that this statement justifies the apprehension that restriction may not always mean reform. People provide themselves against Sunday and the early closing of houses of entertainment by a private bottle. From Newcastle-upon-Type an equally unsatisfactory statement is transmitted :--" Many persons are found in a state of intoxication, having " in their possession small dram-bottles sold by innkeepers. This case must not be credited to the grocers, but the same remark applies to all these cases. They do not prove that restriction of hours does harm, but they suggest that it may do less good than has been expected.

We necessarily write in ignorance as to how the Committee will deal with those amendments which apply to grocers. But we do not hesitate to express the hope that Parliament will not carry the restrictive policy to an absurd and impracticable extreme. The "borough autho-"rities" have been invited to express their opinions whether grocers ought to be placed "on the same conditions as to magisterial approval as other licensed "houses." We should say that substantially this has been done already by the Act of 1872, which requires grocers selling spirits to obtain from the licensing justices "a "licence authorizing such sale." It is true that the same Act provides that such licence shall not be refused except on certain specified grounds having reference to the character or conduct of the applicant. But it is hardly credible that the Home Office could seriously contemplate carrying the matter further than this. A licence may be refused to a house selling liquor "to be drunk on the premises," because the magistrates may think that such house is not required. This practice, however open to theoretical objection, has become established: But it would be a startling novelty to propose to apply the same rule to shops selling lights for home consumption; and if it were applied to gricers, it might with equal reason be applied to those who sell wine and spirits as their sole besiness. It would come in fact to this, that the magistrates of Liverpool must decide whether seventy-nine persons should divide among

themseives a valuable trade, or whether competitors should be introduced into it.

On the whole, we do not think that the restriction of hours, provided it be not carried to an inconvenient extent, will do much good or any harm. We are glad to observe that the publicans and beer-house keepers parceive that shorter hours would be for their own advantage. We think that any restriction which is admitted to require numerous exceptions to make it work had better be abandoned. We do not expect that any possible restrictions will restrain the bettle trade in spirits, and we should not be greatly surprised if a few years' experience produces a reaction against restrictions generally. We do not suppose that the publicans will be greatly affected by Sir W. V. Harcour's demonstration that the present Government are, after all, not so very much their friends. They will look not only to what is done, but to the way of doing it, and they will observe with satisfaction that Mr. Cross has a prudent reluctance to enunciate broad principles.

RATEPAYERS AND COMMUNICANTS.

THE Dake of Argylli's speech on the Scotch Church l'atronage Bill is remarkable both in itself and for the criticisms which it has suggested. It shows among other things how little the late Government understood that public opinion on ecclesiastical matters of which they were in a great measure the creators. It is true that Mr. GLADSTONE and his colleagues " never hesitated to express "their opinion that the measure for the disestablishment of "the Irish Church was founded on the special conditions of "Ireland, and afforded no precedent for a similar measure in respect of England or of Scotland." But it is evident that some at all events of the Ministers did not feel sure how this opinion would be regarded by their followers. "The atmosphere of the "late "Parliament," says the Duke of Argyld, "was unfavour-"able to Established Churches." It would be nearer the truth to say that it was supposed to be unfavourable to Established Churches. The Dissenting wing of the Liberal party had formed an exaggerated estimate of their own strength, and they succeeded for some time in imposing that estimate on the Government. The Duke of ARGYLL'S advice to the leaders of the Scotch Church is evidence of this. When he bade them "avoid coming to Parliament," he probably had in his mind the inconvenience which he thought would result to the Liberal party, as well as the inconvenience which he thought might result to the Church. He must have made the same speech in substance as he made on Tuesday, and by that means influential supporters would have been alienated, and the threatened schism between Liberals and Dissenters precipitated. When reasoning in this way the Duke of Assyll overlooked the impossibility of averting that schism in the long run, and the consequent unwisdom of alienating those who might have been retained in the effort to retain those who were certain to be lost. If he had said in 1872 what he says in 1874, a good many Liberal members might have been offended, but a more than corresponding number of Liberal electors might have been conciliated, always among those who maintained that the impression that the late Government was prepared to yield anything to the Nonconformists, provided that the screw was turned tight enough, was altogether ill founded; but there can be no doubt that the impression was largely entertained, and that it had a most disastrons effect on the fortunes of the Laberal party at the general election. If it had been generally believed that in the opinion of the Government there was "nothing connected with Liberal" politics in a general policy of decatablishment," one great cause of distrust would have been removed. It may be true that in the late Parliament "all questions relating to the connexion between Church and State were in a "state of chaos"; but the chaos was in part attributable to the unwillingness of the Government to offend the Dissenters by speaking its mind. The Daily News considers that the Duke of Arcyll's speech "marked the point at "which the Liberal party of the future will be found to take "farewell of the Liberal party of the past"; and describes latter as merely holding to "Liberalism in politics," while the former hold in addition to "Liberalism in the "relations between Church and State." This is one of the many signs which show that the Nonconformista have entirely missed the lesson of the Liberal disaster. If the Laberal party of the future is to take farewell of the Liberal party of the past in the sense of making the doctrine of Disestablishment an indispensable note of true Liberalism, it may take a long farewell of power at the same time. If the late Government had understood this more clearly, the political history of the next ten years might have been different from what it is likely to be.

The particular point which has moved the Daily News to part company from the Duke of ARGYLL is his desire to see the right of patronage in the Scotch Church given to com-municants rather than to ratepayers. "Herein he sur-"rendered the whole principle upon which the State "Church of the modern political world rests its claims, and "fell back upon the State Church of Ecclesiasticism and of medieval pretence." Large historical generalizations are edged tools in political discussion, and the writer of this last sentence has hardly appreciated the distinction between modern and mediaval Churches. The Duke of Argyll maintains that in modern societies "a bishop or a minister is not " the bishop or minister of every man in a diocese or parish, "but only of those who choose to come to him and who " require his ministrations." It might have been thought that in a country where there are more seets than dioceses, and where every man is free to use the ministrations of a bishop or to leave them alone, this came almost too near a truism. The Daily News, however, has fully justified the Duke of Arayll's repetition of it. So far is it from being a truism, that it appears to an important English newspaper a mediæval protonce, a theory worthy of "the Roman Church of " HILDEBRAND." It is well for the writer that he did not live in Hilderstand. It is well for the writer that he did not live in Hilderstand's time, and feel moved to tell him that he was the bishop only of those who chose to come to him and who required his ministrations. Probably the ministrations most required in that case would have been the last sacraments. The mediaval view of a State Church was exactly the view which the Daily News supposes to be modern - a Church "which never is closed, never can be closed, "against anybody." No doubt at that time another idea was included in the definition, and the State Church was also a Church outside of which no one was allowed to re-But this did but exclude still more completely the notion that it was a matter of choice whether a man should avail himself of a bishop's ministrations. Nor is it only upon the State Church of mediaval times that the Daily News is in confusion. It is equally so as to the State Church of modern times in countries other than England. Among us it is possible by a sort of legal fiction to say that the Established Church is "a public institution to the that the Church is "a public institution." "the benefits of which and the concerns of which are to "be freely open to all classes of the people." But it is not Possible to say this in France or Germany. In France the religious recognized by the State are all in their several ways State Churches, but, except in the sense that they are all glad enough to receive converts, they are not open to all classes of the people. In Germany the concerns of the Evangelical Church are not open to the Roman Catholics, and the present contest between Prince BISMARCK and the Ultramontanes would hardly have been possible if the Roman Catholic Church had not in a sense been established. The only rational idea of a State Church in lished. The only rational idea of a State Church in modern times is that the majority of the nation, finding it convenient to appropriate certain parts of the national property to religious uses, make this appropriation to one or more particular religious bodies. In this country the majority prefer to give all to one. In France and Germany they prefer to give part to one and part to another. The notion of these Churches controlling or being controlled by the whole population of the country is really a survival from the time when citizenship and churchmanship were identical. If it when citizenship and churchmanship were identical. If it has lingered longer in England than elsewhere, that is merely another instance of the antiquarianism which is so marked a characteristic of English legal ideas.

As regards the particular question which has raised this controversy, the substitution of ratepayers for communicants, besides nullifying the whole scope and purpose of the Bill, would be an act of positive tyranny. So long as citizenship means churchmanship, there is no injustice in giving all citizens the rights, whatever they may be, which the Church allows to her lay members. But when citizenship no longer implies churchmanship, when, as is said to be the case in some parts of Scotland, the majority of the inhabitants belong to bestile communions, this attribution of an ecclesiastical virtue to the payment of rates becomes worse than unmeaning. Why should Romas Catholics or Episcopalians or United Presbyterians have a voice in the presentation to

and the 🕺

livings in the Scotch Established Church? If their choice is to be restricted to clergymen of that Church, the privilege is one which they are not fitted to exercise, for they probably know nothing of the candidates; and as they will not avail themselves of their ministrations, it is also one which they cannot care to exercise, except as a means of spiting their neighbours of the Established Church. If, on the contrary, they are not to be thus limited, but may present clergymen of their own religion, this is nothing less than the substitution of a local for a national establishment. Roman Catholicism might become the State religion in one Scotch parish, the Free Kirk in another, and the Scotch Episcopal Church in a third. This might be a change for the better in the Scotch ecclesiastical system, but it would be a strangely complete revolution to be introduced by a mere amendment into a Bill of which the object is to strengthen the Establishment in its present shape.

ROYAL DUKES.

A NOTHER son of the Queen has received a seat in the House of Lords, and there has naturally been the usual kind of talk in the papers. And not the least notable thing in the matter is the piece of advice given by the Times to the Duke of Connaught that, though he has become a Duke, yet he is not to do what another Duke may do; that, though the law gives him certain powers, he must take care not to make use of them; that, though he becomes a member of the Lapislature with a right to speak and vote in one House of Parliament, yet he must not think of voting there, while other members of the same body freely may. We are not going to discuss the practical wisdom of the advice; that is quite another matter. We are going only to meditate a little on the singular state of things which it really is when a may he has just been clothed with new rights and new powers can, to say the least, without manifest absurdity, be at once cautioned to abstain from all use of the rights and powers with which he has just been clothed.

This state of things, like many other things in this country, has come of itself; it is not the result of any formal enactment; for it would be hard to conceive a law for-hidding a man to exercise his legal rights without taking those legal rights from him. It is one of the cases in which a conventional understanding almost as strong as law has gradually grown up. The Duke of Connaught a few days back was a commoner eligible to a seat in the House of Commons; now he is a peer with a seat in the House of Lords. But it would certainly be thought strange, most likely it would be called "unconstitutional," if he were to take to the career which is open to other members of the Houses of Lords and Commons. It would not be thought the thing for a son of the Sovereign to take, as any other member may if he can, a leading part in the delacts of the House, to hold a place in the body which practically administers the government, or to take a part among those whose function—no less constitutionally recognized—it is to look out for the errors of those who administer the government, and to take their place if they can. But no law hinders him from doing these things; if the Puke of Connaught should stand forth, as the Black Prince did, as a Parliamentary leader, a chief of Opposition, the foremost among the champions of reform, he has exactly the same legal right to do all this as the Black Prince had.

The change which makes it impossible for the Duke of Connaught to do with general approval what the Black Prince did—a change which therefore makes it impossible for him to do it at all—comes very naturally from the changes which have taken place since then in the condition of the kingly office itself. But it comes from them combined with certain other influences, of quito another kind and coming from quite another quarter, but which have practically fitted in with those changes in a most remarkable way. The changes which made our sovereigns what is now understood by the words "constitutional monarchs" are all of native growth, and every change has implied some lessening of the real royal power. But side by side with this process, the Continental notion of a royal family, as something altogether distinct from the nation, a notion which had its root in the extremest notions of royal power, came in along with the Hanoverian dynasty; and the two things, so utterly opposite in their origin, starting from principles the most hostile to one another, have been found in practice to work well togother. A royal family there has indeed been from the beginning, a family out of which in an earlier stage Kings were chosen, and whose members in a later stage have succeeded to the crown according to rules marked down by law. Two members of this royal family, the eldest son and the eldest daughter of the reigning Sovereign, have actual rights and privileges bestowed by the law. The rest have, like the children of peers, a barren precedence only. The eldest son is a peer by birth; the other members of the family are not peers or anything else, unless the King chooses to do for them what he may equally do for any other of his subjects.

not peers or anything else, unless the King chooses to do for them what he may equally do for my other of his subjects.

It is plain that this is something very different from the modern popular notion about "royal" personages. The use of the name "royal" at eace shows the difference. It shows, for one thing,

how utterly the notion of the kingly office, as an office, is forgotten, how it has been lest in the rotion of the hereditary explication of a single family. Nothing is more common than for a visit from a subject to be called a "royal" marriage. This means of course that the persons spoken of are some or daughters or other near kinsfolk of a King or Queen. But that does not make their doings "royal." They are members of a royal failly, because they are members of a family which exclusively supplies Kings, but they are not "royal" themselves. No one would call a visit from a Duke's son or daughter a "ducal marriage," or the marriage of a Duke's son or daughter a "ducal marriage. But he might quite rightly speak of a "ducal family," that is, a family which supplies Dukes, a family one member of which at a time is always a Duke. Why is there this difference of usage? To call a visit from a person who is not a King or Queen a "royal visit" is of course a vulgarism which ought to be left to the penny-s-liners. But the fact that any people at all talk about a penny-a-liners. But the fact that any people at all talk about a "royal visit," when they would not in the analogous case speak of a "ducal visit," has causes which are worth thinking of. The cause is just this, that, exalted as Dukes may be, they and their children do not form a class which is absolutely cut off from the rest of the world. There are others whose rank comes so near to theirs that they do not stand by themselves as an absolutely dis-tinct class, but at most as a class within a class. They freely intermarry with other people; they need not be spoken to with bated breath; they are not necessarily "attended" by some one wherever they go; they are not said to "honour" people by dining with them; their doings, public and private, are subject to free discussion. In short, they are still ordinary human beings, though they may hold the first place among ordinary human beings. But the "royal" personages are really, in popular behaf, something more than ordinary human beings. They are "royal"; that is in fact they are treated as if they were themselves kings and not subjects. It is forgotten that the difference between the king and the highest of his subjects is really wider than the difference between the highest of his subjects and the lowest. That is to say, the kingly office is forgotten; that which separates the crowned and anointed king from all who are not crowned and amounted is lost in the King from all who are not crowned and ancieted is lost in the notion of mere exalted hereditary rank. While the children of a Ang from all who are not crowned and mointed is lost in the notion of mere exalted hereditary rank. While the children of a Duke are never mistaken for lukes, while their doings are never called "ducal," the children of a King are practically mistaken for Kings, and their doings are called "royal."

It must of course not be forgotten that, though reverence for

nembers of the royal family has certainly grown stronger, though members of the royal manny has certainly grown stronger, though the distinction between them and other people has certainly grown wider within the last hundred and fifty years or so, yet it would have been equally a sign of what we mean if it had merely stayed as it was. For all other distinctions have got fainter and fainter. It is now thought an honour to "attend" on —in plain words to be a servant to—a "royal" Ducke or Duchess. No one thinks it an honour to "attend" a Ducke or Duchess who is not royal. Now we would not see that there was a time when is not royal. Now we need not say that there was a time when men of any rank thought it an honour to "attend" men of the rank next above their own. When a nobleman had gentlemen and knights in his own service, it was not wonderful that he should himself not disdain the service of a King or even of a King's son. The remarkable thing is that, while the service of rank to rank has died out in all other cases, it has lived on in this. We suspect that the distinction has in some points grown positively stronger; that the distinction has in some points grown positively stronger; but even if it has not, it has practically grown strafger by remaining the only distinction. While the royal family was once merely the highest stage of many according stages, it now stands by itself, parted from all below it in a way in which none of the lower stages are parted from one another. Or perhaps we should say that it is the highest stage but one which has gained, while the highest of all has lost. When we call the doings of the Etholing "royal," we certainly exalt the Ætheling at the expense of the King.
We have said that two opposite causes, at least two causes

springing from opposite sources, have joined together to bring about this state of things. As the personal authority of the Crown scomes less and less, as royalty becomes more and more of a constitutional abstraction, it follows almost naturally that the homnge paid to the sovereign will become, if not greater in degree, at least different in kind. The less real authority the sovereign has, the more does he become a person whose sayings are not to be contra-dicted, whose acts are not to be criticized. For the conventional dicted, whose acts are not to be criticized. For the conventional system of a constitutional monarchy takes care that the sovereign that can be contradicted or do snything that can be contradicted or do snything is a mere puppet. What Ammianus said mockingly of a deepot and his favourite may be said more gravely and in a better sense of as King who is not a despot. Constantius was eaid to have a good deal of influence with the chief of the enuachs, and, in a better sense, a sensible king may have a good deal of influence with a sensible king may have a good deal of influence with a sensible kings who really ruled often did, to oppose or dispute with any of his subjects. No modern king is likely to be told by one of his Earls, "By God, Sir King, I will neither go nik hang." But that is because no modern king is likely to say to one of his Earls, "By God, Sir Kan, you shall either go or hang." The greates the King sursonal power, the more sure his acts are to be fully conversed and condemned. The more the King retires from the exercise of personal authority and the conflicts which it brings

with it, the more he withdraws into a region beyond cancure and criticism. He thus gets surrounded by a halo of reverance which with it, the more he withdraws into a region beyond consure shift oritioism. He thus gets surrounded by a halo of reverence which does not spring directly from his office, and which can more easily extend itself to those about him. While the King was a personal power, his sons, if they thought good, took a leading part in public sifairs. As a great nobleman started in public life with a great advantage, a King's son started with a greater advantage still. And it was not at all thought to be his duty to further to make use of that advantage, any more than it was the duty of the nobleman. As the King has more and more retired from the peaconal exercise of power, it has more and more come to be held that the business of his sens is to held alouf from the practical work of public life, and to keep themselves for purposes of show. The process has been gradual. There is a marked diffurence between the position of the sons of the present Queen and that of the sons of George the Second and George the Third. But the position of the sons of George the Second and George the Third. But the position of the sons of George the Second and George the Third differs yet more widely from the position of the sons of Edward the Third and Many the Fourth. No prince of the House of Brunswick has been the acknowledged leader either of the Minstry or the Opposition in either House of Parliament. Both positions—or what answered to them in those days—were held by Kinga's sons in the fourteenth and lifteenth centuries.

This is one years but as we have said it has been strongthered. and fifteenth conturies.

This is one cause, but, as we have said, it has been strongthened by an opposite cause. The Kings of the House of Brunswick brought over with them a number of notions about the greatness of royal and princely families, and the wide distinction between them and the rest of mankind, which had never before been heard of in England. A change come in these matters when the descendant of the Welfs succeeded the granddaughter of Lard descendant of the wens increased the grandlingnor of Lara Chancellor Clarendon. The change in nonenclature was an outward sign. Englishmen were taught, but only gradually, to talk of "Princess" Early and "Princess" Caroline with tongues which had been used to the Lady Mary and the Lady Anne. The thing reached its climax, not so much in the so-called "Royal Marriage. reached its climax, not so much in the so-called "Royal Marriage Act" itself, as in the feelings which led to it, and in the popular interpretation put upon it. The common, though mistaken, eaving —practically refinted by the good sense of our present Queen—that neither the King nor any member of his family can "marry as subject" marks the full separation of the royal family from the rest of the world. The practical lessening of the royal power renders it practically convenient that members of the royal family should abstain from that prominent part in public affairs which was once open to them as to other people. The new Continental once open to those as to other people. The new Continental notion festered the notion that there was something, not as our fathers held, in the regal office, but in the mere royal blood, which made its owner something of a different nature from other men. Opposite in their origin, the two dectrines worked well together, and they have pradually led to a state of things in which nobody is surprised that, when the Queen's son is clothed with rights and powers which he had not before, he is at once warned that he must not think of using these rights and powers as other holders of them may.

Another incidental cause has helped in all this. For nearly three centuries "royal" personages were so scarce in England that it was no wonder that, when they began to be more common, people began to look upon them as a distinct class from other people. All through the sixteenth and seventmenth centuries the royal family consisted of very few members; sometimes, as in the reign of Elizabeth, there could not be said to be any royal family at all. Between Henry the Fourth and George the First six sovereigns only were the fathers of a Prince of Wales, two of them, it may be noted, were the fathers of two Princes of Wales. And in all that time Charles the First, as Prince of Wales, and James the Second, as Duke of York, were the only sen or brother of a King who had ever the opportunity of playing any part in affairs. The rost either died young or succeeded young. Through the whole sixteenth century there were crowds of people who had contingent claims to the grown, but they were not people whom anybody would have called royal. The "royal family," as a working institution, really takes a leap from the son of Henry the Fourth to the son and grandson of George the First-sis it too bitter a serceou to say, from John Duke of Bedford to Frederick Prince of Wales? Between these there was only a prince or a princess now and then. It was no wonder then that, when the "royal family" began again, they started on quite new terms. And after all, no one has ever tool us what is the royal family. No one has yet been further off the reigning severeign than first cousin. The status of the more Dukes of Connaught may not die out an soon as the lines of so many other royal dukedoms have died out. But we should greatly like to know—it is not the first time that we have put the question—what the son of a younger son of the present Duke will be called. Unless the reigning sovereign specially bestows some rank or title on him, it looks very much as if he will come into the world without even a surmane, and will be nothing at all till he becomes a Christian or otherwise obtains a pronomen.

people than the French Ministerial crisis. The fact is indisputable. Many people during the past week have taken more interest in the health of a dozen racehorses than in the food-supplies of the Indian population. Any trifle which touches us personally will naturally, and within certain limits rightfully, engage our attention much more decidedly than the greater events which have little direct influence upon our affairs. And, moreover, the Chamouni question, though it certainly is a small one as compared with the political interests of a great country, is one which really deserves some consideration. The valley of Chamouni has not a large population; but within its narrow limits we may observe the development of a process which affects the happiness and morality of a very large number of people. The article in the Times gives the most obvious view of the question as it presents itself to the British tourist; but it requires modification before we can accept it as accurate. The writer, indeed, begins with a remark calculated to shock our faith in the intimacy of his knowledge. "Although," he says, "politically Chamouni has ceased to be Swiss, it continues to be the climbing capital of the country." Many people talk of Chamouni as now forming a part of Switzerland; and we may congratulate the writer on his having discovered that dectrine to be erroneous. As he pursues his researches he may possibly discover that it never was in Switzerland, but formed part of a certain region not unfrequently mentioned by historical and geographical writers under the name of Savoy. We he may possibly discover that it never was in Switzerland, but formed part of a certain region not unfrequently mentioned by historical and geographical writers under the name of Savoy. We are afterwards told that, "in an evil moment," the authorities betook themselves to that organizing "of which the French are so fond," and formed a Company of guides. However fond the French may be of organizing, the Chamouni Company had been formed long before Savoy was a French province, and in the good old days when the traveller encountered the gendarme on the aummit of the Forclaz, he was pretty certain, if he was a mountaineer, to have a difficulty with the chef guide at Chamouni afterwards. The Chamouni Company is much more like an English Trade Union than a specimen of French organization. In most Alpine districts the same system has been more or tion. In most Alpine districts the same system has been more or less adopted, though circumstances have given a special prominence to this particular association. The result of the annexation to France was simply that a new code of rules was imposed upon the Chamouni guides, partly in deference to certain appeals from the Alpine Club; and these rules are very much more favourable to travellers than the previously existing regulations. In the old days, as people not very old can distinctly remember, it was next to impossible for travellers to ascend Mont Blanc without a little army composed of four guides and four porters, who were taken by rotation from the roll of guides just as they are at the present time. The energy of a few travellers who found a way up Mont Blanc for themselves, and who introduced guides from other districts, broke down the old monopoly to a considerable extent, and the new rules sanctioned their innovation. At the present and the new rules sanctioned their innovation. At the present day, a large category of persons, including, for example, all members of Alpine Clubs and travellers who have made difficult expeditions, are exempt from the rules altogether. They can take what guides are exempt from the rules altogether. They can take what guides they please, and as many or as few as they please. And therefore, so far from the excessive French organization being at the root of so far from the excessive French organization being at the root of the ovil, the action of the French régime has been to relax the rules of which so many complaints have been made, and, indeed, if paper regulations were always effectual, would have removed every possible ground of objection. And yet it is, we fear, undeniable that the character of the guides has steadily deteriorated, and that whereas, twenty years ago, Chamouni men enjoyed the highest reputation throughout the whole of the Alps, they are now rarely taken by the most experienced travellers even for their own mountains. The aspiring mountaineer would tind half a dozen better men in one little village near Meiringen than ha half a dozen better men in one little village near Meiringen than he could find on the whole of the Chamouni roll. The protective system of the Chamouni cannot, therefore, be fairly charged with the whole of the evil, for the evil has increased contemporaneously with the relaxation of the old restrictions. It is desirable that this should be clearly understood, inasmuch as the misconceptions implied in the Times' article go very far to suggest changes in an entirely wrong direction.

If, then, it should be asked what is the root of the evil, the answer is not far to seek, and indeed is partly indicated in the Times article. The great influx of travellers to Chamouni has had many bad effects upon the character of the people. They have been corrupted by the reckless expenditure of money by thought-less tourists. A man can earn a hundred france by an ascent of Mont Blanc. Now, though the Times' article blunders again in assuming that the ascent of Mont Blanc is always easier than that of the Finsternarhorn or Matterhorn, it is undoubtedly a very simple matter in fine weather and under favourable conditions of the snow. Under other circumstances it still is and always must be one of the most dangerous mountains in the Alps, because the most exposed. Still the temptation to make what is a large sum for a poor peasant by a couple of days' very moderate labour is considerable. A large number of the more able-bodied men are siderable. A large number of the more able-bodied men are therefore tempted to hang about Chancouni for the purpose of drawing a prize in the lottery. An able-bodied man who hangs about a village full of ima has very obvious temptations, and it is unpleasantly common to find that the porter whom you have engaged for a day's expedition has palpably spent the night in a highly feative spirit, and is apt to collapse suddenly on a snow-slope after three or four hours' climbing. This particular av't is indicative of a number of ways in which the chance of earning a large sum acts projudically on the character of

the people. They are encouraged to prey upon tourists instead of trusting to regular labour, and have invented a number of devices for plundering the unsuspecting traveller which would be amusing if the consequences were not serious. Under such influences, which are sufficiently notorious in aimilar cases, the cardless ences, which are sufficiently notorious in similar cases, the cardless expenditure of hurrying tourists, many of whom only come once in their lives for a few days, and know no more of the population than a railway traveller knows of the guard of his train, has converted a large number of the people into drunken idlers. It is lamentable that this should be so, and the more lamentable because it is not very easy to see the remedy. The Chamouni people are by no means without their virtues; they are generally honest, if honesty means abstinence from direct cheating; and they are civil and good-tempered. Still they form a kind of tacit confederation for extracting the maximum from the receives of their visitors at the maximum from the pockets of their visitors at the extracting the minimum of labour for themselves. In the German-speaking districts of the Alps the same evils are to be found; but in those districts there are certain counterbalancing advantages. The people are more independent and more enterprising. Guides take more trouble to qualify themselves for their duty by distinguishing themselves in difficult expeditions. New inns are built for the accommodation of travellers, and greater comforts provided. The cunning but cautious Chamouniard is content to keep up his old dirty taverns at the Montanvert and elsewhere, and to make profit by the simple system of exorbitant charges; and the guides seem disposed to take advantage of the increased demand for their services, not by improving themselves as mountaineers, but by taking it more easily and asking the same price. Whether evils of this kind can be removed by any new regulations or by the action of the Alpine Clubs is not a very simple question. Certainly there is not much hope that the mischief will be cured, as the *Times* seems to anticipate, in the course of a season or two, or by a new code of rules. Still something may be done, and Alpine Clubs, especially the French Club which has been recently founded, may encourage whatever good tendencies exist amongst the people.

The proposals which have been recently made by the English Alpine Club are well meant, and it may be worth while to point out their nature. The regulations of the Chamouni Company are, as we have said, very good upon paper. The much-abused system of rotation is not, we must remark, so objectionable as is sometimes suggested. For ordinary purposes, that is to say, for about ninety-nine expeditions in a hundred, it is by far the most convenient plan. For the ordinary tourist's walk one guide is as convenient plan. For the ordinary tourists walk one guide is as good as another; and the alternative to a system of rotation is simply a system of touting. An average tourist in other districts takes the man recommended by the innkeeper, or, it may be, the man who has waylaid him by the road. In Chamouni he takes the man according to his place on the roll; and it is no small comfort that he is therefore free from the importunities of the loafers who frequently beset him in the Oberland. So long as admission to the Company is confined to competent men, there is admission to the Company is confined to competent men, there is little ground for complaint; and the Chamouni regulations declare that no man is to be admitted who has not undergone a searching examination. But, it is said, travellers who attempt difficult expeditions should be able to select the best men. This, too, though the *Times* does not seem to know it, is amply provided for in the regulations. If travellers cared to exercise their privileges, they would be enabled to pick and choose the most experienced guides at would be enabled to pick and choose the most experienced guides at pleasure. Of course when a traveller who has never seen a mountain before wants to have the glory of ascending Mont Blanc, he is generally ignorant of his rights, and takes the first man sent to him who happens to be in order for service. But such travellers would be equally incompetent, and would in all probability be as badly served, if there were no regulations at all, and if they consequently trusted to the innkeeper or to chance. The Alpine Club, therefore, has not proposed the abolition of the regulations, but has asked for securities that they may be carried out more according to the spirit. The examination, it is said, is worthless. Practically anybody is admitted who wishes to be admitted, and the consequence is that the Company of guides has been swamped by all the idlers and ineffectives in the valley. The root of the evil, so they suggest, is in the election of the chief guide by the general body of guides. He becomes dependent upon his constituents, and unwilling to offend anybody by enforcing regulations strictly. The examination has thus become a mere farce; and the chief guide is quite as likely to be a man who has been a popular tavernkeeper as a is quite as likely to be a man who has been a popular tavernkeeper as a man with any real knowledge of his profession. The Club, therefore, proposes that the chief guide should be appointed by some superior authority, and so placed in an independent position. Further, in order to facilitate the exercise of some discrimination by travellers, they propose that the guides should be divided into two classes, according an that have on have not sufficient aversiones of difficult area. ing as they have or have not sufficient experience of difficult expeditions. The discrimination would clearly impose an invidious duty upon the authorities, whose independence is therefore all the more necessary. Finally, it is suggested that by some device, such as keeping a register of expeditions easily open to inspection, the traveller should have some means of knowing what has really been done by the men whom he employs. This want is in some degree met already by the book which every guide has to carry about him; but a public register would doubtless enable the traveller to see more easily who were the available persons for employment. These proposals, whatever their result, are not opposed, it may be observed, to the French "love of organizing." They are designed to make the organization more efficient, and are directed in favour of centralization, as opposed to self-government. It would be absurd to suppose that they strike at the root of the evil. Indeed they ing as they have or have not sufficient experience of difficult expe-

could not produce any great effect without the intelligent cooperation of tavellers themselves. So long as people are content
to undertake an expedition which may involve very serious risk
to life without examining the antecedents of their companious, it
may be feared that the unintelligent demand will be met by a
supply of very poor quality. And this remark suggests that
travellers should be impressed as much as possible with a sense of
their duty towards the population which they treat so carelessly,
and so frequently corrupt. The extravagant liberality displayed
both by chance travellers and by enthusiasts who have a superstitious belief in the virtues of their pet guides does much to demoralize the people. We may, however, admit that the proposed
changes are simed in the right direction, whatever their efficacy.
They aim at proving to the guides of Chamouni that it is worth
their while to become really competent members of their profession. If they are capable of taking the lesson, they may regain
the reputation which has now departed from them; and we earmestly hope that they will show themselves amenable to reason.
There are still some good men amongst them, and we would hope
that there may be enough to form a nucleus for the growth of
a sounder public opinion.

FEMALE SUFFRAGE.

THE article on "Female Suffrage" which Mr. Goldwin Smith has written in Macmillan's Magazine is a weighty declaration of opinion against a party with which on other questions the writer has been, and perhaps still is, allied. Mr. Goldwin Smith still maintains in theoretical politics the language of an advanced Liberal, although on the practical point with which he deals he is omphatically Conservative. He has been to the United States, and has seen and heard the advocates of woman's rights, and thus he has been led to decide against them. We care little whether his arguments in support of this decision be good or bad, as no argument on the other side will mitigate the fact that he was induced to declare against female suffrage by the diagnat which he felt for its supporters. He has seen, and, having seen, he ought to know. Mrs. Woodhull and her allies, who are merely names to us, are formidable realities to him. The very moderation of his language adds force to the condemnation which he delivers. It is alleged, he says, that female influence would mitigate the violence of party politics, but he thinks that both reason and experience of party politics, but he thinks that both reason and experience of the revolt of the Commune, the women notoriously rivalled the men in fury and strocity. The same was the case in the late American Civil War. What has been the effect of public life on the character of the women who have thrown themselves into it in the United States, says Mr. Goldwin Smith, the grievance of which most is heard is the tyrannical stringency of the marriage tie, which, it is alleged, gives a man property in a woman, and unduly interferes with the freedom and genuineness of affection. "Some of the language used is more startling than this, and if reproduced might unfairly prejudice the case." Almost all English men and women would be startled at this language, and would be likely to decide the case against the side which uses it. Indeed the impression which one gets from reading reports of speeches of

It may perhaps have occurred to Conservative leaders to rejoice when they meet a young and ardent Radical, because experience shows that he is excellent material for making a middle-aged Tory. In the same way the consistent opponents of the late Mr. Mill must think it fortunate that Mr. Goldwin Smith was at one time numbered among his followers. Next to his contact with female politicians in America, the reading of Mr. Mill's Autobiography has had the greatest influence in deciding him against the views which Mr. Mill advocated. He states that he once aigned a petition for female household suffrage got up by Mr. Mill, and he proceeds to explain how he has changed his mind. "He had not, when he signed the petition, seen the public life of women in the United States." It would be difficult to increase the force of this simple statement. Indeed the frank and ingenuous character of the whole article, while it ought to protect the writer from the taunts of the party he has joined, adds cogency to its condemnation of the party he has left. He tells us that Mr. Mill's Autobiography has gevealed the history of his extraordinary and almost portentous education, the singular circumstances of his marriage, his hallucination as to the unparalleled genius of his wife, and peculiarities of character and temperament which prevented him from appreciating "the power of influences which, whatever our philosophy may any, reign and will continue to reign supreme over questions of this kind." Here, again, we cannot but admire the gentic force of Mr. Goldwin Smith's style. We have heard that an enthinsistic admirer of Mr. Mill expounded his views of society from the hustings to a rustic audience, and grovaked a commentary equal in force, but far infarior in elegance

to that of Mr. Goldwin Smith. We may, indeed, safely leave Mr. Mill where Mr. Goldwin Smith has placed him. If Mr. Mill's authority is taken away from the movement for female suffrage, there is no substantial support left to it, and Mr. Mill committed a sort of intellectual saicide by writing his own life. "To him," says Mr. Goldwin Smith, with involuntary but trenchant satire, "marriage was the union of two philosophers in the pursuit of truth; and in his work on the position and destiny of women, not only does he searcedy think of children, but sex and its influences seem hardly to be present to his mind." The American ladies whose language Mr. Goldwin Smith finds "startling" and likely to prejudice their case may perhaps be not unfairly described as the philosophical complement of Mr. Mill. They say enough, and even too much, about matters female seems to have foreotten. But neither Mr. Mill nor his female allies can stand before the crushing blows of Mr. Goldwin Smith, nor will the cause for which they have vainly striven be greatly helped by Mr. Forsyth or even by Mr. Disraeli.

Smith, nor will the cause for which they have vainly striven be greatly helped by Mr. Foresth or even by Mr. Disraeli.

It will be difficult for the Conservative loader to show that Mr. Goldwin Smith is not a better Conservative of the social life of the civilized world than he is, and perhaps a new edition of Lothair may be required to demonstrate this point matigateristic. Many passagree of the article before the article before the second. satisfactorily. Many passages of the article before that to our mind Conservatism in its best sense. Take, for instance, the writer's view of history. If, he says, the woman has had the writer's view of history. If, he says, the woman has had her sorrows at home, the man has had his wars and his rough struggles with nature abroad. If the woman has had her disabilities, she has also had her privileges. "War has spared her; for if in primitive times she was made a slave, this was better, in the days before sentiment at least, than being massacred." Take, again, his account of the present condition of women in America. Their privileges, he says, extend to impunity, not only for ordinary outrage, but for murder. A prisoner whose guilt has been clearly proved is let off because she is a woman. The whisky crusade shows that woman is above the law. "Rioting and injury to the property of tradesmen, when committed by the privileged sex, are bailed as a new and beneficent agency in public life; and because the German population, being less sentimental, asserts the principles of legality and decency, the women are said to have suffered martyrdom. It would be difficult to surpass either the accuracy or the fedicity of this description of recent proceedings in America. In another striking passage Mr. Goldwin Smith notices hat there have been intimations, on the part of the women of the United States, of a desire to make very lavish use of capital punishment untranmelled by the technical rules of evidence, for offences or supposed offences against the sex. We may observe by way of commentary on this passage that hardly an assize occurs in England without at least one trial for what is called a "rape" which is really an attempt by a woman to vindicate her character by perjury. It is difficult enough sometimes, even with the help of the technical rules of evidence, to defeat these attempts, nor can it be doubted that under precisely similar circumstances some men have been hanged for rape, while other men have paid pecuniary penalties for seduction. The Professor, however, does not appropend that in America or any other country man weekless. penalties for seduction. The Professor, however, does not appro-hend that in America or any other country men would go on allowing women to hang them for "offences against the sex." But he approhends that, as men supply the force on which law rests, this force would be withdrawn, and all law would fall together. In England he thinks women, in order to reform drunken husbands, would vote for extreme prohibitory measures against liquor, and the difficulty of carrying such legislation into effect, which is great already, would be increased by the fact that it had originated with women. In France, if votes were given to women, he anticipates as the first result "the restoration to power of the Bourbous, with their reactionary priesthood, and the destruction of all that has been gamed by the national agonies of the last century." Even those who may think that little has been gained would probably join Mr. Goldwin Smith in wishing that that little should be preserved. To introduce female suffrage into France would be to make confusion worse confounded. It would add another element of disorder where there are too many already. In fact, it is only with ourselves and America that such experiments can even be proposed. We of the English-speaking race alone have that strength of political constitution which can bear to have played with it. As for Germany, Mr. Goldwin Smith conclusively remarks that a woman can nover be a full citizen in countries where it is part of a citizen's duty to bear arms. If this duty could be imposed upon citizens in lingland, many advantages would result, and among them this, that the agitation for female suffrage

would, or at least ought to, terminate.

It is remarkable that the Indig News, in endeavouring to answer Mr. Goldwin Smith's article, admits that objection to female suffrage is felt by men in proportion to their attachment to political and religious liberty, and that the influence of female votors would for some time to come be mainly thrown into the scale of Conservatism. It is possible that this might be so, but if in this expectation so-called Conservatives support Mr. Forsyth's Bill, they will sacrifice the permanent interest of their party to temporary expediency. Mr. Goldwin Smith is undoubtedly right in saying that the line could not be maintained where Mr. Forsyth would now draw it. Not merely unmarried women being householders, but all women, would obtain the franchise, and "those at least who hold the family to be worth as much as the State will think twice before they concur in such a change." We must say that this is true Conservatism, and we think that the remedy for much

that is wrong in modern society is to be found in acting upon this idea of the value of the family. "The expensiveness of living in a country where the fashion is set by millionaires has put extraordinary difficulties in the way of marriage." If it were possible to change the fashion, and thus to remove the difficulty, nature might be trusted to do the rest. Girls in general, if they had a fair choice, would rather be mothers than philosophers, and the choice when once made would be irrevocable. Perhaps this very expensiveness of living may increase until it gradually works a cure of the evil it has created. If servants become very dear, a man may perceive that it would be cheaper to take a wife. The limited and transient success of the movement for female suffrage is due to causes which are exceptional, and, as we would hope, temporary. At any rate we are not surprised to learn that Mr. Goldwin Smith found that this movement "was received with mistrust by some of the best and most sensible women of his acquaintance." Sir Henry James is reported—whether rightly or wrongly we will not inquire—to have said that when half the ladies of Taunton appealed to him to support female suffrage he would do it; and we think that at any rate he may safely wait until the movement has reached that point, and then consider what he ought to do.

THE FARM LABOURERS CATECHISM,

THOSE who are surprised that the formers should exhibit so much resentment against the Agricultural Labourers' Unions, and should receive with distrust the overtures of self-appointed arbiters who are identified with those associations, such as Mr. Morley and Mr. Dixon, should look a little beneath the surface of the movement. An explanation will perhaps be supplied by remembering that the Unionists were the original assailants, and by observing the spirit in which they have thrown themselves into the attack on the farmers. The campaign of the Unionists is by no means limited to a mero question of wages or hours of labour; if that had been all, it might soon have been brought to an amicable termination. It has taken unfortunately a wider range. The object of the agitators who work behind or through the Unions would appear to be to inspire the labourer with vindictive faelings against those above him, and to conomit him to a policy of irreconcilable hatred and hostility. We have before us a small tract which, we understand, has been largely circulated among the labourers of Essax. It is called the Farm Labourers' Catechism, and on the title-pare we read that it has been "prepared for the special use of those agricultural labourers who are not in the Union." It may be interred that these who are already members are supposed to stand in no need of the sort of stimulant which is here supplied. It is also stated on the title-page that the author of this Catechism is the Chairmonn of the North Essex District of the National Agricultural Labourers' Union, and that the work itself can be procured at the office of the NA.L.U. at Halsted. This is, therefore, an official publication. It is written by a prominent official of the Union, and is sold at the offices of the Society. We may consequently accept it as an authoritative exponent of the spirit and objects of the body in whose name it is issued. It is perhaps characteristic that a document of this kind should take the form of a blasphenous paredy of the Church Catechi

The Calcelium, beginning "What is your name?" with the answer "Clodhopper," goes on to give the following answer to the next question, "Who gave you that name?" "My masters, the landowners and farmers, when I was made a tiller of the soil, a scaper of birds, a snagger of turnips, a keeper of cows and sheep, a follower of the plough, a sower and reaper, a producer of wealth, that my masters might live in idleness and haurionaness all the days of their lives." In another answer the labourer says he is truly grateful to the landlords and farmers "that they have condescended in their great mercy even to permit me to till the soil for their benefit, that I may have the pleasure of witnessing their prosperity and happiness in living on the fruits of my toil; that pleasure being increased by the contrast of our wives and children perishing with starvation on the wage which they so kindly and generously give us for our toil." The Commandments are travestical in a similar manner. Here are one or two of them:—

Thou shalt not take my name ir vain, nor speak disrespectfully of my ways, for I am on the Bench of M., urates, and will bring down the law upon thy head, and by imprisonment with hard labour satisfy my vengouses at the expense of the country; therefore take head lest ye break my commandments.

Honour the squire, the landowners, the farmers, the magistrates, the guardians of the poof, the buildf, and the gamekeeper, that thy days may be long spated to enjoy such blessings.

If the children have not sufficient food, alothing, or shelter, and they die in consequence thereof, thou shalt not call this murder.

If a landowner, furmer, or parson assail the chastity of thy wife or daughters, and sodnes them from the paths of virtue, thou shall said this adultry, but he thankful for their cel descension in thus headering these.

If in thy work thy master does not give thee so much money as he agreed

with thee for, taking advantage when measuring the work, thou shall met call this stealing, but thou disait he thankful that he has given thee what he has

Thou shalt not look with feelings of envy upon thy master's wife, his sons, his daughters, his oxen, his ass, his dog, nor his cat, nor contrast their condition in life with thine; thou shalt not covet neither tha disagraments, food, or dwellings of thy muster, for these things were not made for such as thou are, but for those sot in authority over thes.

What follows is too blasphemous for quotation; but we have given enough to show the sort of poisonous seed which the Unionists have been engaged in sowing. It may be said that this is only very coarse and stupid fun, and that it indicates nothing more than a deplorable want of taste. If the publication had emanated from this excuse. But this is not the casual composition of an obscurs and isolated labourer. It is a tract written by a District Chairman expressly for Union purposes, and deliberately published and circulated under the direct authority of the National Union and by means of its agents. Moreover it is not the form of the parody—odious as it is—as the malignant and mischievous spirit of the whole pamphlet, which makes its publication, especially at a time when it was desirable to bring together the labourers and their employers in a conciliatory mood, so serious an offence. The Catechism, it must be remembered, does not stand alone. The speeches of the Unionist delegates have been habitually much more violent than the newspapers have given any idea of; and it is not long since the official journal of the National Union openly preached the doctrines of Captain Swing. It is true that one or two of the more cautious members of the Association were alarmed by the probable consequences of this outspoken language; but the journal never retracted what it had said; the Council of the Union did not repudiate the incendiarism which had been published in its name; nor, as far as we are aware, did the members who had protested retire from the Association.

It is creditable to the great body of the labourers that the violent It is creditable to the great body of the labourers that the violent and unscripplous instigations of the agritators whom they have accepted, on their own offer, as the rulers of the Unions have not as yet had any practical effect. It is known, however, that the mind of the labourer is slow in catching fire, and there is no saying what may some day be the consequences of these insidious inflammatory address s. In any case the incondiary who lays the train is not to be excused because, when he applies the match, the field, the model of dams. Even if the spaceless and literature of he finds the powder damp. Even if the speeches and literature of which the Catechusm is a fair example have not hitherto done much horm, it is quite clear that they were intended to do harm, and the farmers may be excused for resenting the intention without waiting to judge by the result. In this instance the agitators had the advantage of discovering a sufficiently solid basis of misery and discontent to work upon. Nebody can pretend that the position of the agricultural labourers is satisfactory. They have been for some fine in a transition stage between the old system of domestic dependence on their employers and the new system of so much pay for so much work and nothing more. It may be well that the labourers should take their chance in the world like other workmen, but nobody who had any acquaintance with their circumstances could doubt that a sudden and violent assertion of their independence would be certain to recoil most severely on themselves. independence would be certain to recoil most see erely on themselves. The system of which they complain, whatever may be said for or against it, has been the growth of generations, and cannot be revolutionized all in a minute. The difficulty of the case is, that if the farmer has to pay higher wages, he must seek a better class of workmen than these whom he now employs, and it is on the latter that the blow will full. It is not the labourers' fault that in many cases they have ank into such a state of inefficiency; but then neither is it the farmers'. It is possible that political motives may have had their influence in shaping the tactics of the originators of the Unions, and that the Farm Labourers Catechism was designed as a Unions, and that the Farm Labourers' Catechism was designed as a fitting introduction to the extended franchise. However that may be, it is at least certain that nothing can be more disastrous for the immediate interests of the labourers than that the farmers and handlords should be attacked with so much personal bitterness and malignity that they can hardly avoid standing at hay. There is an old proverb which Mr. Morley and some of his friends may perhaps have heard in their rural rambles, and on which it may be worth their while to meditate. It is that you cannot run with the hare and hunt with the hounds. In other words, it is idle for a prominent supporter of the National Agricultural Labourers' Union to offer his friendly services to the farmers while at the same time the National Union is scattering broadcast venomous and incendiary pamphlets with a view to personde the labourers that they ought to take personal vengeance on their employers. We have of course no intention of fastening on Mr. Morley himself any responsibility for this peatilent production, of the existence of be, it is at least certain that nothing can be more disastrous for the any responsibility for this pestilent production, of the existence of which, indeed, he may possibly be ignorant; and it can hardly be doubted that he will dissyow it when it is brought to his notice. doubted that he will disavow it when it is brought to his notice. It has been Mr. Morley's misfortune, although personally no doubt an amiable and moderate person, to find himself continually playing into the hands of firebrands whose projects go far beyond his own, and whom it is difficult to control. After so many warnings he can perhaps hardly be surprised to learn that his usual fate has again bafallen him; and that when he went, in the simplicity of his heart, to offer the olive-branch to the farmers, his more reckless associates were doing all they could behind his back to britate and alarm the class whom it was necessary to conditate. It is natural perhaps that public-spirited men like Mr.

Mariey, Mr. Mundelle, and other volunteer arbiters should be auxious to distinguish themselves on these somatons, but it is difficult to resonate the political character which they have those to adopt with the rigid importality of an unspire, and at any rate there is no reason to be surprised that, after having openly sympashined with one side, they should be suspected by the other.

THE OLD CATHOLIC SYNOD.

VE have not heard very much lately about the doings of the Old Catholics in Germany. Whether they thought that, while Prince Rismanch was in one sense doing their work for them so effectually, they might rest on their laurels, or whether it is morely that all ecclesiastical interest has been absorbed in the contest about the Falk laws, little has been reported for some months past of the progress of the movement. Last week however the First Old Catholic Synod assembled at Bonn, and sat from the 27th to the 29th of May under the presidency of Bishop Reinkens, consisting of 28 clerical and 57 lay delegates, and we maturally looked with some curiosity to the record of its proceedings. But the Swood set with closed doors, and a here outline of But the Synod set with closed doors, and a bare outline of the results is all that has us yet been communicated to the public; nor can we recken on learning more till an official Report is forthoming, which may not be for several months. Meanwhile the little that is told us, taken in connexion with the previously reported action of local Committees, is enough to suggest grave reported action of local Committees, is enough to suggest grave doubt—it would perhaps be premature without fuller information to say more than doubt—as to how far the Old Catholic leaders are still moving on their original lines. It will be remembered that when the first Congress was held at Munich three years ago, the Tridentine croed was formally acknowledged as the doctrinal basis of the movement, and its adherents claimed to represent "the Catholic Church up to 1870." and indeed to be its sole faithful representatives. They earnestly discovered all idea of separation, and insisted that they meant up, and that they retained, and were resolved to retain, all rights and privileges appertaining to them as Catholics, whether spiritual and privileges appertaining to them as Catholics, whether spiritual or temporal; and on this express plea they based their civil claim to the retention of Church property, and the recognition of their Bishops and clergy, as Catholic Bishops and priests, by the State. In Prussia and in some other German States, as in Baden, that claim has been unreservedly, while in other States it has been partially, admitted. But it is obvious that its whole force depends on the unbroken identity of the Old Catholics with their former on the unbroken identity of the Old Catholics with their former selves, or in other words with the great religious body to which they certainly belonged before the Vatican Council. The Roman Oatholic Church might be in urgent need of reformation, and they might hope that it would be eventually led to reform itself under their influence, as in some respects it did reform itself in the six teenth century. But they could hardly doubt that to break off from it and organize an independent reformation in general matters of Church discipline, and still more of doctrine, whether right or wrong—that is quite another question—would be simply to follow the precedent set by the Protestant separatists at that period, and was absolutely incompatible with the claim to remain Catholics in the same sense as before. Yet this is very much the position, so far as our present information enables us to judge, into which they appear to be drifting. We say advisedly "appear to be drifting," first because our information, as was observed just now, is incomplete, and secondly because there has certainly been no formal repudation of the original programme put forward at the Munich Congress of 1871, still less any formal announcement of a different principle of action. As long ago, however, as 1872, when the Second Old Catholic Congress was held at Bonn, a distinguished English elergyman who had been invited to attend, and who had consequently rrong—that is quite another question—would be simply to follow clergyman who had been invited to attend, and who had consequently written for more precise information about the principles of the movement, could get no reply. In the third Congress, held last year at Constance, there were evident symptoms of radical if not revolutionary tendencies among at least one section of the members And still more decisive expression has been given to these tendencies since.

We are not now referring to the Swiss contingent of the Old Oatholics, who have from the first shown a disposition to take the law into their own hands, and for whose eccentricities Bishop Reinkems and his colleagues cannot fairly be held responsible. When Father Hyacinthe two years ago disposed of the vexed question of cherical celibacy by marrying an American widow, and when somewhat later he settled another fundamental question of ecclesiastical discipline by rule of thumb, and amounced that thenceforth he should say mass in French instead of Latin, he perhaps wished to be regarded as only acting for himself. Still it must be remembered that he continued—and, we suppose, still continues—to maintain his profession of Catholicians unchanged, and vehemently disclaimed any intention of accepting a Protestant position. It is not theselore irrelevant to observe flux such matters as obligatory celibacy and the language of the live my can hardly be suffered by any Church, Catholic or Protestant, to be left to the arbitrary judgment of its individual ministers. Even the systematic license of Congregationalism would be severely strained by the absence of any fixed rule on such points as these. Yet it is said to have been proceed at Old Catholic meetings in Germany, held in anticipation of the recent Synol, to adopt not only the changes introduced by Father Hyacinthe, but further and still more sweeping measures

of reform, some of them directly affecting maisses of destines. Thus resolutions have been peaked in favour of shrogating the rafe of electical celibacy, of confession, and of fasting, cholishing allifestivals of saints, and introducing a voracular liturgy. And, one at least of these suggestions, as will presently appear, has been definitively adopted by the Synod. Now we are not of course going to raise any question as to the theological or religious merits of these proposed innovations. We only say what is obvious, that they are innovations, and very important ones, and that they seem at first sight wholly beyond the competence of a community claiming to retain unbroken its organic consextion with the great body of the Roman Catholic Charols. Two at least of the points at issue, regarding the duty of secremental confession and the invocation of saints, directly involve destrical considerations. Clerical celibacy again, though a disciplinary and not a dootrinal matter, is one hardly admitting in practice of a different rule in different parts of the same religious community. It is true that the Unisto clergy, under the obedience of Itoms, are allowed to marry, but then they are a very small minority, and practically do not come into contact with the great body of the Latin clergy at all. But it is hardly conceivable, for instance, that the Catholic clergy of termany should be left free to marry, while their brethren in France and Italy remain bound by the rule of celibacy. If the rule is to be relaxed at all in the Roman Catholic Church, it surely stands to common sense that it must be relaxed an inversally, and not for this or that national or other division of the pricethood. And the present state of things in Prussia gives a more immediate significance to the attitude of the Old Catholics on such points as these. It is provided by the new laws that in vacant parishes—and more than 1,200 parishes are already legally vacant in the two discesses of Cologne and Treves alono—the parished parished in the summer o

The First Old Catholic Synod sat, as we have mentioned, on the 27th, 28th, and 29th of May, the sessions being each day opened by the celebration of mass, followed on the first occasion by an address from Bishop Reinkens, and on the second by a discourse from Professor Reusch, on the deceased members of the body for whem the mass had been offered. On the third morning the Bishop solemnized his first-ordination, conferring the minor orders and subsolemmed his hist ordination, conterring the immor orders and sub-diaconate on one of his theological students. The synoid and parochial organization provisionally approved at the Congress of Constance last autumn was adopted on bloc on the first day, after which Schulte read a report on the present condition of the Old Catholic movement, which, we presume, will be eventually pub-lished. And then followed the discussion of the project of ratural drawn up by the Synoidal Council. It appears to have dealt chiefly with confession fact days the entachiam and literate and the last with confession, fast days, the catechism and liturgy, and the laws of marriage. As regards the first point, the Sacrament of Penance was declared by the Synod to be a great means of grace, always existing in the Church, but not necessary to salvation, and there fore its use was ruled to be optional; it is rather oddly added that confession ought not to be made the occasion of seeking advice and direction from the confessor, though the ponitent is at liberty to do so if he wishes. This synodal decase involves, it will be seen, a fundamental innotation on the received teaching and practice of the Roman Catholic Church. The rule of annual confession dates from the fourth Lateran Council of 1215, but is based of course on a much older belief. What changes were made in the observances of fast-days, and in the catechism and liturgy, does not appear; but resolutions were passed at the Synod on all these subjects. As regards marriage, the elaborate system of dispensations was simplified, and the rule about the education of the children of mixed marriages in the Catholis religion was abolished. Freiburg in Breisgan was fixed as the place for the meeting of the Oid Catholic Congress of next autumn. At the close of the proceedings Dr. Dollinger's health was drunk with much enthusiaem and a telegram was despatched to him, in return much enthusiasm and a telegram was despatched to time, in return apparently for the greetings he had commissioned Dr. Friedrich to deliver in his name to the Synod. But how for the Nester of the movement, as he has been termed, may approve of the line it is now taking remains to be seen. He studiously absented himself last autumn from the Congress of Constance, and it is highly important to the studiously absented to be a the studiously absented the base the studiously absented the base the studiously and the studiously are studiously as the studiously as the studiously are studiously as the studiously as the studiously are studiously as the studiously as the studiously as the studiously as the studiously are studiously as the studiousl probable, from the attitude he has throughout maintained, that he breach with the great body of the Church. His ain has all along been to present the great body of the Church. His ain has all along been to present the great all introduction of internal reforms, not the organization of a schiem, and it was only as a temporary and provisional measure that he acquiexed in the consecration of a Nothbischof and the formation of new parochial curse. Of course he may have changed his mind, or the movement may have got beyond his control, or there may be some exaggeration in the current reports about it. But its ensuies will certainly be the first to rejoice at any manifestation of a tendency to abandon the vantage ground it first assumed and fall back on the humbler, though possibly more exciting, position of an independent sect. That game has been played so often, both in Germany and elaewhere, that it has lost its interest for outsiders. Ultramontanes taunted the Old Catholics from the first with being only New Protestants in disguise. Protestantism may be an excellent thing, but its novelties are by this time pretty well exhausted, and Protestants who cannot make themselves at home in any of the existing sects must be rather hard to please. Meanwhile it would clearly be the wisdom of the anti-infallibilist Catholics, if they be the wisdom of the anti-infallibilist Catholics, if they clearly be the wisdom of the anti-manifolist Catholics, it they still cherish the lofty designs announced in their original programme, to show that the taunt of their adversaries is undeserved. The movement is passing through a very critical stage, and the direction impressed on it during the next few months may be practically decisive of its future.

HOSPITAL SUNDAY.

INOSPITAL Sunday will soon be round again, and, as it promises to become an established institution, it may be worth while to consider a little more carefully than has apparently yet been done the circumstances under which the appeal is made. It may be assumed that the line which will be taken in most of the pulpits will be to expatiate on the misery and distress of a large part of the population of London, on the immense good which is done by timely and skilful medical attention, and on the general duties of charity and benevolence. We need hardly say that will overything that can be urged on these heads we heartly concur. Of all the forms of charity, medical charity is perhaps that Of all the forms of charity, medical charity is perhaps that which is most urgently required, and which is also most successful in its operations. There is no class on whom charity may be so in its operations. There is no class on whom charity may be so usefully and appropriately bestowed as the sick poor, and the good which is thus done has a wide range of benignant influence far beyond its immediate recipients. From one point of view, indeed, charity in this shape might almost be regarded as a measure of self-interest. It is a sanitary precaution which operates for the benefit of the whole community; it checks the spread of disease, it keeps down pauporism, and it also contributes materially to the progress of medical science. The medical arrangements of the Poor Law system have been greatly simplified and improved in recent years, but they still have and in medical arrangements of the Poor Law system have been greatly amplified and improved in recent years, but they still leave, and, in the nature of things always must leave, much to be done by voluntary effort. On every ground, then, the medical charities, on behalf of which an appeal is to be made, deserve support, and so far the object which the promoters of the Hospital Sunday movement have in view is an excellent one. It does not follow, however, that the practical working of the movement is equally unimpeachable; and there are one or two considerations bearing on this point which ought not to be overlooked.

The chief argument in favour of Hospital Sunday is that it will

this point which ought not to be overlooked.

The chief argument in favour of Hospital Sunday is that it will bring in a larger sum of money for the support of hospitals and dispensaries than has hitherto been obtained, and it is not improbable that this will actually be the result, at any rate in the first instance. A general appeal of this kind, made simultaneously in a large number of churches, is perhaps more likely to cause excitement, and consequently to stimulate the flow of subscriptions, than scattered and isolated collections. It is possible, however, that when the novelty of the sensation has passed away the same effect may not be produced; and it is at least obvious that a comprehensive appeal of this kind, in which details are necessarily suppressed, and in which the various forms of medical charity are lumped together in a vague and featureless mass, is naturally destructive of that personal interest in particular institutions which is the best guarantee not only interest in particular institutions which is the best guarantee not only of continued support, but of close and efficient supervision. It will be said no doubt that what is expected is that people should contribute to the hospitals generally without discontinuing their gifts to such hospitals as they may happen to be specially interested in; but there is some reason to fear that, human nature being what it but there is some reason to loar that, filliam nature being what is, this expoctation may not be very satisfactorily realized. Everybody can understand that an interest in hospitals generally is likely to be a very vague and not very active feeling as compared with an interest in a particular establishment, with the affairs of which a subscriber is personally well acquainted. In a case of this kind we have to observe not merely the financial results of the new system, but its probable effect on the administration of the charities which it is intended to provide with funds. Hitherto each hospital has been supported by a body of subscribers who read its reports and paid more or less attention to its operations, and who were naturally led to consider whether their money yielded a satisfactory return. The managers of the hospital had to keep these persons in view; they were aware that, if their establishment was suspected of being inefficiently or extravagantly conducted, the subscriptions would be likely to fall off; and they had therefore the strongest motives, in addition to a sense of duty, for keeping everything in good order. Under the new system these personal ties will in a great degree be broken. The subscribers will give, not to this or that institution, but to medical charity in the abstract. The hospitals, on the other hand, will receive the money, not from persons who are known to them, has from an anonymous public. There will be no longer any is, this expectation may not be very satisfactorily realized.

sort of relation between the way in which the hospitals are managed and the amount of support which they will receive. The gifts will come, not as direct rewards for special exertions, but as the result of a general impulse of charity, which has been evoked on grounds quite distinct from the merits of particular institutions. It will be just as if the managers of the hospitals were assured that on a particular day of the year so much money would, as a matter of course, fall to them from the clouds, and that they could, within certain limits, calculate on this as a fixed and permanent revenue which would be certain to come quite independently of any efforts on their part. At present the managers are responsible to individual subscribers; hetherforth, if Hospital Sunday is regularly established, they will be practically responsible to nobody at all. The Committee of Distribution at the Mansion House has undertaken to distribute the money collected among the different hospitals and dispensaries, but there is no one to see that the money so paid is properly expended. The Committee has no means of exercising supervision over the various charities, and no authority to enforce any measures which it might think desirable. It is merely an agency for paying over to the managers the money which has been subscribed by the anonymous benevolence of the congregations. It would appear, therefore, that we are coming to this—that an irresponsible body of hospital managers will have paid over to them annually, with something like the regularity of a Government grant, a vast sun of money which will be at their disposal to be employed in any way they choose, without check or supervision, and for which they will not be bound to render any account. Whether this state

sum of money which will be at their disposal to be employed in any way they choose, without check or supervision, and for which they will not be bound to render any account. Whether this state of things is likely to promote the true interests of the charities may, we think, reasonably be doubted.

We should be sorry to say anything in disparagement of the gentlemen who have the management of the various medical charities. They are no doubt, as a body, animated by the highest motives, and their personal integrity is unimpeschable. Still they are, after all, only human beings, and subject to the weaknesses of their kind; and there are one or two questions which irresistibly suggest themselves. Has it ever in the experience of the world been found to answer to entrust a large income intended to be applied to public purposes to irresponsible officials? Are the hospitals which have the largest assured incomes, and which are consequently most independent, those which, as a rule, are most carefully and economically managed? Even as it is, under the supervision of private subscribers who can punish misconduct by withdrawing their contributions, the administration of many of the hospitals and dispensaries is very far from being satisfactory. In some cases the expenditure very far from being satisfactory. In some cases the expenditure is excessive; in others the interests of the class for which hospitals are supposed to be specially established—the sick poor—are thrown into the background. There seems to be a concurrence of authoritative professional testimony to the fact that a large proportion of the processional testimony to the fact that a large proportion of the resources of some of the principal hospitals are wasted upon people who have no claim to gratuitous medical attendance; and there is also reason to suspect that the arrangements for professional education are occasionally allowed to encroach on the natural and education are occasionally allowed to encroach on the natural and legitimate province of the charity. A tendency to aggrandizement at the expense of efficiency requires to be jealously watched. Managers are constantly exposed to the temptation of trying to make as big a thing as possible of their establishment, with imposing buildings, a large staff, and everything on a large scale, including the expenses. They like to do what shopkeepers call a rearing business, to have a great crowd of patients always at their doors, and a great warriety of cases passed through the wards. It may be and a great variety of cases passed through the wards. It may be doubted, however, whether in these large projects the proper objects of medical charity are not somewhat lost sight of. If these objects of medical charity are not somewhat lost sight of. If these abuses exist at present, while hospitals and dispensaries are dependent for support on the opinion which is formed of their respective merits, they are hardly likely to be cured by relieving the managers from the moderate responsibility which now rests on them, and encouraging them to expect an income which has its origin, not in an appreciation of their offorts, but only in a vague feeling that it is proper to be charitable. Two things are essential for the properous management of an hospital—money, and the watchful interest and supervision of subscribers; and the tendency of Hospital Sunday will be unfavourable to the second of these conditions. It appears to us that the promoters of this movement have either gone too far or not far enough. They are taking away an important security for good management without making any endeavour to provide a substitute. It is possible that the Committee of Distribution might organize itself into a Committee of Supervision, and distribute the money entrusted to it, not merely on the printribution might organize itself into a Committee of Supervision, and distribute the money entrusted to it, not merely on the principle of greasing the fat pig's ear, but with reference to the respective meefulness and necessities of the different claimants; but it is not certain that the claimants would accept the boon on these terms. As it is, the Committee is certainly in a false position. It is weakening the control of private subscribers over the hospitals by rendering the latter independent of them, without undertaking to exercise any corresponding control on its own account.

ADULTERATION.

THERE could hardly be a more striking illustration of the sort of callous effrontery which is produced by habitual dishonasty in the way of business than the attempt which has just been made on behalf of the grocers to obtain a judicial decision in favour of the practice of selling adulterated goods as genuine. That such

precises should exist at all is had enough, but that they should be ownly justified, and ithat it should be thought likely that a court of law would lend its authority to enforce them against the public, in certainly startling. It shows at least the deplorable confusion of mind into which tradesuses have fallen on the subject of commercial honesty. The shopkseper at Pirksnhead who has been punished for salling adulterated tes no doubt did only what he had always been in the habit of doing, and what he knew other shopksepers did, and there was certainly no personal dishonesty, in the ordinary sense, on his part. There can be no doubt, however, that the act was intrinsically dishonest, and the fact that it is generally innectised by the trade cannot possibly alter its quality. The Times in reporting this case observed that it raised an important question as to whether the sale as genuine of any article which is adulterated can be excused on the ground that the adulteration is and to whether the said as genuine of any article which is adulterated can be excused on the ground that the adulteration is known to the trade. Some of these days we shall perhaps have the people who manufacture and circulate counterfeit coin raising the important question whether the passing of leaden half-crowns and brase sovereigns can be excused on the ground that the trick is known to the trade. There was no dispute in this case as 40 the adulteration of the article. It was admitted that tea thickly coated with gypsum and Prussian blue had been sold as genuine green tea, and it was contended that this artificial and poisonous production was contended that this artificial and poisonous production must be accepted as genuine green tea simply because the grocers chose to call it so. The grocers argue that they have themselves no hand in the adulteration; they give an order to their agents for green tea, and they sell the article supplied to them under that name exactly as it comes to them from China. It appears name exactly as it comes to them from China. It appears that there is a Japanese green tea which is not painted in this manner, and we are under the impression that pure green tea is also to be got in China, though perhaps very little of it reaches this country. In any case, it may be assumed that the ordinary green tea of commerce is all coloured, and that grocurs are in the habit of selling doses of gypsum and Prussian blue as genuine green tea. The magistrates before whom the case was taken in the first instance held that this constituted adulteration under the Act, inasmuch as the admixture of poisonous ingredients, though known to the trade, is not known to the public; and this though known to the trade, is not known to the public; and this decision has been supported by four out of five judges of the Court of Queen's Bench. Mr. Justice Quain dissented on the ground that the shopkeeper sold the only article known in the trade as green tea, and did not alter it in any way. If it had been a question between persons engaged in the trade, this would no doubt have been a very proper view to take of it; but the question really was, whether the outside public could be assumed to be acquainted with all the secrets of the trade—in short, as Mr. Justice Blackburn said, does a man when he asks for green tea at a shop mean that he wants gypsum and Prussian blue? It is impossible to imagine gypsum and Prussian blue? It is impossible to imagine reasonable creature would knowingly desire to drink he wants gypsum and Prussian line? It is impossible to imagine that any reasonable creature would knowingly desire to drink poison of this kind, and especially to pay a ridiculously high price for it; and the shopkeeper's plea, it should be observed, did not go the length of saying that the painting of the leaf was known to the public, but only that it was known to the trade.

The decision in this case seems to us a very sound one, and the principle involved in it may be thus stated—that tradesner must

be supposed to use the English language in its natural sense, and that the general public is not to be assumed to be acquainted with all the secrets of a trade. The manner in which commercial green tes is prepared has been repeatedly exposed, and there can be no doubt that it has a very bad character. Still there are simple-minded people who continue to believe that there such a thing as pure unadulterated green to a to be got at the shops, and they are therefore imposed upon when they are supplied with painted tea-leaves. If they want to drink pypsum and Prussian blue, they can make themselves sufficiently ill for a penny, whereas the spurious tea costs some 3s. a pound; but there is no reason to suppose that they want to drink this sort of nastiness at all. It is incredible that people who drink green tea can know how it is made, and it is disgraceful that tradesmen who possess this knowledge should have so long gone on selling it.

If they wish to continue to do so they have only to label the
article "Prussian-blue tea," and nobody will be able to interfere with them. But they have no right to call an article genuine when they know that it is not genuine merely because other people do so and it helps the sale. The idea of the grocers—and we when they know that it is not genuine merely because ofher people do so and it helps the sale. The idea of the grocers—and we fear it is an idea which is also prevalent in other trades—seems to be that they have a right to attach a professional cooteric meaning to a word, and to use the word in this sense in their dealings with the public. The adjective "commercial" is to be understood as prefixed to the name of every article in a shopf-keeper's list, and this introduces a subtle and important qualification. Thus tensions were contact with raint, though not convince cation. Thus teadeaves coated with paint, though not genuine green tea, are "genuine commercial green tea," and the public is expected to understand that it is not green tea, but commercial green tea, that is sold. The Court of Queen's Bench has condemned this practice, but the shopkeepers have the remedy entirely in their own hands, for they have only to label their packets "comthis practice, but the shopkeepers have the remedy entirely in their own hands, for they have only to label their packets "commercial," and to explain that what they mean by it is that any rubbish or poison may be called tea if the trade generally agree to commit the fraud. A tradesman can always protect himself against the penalties of the Adulteration Act by frankly taking the public into his confidence on the subject of the adulterations which he practises or accepts. It is obvious that, if the principle contended for in this instants on behalf of the tea-dealers had been sanctioned, it would have had a very wide application. It is known that a great deal of the tim of commerce is composed

of irea-filings and dirt, and this is just as much a guarante article as painted tea. Buildes, as Mr. Justice Blackburn remarked, if there is to be commercial tea, why may there not be commercial batter, made of course of anything but butter? There can be little doubt that this system of fictitious nonmenchature extends to a large variety of articles of commerce. The coffee of commerce has an unpleasant resemblance to chicory, the mustard of commerce has an unpleasant resemblance to chicory, the mustard of commerce has each chiefly composed of potato flour and turneric, and the wine of commerce is remotely, if at all, connected with the jules of the grape. In some instances the magiatrates have shown themselves disposed to accept the commercial theory of adulteration. In Hassall has drawn attention to a case at Glasgow where pickles containing our per cent of copper were held to be not adulterated, on the ground that copper has been detected in certain vegetable and animal substances; the material distinction being left out of sight, that in the latter case the quantity of copper was very minute, whereas the pickles contained a dangerous quantity of metallic poison. In another instance a London magistrate accepted as genuine the butter of commerce, although it was adultanted with a fourth metallic poison. copper was very minute, whereas the pickies contained a dangerous quantity of metallic poison. In another instance a London magistrate accepted as genuine the butter of commerce, although it was adulterated with a fourth part of water. The magistrate distinguished between water added to the butter and water not squeszed out of it, and held that the latter did not matter. This decision will of course operate as an encouragement to the manufacturors to leave as much water as possible in the butter, and Dg. Hassall are be has much with course containing forthy response. says he has met with cases containing forty per cent. of water. Whatever the trude may think of articles thus adulterated, they

Whatever the trade may think of articles thus adulterated, they are hardly what the public understands as genuine.

The Adulteration Act is an act which will necessarily always be difficult to work, and especially at the beginning. In the first place, authoritative testimony cannot always be obtained as to actual composition of the substance complained of. Some of the professional witnesses would appear to be not very well qualified for their work, and they are also ant to be projected by measured interpret their work, and they are also apt to be projudiced by personal interest or professional rivalry. And then, when the analysis of the substance been settled, there is the difficulty of determining what conatitutes adulteration as distinguished from the natural and necessary processes of manufacture. It is easy to conceive how, under these cir cumstances, if the Act were to be pressed too far it might be made intolerable. Adulteration has rooted itself too deeply in English trade to be got rid of all at once. Its eradication must in the nature of things be a slow and gradual process, and in this, as in some other cases, the more haste will perhaps prove to be the worse speed. Where there is really a doubt as to the composition of an article, or as to whether the introduction of foreign elements constitutes a fraudulent deception, the dealer ought undoubtedly to have the benefit of the doubt. But when it is clear that an article is adulterated, the excuse that the adulteration is known to the trade ought at once to be set aside. There may be cases in which a small shopkeeper may be made to suffer for the offences of others, but it is obvious that the public has no chance of protection against adulteration unless the retail dealer is made directly responsible for the quality of the articles which he supplies. He is not bound to guarantee that they are genuine; he can give notice that he sells merely what the wholesale people send him, and that he does not know whether wholesale perpension in and that he does not know wholesale they are pure or not. But if he takes upon himself to offer the goods as genuine, he must be made answerable for it. If he has been imposed upon, he has his remedy against the wholesale dealer who deceived him, and the wholesale dealer may be left to settle with the importer or original producer. A trademman must settle with the importer or original producer. A tradesman must be supposed to know his own business, and if he sells as genuine an article which is not genuine, he must take the consequences. The protection of the public would obviously be reduced to a mere farce if the shopkeeper could say, "Oh! I said it was genuine merely because I bought it as such," and if the wholesale importer or manufacturer could plead the custom of the trade to justify. adulteration. What a customer has clearly a right to demand is that what he buys shall honestly answer to the description given of it, that genuine tea shall be real tea and nothing else, that mustard shall be mustard, and butter butter, and wine wine. It will invariably be found that the object of adulteration is simply to defraud the purchaser by mixing the genuine substance with some changer stuff, but a plausible pretext for adulteration is sometimes found in the argument that the genuine article is improved by these additions.

THE BOYAL ACADEMY.

In any case, however, the customer should be fairly told what he is buying. The great point to aim at is to teach tradesmen that they cannot be allowed to use words in a non-natural sense, however

well this sense may be understood in the trade. They need not guarantee the purity of their goods unless they please, but if they do, they must be prepared to justify the use of such words as "pure" and "genuine" in their ordinary meaning.

THIS year the "Outsiders" are more than ever numerous and strong; indeed it is evident that many among them are equal, and some superior, to what may be called the average Academician. In fact, in the present day there are so many men who can turn out tolerably good work that a second Academy might easily be formed out of the first-class candidates for distinction. Among these a prominent place would be given to Mr. Storey, whose quiet manner, tender in unobtrasive greys, is in favourable contrast to the loud style and acreaming colour of the majority of our contemporary painters, who seem determined to make what has

been called "a silent art" speak clausorously. "Grandmamma's Christmas Visitors" (521) has a quaint old-fashioned simplicity, spiced with quiet humour; it takes us pleasantly back to the days of our grandmothers. This artist has usually an agreeable and clustry way of telling a tale; his pictures run in parallel lines with the writings of Addison and Steele; they even have something in common with the Essays of Elia, though that is a book which stands almost alone in literature and art. We wish we could speak in terms of equal praise of Mr. Wynfield's "Visit from the Inquisitors" (546). This is history brought down to the standard of genra; the execution is on a level with that of Gerard Dow, the colour is unpleasantly brown and red. The artist is much more at home in a schoolroom of young ladies who are taken in the act of receiving "Instructions in Deportment—the Curtsey" (444). The colour is even worse than we could have feared from young ladies in their teens. Such scenes would appear to excite in the public mind somewhat of the same curiosity as peeps into convents or revelations of harem life. Accordingly, this picture attracts around it an eager crowd, amused by the story more than edified by the art. Mr. Yeanes, A.R.A., living within the precincts of "the St. John's Wood school," is naturally allied to Mr. Storey and Mr. Wynfield. "The Appeal to the Podestà" (280) is a scene laid in the famous Florentine courtyard of the Bargello. The artist in his detailed realism of the magnificent stone stairs, with armorial bearings on the walls, has probably been aided by the admirable photographs which for years we have known in the shops of Florence. Indeed the picture is photographic even to a fault; it is almost too painstaking.

The non-Academicians, it has sometimes been pleaded, go so far to make the success of the Exhibition that they ought to command more consideration than they receive. Yet when we look around the walls, we can see little injustice to complain of; with few exceptions, a work hadly hung is scarcely worth a nearer view, and pictures thrown out altogether are, as a rule, cared for only by partial friends and relatives. The following "outsiders," who are among the best in the class of genre, have certainly little to complain of, M. Tissot, whose sparkling but scattered, pleasing but superficial, compositions have obtained consideration in the Paris Salon, favours the Academy with "A Bull on Shipboard" (690). Again the artist nearly solves the most perplexing puzzles in perspective. Correggio was not more clever when he cooked his famous "hash of frogs" than is M. Tissot when he conford his famous "hash of frogs" than is M. Tissot when he compounds this "topsy-turveydom" on shipboard. Signor Perugini will be remembered for "A Cup of Tea" (13); the lady in a brocaded dress with blue china before her is graceful in flow of line; altogether the picture is by its taste and execution a bijon. Mr. Watson, were he less ambitious of varsatility, would inspire confidence by a composition so tender and true as "The Pet of the Common" (613). But of what avail is this delicate interview between a girl and calf when we have to encounter anything so vulgar as "Only been with a Few Friends" (15)? Praise is due to Mr. Liddertale for a literal and expressive study "1703—Proscribed" (81); also to Mr. Sain for a faithful study of "A Capri Girl" (1040); likewise to Miss Havors for a charming little child puzzling over a sum in arithmetic (635). Mr. Poingdestre, an artist long known in Italy, wins the line by "The Roman Cattle Market" (1398). The composition is intricate and crowded to confusion; we preferred in a former Exhibition cattle carts in the quarries of Carrara. Also on the line is another scene from Italy, "The Winged Pensioners

(1414). Here Mr. C. W. W. Topham escapes his tortuer meretriciousness, and yet retains sufficient sunshine and colour. Closer study might secure for this artist a sustained success.

The portraits this year are more numerous than ever, without the excuse of being of greater excellence. Mr. Millais, R.A., having diverted himself with landscapes and fancy figures, has no astounding "picture portrait" to show. But brilliant as heretofore is "Walter, son of Nathaffiel de Rothschild, Esq., M.P." (95). "Still for a Moment" (484) has, if possible, more than the painter's accustomed strength of pallet; and the clever mannerism is carried rather far in a lady supposed to be in "A Day-dream" (1432). In both these pictures the pigments are loaded on with ultra opacity and dryness: the artist, falling into the fashion of the day, eschews the surface polish which varuish gives. In our opinion not a few of the pictures of the year suffer in consequence from denduess and sinking in of the colours. Mr. Sant might almost be mistaken for Mr. Millais in a charming figure of a little girl holding in her hands big resy peaches just gathered from the tree (158). The same artist beats Mr. Buckner hollow in the way of a magnificent epalescent satia dress; yet the portrait of "Mrs. Charles M. Palmer" (239), supreme as a piece of drapery painting, suffers by a crude background of which we should have hoped only a German could have been guilty. A garish colour, inclining to contrast rather than to harmony, has been long the besetting ain of this popular portrait-painter. Mr. Buckner is not himself, yet he is nothing worse than weakly innocuous, in the full length of "Mrs. Leslie" (255). Mr. Prinsep we have never seen so quiet as in "Mrs. Leslie" (255). Mr. Prinsep we have never seen so quiet as in "Mrs. Leslie" (255). Mr. Prinsep we have never seen so quiet as in "Mrs. Leslie" (274); this portrait has style and refinement. Mr. Archer, too, in several pictures distinguished by good taste and tentative care, not to say calculating entired.

Sidley has enhanced by pleasing fancy the beauty which nature gave his little sitter. Indeed a fancy treatment of portraiture is now the vogue; a dark background with nothing in it is quite out of date, and the old expedient of a column and a curtain has been supersuded by gardens and green fields, or by the book-shelves of libraries and the nick-nacks of boudoirs.

But though there are changes for the better even among the most popular styles of portrait-painting, still the majority of the heads displayed are almost as bad as bad can be. To begin in high places, let us point to "Knitting a Stocking" (189), by Sir Francis Grant, P.R.A.; also let the visitor admire a figure by the same artist, in veritable signboard style, "On Board the Harleguein" (529). The present polite President of the Academy is known to hold a poor opinion of critica, and therefore he may prefer to hear his praises sounded by an Archbishop. We may mention, however, that some of the artists present at the Academy dinner interpreted ironically the following words of the Archbishop of York when proposing a toast:—"It might well be that Sir Francis Grant, trusting to his past distinction, should devote himself at this time of day to the important institution he has under his charge, but he rather chooses to continue adoming these walls with works that prove his perception is not dim, and that his hand has not lost its firmness." "Adoming these walls" may after all be nothing more than a cuphomistic version of the art of "house-painting." In that case the President might easily call to his aid a goodly company of efficient assistants. Take the following:—"The Right Hon. John Bright, M.P." (112), by Mr. L. Dickinson (this portrait, if not precisely decorative, is decidedly democratic); "The Earl of Macclesfield" (446), by the Hon. H. Graves (a worse portrait has not to our knowledge been painted for the last three hundred years); "The Archbishop of York," (618) by Mr. H. Weigall (look at this picture after reading the Archbishop's eulogy on the President, and interpret the one by the other); "Helen Bremner and Lion" (644), by Mr. Desanges (this composition hung at the ceiling has been too well served—outside the skylight was the place for it); "Mrs. Dixon Hartland and her daughter Roma" (56), by Herr Bauerle (also, notwithstanding the artist's distinguished clientile, deservedly hung high). Again royalty h

How the great men of our times will be transmitted to posterity by contemporary portrait-painters is always a question of some moment for the men themselves as well as tor us and for posterity. And how a high historic character may be painted down we have painful proof in Mr. Healey's head of M. Thiers (279). This American artist has, in a way peculiar to himself, managed to mar some of the most intellectual heads in Europe. M. Yvon, the favourite of the Second Empire, clothes with infallihility and the spirit of aggression the comely figure of Monsignor Capel (92). The picture takes no rank in point of art. Mr. Roden's reading of the head of "Father Newman" (143), though poor in colour, is more student-like. M. Lehmann had the advantage of good taste and intellectual insight when he painted the unobtrusive but persussive portrait of Sir W. Ferguson (192). Mr. Holman Hant with a vengeance brings down his latest and heaviest mannerism on the head of "Thomas Fairbairn, Esq." (660). This is a portrait repellent in its power and obnoxious by its obtrusive realism. When we had the pleasure of bestowing more than faint praise on "The Shadow of the Cross," we little thought that non-ideal modes of study would lead down to this naturalistic bathos. A head striking for its thoughtfulness is that of the artist, Mr. W. G. Herbert. The painter, Mr. Herbert, R.A., who might be expected, the austerity of his own style.

To Mr. Watta, R.A., has fallen a greater share of men of capacious brains and of intellectual countenances than to almost any other

To Mr. Watts, R.A., has fallen a greater share of men of capacious brains and of intellectual countainances than to almost any other painter, but a fair chance is hardly given to an artist when great men come for a sitting after the prime of life. This in some measure may account for what is painful in the portraits of "The late John Stuart Mill" (246) and of "The Rev. James Martineau" (51). The face of the latter is known to light up under the influence of unimated discourse with a mental fervour wholly absent from this canvas. Mr. Wells, R.A., though not quite so particular as Mr. Watts in the choice of good subjects, has been identified with several of the leading men of the day. Perhaps it was not a piece of good luck that Mr. Morley, M.P. (664), should have fallen to his lot; but Mr. Wells is seldom wrong in the reading of character; and here the member for Bristol stands full length before us in the vehement action of a stump orator. Lord Selborne (321) in the robes of Lord Chancellor, by the same artist, naturally hears himself with greatur calinness and dignity. The solid style of Mr. Wella and the deep-toned harmonies of Mr. Watts as exemplified in the above-mentioned portraits are almost too well known to med comment. But the unfinching and thorough manner of Mr. Ouless, comparatively a newcomer among us, is not so finallier.

It is short of the truth to say that Lord Salberne (178), by this artist, does not suffer by comparison with the portrait of the same bouned lord by Mr. Wells. Indeed some have gone so far as to place Mr. Suless on a level with Mr. Milleis. But comparisons are peculiarly odious when pointed at contemporary artists. It is sufficient to say that each of the four portrait-painters we have just mentioned is sufficiently strong and distinctive to stand on his individual merits.

THE DERBY.

TN a year remarkable for the accidents that have happened to many prominent Derby candidates, as well as for the generally indifferent character of the three-year-olds, a sound and honest, though far from first-class, horse has deservedly carried off the prise. It has been of late a common remark that anything might win the Derby this year; but never was a sweeping assertion so signally falsified. There was, in fact, only one in the race after Tattenham Corner was safely rounded, and an easier victory was never accomplished. That anything might get a place in the Derby would have been a much safer prediction, for a sheet would have covered the half-dozen horses immediately behind the winner. and favourites and outsiders finished abreast of one another as they always do when both favourites and outsiders are alike of moderate quality. As will easily be remembered, there was a singular dearth of first-class merit among the two-year-old colts last year, and, as ill luck would have it, the very three whose claims to distinction were highest became the victims of unforeseen casualties. Marsworth, Ecossais, and Couronne de Fer were undoubtedly the cream of the two-year-olds, and George Frederick, who on Wednesday achieved the ensiest Derby victory that has been seen for many a year, was not within a stone of any one of them. The for many a year, was not within a stone of any one of them. The lamented death of Paron Rothschild caused the disqualification of lamented death of Haron Rothschild caused the disqualification of Marsworth for all his engagements; Ecossais, whose legs were always suspicious, was brought out for the Two Thousand in a half-prepared condition, as if his trainer had been mable or afraid to expose him to the ordeal of really hard work; and Couronne de Fer was believed to have become a roarer, and was certainly sold out of the last stable in England which would part with its best representative, and by the last owner in England who would let a Derby winner slip through his tingers for such a bignatelle as two thousand five hundred pounds. Further to smooth the way for a thousand five hundred pounds. Further to smooth the way for a fair second-class horse whose legs could stand hard ground, neither Newry, the winner of the Middle Park Plate, nor Spectator, second in the same race, nor Napoleon III., winner of the Champagne Stakes, was engaged in the Derby. Moreover, Feu d'Amour, superior to George Frederick on public form, did not make the improvement that was expected during the winter, and was improvement that was expected during the winter, and was ultimately prevented by an accident from coming to the post; Reverberation, who had so rapidly advanced in form as to be able to make a dead heat with the unconquered Miss Toto, and run the Two Thousand winner to a neck, had since been unable to resist the effects of the fearfully hard ground, and though he did put in an appearance last Wednesday, could hardly move in the preliminary canter; and, to complete the chapter of accidents, Atlantic, the winner of the Two Thousand, injured himself during him iconspan from Newmarket to Epson quito sufficiently to make his journey from Newmarket to Epsom quite sufficiently to make the marks of the injury plantly perceptible on the Derby day, and thereby, however superficial the mischief may have been, decidedly

did not improve his chance.

It really seemed as if, what with disqualifications, breaksdown, and other casualties, there would not only be no first-class horses left to do battle in the Derby, but very few of the second class either. Hence public attention was directed to a number of obscure candidates, whose names would otherwise never have been mentioned in connexion with a prest race. Mr. Merry had five engaged in the Derby, and it was hardly possible that not one of the five could stay a mile and a half in moderate company. So Inniel, Glenalmond, Rob Roy, and Sir William Wallace were backed in turn, the public vainly endeavouring to anticipate the judgment of the stable as to which should be its trusted representative; and when at length it was discovered that Glenalmond was the selected one, the public rushed to support him with all the old fervour of allegiance to the yellow jacket and black cap, although his solitary victory over Lemmos at Goodwood was the only public performance on which the hopes of his success could be founded. Glenalmond actually started first favourite for the Derby; and pechably no home, possessing such slender credentials, ever occupied a similar position. Then it was remembered that Tipster, a son of Adventurer, had besten Atlantic last year at York; and that fact was quite enough to make people ask why he should not beat him again this year. Leolinus, whose name was heardly known to racing men before lie was second in the Chester Cup, was also deemed worthy of support in the present emergency, probably because he had actually succeeded in galloping two miles and a half with some credit to himself and without breaking down, the should friends, the answer to all inquiries as to the grounds for the confidence reposed in them being that, as there was not a really good home in the race, mything that only fire was never finally described. Beginte his wretched foundary, and his obvious want of condition a month ago, the recolled

tion of his brilliant speed sould not be efficient; and people flattered themselves with the idea that, if he could only enfort get down the hill and into the streight, he would have little difficulty in shaking off the rebbish opposed to him. Se, also, Couranne du Fer was rapidly brought back into favour when his distinguished two-year-old performances were recalled. Indeed, at the legisning of this week he was first favourite; but, despite the undinguised confidence of his friends, the established axiom that no reaser was win the Derby could not fail to influence the judgment of business in the end, and both Glenalmond and Aquilo pessed him in the quotations. Oddly enough, George Frederick, who had at any rate the recommendation of being perfectly sound in wind and limb and of having always run creditably, if not buildinatly, rather lost ground than gained it as the day of the race drew near. The fact is, that he is not a perfecularly taking home to the eye. He is a somewhat clumsy-looking animal, with a heavy shoulder, and peacocky neck. He has always looked big also, and he looked big on Wednesday, though certainly less so than at Newmarket a month age. Very few encomiums, however, were passed upon him, and had the start been delayed half an hour longer, it is probable that the offers against him would have been considerably enlarged.

The min that fell on Wednesday morning, though not sufficient to affect the course, materially increased the confort of the visitors to Epson, who, by the way, were fewer in number than we over remember to have seen. The Derby day is no longer the great annual holiday for Londoners, nor are Epson Downs the only place where they can conveniently enjoy—or imagine they enjoy—a day's racing. Londoners have many holidays new, and all sorts of metropolitan race meetings are arranged for their numsement. They have developed of late years a decided preference for hurdle-races and steeplechases, and we think that they are beginning to find Epsons a delusion. They certainly stop away from it more and more every year; and on last Wednesday—a picked learby day as far as the weather was concerned—the diminished attendance was everywhere perceptible, at the railway stations, on the read up the hill, in the paddock, in the neighbourhood of the Grand Stand, and even in the Grand Stand itself. Not only were the visitors fawer in number, but they were also as unenthusiatic as can well be imagined. The leave in the paddock was the dullest affair we even in the fermion of the stand of the shabby-looking lot of horses paraded before them, and that the great race of the year should be so unworthily contested. There was some compasof metropolitan race meetings are arranged for their assusement year should be so unworthily contested. There was some compassion for a fallen favourite like Ecosasis, some curiosity to see Couronne de Fer, whom one of the cleverest trainers in England had been content to dismiss from his stable, and some faint amusement at the appearance of two such remarkable candidates for herby honours as Sir Arthur and Belford, who, according to current reports, were going to start to settle a bet as to which would come in last. But there was no enthusiasm, little partisenwould come in last. Full there was no entimensum, into particular, ship, and but little expression of pronounced opinion as to the issue of the contest. Poubt took the place of confidence, and indifference of excitement. Perhaps the horse most liked was Leolinus—certainly he was preferred to either of his stable companions, Atlantic and Aquilo; and he is a well-shaped, lengthy horse, with good legs, and presenting the general appearance of a stayer. Trent was voted a handsome and Whitchall an improved horse. Couronne de Fer, though not much crown was wire and well trained, full of remedia, and with four grown, was wiry and well trained, full of muscle, and with four excellent legs. Atlantic and Aquilo were both in splendid condition, and the first-named seemed none the worse for his accident, although, as we have said, its marks were phinly perceptible. Glenslmond was also in magnificent condition, but his small size created some astonishment. He has hardly grown since last year, and gives one the idea of being more fitted to a half-mile than a mile and a half course. Ecossis had evidently done some work since the Two Thousand week, but he looked as if his preparation had been hurried—which no doubt was the case—and a glance at his forelegs was in no way reassuring as to the chance of his deseemding the hill to Tattenham Corner in safety. Lastly, Course Frederick, as we have said, failed to please. He made more enemies than friends in the paddock; and being evidently susceptible of considerably greater improvement, it was held that he would tire for want of condition in the last half-mile. Not a few resolved to reserve their support of him till the autumn, when they were of opinion he would be fully would up; and they will still be able to carry their intention into effect, though perhaps on less advantageous

The dulland spiritless inspection in the paddock having terminated, the parade and canter past the Grand Stand followed, and was get through with great celerity. Again were Leolinus and Trent most liked, the lengthy stride of the former attracting especial attention; while Lord Falmouth's pair, Couronne de Fer, and Econsis, all went well, and Glenalmond seemed full of fire, though of a fire that was likely to burn itself out before more than half the distance had been traversed. Reverberation could not raise a gallop, and ought not to have been sent to the post, and some of the other competitors seemed quite out of their element. The twenty—sight more than last year, though with lastily one among them as good as Kaiser or Gang Forward—got to the starting-post in good time, and had the decency not to give the starter much trouble. The least that such a sorry lot of huenes could do was to get off and have done with the mee as specified and then yourish, most of them, out of sight of men; and thus much, we are willing to admit, they did accomplish to perfection. At the very first real attempt—there was just one opportunity before for a fly-

ing start which in other days would have been taken advantage of —the flag fell; but so indifferent were the public that the customary shout announcing that the race has commenced was hardly audible. The story of the race is simply this, that Voltume made the running for George Frederick, who kept leisurely in the rear, up to Tattenham Corner, and that, when that wretched turn had been asfely negotiated, George Frederick took up the running for himself, lied all his opponents safe in a moment, and won in a common center by two lengths, which might have been air if it had been desired. We never saw the Derby so decisively won at such a distance from the finish. At a quarter of a mile from the judge's box nineteen horses out of the twenty might have been pulled up; so utterly hopelese was their chance, so assured, beyond the possibility of doubt, was George Frederick's victory. The contest for second and third places was, however, as close as the winner's triumph was decisive. Here Jack proved himself as good as his master, and favourites and outsiders were associated in a strange medley. Atlantic and Aquilo, their stable companion Leolinus, and their former stable companions Couronne de Fer, Rostrevor, Trent, and the Vertumna filly, finished all together, Couronne de Fer just securing the second money from Atlantic, who thus verified another Turf maxim that the winner of the Two Thousand is almost sure to get a place in the Eerby, and the other five being so close up that it was hardly possible to separate them. It must have been a great mortification to Matthew Dawson to see all his horses beaten by their former companion, and it is clear that he must have taken an unduly unfavourable view of Couronne de Fer's condition. Not that his performance is much to boast of, for, when seven horses can hardly be whipped apart, while an eighth is walking away from them at his leisure, the legitimate inference is that the seven are all moderate. For, easily as George Frederick won, he has yet to prove himself a first-class

REVIEWS.

CAIRNES'S POLITICAL ECONOMY.

T is with great pleasure that we welcome another contribution to Political Economy from the ablest living representative of the school of Ricardo and Mill. Mr. Cairnes in his present work aims at restating and medifying some of the doctrines which have hitherto passed muster as established principles. He brings to the task a remarkable power of sustained and accurate thought upon topics which are apt to be wilder an ordinary brain; and a capacity for lucid expression which is hardly less rare and admirable. Mr. Cairnes, indeed, is so much at his ease amidst the complex phenomena presented by modern commerce, he takes such obvious delight in working out corollaries hitherto unnoticed, he has such difficulty in tearing himself away from speculations which are of theoretical interest, though too refined to be of much practical utility, that the task of the critic is rather unpleasantly onerous. We should never differ from Mr. Cairnes on economical questions without suspecting the accuracy of our own logic, for every proposition which he puts forward has evidently been considered carefully by a trained and acute thinker. In such cases a critic criticizus himself as well as his suthor. We are happy, indeed, to find ourselves so far in substantial agreement with Mr. Cairnes that we shall have little occasion for misgivings of this nature; and if we expressed disagreement we should intend to suggest grounds for an arrest of judgment rather than for reversing the decision. Mr. Cairnes, indeed, does not, like some recent writers, countenance any economical volume he rather endeavours to re-establish the orthodox doctrine which had suffered from the lapse into heterodoxy of one of its most distinguished expounders. Mr. Cairnes has consistently defended the claims of Political Economy to be considered as a cleuce. Mr. Thornton, partly followed by Mr. Mill, proposed a change which, from this point of view, would be little less revolutionary than a proposal to give up the truth of the laws of motion in dynamical treatises.

criticisms would be to admit that the science still registred to be founded, if indeed a science were possible. Mr. Cairne's criticisms of the established dogmas is of a different nature. He holds that oversights have been made and disturbing forces neglected; and that by making a fuller statement, the valuable truths already discovered may be preserved, and theory be made to accommodate itself more accurately to facts. We may illustrate the point by the analogy of the natural sciences. Writers on mechanics make a number of assumptions for the sake of simplicity which are not accurately verified. They talk, for example, of perfectly rigid and perfectly flexible materials, though such materials do not exist in nature. If the formulae derived from such hypotheses were applied to concrete cases they would of course be found wanting. As no machine is constructed with mathematical accuracy, nor of absolutely rigid materials, a microscopical examination would prove that the results given by theory were not precisely realized. Mr. Thornton, pointing to such discrepancies, would say that the theory must be indically erroneous. Mr. Cairnes, more logically as we think, points out that the theory requires to be supplemented by making the original assumptions correspond more accurately to the facts. Allow for friction or imperfect rigidity, and the doctrine will be fully vorified. The hypotheses made by political economists differ far more widely from the facts of experience than those of mechanical philosophers, because the phenomena under consideration are farmore complex. Economists, for example, generally assume the existence of unrestricted freedom of competition to explain many phenomena of prices and wages. As Mr. Cairnes very ably points out, this assumption is often very far indeed from representing the actual state of the case. He shows especially, in the case of wages, how the phenomena will be modified by the existence of what he calls "non-competing groups" of labourers. He thus arrives at formulae which are n

accurate account of various social changes. Income unout wrong as inadequate. The tendencies which it assumed really existed; but they were masked or counteracted by other forces. By such modifications, Political Economy can be brought nearer to the problems actually presented; and it is chiefly in this direction that we must look for its improvement, and for its becoming ultimately fitted to form part of a harmonious social science. Mr. Cairnes is therefore fully justified in expressing a belief that his book is not antagonistic, but rather supplementary to the teachings of Adam Smith, Malthus, Ricardo, and Mill.

The work is divided into three parts, dealing respectively with the theories of value, of labour and capital, and of international value. We can give but a very inadequate account within our space of the problems with which he deals; and we must content ourselves with saying, in regard to the last chapter, that it contains an admirable investigation of the general doctrine of international trade, illustrated by some very instructive remarks upon the recent industrial development of the United States. We would fain hope that some of the Protectionists of that country would read and digest Mr. Cairnes'scriticism; but we much fear that they require to be oducated before they can appreciate his arguments, and to be rendered less selfish before they would admitt that the arguments however the protection of the professors and the professors are referred to the content of the professors and to be rendered less selfish before they would admit that the arguments however are professors and the professors are referred to the professors are referred to the professors and the professors are referred to the professors are referred to the professors and the professors are referred to the professors are would fain hope that some of the Protectionists of that country would read and digest Mr. Cairnes'scritician; but we much fear that they require to be educated before they can appreciate his arguments, and to be rendered less selfish before they would admit that the arguments, however sound in themselves, should lead them to prefer national welfare to personal profit. On the other two parts of the book we must say a little more. Mr. Cairnes subjects the doctrine of Ricardo and Mill, that "cost of production" determines prices in the case of unrestricted competition, to a searching examination. Admitting that, in a certain sense, the theory is not only true but of great importance, he thinks that it requires to be at once restated and modified. Besides supplying some valuable corrections, chiefly suggested by the absence in many cases of effective competition, Mr. Cairnes mode of stating the case clears away many popular fallacies. Mr. Mill considers wages and profits to be the chief elements of "cost of production." Now, says Mr. Cairnes, it is illogical to identify wages with cost, for this is to identify the two ideas most radically opposed to each other—namely, the sacrifice which men incur in labouring and the reward of their sacrifice. The cause of the confusion is a simple one, which has contributed much to perplex other economical questions. It comes in fact from placing ourselves at the capitalist's point of view, instead of taking the more general ground of the interests of society at large. Wages form, of course, part of the cost to the capitalist who advances them; but it is a fallacy to treat them as part of the cost to the whole organization of which he forms a part. The vocabulary of commerce has of course been constructed from the capitalist in astronomy if we used the cosmical force of gravitation in the sense of a force which attracts bodies towards the centre of the earth. Mr. Cairnes, therefore, placing himself at the more general point of view, resolves the "cost of production" into the sacr

^{*} Same Leading Principles of Political Keomony sawey Expounded. By J. E. Cairnes. Loudon: Macmillan & Co. 1874.

The doctrine frequently occurs in discussions upon American trade, and is used to justify a demand for protection. When we have more seized the true meaning of cost of production, the fallacy is testly unrevelled. A high rate of wages means, in Mr. Cairnes's sense of the words, a low cost of production. In fact, as he says, "capitalists and labourers receive large remuneration in America because their industry produces largely"; and therefore the claim to protection of American industry, grounded upon the high "cost of production" (in the common sense) means "a demand for special legislative aid in consideration of the possession of special industrial facilities, a complaint, in short, against the exceptional bounty of nature." He goes on to show clearly that the alleged inability of Americans to compete with England in the manufacture of cutiery and calico means simply that they cannot compets with us "consistently with obtaining that rate of remuneration on their industry which is current in the United States." The inability proves that they possess advantages, not that they suffer from drawbacks. "It is as if a skilled artisan should complain that he could not compete with the hedger and should complain that he could not compete with the hedger and ditcher. Let him only be content with the hedger and ditcher rate of pay, and there will be nothing to prevent him from entering the lists even against this rival." The ambition of the Americans is, in fact, to compete not merely in those commodities in the production of which they have a great advantage, but in all com-modities; and this pretension could only reach its legitimate end by destroying all international trade whatever. Though the fallacy may have been often pointed out in some degree, it has never been so decisively slain, and its root in the loose conception of what is meant by "cost of production" so clearly exhibited. If this were the only service rendered to Political Economy by Mr. Cairnes, he would deserve the praise of having probably added more than most living writers to the clearness of our conceptions.

We must add, however, that the second part, in which he attacks, and to our thinking disposes conclusively of, the fallacies of such writers as M. Lange and Mr. Thornton, some of which, as we anch writers as M. Longo and Air. Informed, some of which, as we have said, were sanctioned by Mr. Mill, is also of great value. We fear that even Mr. Cairnes will not be able to slay that most persistent and pestilent of all fallacies, which is implicitly admitted by Mr. Thornton and more expressly maintained by M. Longe, that a demand for commodities is a demand for labour. It is rather amusing to find that the New Fork Tribune reproduces the old sophistry in the old application. Mandeville said that the fire of London had done as much good as harm on account of the en-couragement given to builders and carpenters; and the intelligent couragement given to builders and carpenters; and the intelligent Tribuns uses the same argument on the occasion of the fire of Chicago. Mr. Cairnes's new exposition of the "wage-fund" theory is in our opinion perfectly satisfactory, and disperses the objections founded on an erroneous conception of its meaning. But, without following him upon this ground, we must venture a few remarks upon an argument which purhaps requires some elucidation. Mr. Cairnes discusses the great problem as to the cause of the increasing divergence between large and small properties. He argues, amongst other things, that an increased efficiency of labour will only affect the poor so far as it cheapens the commodities which they consume. If, he says, the production of some article consumed only by the rich be made easier, the only result will be that the value of the article will decline in proportion. A given capital will yield a larger return on this particular article; but as the value declines, the rates of the value produced to the value exthe value declines, the rates of the value produced to the value expended will remain undisturbed. This strikes us as an incompended will remain undisturbed. This strikes us as an incomplete statement of the case. Admitting that the value of the supposed commodity will fall, it will yet follow that the total products of industry are increased and, so far, that there is a greater inducement to saving. If the efficiency of labour in regard to all articles of luxury were suddenly doubled, the result might be that the price of each article would be halved; and, in that sense, profits would be unaltered. But in that case every pound received by the capitalist would bring in twice as many luxuries. The immediate effect upon the labourer would be nothing; but, if we assume human nature to remain constant, an increased disposition on the part of the rich to save, and therefore an increase of the wage-fund, should be the result. The correction may be of small importance; and yet we seem otherwise to be led to the awkward conclusion that the desire to save is proportional not to the substantial reward, but to a sire to save is proportional not to the substantial reward, but to a certain arbitrary proportion between the values expended and received. If we ask why the rate of profit should prevail, the answer can only be given by saying that the sacrifice of abstinence is repaid by the enjoyment derived from the product. If, then, the

is repaid by the enjoyment derived from the product. If, then, the product be suddenly increased, a lower rate of profit should be a sufficient inducement to the same amount of saving.

We do not attach much importance to this criticism, which would not in any case effect the general soundness of Mr. Cairnes's conclusions. On another point we feel more doubt. Seeing the difficulty of increasing the wage-fund, he finally decides that the only real hope of improving the labourer's position lies in co-operation. Mr. Cairnes, indeed, is fully sensible that the problem is not merely economical, and that the spread of co-operation could only be made possible by an increase of prudence and intelligence on the part of the labouring population. If this be granted, we do not see why improvement should not take place in other directions. Mr. Cuirnes remarks, for example, that 120,000,000 is samually spent on alcoholic drinks. If the working-man seved half of this he would throw 60,000,000. A year spon the market, which, as Mr. Cuirnes anticipates, would reduce the rate of interest to 1 or 2 per cent., a totally inadequate compensation for

the sacrifice of abstinence. Perhaps it would rather lead to an it creased outflow of capital to countries in which the rate of profit still higher, and is likely to be so for any period worth taking intercount. He therefore argues that the labourers should combin and become capitalists themselves. Now, in the first place, seems to us conceivable that the expanditure of 60,000,000, with drawn from the publicans and spent on rational objects, inight is sufficient to effect a very material improvement in the position the labouring classes. The wages of all classes of labourers about the lowest would be sufficient to enable them to lead rations the labouring classes. The wages of all classes of labourers above the lowest would be sufficient to enable them to lead rational lives if only they had the necessary tastes and capaci-ties; and the consequent improvement in self-restraint and prudence would prevent population from pressing as at present against the wage-fund. And, in the next place, the question whether they invest their savings in order to become themselves against the wage-fund. And, in the next place, the question whether they invest their avings in order to become themselves capitalists, employers of labour as well as labourers, or simply put them out to interest, seems to us to be of secondary importance. In one case they would have to oust a certain number of capitalists, and in the other they would, to a certain extent, discourage the savings of other classes by occupying the field for investment. If the capitalists found themselves beaten by the competition of Co-operative Societies, they would be disposed to lend their money rather than employ it in business, and the same effect would be produced on the rate of interest which Mr. Cairnes dreads from the other alternative. If workmen generally used their savings to buy their own houses, or to purchase annuities for their old age, we do not see why the effect should not be as good as if they became sharers in the risks and profits of commercial speculations. Mr. Cairnes states very truly the advantages of accumulated capital in increasing the efficiency of industry, and the same causes may be expected to promote the advantages of unity of administration. The question, however, is something of the largest, and we may be content to say that probably the result will not be so uniform as theorists are apt to assume. Cooperation has doubtless a great future, but we have yet to learn what are the limits to its applicability. We must, however, conclude by expressing our consciousness that we have done very scanty justice to a book which is full of luminous suggestions for the improvement of the theory of which it treats. the improvement of the theory of which it treats.

SWINBURNE'S BOTHWELL.

MR. SWINBURNE'S new poem has been looked for with some curiosity. His earlier writings, amid much that was rank and noisone, contained also much that was noble and beautiful. It was clear that he had the genuine poetic faculty, however insane and degraded might occasionally be his use of it; and there were many who looked hopefully to the future, trusting that time might purify as well as mature his muse. Seven or eight years have alwayed since then, and it cannot be said that Mr. Swinburne. have clapsed since then, and it cannot be said that Mr. Swinburne have clapsed since then, and it cannot be said that Mr. Swinburne has during that period given his votaries much encouragement. Since the appearance of Poems and Ballads he has published only some stray snatches of verse, which seemed to indicate rather a decline than growth of power. He appeared indeed to be settling down into chronic hysterics, and to have grown content with sound at the expense of sense. When it was announced that he was engaged on an important work which was to cast his former visiting into the shade and to vindicate his coming it was found that was angaged on an important work which was to cast his former trifling into the shade and to vindicate his genius, it was feared that perhaps the effort had been deferred too long. This work, however, has now appeared, and we may say at once that it seems to us fully to justify those who had confidence in Mr. Swinburne's capacity for higher things. There is nothing here to gratify the prurient or to alarm the prudish. If there is occasionally a plainness of speech which sounds a little strange, it is only an honest simplicity, and gives the flavour of the age to which the story belongs. Referred gives the flavour of the age to which the story belongs. Bothwell, in short, is not a mere repetition of Chastelard. It is altogether

In short, is not a mere repetition of Chastelard. It is altogether larger in conception and execution, and the atmosphere is pure.

Mr. Swinburne's most prejudiced critic cannot, we think, deny that Bothwell is a poem of a very high character. It is written in a broad, nervous style and moves with stately measure. Every line bears traces of power, individuality, and vivid imagination. There is much energy and passion in the book, but the reader will be agreeably surprised by Mr. Swinburne's new moderation and sobrlety. The versification, while characteristically supple and melodious, also attains, in spite of some affectations, to a sustained strength and dignity of a remarkable kind. Mr. Swinburne is not only a master of the music of language, but he has that indescribable touch which discloses the true post—the touch that lifts from off master of the music of language, but he has that indescribable touch which discloses the true poet—the touch that lifts from off the ground. At the same time, with all these merits, Bothwell must be acknowledged to be rather a disappointing book. It is so good that it ought to have been much better, and it might easily have been made better. It is ratisfactory to find that the poet has lifted himself out of the mire in which he previously dabbled, and that he is now devoting himself to work more worthy of his powers. Unfortunately, either from a too wanton self-confidence, or from a bluntness of artistic sense, he has contrived to make it difficult to do justice to the excellences of his power. To be enjoyed, a poem must be read, and Bothwell is very hard reading. In the first place, there is a terrible deal of it. It is not everybody who, in these hasty days, has time to read through 532 pages of rather closely printed verse. And even those who have time and patience for the task must find themselves fagged and weary at the end of it. The mischief is not merely that it is a very long story. It is

^{*} Rothwell A Tragedy. By Algernon Charles Swinburne. Loudon:

that it is a story told in far too many words. It is not mere that it is a story told in far too many words. It is not mere length, but unreasonable and unnecessary length, that we object to. The five acts of Bothwell are about equal to four or five plays of Shakspeare rolled together. There are single speeches in it which are as long as two or three of Shakspeare's access. Scarcely any of the characters deign to open their mouths for less than a whole page or two of talking, and some of them have a way of running through half-a-dozen or a dozen pages, without requiring for beauth.

pausing for breath.

On the title-page the poom is called a tragedy, and the author, in his dedication to M. Victor Hugo, speaks of it as

Mon drame épique et ploin de tumulte et de fiamme.

Mon drame épique et ploin de tumulte et de slamme.

It is needless of course to say that this does not imply that the work is intended for the stage. All that is meant is that it is a poem in a dramatic form. But there are fair limits to the length even of an epic, and there can be no question that Mr. Swinburne has transgressed them in this instance. The book is ruined by its exuberant and irrepressible diffusences. It is sometimes said of a wood that it cannot be seen for the trees, and it may certainly be said here that the poem is hidden in the dense profusion of the words. Mr. Swinburne's muse is like an ill-regulated tap; though only a drop in a spoon is wanted, out blurts a deluge whenever the tap is turned. The victim of a toe easy fluency, he apparently finds it easier to go on than to leave off; and his verse is freally so round and full and flowing that sometimes we can hardly wonder at his infatuation. On the whole, however, Mr. Browning's closely-packed puzzles are far from being so fatiguing as Mr. Swinburne's overpowering wordiness. He might almost be supposed to have made a match with himself to wrap fatigulag as Mr. Swinburne's overpowering wordiness. He might almost be supposed to have made a match with himself to wrap up everything he has to say in the greatest possible number of words. The wearying and depressing influence of this extravagant prolixity is intensified by deficiencies in perspective and dramatic variety. The characters all make too long speeches, and the speeches are too much in the same style. Lighting on a page at random, without the name of the character then speaking to guide you, it is sometimes difficult to know to whom the speech should be assigned. Mary Sturt at times has evidently modelled her style on Knox, or Knox has copied the Queen's. There are two dreams in the book, both of a shipwreck, one dreamt by Darnley, and the other by Bothwell, but the style in which each dream is told is the same. Mr. Swinburne has undoubtedly flashes of dramatic brightness; but he is delicient in sustained dramatic animation. His characters are too much talking-machines. They come in and make long statements of their feelings and general state of mind, and what they would like or would not like; but there is scarcely anything of the quick interchange of dramatic dialogue. In fact, it is rather monologue than dialogue, because, though there may be two people at once on the stage, they do not converse so much as follow each other in monologues. The same defect was observable in Chastelard, which was admirable as a subtle study of character, but weak as a dramatic representation. In such a story as Mr. Swinburne has chosen there is of course abundance of stirring incident, but the incident is almost all outside the play, and has little or no effect on the characters. The puppets have been dressed and trained beforehand, and remain to the end just what they were when first put upon the stage. The object of a drama should be to show how character is evolved or modified under the influence of incident. almost be supposed to have made a match with himself to wrap should be to show how character is evolved or modified under the influence of incident.

Those who have road Chastelard will know the view which Mr. Swinburne takes of the character of Queen Mary, and to this he adheres, although abating the poisonous animalism which was a stain upon the former picture. Mary is still the same lithe, bright, inhuman creature, unscruppilous and remorseless in the indulgence of her passions, whether of love or hate, now threatening, now cajoling or betraying, and true only to the lust of the hour which she identifies with herself. By the side of Bothwell she assumes somewhat of a resemblance to Cleopatra, but she lacks the large and genial philosophy of Shakspeare's Egyptian, and Bothwell is but a clownish Antony. The character which Mr. Swinburne has endeavoured to portray is thus described by Knox:— Those who have road Chastelard will know the view which Mr.

Is as a flame of fire, insatiable, And subtle as thin water; with her craft is passion mingled so inseparably. That each gets strength from other, her swift wit By passion being enkindled and made hot, And by her wit her keen and passionate heart So tempered that it burn itself not out, Consuming to no end.

passionate nature.

Consuming to no ond.

Her fierce passionate nature craves perpetual variety and excitement. She is in love with Bothwell while still playing with Rizzio, and she chafes Bothwell with her jealous coquetry in a vain effort to strike new sparks of love out of the rough trooper. Her changeful moods are cleverly touched in one of her scenes with Rizzio. She has just been gloating with savage ferocity over the contemplated destruction of her half-brother Murray, and then she suddenly drops into a tone of simple innocence, and wishes she were some plain common woman "with no State to stay":—

Queen common woman "with no state to say

Queen. God witness me, I had rather be re-horn

And lord a poor mean woman, and live low

With haradoss habit and poor purity

Bown to my dull death-day, a shepherd's wife,

Than a queen dothed and crowned with furpe and fear.

Rizzus Are you so weary of crowns, and would not be

Suon wearier waxon of sheepfolds?

Faith who become Unique. Takb, who knows? But I would not be weary, let that be Part of my wish. I could be glad and good
Living so low, with little labours set
And little sleeps and watches, night and day
Falling and flowing as small waves in low see.
From shine to shadow and back, and out and in
Among the firths and reaches of low life:
I would I were away and well. No more,
For dearlove talk no more of policy.
Let France and faith and envy and England be,
And kingdom go and people; I had rather rest.
Quiet for all my simple space of life.
With few friends' loves closing my life-days in
And few things known and grace of humble ways
A loving little life of sweet small works.
Good faith, I was not made for other life.
too much iteration in the picture of t

Good faith, I was not made for other life.

There is too much iteration in the picture of the Queen. Her bursts of rage, her curses of her conemies, her alternations of queenly dignity and womanly wile, har fondling of her bursty lover are repeated to weariness. The most tiresome parts of the poem are her love messages to Bothwell. There is perhaps more evidence of dramatic capacity in the delineation of Darnley than in that of any of the other characters. His weak, vain, swaggering nature, yet not without a touch of nobler qualities which might have ripeued if Mary had not blighted them by her contempt and hatred, is skilfully touched. Rizzio is a mere shadow, and Bothwell scarcely more, and John Knox is only a grave figure in a black gown, who delivers elequent denunciations of the Queen. One of Knox's speeches fills fourteen denunciations of the Queen. One of Knox's speeches fills fourteen pages without break, and is undoubtedly very grand in its majestic intensity. We can only quote a fragment of it. Knox points to the fate which had befallen all who ever leved her—Hamilton, Gordon, then Chastelard, Rizzio, and Darnley:-

Of these The stain and slayer, the spoiled and the spoiled That each have lain down by her wedded side, Which will ye say hath slept within her hed A sleep more cursed, and from more evil dreams. Found a worse waking? he that with a blast Which rent the loud night as a cry from hell Was blown forth darkling from her sheets, or he That shared and soiled them to this day whereon God easts him out upon the track of Cain To flee for ever with uncleaned red hands. And seek and find not where in the waste world To hide the wicked writing on his brow Till God rain death upon him? () thesa

Till God rain death upon him?

Or if God haply give his lightnings charge. They burt him not, and bid his wind pass by And the stroke spare him of the bolted cloud. Then seeing himself cast out of all that live. But not of death accepted, everywhere. An alten soul and shelterless from God, He shall go mad with hate of his own soul. Of God and man and life and death, and live. A loathlier life and deadlier than the worm?

That feeds on death, and when it rots from him Curse God and die. Such end have these that loved; And she that was beloved, what end shall she?

While there is throughout the poem much passion, there is a While there is throughout the poem nuch passion, there is a curious absence of the pathetic element. There is especially a hardness about Mary which is, to say the least, a mistake in art. After Rizzio is killed, she is full of pity for herself and rage against his murderers, but there is not a word of tenderness for the poor wrotch himself. The only approach to pathes is in the very fine scene where Jane Gordon, Bothwell's divorced wife, takes leave of himself. The pathetic of the Court Wilesherders of the court of the scene where Jane Gordon, Bothwell's divorced wife, takes leave of him and of the Queen. This hardness of tone, and want of tenderness and spiritual sympathy, are certainly serious blemishes. Indeed, it is continually forced on one that, skilful as Mr. Swinburne is within his range, it is a range with decided limitations, and that he fails to touch the noblest chords of human nature. The reader is left at last with a sense of something wanting. There are no lines that linger in the memory, no thoughts that open up the higher spheres of feeling and imagination. Mr. Swinburne is more at home in description than in dramatic evolution. Here, for example, is a vivid picture of the marriage of Mary and Bothwell:—

Melville. I have not seen for any chance till now So changed a woman in the tace as she, Saving with extreme sickness. She was wed In her old mourning habits, and her face As deadly as were they; the soft warm joy. That laughed in its fair feature, and put heart In the eyes and gracious lips as to salute All others' eyes with sweet regardininess, Looked as when winds have worn the white-rose leaf; No fire between her cyclids, and no flower in the April of her cheeks; their spring acold, And but for want of vary heart to weep. They had been rainier than they were forbrun. Herries. And his new grace of Orkney? Melville. The good Duke Was dumb while Adam Bothwell with grave lips Set forth the scandal of his level life past. And fair faith of his present penitence, Whose days to come being higher than his past place Should explain those gons by, and their good works. Atone those evil; hardly twitched his eye. Or twinkled half his thick lip's curve of hair, Listening; but when the bishop made indeed. His large hard hand with harn so flowed indeed. His large hard hand with harn so flowed indeed. His large hard hand with harn so flowed indeed. All dangers and all adverse things that flight line out of days marison, so been them up. With its green hand of triumply; and the hand.

Pastening on here so griped it that her lips Trembled, and turned to eatab the smile free Trembied, and furned to eatch the emile from a As though her spirit had put its own life off And same of joy or property of pain. So close with his about; but this twin smile Was briefer than a flash or gust that strikes And is not; for the next word was not said. Ere her five waned again to winter-ward he a mace unition, and her answer cause he would from dearly men wickedly wrang forth By out of wiscate, suger and forceful breath Which hange on lips that loath it.

Interspersed through the tragedy are several sough, one in French, which show that Mr. Swinburne has lost none of his delicacy and

finish in such compositions.

On the whole, while we welcome the reappearance of Mr. Swinburne clothed and in his right mind, and gladly recognize the masculine vigour and robustness of his present work, we are sorry that he should have been led by an overflow of words to make the reading of it so wearisome. What it needs is rigorous compassion—not merely the excision of particular scenes, but condensation throughout. It would then be a powerful and vivid poom, which could be read with pleasure, though in any case it would remain deficient in some of the very highest qualities of poetry.

MOTLEY'S LIFE OF BARNEVELD. (Swand Notice.)

THE trial and death of Burneveld, besides its interest as a tale and its importance as a piece of general European history, has a further importance as a piece of constitutional study, to which Mr. Motley, as an American writer and diplomatist, could not fail to be alive. Setting aside his actual innocence of anything which the law of any time or place would call a crime, Barneveld died for what an American would call the principle of State-right as opposed to the absorption of the powers of the separate Cantons of a Federal body into the hands of a central power. Barneveld was Advocate of Holland, one of the highest offices in the chief province of the Confederation. He was tried and put to death by judges appointed by the States-General, the highest Federal authority, but which, like every central power in a Confederation of independent States, can only have such powers as the confederated States have chosen to entrust to it. The principle is exactly the same, whether the powers entrusted to the central body are greater or smaller. The Swiss Constitution which has just been voted gives greater power to the Federal body than the Constitution of 1848, just as the Constitution of 1848 gave the Federal body greater power than the Pact of 1815. The powers granted in 1815 were about as small as they could be, if the Federal power was to have any authority at all; the powers granted in 1874 are about as large as they can be if the Cantons are to keep any independent being at all. But in either case the Cantons, as sovereign States, keep whatever powers they do not formally give up, and they keep them, not by grant or by sufferance, but of right. The Federal body, be its powers great or small, can neither increase nor lesson them of its own act; they can be increased or lessened only by the process, whatever it may be, which the sovereign Cantons have agreed upon as the means for making amendments in the terms of their union. Now the union of the Seven United Provinces was of the very laxest kind; it gave the States-General no powers whatever within the several provinces. It answered to the Swiss Pact of 1815, or perhaps rather to the still laxer union of the old times, and to the first Articles of Union between the United States of and to the first Articles of Union between the United States of America in 1777. But the far larger powers possessed by the present Federal bodies in America and Switzerland are held by exactly the same right as the smaller powers held by the Federal bodies which went before them. The Federal Assembly under the Constitution of 1874 has no right to take to itself any powers which are not granted to it in that instrument, any more than the old Diet had to take to itself any powers not granted to it in the Pact of 1815. In all these cases the sovereignty is divided between the several Cantons and the Federal body. Each has a range in which it is independent, and in which the other has no right to interfere with it. It matters not in what proportion the sovereignests may be divided; it matters not whether the range ereignty may be divided; it matters not whether the range sovereignty may be divided; it matters not whether the range of the cantonal or of the Federal power be wider or narrower; the principle is that each of them is sovereign and independent in its own range, whatever that range may be. Barneveld was put to ideath by judges appointed by the States-General, but the States-General had no judicial powers; the acts for which Barneveld was condemned, granting that he had done them and granting that they were crimes, were acts for which he was responsible to the courte demned, granting that he had done them and granting that they were crimes, were acts for which he was responsible to the courts of Holland only. The States-freneral had no power to judge Barneveld in any case. When they took upon themselves to judge him, even if the trial had been as fair and the sentence as just as they were manifestly the centrary, the breach of the rights of the province of Holland would have been exactly the same. The present Federal hodies both of America and Switzerland have judicial powers; but they can of course be exercised only which the Constitution marks out. If the Federal Courts were to take upon themselves to indee any mainter which Gourts were to take upon themselves to judge eny matter which the Constitution has not essigned to them, they would be guilty of the more breach of State-right of which the States-General

* The Life and Dunth of John of Burnswill, Advante of Helland, with a view of the Primary Causes and Movements of the Thirty Fours' War. By John Lethrop Hotley, D.C.L., L.L.D. a vols. Landon: Murray. 1874.

were guilty when they took upon themselves to name judges for the trials of Rameveld and Grotius. It is necessary to make these remarks in order to clear the way for what we have to say on account of the comments which Mr. Motley makes in some parts of his

The republic of the United Provinces, as Mr. Motley severe times strongly insists, arose, like most successful republics, not out of any set purpose, but out of the circumstances of its history. The provinces of the Notherlands were members of the Empire, which came one by one, by various processes, under a single immediate sovereign, that sovereign being one of the great princes of Europe who grew into one still greater, a Duke of Europedy who grew into a king of Spain and the Indies. Union under a great princes of the province of the great princes of Europe who grew into one still greater, a Duke of Europedy who monarchy, a monarchy practically far more powerful than the Empire, naturally weakened the connexion with the Imperial overlord far more thoroughly than it was weakened in the case of countries whose princes were Princes of the Empire, and nothing else. The provinces were not formally separated from the Empire till the Peace of Westphalia; they were practically the Empire till the Fears of Westpiana; they were practically separated from it when they were first united under the Burguin-dian Dukes. Add to this that two of the southern provinces, Flanders and Artois, were, up to the Treaty of Madrid, fiels, not of the Empire, but of the Crown of France. The one tie among the seventeen provinces was the common sovereign, a sovereign who was not King over the whole country, but Duke, Count, or Lord of this or that district separately. Within the provinces again the cities had the largest nessible degree of numerical inde-Lord of this or that district separately. Within the provinces again the cities had the largest possible degree of numicipal independence, though their form of government, like those of so many other cities, showed the usual tendency to grow up into narrow oligarchies. Thus, when cortain of the provinces successfully threw off the yoke of the actual sovereign, and unsuccessfully tried to find some other sovereign to take his place, they diffted into a republican form of government through sheer necessity. But, when the one common tie was broken, they because, not one republic, but as many republics as there were provinces, one might almost say as many republics as there were cities. The state of things came about which Mr. Motley thus describes:—

things came about which Mr. Motley thus describes!—
The sovereignty of the country so far as its nature could be satisfactorily analysed scened to be scattered through, and inherent in each one of, the unifitudinous boards of magistracy—close corporations, self-elected—by which every city was governed. Nothing could be more preposterous. Practically, however, these boards were noteenied by deputies in each of the seven provincial assembles, and these again sent councillors from among their number to the general assembly which was that of their High Mightinesses the Lords States-Leneval.

The Province of Holland, being richer and more powerful than all its six saters combined, was not unwilling to impose a supremacy which on the

sisters combined, was not unwilling to impose a supremacy which on the whole was practically conceded by the rest. Thus the Union of Utrecht established in 1779 was manutained for want of anything better as the foundation of the Commonwealth.

He adds a note which we do not fully understand:-

He adds a note which we do not fully understand:—
Such a constitution, redimentary and almost chaotic, would have been impossible on a large territorial scale. Notlang but the exhguity of the domain prevented its policy from falling into imbecility instead of manifesting that extraordinary various which astemshed the world. The secret of its force lay in the democratic principle, the sentiment of national independence and popular freedom of movement which underlys these petty numbelpal sovereignties. They were indeed so numerous that, while claiming to be oligarchies, they made up a blad of irregular democracy. Had such a constitution been copied ustend of avoided by the fathers of our own republic the consequences would have probably been disastrons. Disintegration of the commonwealth at an early day, and possibly the birth of a hundred rival states, with different religious laws, and even languages—such inlight base been the phenomena exhibited on what is now the soil of the United States.

" Exiguity" is, one would hope, a word of Mr. Motley's own coinage; so far un we can venture a guess at its meaning, that the territory of the Confederation of the United was not so big as the territory of the other Confederation which stretches from the Atlantic to the Pacific. But surely the fathers of that Confederation neither copied nor sycided the Constitution of the United Provinces, but, like them, drifted into a state of things which their circumstances made in some points like, and things which their circumstances made in some pomes are, in other points unlike, the state of things in the provinces. In the United States there was nothing like the practical supremacy of Holland, nothing like the manicipal oligarchies, nothing like the manicipal oligarchies, nothing like the princely Statholder. It was most likely of Holland, nothing like the maintenal oligarchies, rathing likes the position of the princely Statholder. It was most likely the absence of these things which esabled the United States to take in 1789 the step which Switzerland took in 1848, but which the United Provinces never took, that of changing from a lax Statenburd into an organized and thoroughly republican Bundesstaat. The points of likeness and unlikeness in the history of the transfer of the continuous form therefore a most intensities. Bundesstaat. The points of likeness and unlikeness in the history of the two Confederations form therefore a most instructive piece of constitutional study; but it does not strike us that Mr. Motley has set about it in the most philosophical spirit. We do not know whether he has had any dealings with Mr. Lowe, but he certainly seems to have got somewhat of that contempt for "exiguity" which is at once fatal to historical and political study. He tells us at the beginning of his eleventh coast on to say: gnes on to say:-

goes on to any:—

It may also be not uninteresting to vanture a glance into the internal structure and workings of a republican and federal system of government, then for the first time reproduced sincest spontaneously upon an extended scale.

Perhaps the revelation of some of its defects, in spits of the faculty and vitality struggling against them, may not be without value for our own country and spech. The system of Swinserland was too limited and homely, that of Venics too purely oliganshiped, to have much morel for un now, or to mader a study of their pathological pleasurement especially instructive. The lessons taught us by the history of the Netherland confederacy may have mass permanent meaning.

Not long before, in the last chapter but one of the first volume, when saying that the Ministers of the Confederation in foreign sountries were allowed the rank of Ambassadors, he adds:—

And this was at a moment when, with exception of the brave but insignificant cantons of Switzerland, the Republic had long been an obsolete

We are sorry to see Mr. Motley falling into the wretched French jargon about "the Republic," "the Revolution," and the like. Nor can we understand what he means by saying that the Republic was an obsolete idea, when, as he presently remembers, there was still Venice, when there were also Genoa and Lucca and Ragusa, to say nothing of the Free Cities of Germany. Perhaps, however, most of these were guilty of the unpardonable ain of "exiguity." Nor do we quite see the good of such strange metaphors as the "pathological phenomens" of a Commonwealth. Nor do we know what is meant by the system of Switzerland being "too limited and homely." The United States themselves are not unlimited, and we do not know that homeliness is a fault. Nor can we understand why the political history of Switzerland, which goes on still, should not be as instructive as that of the Netherlands, which, in its republican and Federal form, has come to an end. of an instructive study of the various forms of Federal government carry us over a wider range both in time and space than Mr. Motley's. We must begin earlier, and we must on our own continent go on later. Mr. Motley has most likely shut his eyes to what is really the most remarkable political event of the present year, on account of the "exiguity" of the land in which it has

The position of the several States of the United Provinces towards the States-General could hardly be better put than it was put by Barneveld speaking through the mouth of the States of Utrecht. In Mr. Motley's analysis it stands thus:—

They reminded the general government that by the 1st article of the "Closer Union" of Utrecht, on which that Assembly was founded, it was bound to support the States of the respective provinces and strengthen them with counsel, treasure, and blood if their respective rights, more especially their individual sovereignty, the most precious of all, should be assailed. To refrain from so doing would be to violate a selemn contract. They further reminded the council of state that by its institution the States-Provincial had not abelicated their respective sovereignties, but had reserved it in all matters not specifically mentioned in the original instruction by which it was created.

And again, in a letter to the French Ambassador Du Maurier, and in another to Caron, the Ambassador of the Provinces in England, he puts forth the state of the case in the clearest

"If the King were better informed," said Barneveld, "of our system and laws, we should have better hope than now. But one supposes through notorious error in foreign countries that the sovereignty stands with the States-General, which is not the case, except in things which by the Articles of Closer Union have been made common to all the provinces, while in other matters, as religion, justice, and polity, the sovereignty remains with each province, which foreigners seem unable to comprehend."

The complaint of Barneveld was that Englishmen could not understand that the separate States were sovereign commonwealths; they could not understand the doctrine of divided sovereignty which Barneveld so clearly put forth. Mr. Motley complains that, when the late civil war broke out in the United States, Englishmen were equally unable to understand the nature of a Confederation; they fell into the opposite error from their forefathers in the time of James the First, the error of believing that the States of the American Union were sovereign and independent. States of the American Union were sovereign and independent. We must give the passage in full, though it is rather long:—

We must give the passage in full, though it is rather long:

The States in arms against the general government on the other side of the Atlantic were strangely but not disingenuously assumed to be sovereign and independent, and many statemen and a leading portion of the public justified them in their attempt to shake off the central government as if it were but a board of agency cetablished by treaty among sovereigns and terminable at pleasure of any one of them.

Yet even a superficial glance at the written constitution of the Republic showed that its main object was to convert what had been a confederacy into an Incorporation; and that the very essence of its renewed political existence was an organic law laid down by a whole people in their primitive capacity in place of a league banding together a group of independent little corporations. The chief attributes of sovereignty—the rights of war and peace, of coinage, of holding armies and navies, of issuing bills of credit, of foreign relations, of regulating and taxing foreign commerce—having been taken from the separate States by the united people thereof and bestowed upon a government provided with a single executive head, with a supreme tribunal, with a popular house of representatives and a senate, and with power to deal directly with the life and property of every individual in the land, it was strange indeed that the feudal, and in America utterly unmeaning, word Sovereign should have been thought an appropriate term for the different States which had fused themselves three-quarters of a century before into a Union.

It is really strange that an American statesman should fail to

It is really strange that an American statesman should fail to catch the doctrine of divided sovereignty so clearly put forth by flarneveld. Nor can we understand why the word sovereignty should in America be "utterly unmeaning." It is constantly used in political discussions in Switzerland, and we do not see what other there is to put in its place. What Mr. Motley has got in his head, what he is really fighting against, is not the doctrine of the sovereignty and independence of the States, but the further doctrine that the sovereignty and independence of the States imply their right to second from the Confederation. But this last doctrine is by no means implied in the other. If it is to be made out, it must be made out by other arguments. The sovereignty and independence of the States, as set forth by Barneveld, and as every student of American or Swiss politics must understand it, means what we not forth at the be-It is really strange that an American statesman should fail to

ginning of this article. It means that, while the central power of the Confederation has its own range within which the States may not meddle with it, and is therefore sovereign within that range, the States also have their range within which the central power may not meddle with them, and within which they also are sovereign. This is the difference between a State or Canton of a Confederation and a county or province or department of an ordinary kingdom or commonwealth. An Act of Parliament can do exactly what it pleases with everything in Yorkahire or in Rutland. An Act of Congress cannot do exactly what it pleases with everything in New York or Rhode Island. It can only regulate those things which New York or Rhode Island. It can only regulate those things which the Federal Constitution gives it power to regulate. Mr. Metley shows with great truth that the range of the Federal power in the shows with great truth that the range of the Federal power in the United States at present is far wider than the range of the Federal power was in the United Povinces in the days of Barneveld; but that fact in no way touches the sovereignty and independence of the States within the range, great or small, which either system tends to. Barneveld says that religion, justice, and polity were matters which were left to the States. The whole quarrel mainly arose out of an attempt on the part of the States-General to enforce one way of thinking in religion on the whole country. What would Mr. Motley think if the President and Congress were to attempt to legislate on religious matters—to set up, for instance, an Established Church throughout the Union or in any particular State? He would surely feel that the President and Congress had encroached, that they had violated a right of some kind. The right which they would violate by so doing would be that sovereignty and independence of the particular States which he denies. On this point the state of things in the United Provinces in the days of Barneveld. In the matter of religion the sovereignty of the several States is state of things in the United Provinces in the days of Barneveld. In the matter of religion the sovereignty of the several States is still untouched and undivided. In the matter of justice the case is different. The Federal power in the United Provinces had no judiciary; the Federal power in the United States has a judiciary. That is, in the matter of justice the sovereignty is divided. The sovereignty of the Union hinders the States from meddling with matters which belong to the courts of the Union. But the sovereignty of the States equally hinders the Union from meddling with matters which belong to the courts of the States. Mr. Motley would hardly like to see the judicial system of his own State reconstructed by the authority of the President or of Congress; that is, he would not like to see a violation of that sovereignty or independence of the States a violation of that sovereignty or independence of the States the existence of which he denies. Lastly, as to polity, the fact that the Constitutions of all the American States have converged so nearly to one model has put out of sight the liberty which the Federal Constitution leaves to them in this matter, and the actual amount of difference which there was between the Constitutions of amount of difference which there was between the Constitutions of different States during the earlier days of the Confederation. No State can make any branch of its Government hereditary; that is about the only limit. But it may be at pleasure a pure democracy such as Rhode Island once was, or a State with a strong oligarchic silen as ithous Island once was, or a State with a strong oligarchic element, provided oligarchy does not take an hereditary form; and, though it may not set up an hereditary Prince, there is nothing to hinder it from setting up a Doge for life. As a matter of fact, the States have hit upon a form of Constitution different from any of these; but this has been done in the exercise of that sovereignty and these; but this has been done in the exercise of that sovereignty and independence which they might have exercised in choosing something quite different. What would Mr. Motley say to a change in the constitution of any State made by the authority of Congress? The thing to be got rid of is the notion, under which Mr. Motley clearly writes, that the doctrine of State sovereignty, as it was understood by Barneveld, as it is still understood in Switzerland, as it was lately understood in America, implies the right of secession. The two things have nothing to do with one another. Those who maintain the right of secession must maintain it on some other ground than that of the sovereignty of the States. The sovereignty of the States simply means that there is a range within which they are responsible to no higher power, within which they are independently, not of grant or sufference, but of right. That this range is much narrower in the case of an American State now than it was in the case of one of the United Provinces in the time of Barneveld makes no difference in the principle. If Mr. Motley simply dislikes the words sovereignty Provinces in the time of Barneveld makes no difference in the principle. If Mr. Motley simply dislikes the words sovereignty and independence, as used to express the difference between an American State and an English county, we do not care about the words. If Mr. Motley can give us other words, especially if they are Teutonic words, to express the idea, we will heartily thank him. Till he does so, we must use such words as we have got, as we know no others which will so well express the meaning.

AILEEN FERRERS.

THE literary market is so overstocked with novels by ladice that a new authorese starts at a considerable disadvantage; and as there are no indications of previous publications in the title-page, we may bresume that this is Miss Morley's first attempt. But she certainly has one claim to notice which is sufficient to make her first attempt deserving of much more than the usual amount of attention which such works command. It is wholly unlike the ordinary noval by a lady. Its grammar is faultless, its style is

* Ailess Perrers, By Susan Morley, London: Henry S. King & Co. 1874.

.

pure, flowing, terse, and correct, there is not a line of fine writing from beginning to end, and there is a total absence of anything like mosalising or the introduction of pretty, ineffectual sermons. To the elaboration of the main subject of the encry everything conduces from the outset to the close. There is a directness and simplicity about the book which few men could surpass; while in its refinement, in its tone of somewhat melancholy reserve, and in its perhaps excessive minuteness of detail, it betrays in every page the marks of faminine composition. Such descriptions of scenery as it contains are short and natural, and compressed within the sewest limits of good tasts. Aiken Ferrers is the story of a girlwho, without any fault of her own, finds herself placed in a difficult and trying position; and her fortunes carry her alternately into high London society and into the life of humble people on the Northern moors. Evidently at home in both spheres, the author makes incidents and character fit easily into the framework she has designed for them, and has carefully studied the problem how such a girl as Aileen would feel and act under the varying circumstances of her lot. It is as a study of character worked out in a manner that is free from almost all the usual faults of lady writers that Aileen Ferrers merits a place apart from its innunerable rivals. But it would be almost impossible that a novel with such merits should not also have cognate defects. It is interesting rather than entertaining. The story never drags, and in one part of the book where the troubles of Aileen come to a climax the interest is great, and of a high order; but in those parts where the mere business of the story is going on the amusement of the reader is certainly not consulted. The description of London society is in its way accurate, but the author knows it, or one side of it, perhaps too well, and seems to have found it to be a very poor affair. The simplicity of the writing procludes the notion of anything like designed af

that is to give the key to preceding mysteries. Perhaps it may even be said to be a book which gains by its plot being known, as then the merits of execution become more obvious. The problem then the merits of execution become more obvious. The problem which the author has set before herself is this:—Aileen is the orphan daughter by a secret marriage of a brother of Lord Braithwaite. She is brought up by her grandmother, the wife of a bailiff living in a farmhouse on the moors, until she is sixteen, and on her sixteenth birthday consents to become the wife of a young gamekeeper. But the secret of her birth has just at this crisis become known to her dead feathers family and her sure Lady Green arrives to claim. father's family, and her sunt, Lady Grace, arrives to claim and adopt her. Ailsen refuses to go unless it is understood that she is at liberty to return when she is twenty-one and marry Ralph if she pleases; and, this being settled, she is carried off by her aunt, who gives her an excellent education abroad and then introduces her into the great world of London. She does not find any new lover to her taste, she is naturally disgusted with the frivolity and selfishness of the men and the petty malignity of the women by whom she is surrounded, and, although warmly attached to her uncle Lord Braithwaite, to her aunt, and to Mr. Lushington, an old friend of her father, she is quite in the mood, when her twenty-first birthday arrives, to go back to her old Northern home and fulfil her engagement with the excellent and simple-hearted Ralph, although she is a fine lady and he is a gamekeeper. She is quite ready to bind herself at once; but she has promised her aunt that before coming to a final decision she will let a month go by in order that she may have time to ascertain the real nature of her her aunt, who gives her an excellent education abroad and then in in order that she may have time to ascertain the real nature of her feelings. During this month she slowly awakens to the painful consciousness that a marriage with a man so much her inferior in cultivation would be a fatal mistake. She struggles hard not to seem wanting in generosity and to convince herself that she must not trifle with the happiness of her humble has depended homes. At least she takes the plungs tells klalph but devoted lover. At last she takes the plunge, tells Halph that it cannot be, and leaves her moorland home for ever in the charge of Lord Braithwaite. She has been greatly fortified in her charge of Lord Braithwaite. She has been greatly fortified in her resolve by the companionship of Mr. Lushington, who has been injured by an accident while on a shooting party on the moors and has been carried to the farm where Aileen is staying. His society, has been carried to the farm where Aileen is staying. His society, the friendly talks they have together, the books she reads to him and with him, awaken the conviction that she can never again go back to the days of her untutored girlhood, and that a life from which all she has learnt to know and value is excluded must be one of sheer and simple misery. After she leaves Ralph and is once more free she soon begins to feel that the society of her old friend has become indispensable to her, and the story rapidly concludes with her engagement to Mr. Lushington. The month of doubt, affection, restores, and hardening resolution that she passes at the moors is the centre of the interest of the tale, and it is here that the author shows what she can really do when at her best. But there are many of the minor parts of the story which exhibit fertility of invention and a sense of the value at-

taching to unity of design. The description of London society, which in itself is rather flat and perhaps disproportionately long, is so managed that almost every part of it bears more or less directly on the conduct and character of Aileen during the one important and interesting month of her life; and as herolnes must be married, and, if a novel is drawing to its close, must be married quickly, considerable praise is due to the arrangement which confides Aileen to the sobor sense and mature pleasantness of Mr. Lushington. Miss Morley has too just a porception of what will be in harmony with the reader's feelings to let Ailsen, immediately after she has gone through the painful crisis of her broken sugarement with Ralph, succumb to the rapture of a young love or the brilliancy of a great match.

ment with Ralph, succumb to the rapture of a young love or the brilliancy of a great match.

In order to estimate how the author has dealt with the difficulties which her subject presented to her as she approached its climax, it is necessary to remember what these difficulties were. Alleen is a young lady and Ralph is a gamskeeper, and it is not by any means an easy thing to sit down and write a story so that the engagement of a young lady to a gamskeeper shall be natural, probable, and interesting. Mr. Trollope has lately, in Lady Asses, treated a somewhat similar subject; but his tailor is one of those flery spirits who belong to no particular rank, and Lady Anna is the worse educated of the two, and, except that she becomes Lady Anna and rich, has no advantage over him; and then what Mr. Trollope sets himself to do is to show how, in spite of being Lady Anna and rich, she is to be excused for marrying her ardent tailor. Miss Morley has imposed on herself quite a different task. She Anna and rich, she is to be excused for marrying her ardent tailor. Miss Morley has imposed on herself quite a different task. She has attempted to realize the feelings of a girl accustomed to high and refined society and keenly alive to intellectual and social pleasures, and yet with a totally different side to her nature—an openness to the great things of life, a lively sympathy with homely things and people, a generosity that trembles to give pain, a rebelliousness against conventional standards, and a just estimate of the value of the honest love she has awakened. To do this was difficult, but Miss Morley has done it, and it is because she has done it that her honest love she has awakened. To do this was difficult, but Miss Morley has done it, and it is because she has done it that her novel rises to a level far above that which cultivated women with a facile pen ordinarily attain when they set themselves to write a story. But she has not been able, or has notventured, to paint the other side of the picture. The young lady engaged to the gamekeeper is depicted, but not the gamekeeper engaged to the young lady. It would have required genius of a very high order to make a warm in such a required genius of a very high order. to niake a man in such a position at once natural and true to life, and yet with such unusual elevation of character that the reader would find it probable that a girl like Aileen would be for a long time ready to give up everything for him. No one living, perhaps, but the writer who drew Adam Bede could have successfully encountered the enormous difficulties of the task; but Miss Morley is an author who ought never to be content unless she aims, with however imperfect success, at the great things in her art; and she has exercised the discretion of a too timid prudence in confining within the narrow bounds of safety her portraiture of Ralph. By endowing him with high moral qualities and the tact with which unselfah regard for a woman inspires men in every station, Miss Morley avoids the danger of making it seem impossible that Aileen should have had a sharp struggle of feeling as to how she was finally to decide. But he is only described, not made alive, and he comes across the thread of Aileon's life more as a source of embarrassment and mental conflict than as a lover able to bring the influence of manly passion to affect the will of a woman who thinks herself not only bound but ready to Aileen is thus left alone in the story. The society marry him. in which she moves in London exists to educate her by what It has of good, and to alienate her by what it has of bad. Halph exists to get her into a difficulty, and Basil Lushington exists to get her out of it. This concentration of all the interest of a story on the heroine is a familiar feature in the novels of ladies. Women feel that, however limited may be their knowledge of other things, they are on sure ground when they touch on the passions, the sorrows, the hopes, and the fears of a woman. It is true that Miss Morley does not write as most ladies write. She makes her incidents converge to one main end; she has by more fidelity of observation and simplicity of writing given to the several parts of her story a likeness to real life; her men are not like the man ordinarily met with in ladies novels, mere barber's blocks trimmed with a few feminine virtues. But still art is art, and Miss Morley has obviously a sense denied to most authoresses that novel-writing is an art; and art demands that fiction, which, to be great, must be always in some shape or other a mirror of life, should be on the heroine is a familiar feature in the novels of ladies. Women must be always in some shape or other a mirror of life, should be a mirror of something more than the concesses of a more than Miss Morley, who has done so much, could sarely do more than mirror of something more than the emotions of a girl of twenty.

Her story, however, as she has written it, has to be judged by her conception and elaboration of the character of Aileen; and to see Aileen at her best, she must be seen in her moorland home during her month of suspense and trial. She is welcomed by her grandmother, who nevertheless lets her see that she thinks that a girl like Aileen coming back to a man like Ralph and to the simple ways of her old home must be a mere whim which will soon pass away. Aileen, however, thinks very differently. She is thoroughly in earnest, she wishes to forget her London life, and honestly believes that the new life she has chosen is the one really suited to her. The day after her arrival she goes out with a zealous determination to make herself useful, and her feelings at the outset of her country life are described in the following charming passage:—

After dinner Mrs. Dymock and Allem also went to the hay-field, and worked there for an hote w two. Somehow the day of real country life, the

cheerful, useful employments, the scent of the hay, the hum of talk among the haymakers, and the unceasing accompaniment kept up by the little river which ran at the foot of the mendow, acted upon Alleen's imagination and made her feel that this was her right place in the world. Here should find healthy occupation, a round of pleasant, useful, definite duties, affection and peace, and rest from all the vexed questions constantly asising in society and from such exhausting mental conflicts as she had been enduring lately. She was in a sort of dream, in which she seemed to find it easy to make up her mind. The fear of future regret passed away for the moment, and she felt pleasure in the prospect of the sort of life she imagined herself leading. There was a charm even in its monotony.

Aileen soon mosts Ralph, but with very little of the eagerness a girl ought to feel in meeting a lover. It almost pains her to see how totally his sentiments are unchanged. The exigencies of the story demand that, unconsciously to herself, she shall never have been in love with him. She is bound to him because he loves her, because he is so good, because she is under a promise to him. But she has never lost her hoart, and if she had lost it even for a moment, has never lost ner hoars, and it she had lost it even for a moment, the story must have come to an abrupt end. As, however, she fully intends to marry him, she behaves to him as if their engagement was a recognized fact, and she walks and talks with him on as easy a footing as she finds possible, and listens to him while he at once expresses his gratitude and love, and gives vent to his doubts whether after all he is destined to be having. But at the end of a fortisish she having to be protected. and gives vent to his doubts whether after all he is destined to be happy. But at the end of a fortnight she begins to be wretched. She realizes that he is not meant for her, nor she for him. "She felt that in truth she dreaded Ralph's constant companionship. She had condemned herself to mental solitade for life, and the prespect was dreary." She can get on with him, for her old knowledge of country life serves her with materials for conversation. But she acutely feels that there is no real sympathy between them. "She was conscious that she always talked to him and for him, nover with him or for herself," a sentence which in its epigrammatic brovity conveys as much as might have filled in its epigrammatic brevity conveys as much as might have filled half-a-dozen pages. She will not tolerate in herself any shrinking from what she believes to be the path of duty. She will never let him know the sacrifice she is making for him, while for herself she can best express her feelings by a passage which she recites from the Spanish Gipsy, to the effect, among other things, that "faithfulness can feed on suffering and knows no disappointment." She at once charts have thoughts and reproaches herself for giving She at once checks her thoughts, and reproaches berself for giving way to "melodramatic nonsense"; but the reader is made alive to way to "molodramatic nonsonse"; but the reader is made alive to the absurdity of a girl whose feelings tind expression in passages from the Spanish Gysy being condemned to spend every hour of the day and night with a gamekeeper. Then comes the scene when Busil Lushington is on the moors, moets Aileen, hears of her intended marriage with indignation, pity, and alarm, and tinally encounters the lucky accident which lays him up with Aileen to nurse him, until she sees that she cannot endure the pain of living with an uncultivated man, and the equally great pain of not living with a cultivated one. She knows now what she must tell Ralph, but she feels intense shame and poignant regret at having to tell snything so painful. Her self-repreach is perhaps excessive, but she would have been worth very little if, under such circumstances, it had not been excessive. As we have said before, we could wish that a writer like Miss Morley had seen her way to do something mere than analyse and describe the emotions of a girl. But if the emotions of a girl in Aileen's position are to be analysed and described, it is hard to see how the thing could have been better done than Miss Morley has done it. done than Miss Morley has done it :-

dono than Miss Morley has dono it:—

The time had come at last when there could be no more hesitation. The final decision must now be made, and Aileen could not doubt what it must he. She knew that the sacrifice which she must make in keeping her engagement was one greater than she was capable of making in the way in which alone it would be of any avail. She felt that Basil had speken truly when he told her that the sacrifice would be worse than useless, only an unjustifiable erubity, unless it were carried out by consistent self-suppression for the nest of her life. She seemed to herself very poor-hearted, mean, and despicably wonk; but she seemed to herself very poor-hearted, mean, and despicably wonk; but she seemed to herself very poor-hearted, mean, and despicably wonk; but she was, she must not take upon her a burden which it had not been given to her to bear. She must submit to the humilitation of accepting the sacrifice of Ralph's happiness, because she was so woak that she must decide it thus, but it caused her acute shame and pain to do so. It was horrible to her to think of Ralph's having to endure such suffering at her hands, and she felt that it ought not to have been so impossible to her to keep her faith when the time came; that it could not have been so had she not carelessly allowed herself to forget the tie by which she was bound, and to live another life filled with different interests and sympathies.

Hud she kept before her a vivid recollection of Ralph, and of the love she had promised him, all would have been easy now; but she had failed miserably in truth and constancy; she had yielded weakly to each temptation as it came to her, and when at last she had tried to recall the feelings of the past and to keep her promise, she could not do it. She had been selfish, weak, and faithless—all that in another she would have most bitterly condomned—and unfortunately the punishment could not be borne by her alone.

She nerves herself to the effort. She tells Ralph, and all is over. The story, or at that all that is really interesting in the story, is done. Sorrowful, and the cause of sorrow, Ailcen retires from her gamehoeper and her old home to a lot really to her taste. All that can be said to mitigate her-regret and soften her self-accusings is expressed by the old bailiff whose house she is quitting, when he tells her—"There's a deal of suffering got to be done, in this world, Ailee', and some has one sort and some another; but where there's been no wrong done by anybody, folks get over it far quicker."

BELL'S BRITISH QUADRUPEDS.

IT is five-and-thirty years since the original publication of Bell's British Quadrupeds, as one volume of the series of works on the scology of these islands prepared by a number of eminent naturalists for a firm of enterprising publishers. There is much ground for satisfaction in learning that so meritorious an undertaking has met with the success that befitted it, the series of treatment that the property of standard works upon the property of the series of treatment works upon the series of treatment works upon the series of treatment works upon the series of treatment to the series of standard works upon the series of treatment to the series of treatment to the series of treatment to the series of the s taking has met with the success that pentied it, the series of times generally having taken the place of standard works upon such several department of nature, and the demand having encouraged the publishers to issue further editions. So much has been added in the interval to what was known of our native animals that Mr. Bell has found it incumbent upon him to revise throughout and in no inconsiderable measure to re-write his original treatise. may congratulate a veteran naturalist upon having crowned with his mature observation and study the edifice of a life's earnest and patient labour. Certain modifications in the plan and structure of the work, as well as manifold additions and corrections in detail, have been the result of this revision. The chapters upon our departs a nimely including the house dozent at the results. domestic animals, including the horse, dog, cat, and other familiar denizens of the farm or pets of the household, have been omitted altogether, partly because those species are not to be properly regarded as members of our fauna, partly because no adequate or inits. The reasonableness of this plea will be apparent on looking back to the meagre treatment which subjects of such wide and varied interest received in the first edition. The process of domestication alone serves to introduce an element of the third that the connection of differentiation of process or description of differentiation of process. ment into the enumeration or differentiation of species or varisties which admits or calls for boundless discussion in the face ters which admits or calls for boundless discussion in the face of recent views of evolution within the animal pale. Nor has it been so much Mr. Bell's aim to open up problems of biology, or even of development in specific forms, as to ascertain and enunciate clearly the facts which characterize the nature and the habits of every group or type of animals within his scope. The domestic series apart, sixty-seven species of British Mammals—which, the Cetacea being included, we should have thought a fitter title for Mr. Bell's book than that of British Quadrupeds—were treated of in the first edition. Of these seven have now been rejected; Venerallia engranging the though a well-marked species common to Vespertilio emarginatus, though a well-marked species common to France and Belgium, never having been recognized in the British Islands, Phoca burbuta having been wrongly identified, Verpertilio pyymaus, obviously the young of the Pipistrelle, Piccotus brevimanus, now universally regarded as the young of Plecotus aucitus, and Sorev remifer, Lepus Hibernicus and Physiter tursio, not being certainly distinct species. On the other hand, thirteen species have been added to the list, of which only one, Sorece psymicus, is a land animal, two are seals, Phoca hispida and Cystophora cristata, and the rest cotaceans. Thus the entire manimalian fauna of the British Islands, as accepted in the work before us, comprises seventy-three species, belonging to the following orders:—

Cheiroptera . Insectivora . Carnivora . Rodentia Ruminantia . Cetacea

The claims of three of these species are, however, held to be somewhat doubtful by our author, on grounds into which he goes in detail when discussing them under their respective heads. in detail when discussing them under their respective heads. These are Vespertilio marinus, Phoca grandlandica, and Balæns musticetus.

The woodcuts illustrative of each typical animal, drawn The woodcuts illustrative of each typical animal, drawn with admirable clearness, delicacy, and truth, are in the main the same as those of the first edition. Amongst those newly included in the list we may notice the razor-back whale, (Balænoptera musculus, Linn.) or common Rorqual, copied from the figure inserted and described by Professor Flower in the Proceedings of the Zoological Society for 1869, as well as Sibhald's Rorqual (B. Sibbald'i, Gray), probably the largest of its family, taken from Professor Turner's paper upon this species, and the curious Ziphius carirostria (Cuvier), first captured off the British coast in 1870, and identified with Cuvier's whale by the same able naturalist, who has thus made an important addition to the list of British cetaceans. Mr. Bell has given no comparative table showing at a glance the distribution of the affinities or the manifold species under which the various orders and genera of our manifold species under which the various orders and genera of our mammalia present themselves. All we get is a mere general index, the systematic names being printed for distinction in italies. Although it may be sufficiently convenient for reference, such a catalogue forms but an insdequate guide or introduction for the student, who has to wade through each description in detail for the characteristics on which each specific difference is seen to turn. It is true that the restriction of the author's design to the British faun exclusively would of necessity have the effect of presenting any such scheme or system of classification in somewhat of a mutilated shape, for the want of those foreign congeners who in the plan of nature have their place and rank in the family tree. But when of hature have their piece and rain in the seminy account was so respectable a show is made by the groups or species that make these islands their home, each several order might at least have been exhibited in some sort as an organic whole, rather than in the simple catalogue which is all we now have to refer to. In the

A History of British Quadrupeds, including the Crtuces. By Thouses Bell, F.R.S., F.L.S., F.Z.S., F.G.S., Sec. Second Edition, revised and partly re-written by the Author, sesisted by Robert P. Tomes and Editorial Elebert Alaten, F.E.S. Blustened by 150 Woodsuts. London. 3. Van Voorst.

case of the hats, the first order in Mr. Bell's series, restricted as he explains it to be by the necessary dismemberment of the large group formerly comprehended under this torm, the genns Vespertilio still retains a variety of representatives, which, with one species of Plecotus, one of Barbastellus, and two of Rhinolophus, make in all fourteen species, all belonging to the insectivorous division of the order. The opinion expressed in the former edition of the work, that many other species of but would be found indiscusous to this country, is no longer to be entertained. former edition of the work, that many other species of that would be found indigenous to this country, is no longer to be entertsized. As averaged their general structure and habits, which are made the subject of the author's introductory remarks, the more recent studies of Professor Blasius, Kuhl, and other naturalists are incorporated with the facts which we owe to the patient and accurate observations of White and Jenyns. The system of division by means observations of White and Jenyas. The system of division by means of the specific characters of the ears and tragus, coupled with those of the dentition (first made use of by him in the discrimination of the species of this genus), is supplemented by differences of the head and the wing membranes, which materially assist towards discriminating some of the more easily confounded British species. The same division of the simple-nosed species having been adopted by Count Keyserling and Blasius, the generic name Vesperuge was given by them to the group having the rounded ear and broad tragus. Vesperus being proposed as a sub-reneric name ear and broad tragus, Vesperus being proposed as a sub-generic name for the group represented by the Servine but. But, as it has been shown that Dr. Leach long ago applied to one of these groups the name of Scotophilus, his typical specimen preserved in the British Museum proving to be either a young Serotine or other allied form, it is clear that the name of Scotophilus should be substituted for Veperago. Of this group the Noctule, or great bat (Scoto-philus noctula), first discriminated by Daubenton, and named Alticolons by White, who first noted it as a British species at Selborne, where it still abounds, is one of the most marked, the largest in Britain next to V. murinus. Though never found here north of Yorkshife, it is described as widely distributed in Europe, reaching Scandinavia and parts of Russia. Specimens have been sent hither from North Africa, Mozambique, and Japan, and Mr. Bell is convinced of its identity with Scotophilas labatus, from Nepaul. While admitting its local disappearance, he is silent as to the migratory character of this but accounting in part for this recurrence of similar species.

The singular error, countenanced as it has been by men as great as Aristotle and Pliny, of classing the bat with birds, only to be paralleled by the senseless projudice or antipathy which has beset these harmless and interesting creatures, has been corrected by the common some of the less learned. "Flitter-mouse," or the still older and probably obsolete "reremouse," expresses our foreiathers' feeling of the true affinity of the hand-winged family. Much confusion at the same time hung over the synonyms of our common but, until Mr. Jenyus made it clear that the common but of Britain is the Pipistrelle of Continental writers. Because Veopertilio marrinus was their common but—their "chauve-souris" pur excellence—it was presumed even by Pennant that our common but must be the same species, albeit V. murinus is really one of the rarest amongst us. Mr. Bell's minute and careful description will enable any body to discriminate it from V. nattereri, V. mystucinus, Plecolus auritus, Barbastellus, or other species which are often taken in company with it, and exhibit a generic resemblance. Minute as it is, in fact the least in size of British species, Dr. Schinz has, we learn, thought himself to have found a smaller hat, which he has described under the name of V. minutusimus. Mr. Bell has no doubt whatever of this being the young of the Pipistrelle, or common bat, like . pypnaus, of which he gives an illustration. A handsome and triking species, known as Bechstein's but, is among the rarest in this country, having been taken only in the New Forest, but it is readily correlated with Continental specimens. It is far from sociable, haunting hollow trees exclusively. Its core are exceptionally large, and its wings, though broad, comparatively abort. For length of cars no animal comes near l'accous auritus, these highly-developed organs being as long as the body itself. It was upon the long-cared bat that the experiments of M. Jurine were made as to the flight of bats when deprived of eight. No lessening of their power to keep clear, in their most rapid flight, of objects the most intricate or minute, their most rapid flight, or objects the most intricate or minute, such as the furniture or cords stretched across the room, was observed until their organs of hearing were also closed. This is a common, though not very abundant, species in Britain, readily tamed and even playful. Its voice and walk are peculiar. The Plecous brevimanus of Jenyns, of which a figure was given in the first edition, is now recognized by our author as simply a young

long-eared bat.

In his original work Mr. Bell conformed to the prevailing opinion that the Arvicola constituted an aberrant group of the beavers, instead of being placed with the mice, the patronymic name of Arvicolide giving way in consequence to that of Castoride. It is to Mr. Waterhouse that he assigns the credit of having corrected this mistake, by reference to the osteological characters on which rather than on mere points of superficial resemblance the classification of this difficult order of mammals is to be deterclassification of this difficult order of mammals is to be determined. Speaking of the genera Ondatra, Arvicola, and Lemmus, represented respectively by the American musk-weah, the volce, and the lemmings, that able naturalist describes those groups as having all the essential characters of the Mutidae, differing mainly in having rootless molars, and in the form of the letter by Application of the cranium. Not only is this affinity made clear by the instance of an American rodent, the genus Neotoma, but in a truly Report Lance Rest Lance Reports and the volce of the Caracter of the C

Schreber), is seen a passage from the voles to the true rate. dominion and other characteristic marks of this species, together. dontition and other characteristic marks of this species, together with those of the remaining two which haunt our river banks and meadows, the water vole or rat (A. amphibia, Dasmar.) and common field vole (A. agrestie, Lina.) are minutely detailed Mr. Hell. The five comental spaces in the second upper molar of A. agrestic sufficiently show it to be distinct from its Continents oungener A. acculis, which, like all the other European voles, has but four. It is remarked by Mr. Ball as strange that, whilst A. arcalis, so common throughout central Europe, has mover yet been met with in Great Britain, its teeth have been found, in a semi-fossil condition in fissures in the limestone rocks mear Bath. The fessil condition in fisance in the limestone rocks mar Leth. The drift formations of Wilts and Somerset have also yielded remains of species now extinct in Britain, including the Alpine A. needs and

the northern A. ratticeps.

To find not only the seal and walrus, but the whale, class among British manusuals might take an unthinking reader by surprise. Considering, however, the wide range of latitude over which the British group of islands extends, it need no longer be thought strange that the list includes many forms of enimal life whose proper home is the Arctic seas. The only question is where to draw the line of identification. Not only do the Orkneys and Hebrides afford shelter and breeding ground to species of Pherides, which Mr. Bell sets down as cleven in number after all deductions; but the walrus, the single representative of its genns (Trichecus) to be regarded as a true seal under the sub-order Pinnepedia, with the Phocids and Otarido (eared scals), is found as an occasional struggler to our northern coasts, though not so frequently as of yore. Of the Cetacon, with which Mr. Hell closes his list, including with the right or Greenland, the Atlantic, sporm, and other whales, the perpoise and the delphin, our waters yield specimens enough to call for much discrimination on the part of the naturalist who has to lay down their points of specific difference. The way in which these finely divided species have been classified, the homologies of the bony structure determined, and the specific marks of character and function in each made clear, forms not the least valuable portion of the work for which we have to thank Mr. Bell and his condiutors.

COOKS AND COOKERY.

YULINARY literature can hardly be said to be at a standstill in England when we have before us contemporary contributions to it from artists, professors, and directors at Bucking-ham Palace, the Crystal Palace, and the South Kansington School of Cookery. While the Gouffes in the "Royal Pastry Book," as of Cookery. While the Gouffes in the "Royal Pastry Book," as also in the "Livre do Cuisine," prescribe for aristocratic appetites with exquisite delicacy and elaborate art, Mrs. Mary Hooper, on the other hand, bids for clients unidst the rather undefinable grade which other hand, bids for chients unridst the rather undefinable grade which limits its number of dinner-puests to five or six, and professes to give small menus for small parties, small incomes, and small establishments. Of the three perhaps Lady Barker is the most cosmopolitm, as she is certainly the most anusing; and in literary cooking at least she has proved herself an adept, a considerable part of her little book being, as a contemporary has pointed out, a hash or rechauffe of Dr. Lankester's well-known work on food, hash or reclaiffe of Dr. Lankester's well-known work on food, Lady Barker pleads for less waste, without worse living, in the upper circles, and looks to the National School of Gookery (with or without reason, as the result will show) to develop culinary education so that it may spread downwards from the well-to-do classes to the cettage of the labouring-man, whose food is "monotonous and unwholesome as much from lack of invention as from shellowness of Readers may or may not take in the little dozen of horrowed chemistry with which she gives a dash of profundity to her usually lively pages, but we suspect that they will find themselves more at home with her for guide than with the illustrious chef of the Paris Jockey Club on the one hand, or the fair professor of domestic economy at the Crystal Palace School of Art on the other. As Horsce says, "Est inter Innaim quiddam soccramque Viselli"; and—we almost say it with save—there is a wide gulf, which even Lady Barker does not adequately fill, between the pupil of Carlona where introduction to partnerships were at the Careme, whose introduction to pastry-making was at the prepara-tion for the great ball given by the city of Paris to the Duke of Angoulème in 1823, at which 7,000 guests sat down to suppor, and the ultra-economic lady who, in ruppesting little dinners for little people, almost rushes into the Scylla of shabbiness in her desire to steer clear of the Charybdis of "Cookery-Book quarts of cream and dozens of eggs and oysters."

and dozens of eggs and ovaters."

The ordinary meat and pudding dinner may doubtless involve too much solid meat; but the English stomach, unless we are mistaken, will shudder at the little mean in which chickengiblet soup, chicken-giblet pie, or stowed chicken giblets, are recommended as an important feature, because "in large towns the giblets of fowls are to be bought the very moderate price at the poulterer's." In most country kitchens their utmost use would be to merce for stock and dressing for the chicken to which the the positioners." In most country attenues uses at the would be to serve for stock and dressing for the chicker, to which they appertain, and we must say that if we are invited to one of him. Hooper's "little dinners" we shall pray that it may have been found convenient (for it appears this is not de riguour) to

^{*} The Boyal Pastry and Confestionary Book. By Jules Goullé. Translated by Alphanan Goullé. Mand Pastrycook to the Queen. London: Banquan Low & Co. 1874.

First Lessons in the Principles of Cooking. By Ludy Barker. Macmillan & Co. 1874.

serve a few forcement balls in the stewed chicken giblets, as it serve a few forcement balls in the stewed chicken giblets, as it is not clear that, without these, there would be aught in the dish for the teeth to lay hold upon. Indeed, as has been already hinted, our doubt about these "little dinners" is as to what precise rank or household they are suitable. Certainly the average cook of a middle-class household of the period would "thank heaven she was respectable" and announce her intention of leaving that day month. if bidden to go to the butcher and purchase, as materials for soup, the calves'-tails which Mrs. Hooper in the same breath pronounces delicious and admits to be usually left by the butcher as nounces delicious and admits to be usually left by the butcher as the perquisite of the skin-collector. A notable housewife, with a grandmotherly culinary instinct, and a knack of turning out nice little dinners with no other help save that of a maid-of-all-work, might conceivably produce a delicious novelty in soups out of castaway calves'-tails; but doen then she would be unwise to publish the nature of this novelty on her menu. Mrs. Hooper has so much faith in these caudal resources that she advises the utilizing the meat and secretables of such sour for a baked via with a mashed potate. faith in these caudal resources that she advises the utilizing the mean and vegetables of such soup for a baked pie with a mashed potato crust. It might be great fun to partake of a little dinner of this sort, such as Traddles, and the dear girls might surprise David Copperfield withal; but, for better for worse, we take it that the English husband would sooner endure the unimaginative house. English husband would sooner endure the unimaginative house-keeping which rings the changes on mutton-chops, pork-chops, lamb-chops, and beefsteaks, than knowingly acquiesce in a double debt to such delicacies as Mrs. Hooper would wrest from the hitherto monopolist skin-collectors. The roasted hare in p. 34 might be the basis of a very good dinner, but we may be excused for indulging one lingering thought upon the bacon which is used to cover the back in basting. Mrs. Hooper, in her thrift, tells us that it will serve for making stuffing, or as an addition to rissoles, or is very good eaten cold. Elsewhere she rather damps our critical appetite by the somewhat apologetic or make-believe nature of her "hors-d'œuvres," and her advocacy of ox-hearts and sheep's-hearts as cheap dainties which may be used to great advantage in a pie, mince, rissolette, hash, pudding, or used to great advantage in a pie, mince, rissolette, hash, pudding, or fry, if stewed. It is penny wise and pound foolish to task one's digestive powers for the sake of getting 5 lbs. of meat at 2s. 3d.; and it will take a good deal of stewing to make ox-heart digestible. But we ought not to omit the mention of several very good recipes which Mrs. Hooper vouchsafes us, e.g. rump-steak pudding (151), sheep's-head, Scotch fashion (161), devilled fowl (186), rich plumpudding (222), neck of venison cooked in a V oven (p. 80), how to cook whitebait, and how to "scollop oysters." She has good hints about salmi of wald duck, and her caution on the deliberate preparation of the sauce for the same delicacy, rousted, assures us that—given the means and the heart to put her knowledge in practice—she undeniably knows what is good. Her instincts as to the service of the table, the linen, the glass, the flowers, the wines, the fruit, the facilities for "self-help," are all excellent; and she does not think it too much a matter of detail to recomand she does not think it too much a matter of detail to recommend "Huile d'Aix" as the finest salad oil. It were well too if all cooks would lay to heart the rule she lays down that herrings, eels, &c., should be fried in plenty of fat, because the process draws out the fish-oil (which renders them disagreeable and indigestible), especially if the fish is set before the fire and drained before serving.

On some points it would be curious to compare the views of Mrs. Hooper, Lady Barker, and M. Goullé; for though the last deals especially with pastry and confectionary in the volume now before ne, yet he touches common ground with the other two in such items of what he oddly denominates his "indigenous pastry" chapter, as beefsteak pie, beefsteak pudding, pigeon pie, mutton patties, and mince pies (see pp. 432-8). And here we discover a wonderful concord of ideas. Two of the three writers aim in one way or other at popularizing less hackneyed forms of cooking than the eternal roast and boil, and as soon as we come to stowing, broiling, and frying, we are reminded by both of that which Goullé again and again lays down as the secret of success in all cooking. Disputing Brillat Savarin's aphorism, Goullé holds that a man need not be born a reasting cook, for his whole art "consists in watching the clock; it is more a question of time-keeping than a natural gift." A little further on we shall show how largely in his view precision, eye to temperature, and exactness as to the different degrees of heat enter into the qualifications of a first-rate pastrycook, an artist in his eye of infinitely higher genius than a mere reaster. Mrs. Hooper attributes the failure of stews to "want of proper materials and of knowledge how to regulate the tomperature so that the contents of the stewpan are kept just below boiling point—or at that stage known as simmering." Lady Barker ascribes the cause of hashed mutton being "a by-word of nastiness" to an ignorant cook's omitting to let the gravy and the meat warm gradually and thoroughly together, and suffering it to stew too long, and to be the hard instead of soft. Her own recipe is simple enough, and yet methodically calculated even to the toast sippets; and we share her confidence that the result will be such us to sfultify the oracular caution of the cockney millionaire who bade his family "never eat 'ashes away from ome." The process of frying is often as sadly mismanaged as stew

This we take to be the main lesson to be learnt from the three volumes which have furnished a text for the foregoing remarks. All are more or less excellent in their different ways. Gouffé is great in his large pieces of pastry, his croquenbouches, his méringues, his pear-tartlets in graduated stands, his triumphs of spun sugar; and we do not doubt that these would come out as splendidly on the supper-table as in the chromo-lithographs of Mr. E. Ronjat. Mrs. Hooper atones for the seeming stint of some of her recipes by the thorough goodness of others, and by the common sense which she brings to bear on the regeneration of the culinary art. Lady Burker's book deals with a vast variety of foods, from mutton to macaroni, and modes of preparing them, from enclosing poultry in a crust of dough and baking it gipsy-fashion to boiling potatoes or making omelettes. The wider the circulation of their several views, the more hope will there be of good dinners —big or little —in the future.

ADAMS'S HISTORY OF JAPAN.

THE history of Japan since the conclusion of the foreign treaties, as related by Mr. Adams—and it is to this period that he devotes almost the whole of the volume before us, his title-page notwithstanding—consists of a succession of as startling incidents and strange complications as are to be found in any pages of fiction. We have in the Shogun a claimant to Imperial rank who has no right whatever to the title; we have murders, assassinations, and riots without end; we have a revolution overturning the ancient order of things; and we have an Empire in enjoyment of a feudal system such as was to be found in Europe during the middle ages, suddenly transformed into a brand-new State on the model of the most advanced nations of the West. To students of history this chapter in the world's records is of great interest, presenting as it does probably a unique instance of such instantaneous results arising out of the collision of two systems of civilization so widely different as those of Europe and Japan.

Japan.
Like the monkish authors of old, Mr. Adams begins at the very beginning of things, and gives us at the outsets brief sketch of the Japanese account of the creation of the world and of man; he then traces the growth of the ancient institutions of the Empire, the divine descent of the Mikados, the division of classes, the rise of the Shôguns, the persecutions of the Christians, the establishment of the Tokugawa dynasty of Shôguns, and the long era of peace and prosperity which followed it. With these matters he fills about eighty pages, the remainder of the volume, over four hundred pages, being devoted to the history of the period from 1854 to

The History of Joseph, from the Earliest Period to the Present Time, Vol. To the year tife. By Francis Ottiwell Admin, F.R.G.S. Landon : Hong & King & Go. 1894.

1864. Prior to the first-named date the only foreigners residing 1354. Prior to the first-named date the only foreigners residing in Japan were a few Dutch merchants, who were confined to a small piece of ground at Nagasaki; and so little was known of the institutions of the country that, when Commodore Perry arrived to negotiate a treaty in 1853, he allowed himself to be persuaded into the belief that the Shogun, literally General, was the temporal Emperor, and with him therefore he entered into an alliance. Unfortunately, without making any study of the matter, the Annasadors of the other treaty Powers blindly followed his example, and thus laid the foundation of all the uneasiness, danger, and trouble which disturbed the foreign relations of Japan during

example, and thus laid the foundation of all the uneasiness, danger, and trouble which disturbed the foreign relations of Japan during the succeeding years.

The object of the Shôgun in palming himself off on the foreign envoys as the ruling sovereign was doubtless to shelve the question of the treaties, which was daily becoming more and more trouble-some. He expected by treating in his own name to gain time, and at all events to leave a loophole by which the Mikado might, if he found it convenient to do so, escape from the consequences of his negotiations. But he entirely misunderstood the people with whom he was entering into a covenant, and overlooked the with whom he was entering into a covenant, and overlooked the fact that by dealing with foreigners he was putting a dangerous weapon into the hands of his political enemies at home. For a long time there had existed great jealousy between the Shogun and his advisors on the one hand, and the Dainios connected with the Court of the Mikado on the other. No sooner, therefore, was it known that the Shogun had entered into alliance with the hated foreigner than intrigues were set on foot against him by the officials at Kiota. The many descent foot against him by the officials at Kioto. He was denounced to the Mikado as a traitor to his country. His representa-tions were disregarded, the Emperor's consent to the treaties was refused, and secret orders were issued to the Prince of Mito to expel the foreigners. It was at this juncture that Sir R. Alcock, together with other foreign repre-sentatives, arrived to take up his residence at Yokohama. This was the signal for the prosecution of more active measures on the part of the anti-foreign party, who desired not only to wreak their vengeance on the persons of the foreigners, but also by so doing to embroil in a foreign quarrel the Government of the Shôgun, or rather of the Regent, Ii Kamon no Kami, into whose hands, on the death of the Shôgun during the previous year, the management of affairs at Yedo had fallen. No time was lost in carrying out this galaxys. out this scheme :-

In 1859, on the 25th of August, a Russian officer and two sailors were cut down and mutilated in the streets of Yokohama; and on the 6th of November, the French Consul's Chinese servant, dressed in European clothes, was also killed in that town. In 1850, on the 36th of January, Denkichi, Mr. Alcock's Japanese linguist (also in European clothes), was mortally wounded at the very gateway of the envoy's residence, and on the 26th of February, two Dutchmen, masters of merchant vessels, were backed to pieces in the streets of Yokohama.

These attacks on the foreign communities were followed a month later by the nurder of the Regent, who had shown himself well disposed towards foreigners, at the gate of the Shogun's castle. On New Year's Day of the succeeding year the Ministers were castle. On New Year's Day of the succeeding year the Ministers were officially informed that a band of five hundred ronins, literally "wave-men," had conspired to attack the different Logations and kill all the members thereof. Fortunately the danger, if any then existed, passed away for the time; but almost immediately afterwards Mr. Hensken, the Interpreter to the American Legation, was mortally wounded in the streets of Yedo by a party of assassins, and a few months later a desperate night attack was made upon the British Legation, which was repulsed only by the promptitude and courage of Messrs. Oliphant, Morrison, and other members of the Mission. For not one of these murders and onslaughts was a single person brought to justice by the Yedo bautnorities, who, though anxious to do all in their power, appeared to be afraid of punishing natives for attacks on the persons and property of foreigners. property of foreigners.

Great efforts were made at this time to fill up the breach be-tween the Mikado and the Shogun, and to this end a marriage was arranged to take place between the latter and the Emperor's sister. expected in return, and the request which was directly preferred to the foreign representatives—to put off the opening of the Treaty ports—indicated the price the Shogun was paying for the honour done to him. The matter was referred to the Foreign Office, and eventually a mission was despatched to London to urge the views of the Shogun's Government on Lord Russell. Meanwhile a second night attack was made on the English Legation, which resulted in the death of two Marines and the suncide of the marines are compensaturing the sum of 10,000/. was demanded and paid as compensaturing the sum of the two murdered men. The insolence of the death of two Marines and the suicide of the assailant. For this tion to the families of the two murdered men. The insolence of the war party was now approaching a climax, but the roll of the victims was not yet complete. A few months later as an English lady, Mrs. Borrodaile, and these gentlemen, Mesars. Richardson, Marshall, and Clarke, were riding along the high road, they met a procession of several hundred Samurai escorting a Prince of the House of Satsums on his way from the capital. The riders

kept well to the near side, walking their horses, until they arrived at the main body, which was then occupying the whole of the road. Mrs. Bornedisie and Mr. Richardson were riding about ton yards in advance, Mr. Braking his Richardson riding on the off side of that lady. When a few of the procession had passed a man stepped in front of them, and barred the way. Mr. Clarke exclaimed, "Don't go one; we can turn into a side road," and Mr. Marshall added, "For God's sake, let us have no row." The horse of the whole party were being then quietly turned round, when, as 30r. Marshall nation in his evidence on oath, "I saw a man in the centire of the procession throwing the upper part of his clothes off his shoulders, leaving himself flee. 1374.

naked to the waist, and drawing his sword, which he swung wi hands, he rushed upon Richardson. I shouted "Away!" but he horses were started, Hichardson was struck secress the side, under arm. The same man rushed upon me, and struck me in the same under the late area.

Others of the escort then drew their swords, and both Mr. Clarks Others of the escort then drew their swords, and both Mr. Clarks and his horse were wounded. Eventually, however, the riders outstripped their pursuers, but before they had gone far it was obvious that Richardson was mortally wounded. At length he dropped off his horse, apparently dead, and his companions, believing all further help would be of no avail, rode on to a place of safety. As the name of the Prince was well known, Colonel Neale, II.M.'s Charge d'Affaires, at once demanded that the murdorers should be given up. This the Shegun's Government declared itself powerless to effect, and Colonel Neale therefore called upon the British Admiral to send a fleet to the Satsuma territory to chastise the offending to send a fleet to the Satsuma territory to chastise the offending Daimio. After several delays the expedition arrived at Kagoshima, where they met with a most determined resistance. The fire of the English ships, however, was not to be withstood; the batteries were destroyed and part of the town was burned to the ground. The effect of this engagement on the vanquished was as in-stantaneous as it was salutary. They speedily " took the Read in introducing European machinery and inventions, and in employing skilled Europeans to teach them, and they became fired with a desire to rival foreign nations in the arts of civilization and posce as well as in the art of war." Another expedition undertaken later against the chief of the Chôshiu clan was equally beneficial in its results, and thus two of the most powerful of the war party were gained over to our side.

Were gained over to our side.

Great exception was taken in Parliament to these warlike proceedings. But it may fairly be said that to them is to be attributed the present peaceful state of our relations with Japan, and it is to be hoped that the very important ends gained will impress the lesson to be learnt from them upon our Foreign Office. The difficulty we have had to contend with both in China and in Larar learn hope to impress upon the nearly the fact of our and in Japan has been to impress upon the people the fact of our superior power. When once this has been accomplished, they have invariably shown themselves ready and willing to treat with us on friendly terms. The spirit of the challenge thrown down in the valley of Elah, "If ye be able to fight with us, then will we be your servants, but if we prevail against you, then shall ye be our servants," has found an ocho on the plains of China, and among the hills and streams of Japan. Let the people of either country thoroughly understand that we have the power to enforce our rights, and that we are ready to use it, and we shall hear no more of assussinations or of wholesale massacres.

We have thus briefly sketched some of the leading political events related in Mr. Adams's volume. As a diplomatic study, and as referring to a deeply interesting episode in contemporary history, it is well worth reading. The information it contains is trustworthy, and is carefully compiled, and the style is all that can be desired.

NO INTENTIONS.*

WE do not expect too much from fallible human nature, and we know that young collegians, whether the sons of earls or of soap-boilers, are apt to be less satisfactory than might be; sometimes silly, sometimes bad, and for the most part selfish and unreflecting after the manner of youth in general. But there are limits to the most philosophic acceptance of frailty and folly; and limits to the most philosophic acceptance of frailty and folly; and Mrs. Ross Church, in the character of her here Eric Keir, as well as of some other personages in her present novel, has passed those limits by a long way. We know that all lads do not go through the Sturm and Drang period of life with the stoical indifference of Kenelm Chillingly; but we hope that many are not so criminally sensual as Eric Keir, and that the love which would be strong enough to induce a fine young gentleman, born in the purple, to marry a preity if uneducated girl of the people, is not generally of that base kind which a three months' possession wears out. Nor do we think Mrs. Ross Church right in even the main lines of her psychology. An older man, a perionced and blass, might lines of her psychology. An older man, experienced and blast, might have got tired of a new mistress in that time; but a young man, fresh, and we may suppose moderately virtuous, who has not yet been brought face to face with any of the graver social consequences of his mistake, who has still the mysterious charm of secresy to keep his romance alive, and who, it is to be presumed, had some kind of foresight, some amount of self-consciousness, when he took the serious step of marrying, would surely have retained a certain love for his beautiful wife, if only of the lowest kind. He could have married her for nothing but the lowest love; and its appealy cessation was not to his honour, and as little according to nature. Had there been the smalles admixture of real tenderness or manly purity to soften the more repulsive quality of his feelings, he would not have told her in three months' time that he should he would not have told her in three months' time that he should be "happy if he could wipe out the remembrance of the past with his blood"; that it "would be bettes if they were both dead, or had died before they saw each other." It was scarcely worth while to ride over from Oxford to Fretterley for the purpose of making his wife cry by saying disagreeable things to her, and of proving himself a cad, according to his own vocabulary, from head to heel. It seems to us that we have never met with a more thoroughly corrupt as well as weak minded young man than this

* No Intentions. A Novel. By Plurence Marryat (Mrs. Ross Church), athor of "Love's Conflict," Sec. 3 vols. London: kichard Bentley &

handsome, affectionate, agreeable, and accomplished Eric Keir, the second son of Lord Northam, and the husband of Myra Cray, the nices of a village laundress. Nor is Myra herself, by the by, to all appearance the stuff of which noblemen's sons make even

clandestine wives.

Eric's interview with Myra has a curious ring of brutality through it; from his first greeting to her at the front door, when he rebukes her for flinging herself upon his neck, to his philosophic sceptance of the kisses which she "showers almost roughly on his mouth, his eyes, his brow"; from his lordly indifference to the "large, histrons, dark eyes, and soft brown hair that flows the "large, histrous, dark eyes, and soft brown hair that flows and curls about her neck, and a pair of passionate red lips that are on a dangerous level with his own" to his "fraternal" adieu, when he says loftily, "It's a shame of me to have made those pretty eyes so red!" continuing with "Don't think twice of what I have said, Myra"—to wit, his shame and regret at having married her—" you arged me on to it with your cross-questioning, and you know I hament this business for both our sakes, but the dark mood will be gone to-morrow. It's nothing unusual after three months of honeymoon, my dear." As Mrs. Ross Church does not present Eric Keir to us as a scoundred, but makes him does not present Fric Keir to us as a scoundrel, but makes him her here and surrounds him with the glory of the situation, we are bound to believe that she does not see his infamy as infamy, and that when she sighs out her aphorism, "Alas! for the love of one-and-twenty, when it begins to temper its love with philo-"she imagines she has given cause and excuse in a breath,

As a further illustration of the quality of this young "scion of a noble house," we may mention his line of conduct when Myra takes flight with her courin Joel Cray, as she does that very night. She has promised to keep the marriage secret, and she loyally holds to her word. When her consin, who is in love with her, taxes her word. When her cousin, who is in love with her a oaxes her with her shame, she shuts her lips on the word that would prove her virtuous, and lets him take her back to her native village disgraced, though she is really "Mr. Hamilton's" lawful wife her child is his legitimate son. She acts with an heroic constancy and solf-suppression entirely mythical; but Eric Keir, after a few perfunctory attempts to find her -"private inquires, and carefully-worded newspaper advertisements," being the rather vague means employed—goes abroad for two years, thirts with all the pretty girls he comes near, but always with "no intentions," and tinally gots entangled in a serious love affair with Irene St. John, whom he has neither the self-control to avoid nor the candour to enlighten. One word as to the reason why he cannot confess the love he makes and declare his "intentions" to be as honourable as they should be, would have prevented all the after complications, and have made the dark things clear. But then Mrs. Ross Church must have claborated another plot and a finer kind of hero; which she might have found troublesome. Deception, coupled with the weakest self-indulgence, is the dominant characteristic of her present yeuns premier; but we will do Mrs. Ross Church the function of acknowledging that she is so far impartial that few of her people are a shade better than Eric in this particular. If they do not tell direct falsehoods, they never tell the truth in this somewhat less than high-toned novel; and no one thinks it necessary to let any one else have the satisfaction of knowing how things really are. Eric Keir conceals his marriage with Myra Cray from Irone, who is breaking her heart for him, while he doing the same for her. Myra conceals her marriage with "Mr. 'Amilton," though to declare it would remove the stigma from her child as well as from herself, quiet her cousin Jod's solicitations, and give her a better chance of finding her lost spouse. Irone conceals from her husband that it was Eric Keir for whom she cried her area was and and that Keir for whom she cried her eyes red and her cheeks pale; and her husband, Colonel Mordanut, conceals from her that his soi-disant nophew, Olivor Ralston, is his own illegitimate son, and that the hold which Mrs. Queket the housekeeper has over him arises from the fact that it was her daughter whom he had soduced, and who was the boy's mother. Not that it is at all clear why this should give Mrs. Quekett a hold over him. Then, as the story goes on, Irene further conceals from her husband the parentage of the little Tommy Brown, Myra's child, whom she adopts and so passionately loves; and, in fact, the whole book is founded on a kind of moral and personal hide-and-seek which is never broken into by voluntary self-revolution, but where discovery comes now from changes and now from appreciate.

from chance and now from sagacity.

No Intentions is curiously destitute of originality. All the materials are old, and all the situations have long been worn threadbare. The marriage of a gentleman with a girl of low birth, and the embarassing advent of an "honourable Tommy" in consequence; the marriage of a pretty young woman with one man while she is desporately in love with another; the return of the lover into the aphere of that pretty young weman, now a wife, still in love, and still beloved; the jealousy of the formerly unsuspecting husband, whose fears and fancies are worked on by a female demon who has her grip on him, and makes him feel it; the passionate outburst of affection hetweap the true learners and account to the passion of the property of the passion of the pa her grip on him, and makes him feel it; the passionate outburst of affection between the two lovers, coming to mutual explanations when too late, and sailing very near to danger in the process; the timely removal of the obstructing conjugalities on both sides, and the happy union of the hitherto unhappy turtle-doves—in all this was do not find one strong or striking situation, nor the faintest attempt at anything like originality. But what was freely allow to be original is Mrs. Ross Church's idea of her own craft. We give the passage at full length; it would be a pity to curtail it:—

The season watched the present of knitting one of your own suchs? I be a season to say measuring readers. If you have, I am season it as a season in the season in the season in the season is a season in the seaso

peared in its proper person, you would have been puzzled to decide how en earth it was ever going to turn into a sock at all. The first few rows, with the exception of a stitch added here or decreased there, go smoothly enough; but when it comes to the toe and heel crisis it is apparently all inextricable confusion until the last stitch is knitted and the worker casts off. Knitting a sock and unravelling the plot of a sensational movel are two very similar things. It has been deflicult at times, I dare say, to trace the reason of some of the actions in this present story, and the "toe and heel crisis" was, I think, a "regular stumper," but I trust that all has been explained to the satisfaction of the reader. satisfaction of the reader.

There is nothing more perilous for a writer to venture upon than a frank confession of the faults and foibles of women. Than a frank contession of the launs and lables of wolden. To say that they are mercenary, fast, untruthful, or what not, is to have the whole sex for one's enemies; and to hint that they sometimes indulge in certain bad habits, as undue alcoholism, for example, is to be inevitably branded as a slanderer. But it would seem that Mrs. Ross Church's experience in this last particular fully bears out the assertions of the worst calumitation. maters of the sex. When Irene is undergoing her disappointment she flies to the bettle for solace. This is a rough way of translating Mrs. Ross Church's more indirect information. of translating Mrs. Ross Controls more indirect information.

"She is harder than she used to be—more cynical, less open to belief in truth and virtue. Added to which her appatite is variable, and she drinks wine feverishly, almost cagerly, and at odd intervals of time." We have read some wonderful things in women's novels before now, but anything more naïve than this matter-of-fact description of the nascent dipsomants. of a young lady crossed in love we have certainly never encountered. We can only hope that, like Azamat-Batuk's famous Miss Lucy, it is an exception rather than the rule; and that the Irenes of society who "drink wine cagerly" and "at odd intervals. of time," because a man who has flirted with them has declared off and pleaded "no intentions," are very few and very far between. Nor do we endorse Mrs. Ross Church's sweeping assertion that the Nor do we endorse Mrs. Ross Church's swedping assertion that the women "who pretend they cannot tell when a man is in love with them "are necessarily "either fools or hypocrites." An old hand would certainly know; the married women, for instance, who, safely intreached behind the security of their position, pass their lives in weaving nets for the sally flies buzzing round them, and who consequently are acquainted with the whole grammar of fascination, from the first "glowing look" to the last passionate declaration—there would be no mistake with them sure enough; but many region are not so knowing, and without being fours or but many women are not so knowing, and, without being focus or hypocrites, can be taken unawares by the confession which every but themselves saw was inevitable.

There are many other things which offend our taste in this book; and the instances of bad style and vulgar sentiment in it are almost innumerable. "Humility is Christian, but in a world of business it does not pay," is one of the author's aphorisms. "There comes Mr. Walmsley and his bundle of papers" is by no means an isolated example of her peculiar ideas on grammar; her preference for bedroom scones with her married couples is also singular, to say the least. We confess that we do not like her We find it more flippant than smart, more audacious than clever; and we think her own parallel of sock-knitting about the most appropriate that can be applied to it.

FRENCH LITERATURE.

FOUILLEE'S valuable and exhaustive work on Socrates * M. begins with a comparative estimate of the merits of Plato and Xenophon as authorities respecting the life of their master. German critics have expressed the opinion that neither the Memo-Creman critics have expressed the opinion that the there the historial reabilities of the latter nor the Dialogues of the former are altorated as a success of information; M. Fouillée believes this view to be an exaggeration, and contends that it is always easy to find where Xenophon and Plato have added to the doctrine of Socrates, and where they give a faithful representation of it. If we wish to study in Socrates chiefly the metaphysician, we must not wish to study in Secretes chiefly the metaphysician, we must not consult the author of the Memoralulia. Xenophon, says M. Foulike, was utterly delicient in what may be called the sens philosophiques; he professedly aims at portraying in his master, not the philosophical reformer, but the citizen, little disposed to innovations and faithful to the religious traditions of his country. Plato, on the other hand, applies himself almost exclusively to the intellectual biography of Socrates, and in so doing adds considerably to the theories he endeavours to explain. This difficulty may, however, says M. Fouillée, be easily overcome by attentive study of the Platonic Dialogues, for in these works the respective shares of the disciple and the teacher are really, though unconsciously, marked but and the generated by several of these compositions. out, and the contrast presented by several of these compositions enables us to trace the boundary line with a considerable approach to accuracy. Plate and Xenophon complete one another, therefore, as biographers of Socrates, and to their syidence we must, add that of Aristotle, which has hitherto been too much perfected. that of Aristotle, which has hitherto been too much regrected. M. Fouillée devotes two large octave volumes to an inquiry into the philosophy of Socrates; and if we consider the revolutions which that philosophy accomplished, we shall not be surprised at the development given by our author to his monograph. Dialectics, ethics, politics, theology, resthetics, all these various topics are fully discussed, and the amount of research brought to bear upon them justifies the homour which the Académie des Sciences morales at politiques conferred upon M. Fouillée when they warded him with one of the prises at their disposal.

P. La ghilosphie de Sirrate. Par & Boellie. Parfer Cormer-

La Rochefoucauld is, from different points of view, one of the chief French writers of the seventeenth century, and his works could not but occupy a distinguished place in Messra. Hachette's Collection des grands écrivains. It is by his Marries that he is known to most readers, and many a battle has been fought on the subject of a code of philosophy which assigns the origin of all our actions to selfishmess. M. Victor Cousin, carried away by his passion for Madame de Longueville, had come to regard La Rochefougauld almost in the light of a personal enemy, whilst Sainte-Bi-Ne, delighted to find an occasion of attacking the champion of French selecticism, entered the lists on the other side. Unfortunately, in the case of La Rochefoucauld as well as of the other great writers of the Louis XIV, period, the texts at our disposal were hitherto extremely imperfect; thanks to other great writers of the Louis Alv. period, the texts at our disposal were hitherto extremely imperfect; thanks to M. Gilbert, and, since his death, to his coadjutor, M. Gourdault, the deficiency is now supplied, and we have another name to place on the list of French writers who can be studied in an edition worthy of them. The first volume contains, besides an edition worthy of them. The first volume contains, besides portraits of La Rochefoucauld by himself and by the Cardinal de Rets, all the Maxims arranged in their proper order, and followed by an excellent analytical index. M. Gourdault has judiciously added an amusing collection of testimonia from Madame de la Payette, Madame de Sablé, and other contemporaries; amongst them we find two fables of La Fontaine, an article of the Journal des seconts, &c. In the second volume we have Is Rochefou-cauld's memoirs, together with the Apologic pour M. le prince de Masilluc, revised from a careful collation of the best MSS.; a biographical memoir of the Puke is announced for publication in a equent instalment.

M. Maine de Biran t was one of the leaders of modern French spiritualism in philosophy. At a time when Condillac still ruled supremo amongst our neighbours, and when De Tracy, Broussis, and Cabanis thought that the famous proposition "nihil act in intellectic cond. The spiritualism of the still stil sais, and Cabanis thought that the famous proposition "nihil est in intellectu quod non prims fuerit in sensu "was to be the definite motto of all ideologists, a rebellion broke out in the sensustionalist camp, and Maine de Biran placed him elf, with Royer Collard, at the head of the disaffected. Some of his writings were published after his death, by M. Consin; others appeared under the editorship of M. Ernest Naville, and amongst these not the least curious was a kind of journal or autohography extending from 1794 to 1824. This interesting document, showing the gradual transition of a thinker from Condillacism to Christanity, amounted for the first time in 1830; the new edition now ansate of the state of the appeared for the first time in 1859; the new edition now announced is augmented by the insertion of a tew family letters which give fresh value to the parentive of an interesting life.

The elegant little volume for which we are indebted to M. Jules Girard I is devoted chiefly to an estimate of Lysins and Hyperides. The name of the former is connected with the most decisive, if not the most brilliant, epoch of Hellenic cloquence. that, namely, in which, casting away all foreign influence, assumed its true character, and appeared in all its originality.

M. Girard has treated the subject of Lysias in a very piquant and interesting manner, combining with the life of his here a number of archivological details respecting Greek forensic cloquence. Hyperides occupies the greater part of the book, and the part which concerns him is a revised reprint of three articles contributed to the Rerue nationale and the Revue des Deux Mondes. M. Girard begins giving the biography of Hyperides and a shetch of his career as an orator; he then discusses the celebrated dis-tourse edited in England by Professor Churchill Balangton, and concludes by an account of the scandalous case of brilery and corruption in which then esthenes was implicated. M. Girard remarks that the condemnation of this illustrious man is an instance of the stern and absolute despotism exercised by the republies of antiquity, and which was the very condition of their existence.

The Bibliothèque elzevirienne begun with so much spirit and talent by the late M. Jannet is, we are imppy to say, still going on; the last two instalments are the complete works of Mellin de-Sainct-Gelava, and the facetime published under the name of Eutrapel, by Noel du Fail, seigneur of La Herissaye. We noticed We noticed the first volume of the former writer \$ at the time when it was issued, and we were able highly to commend the manner in which it was edited; we can also speak well of the concluding volumes, which give us, amongst other things, several pieces which had never yet been printed. The analytical index at the cod will be found of great use, for the persons mentioned by Saint-Golava, or to whom his poems are inscribed, form a very considerable list, and we may almost say that all the celebrities of the sixteenth century appear in it. Together with Ronsard and Remi Holleau, he occupies a very prominent rank in the Remissance movement, and it is well that a really good edition should enable us to study the works of a man whose writings, although not exactly characterized by genius, are agreeable and full of imagination.

The Contes rustiques and Baliverneries of the pseudonymous Entrapel || balong to a class of works which flourished to a con-

siderable extent towards the end of the fifteenth see during the whole of the sixteenth. Rabelaic's Garge the principal representative of those force de Assile gra are fit only for a limited class of readers, but are inte giving us a photograph of society, and also as being the source from which subsequent authors drew largely. Entrapel has found a conscientious editor in M. Assérat, and his admires will not now be driven to consult rare volumes accessible only to those who can frequent the British Museum or the Paris Bibliothèque pationals.

M. Lemerre, like M. Jannet, deserves well of the lowers of eld French literature. After having given us an excellent Montaigne, a Romand, and a IVAubigné, he goes a little further back, and treats us to an edition of Charles d'Urienn. This slegant poet cannot claim the honour of being regarded as an original writer, and the student who examines closely the volume just published by M. C. d'Héricault will find at almost every step traces of imitation both in style and in ideas. The manner tome of the Roman de In rose, the delicacy and gracefulness of Thibault de Champagne, the subtlety of Petrarch, all contributed to shape the talent of Charles d'Orléans; and yet he possesses amerit of his own, and at any rate he deserves attention as the last representative of the spirit of chivalry; his works form a transition between the middle ages and the Hensissance.

Few ladies in the history of the French eighteenth century M. Lemerre, like M. Jannet, deserves well of the lovers of old

Fow ladies in the history of the French eighteenth contury deserve to be known as much as the Duchess de Cholsaul †, and M. Grasset has done well in endeavouring to sketch her attractive pertrait. His volume does not contain anything precisely now, but he has turned to excellent account the innumerable collections of letters which have been handed down to us, especially that of Madame du Deflard. M. Grasset divides his work into three periods; the first of which includes the time of the Duke de Choiseul's public life from 1755 to 1770. As Ambassador and as Minister he exercised a wonderful amount of influence in the history of his country, and we may say of Europe; his liberal principles had made him ex-tremely popular with the nation, whilst they accured to him the the harred of the unworthy invourites who ruled at Versailles under the hing's name. Obliged at last to yield to the caprices of Madamo Du Barry, Chossail retired, and spent a four years exile on his estates at Chanteloup. This period forms the second part of M. Grasact's book, whilst the third relates the residence of Madame de Choisenl in Paris during the reign of Louis & V.L. and ends with her life in 1801. It is much to be regretted that the author of this otherwise interesting and carefully written work should not have extended his researches a little more widely; for instance, that he should have entirely neglected Soulavie's Memoires du due de Choiseal, where he would have found a number of piquant and authentic anecdotes, besides several letters of the Duchess.

Amongst the many institutions created by Louis XIV, there is one which has never yet occupied the attention of historians. Except an article in the Dictronnaire dell'Academic des beaux-arts, a few papers in M. Piecre Clement's letters of Colbert, and a brinf notice in M. Baltard's monograph of the Villa Medici, we have absolutely no record of the school of time arts still existing at Rome 1, the foundation of which is due to Colbert. it cannot be said that underials are wanting for the proparaof consulting them. If any inquisitive student takes the trouble to visit the part of the French State Paper Office known by the name of Maison du Roi, he will find there the almost complete series of correspondence addressed by the directors of the Académie de France to their immediate superior, the Surintendant des bâtiments de la couronne. The letters collected in this set of documents give year by year, and almost day by day, a marrative of what has taken place, not only at the Yead mic, but in the city of Rome, and the abundant details transmitted to Paris by the various directors throw great light both upon general history and upon the development and viciositudes of Colbert's useful founda-Although the correspondence belonging to that statesman's administration to longer exists except in the most fragmantary condition, M. Lecoy do la Marche, the compiler of the volume before us, has been able to supply the deliciency from other sources, and from the year 1087 the series goes on consecutively until the disorganization of the Academic m 1792. M. Lecoy de la Marcha could not very easily reproduce the whole collection of letters; he has timited himself to those bearing upon the time arts, and has thus given us a work which is entirely new and full of valuable information. By way of preface, he explains the whole progress of the French School of Pine Arts at Rome, and this historical introduction is, so to say, the text on which the letters form the comment. He has added much subsidiary information in the

shape of foot-notes and a expious index.

The war of 1870-71 is still the subject of dumorous commentaries. The I'vris Journal has undertaken to publish a cheap but complete edition of the process-rechaux and reports issued by the Committee organized on the 14th June, 1871, to examine the proceedings both of the Covernment of the National Defence and of the Commune. It would be impossible and onnecessary to reprint all these documents in axions, but still, in abridging them, moreovery fact need be left out, no material evidence neglected. It is in this sense that the collections published by the Paris

Journal profess to be complete; moreover, in certain cases, the comparative brevity of the documents to be printed may enable the editors to give them without any alterations; and this has been the case as regards the Report on the camp of Conlie and the

been the case as regards the Report on the camp of Conlie and the army of Brittany.*

M. de la Borderie, the author of the popular publication we have just noticed, has treated the same subject in a separate pamphlet addressed to scientific readers. Not only does he revise the text of the official Report, correct misprints, and rectify numerous blunders, but he adds a copious appendix including various pièces justificatives, details which the author of the Report had not known, and answers to the objections raised by certain newspapers against parts of the Report itself.

M. Rolin's volume is another contribution to the history of the war.† The troops which acted in Normandy had not hither-

M. Rolin's volume is another contribution to the history of the war.† The troops which acted in Normandy had not hither-to had their monograph, perhaps because their commanders having been repeatedly changed, not one of these gentlemen thought that his tenure of office had been long enough to justify him in writing the history of the campaign. The Normandy National Guards, left very much to themselves, and obliged to carry on their share of the war in a rather desultory manner, did not indeed perform any operations of sufficient importance to stand but in history side by side with the engagements at Gravelotte or at Mars-la-Tour. They were not incorporated either with the army of the Loire or with that of the North, and they never had the opportunity of distinguishing themselves under Chanzy the army of the Loire or with that of the North, and they never had the opportunity of distinguishing themselves under Chanzy or Faidherbe; but they honourably and conscientiously discharged the duties assigned to them, and they deserved to find a faithful historian. M. Rolin's volume is not the least valuable addition to the military library published by M. Plon. It is illustrated with a beautiful map of Western France.

Under the title Autorité et liberté † M. Latour du Moulin has published in two duodecimos a collection of political articles the perusal of which might be useful under present circumstances. In his preface, after defining the position of the Conservative-Liberal party, he goes on to contend that the Imperial Clovernment was about to move in that direction if the fatal war of 1870 had not adjourned sine die the peaceful solution of home

of 1870 had not adjourned sine die the peaceful solution of home political questions. He then examines the often discussed question as to the real author of the campaign, and he is inclined to divide the responsibility between the Emperor and the nation. This solution seems to us the true one, and amongst the innumerable details connected with the whole affair, we may notice, as M. Latour du Moulin does, the injudicious interpellation of M. Codery on the 5th of July. It is tolerably clear that if the negotiations relative 5th of July. It is tolerably clear that if the negotiations relative to the Spanish Crown had remained secret, they would probably have ended in a kind of understanding with the Cabinet of Berlin; at all events they might have lasted long enough to secure for France the active co-operation of Austria and Italy. Our author is severe in his judgment of the revolutionary leaders, and he accuses M. Cambetta especially of having sacrificed attrictism to ambition. But we have dwelt long enough on the preface to these volumes; the work itself consists of an elaborate parallel between the political systems of France and England, followed by a narrative of the principal sittings of the Corps Legislatif in which M. Latour du Moulin took an active part, beginning with in which M. Latour du Moulin took an active part, beginning with

January 12th, 1864, and ending with August 27, 1870.

M. Honors Bonhomme, to whom we owe many interesting works on the history of French society in the eighteenth contury, has just published from numerous documents \$, some of which are still but little known, an account of the family of Louis XV. About the King himself it would be difficult to say snything very new; his mistreets. Madame de Pompadour and Madame Du Barry, are familia: the reader in every detail of their eventful caroer; fer, unfortunately, wherever there is a spice of scandal, public curiosity is sure to be on the alert. But in the Court of Versalles during the reign of Louis XV. there were four principles a whose influence often told with decided weight, and Court of Vessailles during the reign of Louis XV. there were four princesses whose influence often told with decided weight, and the ladies to whom their father had given, at the instigation of his mistresses, the sobriquets of Corse, Loque, Graille, and Chiffe, were not the colsumess nonentities that some persons suppose. The memoirs of the Marquis d'Argenson and the Duke de Laynes had already made this fact sufficiently clear; and M. Honoré Bonhamme now produces fresh proofs of it. His work is divided into seven chapters devoted respectively to the Dauphin and to the six daughters of the King, then comes an appendix of documents, including a number of letters from the princesses, never yet published. lished.

The twelfth volume of Saint-Simon's Memoirs opens with the character of Louis XIV. and closes with that of the Regent, two of the most striking parts of a work which never loses its interest although we turn to it for the twentieth time. Voltaire described in his Siècle de Louis XIV. the fair side of a wonderful reign; Saint-Simon lots us see things as they really were, and his character of the monarch is one which the verdict of posterity has amply confirmed. If, as he tells us, Louis XIV. was systemati-

cally kept by his Ministers without the means of becoming acquainted with the nation, the Duke d'Orléans in like manner places between himself and France a barrier of roues and abandoned women. He was an almost unequalled instance of superior talents completely frittered away, and of natural kindliness of disposition

blunted by the grossest vices.

Amongst the scientific publications before us we may mention the seventeenth instalment of the great dictionary of chemistry for which we are indebted to Mr. Wurtz; it includes important and valuable articles on Platinum, Phosphorus, and Photograph.

and valuable articles on Platinum, Phosphorus, and Photografic.

MM. André and Royet have done good service in issuing their neat
little volume on the history of English astronomical observatories. The first chapter gives a full account of the establishment as
Greenwich, together with biographical memoranda of Flamsteed,
Halley, Bradley, Maskelyne, &c. The Universities come next;
Kew and Liverpool supply the materials for the third chapter; and,
finally, we have a description of the principal private observatories
throughout the kingdom. An appendix is devoted to the Savillan
building at Oxford, and the whole work is copiously illustrated
with excellent woodcuts. It is curious to see from the prefixed
that France, which before the Revolution took the lead in astronomical investigations, and boasted of upwards of thirty observatories of various degrees of importance, at present numbers only tories of various degrees of importance, at present numbers only three, whilst all the other Continental States and England have not only outstripped her, but advanced far beyond the position which they themselves occupied eighty years ago. We shall wait with

they themselves occupied eighty years ago. We shall wait with much curiosity for the sequel of this useful work.

Anthropological questions are just now the order of the day, and Dr. Topinard's publication; is a kind of guide for those who may feel disposed to explore the northern part of Africa for the number of studying the various races of men settled these. It purpose of studying the various races of men settled there. contains, besides some introductory remarks by General Faidherbe, a number of hints and indications from Dr. Topinard's able per-They are concise, clearly put, founded upon the personal observa-tions of scientific travellers, and completed by useful bibliogra-

phical notes.

If we now pass to the realms of fiction we must own to some feeling of embarrassment in mentioning what is generally considered as the great success of the past month; we mean M. Flaubert's Tentation de Saint-Antoine, Should any of our readers be attracted towards it by the reputation of the author of Madama Borary, he will probably be amused on learning that for twenty-poven years this work has been anxiously expected, and that, compared with it, Goethe's Faust sinks into absolute insignificance. To our mind, the Tentation is simply the nightmare of an author whose imagination revels in foulness, and who, under the pretence of writing up Pantheism, courts popularity by the most odious means.

The Swiss Bibliothèque universelle for May | abounds in articles The Swiss Hibliotheque universitie for May i abounds in articles of general interest; let us mention M. Rambert's paper on Modern Metaphysics, and the second part of M. Ernest Lehr's essay on Woman's Rights. The letters of the Princess Palatine, edited by M. Jules Chavannes, and concluded in this number, throw much additional light upon the Court of Versailles during the second half of the reign of Louis XIV.

MR. DISRAELI ON THE SESSION.

MR. DISRAELI'S statement that the present Session is destined to be busy and long perhaps attained its main object in the surprise which it produced. Some ouriosity was felt as to the seven great measures which s shout simultaneously to occupy the attention of the House of Commons; but magnitude is a relative and arbitrary quality; and perhaps it may be contended that all legislative operations are in a certain sense important. It is difficult to semember the titles of the seven Bills which Mr. Disease enumerated on another day. Friendly Societies are useful institutions; but an unopposed Bill for regulating their affairs is not a heavy burden on the energies of Parliament. The debates on the hours of closing and opening publichouses might probably appear to Mr. Diseall when he was in a different mood as the most trivial and uninteresting of Parliamentary controversies. It may indeed be necessary that such matters should be discussed and settled; but details which can scarcely be connected with any theory or principle are not in general attractive to statesmen. The Judicature Bill, which affects higher interests, is only an amendment of Lord Selborne's measure; and the authority of the state of the rity of the House of Lords, and especially of the Chartellor, will ensure the acceptance of the principal enactments. There is no doubt that the abolition of the judicial functions of the House of Lords has been regarded by many lawyers with doubt, and by many politicians with disappointment and uneasiness. Mr. Disease I himself is supposed to have regretted the readiness with which the Conservative majority in the House of Lords deferred, under the guidance of Lord Cairns, to the recommendations of Lord Selborne; but the Bill of the present year is introduced by the Government, and the critics of some introduced by the Government, and the critics of some will be a substituted and will rather protest against doctrines which is predecily final. Legal members on both sides of the House will be unwilling to oppose the concurrent authority of Lord Carms and Lord Selborns. The Bill will occupy a certain time in passing through Committee; but it will smarre with little interference, and the lawyers are limited in withher. The Land Tonure Bill has been almost forgother since if this introduced into the House of Lords at the surprise will be felt rinning of the Session, and little surprise will be felt for the progress of the measure is postponed. It is being that nearly all the Bills which have attracted on have offinated in the House of Lords. Mr. and inhibites in his list the Bill for the abolition much Patronege in Scotland; but the Ecclesiastical thick may would from the combined or antagonistic thick may would from the combined or antagonistic sult from the combined or antagonistic the Archesters of Lord Shaffesbur, and Lord re will dispose according to their pleasure of bomeour Bill. The Ecclesiastical Discipline pt. Brownsonn's Bill. The Ecclesiastical Discipline correctly have a chance of becoming an Act unless safely the Government. The Royal Commission g employers said workings has not yet a which is to solve as the less of Mr.

there is not the smallest prospect of an animated party debate. Sir W. Harcourr made a laudable attempt to onliven a dull Session by his criticisms on Mr. Chose, but the House was determined not to be either amused or provoked into pugnacity. The Supplementary Estior provoked into pugnacity. The Supplementary Estimates which must be brought forward before the prorogation will perhaps furnish an opportunity for comments on the fallacy of Sir Stafford Norrhcote's sanguine expectations. In defiance of repeated and serious warnings, the Chancellon of the Excurquen thought fit to calculate on the customary or average percentage of increase in the revenue. Up to the present time the indirect taxes have been less produc-tive than in the last year; and it can scarcely be doubted that the diminution will continue. The reduction in the wages of all the workmen in coal and iron by amounts varying from twelve to twenty per cent. will be followed by a proportionate falling off in the Excise and Customs receipts from beer spirits, and tobacco. A deficiency of two millions may not improbably be the result of the Chan-CELLOR of the EXCHAQUER'S deference to tradition and authority; but the Government is sufficiently secured against attacks on financial grounds. Sir Staprogo NORTHCOTE implicitly followed Mr. Gladstone, who exprossly approved of the calculations made by his pupil and successor. To the criticisms of independent members of Opposition the Government will reply that the leader and the highest financial authority of the Liberal party is played to the sufficiency of the Estimates which have been

partially falsified by experience.

Even the amateur business of Parliament is unusually light. Several of the annual measures introduced by private members were summarily rejected in the early part of the Session, and two Wednesdays will suffice for Mr. Forstra's motion on the rights of women, and for Mr. Burr's Home Rule Resolutions. Mr. Richard and the 15th Clause and happily disposed of for the Session. It has unlined become difficult, except with the sid of the Irish there, to effect a count-out in consequence of the state of many new members, who, having no other transfer or society in London, naturally regard the lines as tends as time a theatre and a club; but general indinered tends in itself to shorten debates, and therefore to acceler the class of the Samion. It is defined to acceler the close of the Session. It is difficult to sustain the close of the Session. It is diment so sustain longed discussions in thin Houses. When the Juture Bill is introduced, it will at first be now with a languid interest; but as soon as it goes Committee, the lawyers will find that they are tipes only to one another. The Ecclesiastical Discipline Bill is not abandoned, may perhaps produce a certain amore excitement, and the Master and Servant's Bill, if it committees the servant of the se will also involve a genuine conflict of opinion.
measure seems likely to furnish metavials a
debate; and the Government has shown in the
the Intoxicating Liquors Bill, and on other resolute disinclination to disturb the policy of the Ministry. Mr. Diseases perhaps thinks it inexperts the country should discover how little has been the way either of legislative activity of the reaction. Mr. Harry continues the work of a well-without perceptible change of system. Neuracora secialously follows in GLADSTONE. The most reactions es been Lord Samon's triffing alker placetion required with come if y Louisid the Government referred

the control claimed by the noman Catholic hierarchy education.

Even if the Minister determines to prolong the Sossion into August, members who are tired of London may conscientiously indulge their inclinations when they find that the occupations of the London season begin to flag. There will be the less practical difficulty in arranging pairs because there will be nothing to pair about. Mr. DISHABLI'S seven great measures will scarcely provide a single regular division; nor has the majority which resulted from the election ever yet been exhibited, except on the minor issue of Lord Sannon's revised Order in Council. On the fur more serious question of the proposed extension of household suffrage to counties, after Mr. Forster had in an elaborate speech apparently established a party programme, Mr. Lows voted against his former colleague, and several members of the late Government abstained from voting. The extreme Liberals have made no second attempt to proclaim a policy of their own which might distinguish them from the moderate section of their party. of their members, Sir Wilfrid Lawson, probably expressed in a playful form their general distaste for political activity when he suggested a fortnight ago that the House should adjourn, not to the morrow of the Derby, but to February 1875. Mr. Disraell, though he cannot be charged with deficiency of humonr, has always taken an odd pleasure in the use of deliberate paradoxes and solemn fictions. It is quite in accordance with his habits of thought or of style to declare that the emptiest Session on record is crowded with important measures, and to warn the House that it must not expect an early release from Unlike some eminent rivals, Mr. DISRAELI never, except for the moment, imposes upon himself, nor does he regulate his conduct by his own extemporaneous phrases. He will deal with his seven great measures with due regard to their intrinsic importance, and in online indifference to his own professed estimate of their magnitude. If the Hosse of Commons accepts his hint by abstaining from unnecessary debate, he will be able to congratulate Parliament in the QUEEN'S Speech at the end of the Session on the energy which it will have displayed, and on the merited reward of an early recess. Some effort of memory or imagination will be needed to recall the achievements of the Session, but the Minister will not be unequal to the occasion.

FRANCE.

The patience is a virtue, France is learning it. As to the other virtues which the calamities of 1870 were expected to foster, it is not very clear that they have flourished under the wholesome process of digging and pruning as they ought to have done. But there can be no doubt that France, and especially Paris, has learnt that things cannot be settled recastly and logically, and so conformably to the demands conformed which was a settled from the country really minds the state of political uncertainty in which it is played is very hard to say. Each party in turn orios out that the country is miserable because it has no settled form of government, and, when the government proposed is not to its taste, vows that the country can very well wait until its real wishes are ascertained, and that there is no reason to be in any violent hurry. Meanwhile life goes on, and it goes on better in a material point of view than it did a year ago. There is no reason to he in any violent hurry. Meanwhile life goes on, and it goes on better in a material point of view than it did a year ago. There is more hospitality and more show in Paris; there is a greater confidence that the resources of the country are requal to all definands; and there are more travellers, more provincial families coming to Paris for a season, more work in the shops, more regular employment in the centres of industry. There is no visible sign that France wants anything for the moment at the Presidency of Marshal MacManon, and all that France seems to ask of Marshal MacManon is that he should be rigidly neutral. If he will meither intrigue nor permit intrigues, then there may be a breathing time, during which it may be possible to buy and sell, to marry and to give in marriage. A proposal has been attributed to an eminent leader of the Left Centre that the Assembly should adjourn for five years; and although that eminent man disclaimed having anything to the with an idea so revolting to a good Liberal Parliamentary leader, it is by no means improbable that n

Assembly, and at the same time to be rid of the inconveniences of the system, by agreeing that the Assembly shall never actually sit, is perhaps as near an embodiment as could be found of what well-to-do Frenchmen, not attached vehemently to any party, really wish. Even the current philosophy of the French press bears the marks of a growing appreciation of the beauty of patience. Not to draw husty conclusions, to associate hasty conclusions with the calamities of France, is a text on which French journalists now love to expatiate in their peculiar strain of moralizing. Everything that France has had to endure lately comes from the uncompromising love of logic which distinguishes the nation. At least, this is the latest discovery of French worldly philosophy; and if the country will only give up being sure of anything and having any distinct hopes as to its future, there is no reason, in the view of these well-contented philosophers, why France should not be as great as ever.

But people, or at least Frenchmon, who are not interested must be amused, and in a dull time any excitement is worth having. It is therefore natural that the present time of quiet in France should also be a time conspicuously enlivened by personal encounters and animosities. There has been in the last few days an exchange of personalities among politicians which has delighted Paris, and has made the small world of Parisians realize with ecstasy that fun has not altogether departed out of existence. A friend of a Republican deputy happened not long ago to be travelling in a first-class carriage—which, as the Bonapartist journalists observe, was rather an aristocratic thing for the friend of a Republican deputy to do—and in his compartment this luxurious traveller found a copy of a circular from a Committee of the Friends of an Appeal to the Country to the electors of the Nièvre, where M. DE BOURGOING has just achieved such a lamentable success. This circular advised all good Bonapartists to be especially attentive to half-pay officers, to remind them of their wrongs, and to conjure them, if they wished for redress, to work hard for M. DE Boungoing and the EMPEROR. Republican deputy whose friend had made this terrible discovery called the attention of the Ministry to the deplorable laxity which permitted the Bonapartists to pursue their vilo designs so very much at their ease. The Ministers present assured the Assembly that they would do all in their power to put an end to such abuses. They were not aware that there was such a Committee existing as that of the Friends of an Appeal to the Country; but if there was such a Committee, and if the police could but find out such a Committee, and it the police could but find out where it met, and of whom it was composed, it should be rigorously suppressed. Curiously enough it happens, according to General DE CISSEY, who is almost unconsciously the present Prime Minister, that half-pay officers are not in the province of any ascertainable Minister; and he owned that it certainly is the case that half-pay officers think themselves aggrieved by some recent regulations, and imagine that under the Empire they would have been better off. But still the Ministry is very violant, and very imoff. But still the Ministry is very vigilant, and very impartial, and it will not endure that aggrieved half-pay officers should be the willing victims of Bonapartist intrigue. This was all that could be expected from the Ministry, but the Reachlian party insisted that M ROUMER should the Rep-blican party insisted that M. Rounen should, on his behalf and on that of his political friends, disavow all complicity with the pernicious circular. M. Rouner, thus called on, not only protested that, so far as he knew, there was no such Committee as that of the Friends of an Appeal to the Country in existence, but he threw out the suggestion that in all probability the circular was a more forgery invented by the local adversaries of M. DE BOURGONG. This provoked M. GAMBETTA to rise in the fulness of his most furious fury, and he apostrophized the Bonapartists as "ces misérables." It was in vain that M. BUFFET, the President of the Assembly, remonstrated.
M. GAMBETTA replied that he addited to his words, and M. Gambetta replied that he address to his words, and only wished he could make them twice as strong. H. Burrer, with much dignity, answered that, if the honourable deputy persisted in such language, he should really be obliged to call him to order. On this a chorus arose from the advanced Left of deputies frantically shouting, "Call" us all to order!" which certainly showed a most language he indifference to this form of Parliamentary consure. The Assembly broke up in confusion; but the battle was not over. In the refreshment-room there was familiant danger less the conflict should assume a maca violent form, as M. Gambetta was threatened by a Constant danger, of when even the Boungaritat Journals restain the great

Break when M. Gasserva got to Paris his troubles were not at an end. At the Paris station an infuriated Benapartist reshedup to him, and, infurming kim that he was eas of the parents designated as "ees misérables," attacked him so violently that the sid of a policeman had to be invoked. The Paris journals, which find out all about every here of the day, soon discovered that this violent person was the "chef du service des pigeens pour" La Liberté, which estainly is one of the oddest employments on which a great man can enter. Still he was a great man. He had publicly insulted M. GAMBETTA, and, according to the Bonapartist journals, had actually made that illustrious politician turn pale, and momentarily deprived him of the power of speech. This incident has filled the columns of the Paris newspapers this week, and has delighted every one, and is universally taken to show that even under the administration of General DE CISEY there is still some salt in the world, and that in the dullest of political periods France is sure to have her legitimate sources of amusement.

It is also very natural that at such a time men should sock to ride their hobbies, and should spend as much time as possible in totally idle discussions. A Legitimist deputy has just brought forward a measure for the better observance of Sunday. It appears that there is still in force a law of 1814, of which foreigners may be content to avow themselves ignorant, as its existence appeared to be totally unknown to mine-tenths of the Assembly, and by this law labour on Sunday is to a great extent forbidden. The Minister who spoke on the proposed measure stated that the provisions of the law were faithfully observed in all departments of the Government, and that no work is done on Sanday if the contractor is working for the Government. The provisions of the law have never been extended to private persons, and thus it happened that under the rule of the great HAUSSMANN, when Paris was spending sixty millions sterling in getting itself beautified, masous, and hodmen, and carpenters worked in an estentations manner all Sunday; and, rather than not assert their superiority to the French law and the projudices of religions people, took their ease and their liquor on Monday, so as to have one day in seven to themselves, provided it was in what Mr. Cross would call an illicit way. new Bill proposed to cure this mischief, and to forbid work on Sanday altogether. But, as every one knows, it is impossible to lay down a hard and fast line on such a subject; and every one except a wrangling Scotchman will own that some things that cost labour to some one must be done on Sunday. The foolish author of the Bill saw this, and he thought that he also saw a means of escape. His measure provided that a reasonable relaxation from its rigours might be obtained from the ecclesiastical authorities. This is a small thing, but it is most indicative of the state of France. Here was a Pronchman who honestly thought that his countrymen would not only agree to discountenance the habit of working on Sundays, which is a had habit deplored by most sonsible Frenchmon, but would allow the ecclesiastical authorities to dictate when the provisions of the law should be suspended. Of course the Bill was thrown out, but nothing could show in a more striking manner how totally apart different sectious of Frenchmen stand from each other; and in a leisurely and idle time the signs of this separation manifest themselves in a haudred ways, the very triviality of which shows how deeply sested the roots of difference are. A discussion little less illustrative of the present state of French opinion has recently been carried on as to the continuance of French designs on Belgium. The organ of M. GAMEETTA republishes the notion of France desiring to annex Belgium as one of the mad designs of the person whom the Republican as one of the mad designs of the person whom the Republican journals delight to designate as the "ex-Casa." A Belgian journal has thought ithereth while to reply that what is called a design of the ex-Casar has been the design of every French Government since 1850. But everything is changed now, the Republican journals calaim; we are the friends of liberty, and we recognise how much Belgium has done for liberty, and if there are any people whom we love and admire, at is our dear Belgium. The real change which has come over the fortuner of Belgium is imposed. to be come over the fortunes of Belgium is ignored to be come over the fortunes of Belgium is ignored they inconvenient to mention. Or many would not now must the ammention of Belgium. This is the real truth, if ends all discussion. The conquerors of France can be say what France may have and what France may not be and France may as well-talk of assuming Cologue as of meaning Brussels. But then, if a fact that this all discussing Brussels. But then, if a fact that this all discussing Brussels.

cussion was recognized, what would become of discussion. And so, rather than not have their beloved discussion. Republican journals go on gushing about their love for liberty and their sympathy with their own patriotic Belgians. All this fine talk belongs to the land of dramma; but France is for the moment more or less asleep, and so to wander in the land of drams seems to writers and readers the most natural thing in the world.

MR. GLADSTONE AND THE UNIONISTS.

S a knowledge of character and human nature never been one of Mr. GLADSTONE'S numerous a plishments, he is naturally surprised to find that a class with which he is almost totally unacquainted fails on one cocasion to display the moral and intellectual perfection which he had attributed to fitsh and blood. It is more creditable to Mr. Gladstone's character that he should resent and disapprove an act of injustice perpetrated by his favourite clients than to his powers of observation that he should be astonished at the selfishness of the Aston Hall colliers. apparently failed to convince them that it was unfair to demand the dismissal of non-Union workmen; and it may even be doubted whether he entered into their feelings and their method of reasoning. The practised logicians who may probably have been found among some hundreds of Welshmen accustomed to Dissenting Debating Societies would find it difficult to reconcile Mr. GLADSTOKE's admiration of their class, and his appreciation of the advantages of Trade Unions, with his censure of their consistent maintenance of the doctrine and practice of exclusive monopoly. The professed and real object of trade combinations and of strikes is to raise wages, to diminish labour, and generally to obtain the greatest possible advantages for the members of Unions at the expense of employers. The whole machinery would become inoperative if competition on the part of non-Union workmen were practically free. In many places the privileges of Unions have been asserted by violent means which expose the perpetrators, if they can be detected, to the penalties of the law. The miners whom Mr. GLADSTONE addressed seem to have confined themselves to the exercise of their legal discretion in refusing to return to work inless a few non-Union men who had supplied vacancies were dismissed. It is a waste of time to remind Unionists that employers may have incurred a debt of honour to the men who have assisted them in their need. The right of combination includes the right or the power of determining the occasions of refusing to work, and the conditions on which labour may be resumed. The Flint colliers practically admitted that they had made a mistake in striking on the question of wages; but they rightly or wrongly deemed themselves strong enough to enforce the dismissal of the offending workmen; and the most premasive of orators, with a great reputation to add weight to his arguments, was unable to convince them that the exercise of a legal right might perhaps involve moral injustice. The intrasive workmen were probably regarded by the Unionist colliers as offenders against the ethical code of their order. In all ranks of society the conscience of a multitude united by a common interest is casily satisfied.

If the Aston Hall colliers are capable of appreciating the honour which has been conferred upon them, they will probably return the compliment by according a special immunity to the four obnoxious workmen. Mr. Gladstons perhaps in some degree compromised the cause of his clients by suggesting that, if they had done wrong, they ought to apologize to their persecutors. On his own showing, the men who remained at work when the majority struck asserted an inalignable right; and it was not pretended that they had committed any offence, except in disobeying the laws of the Union. Excessive candour displayed at the expense of others is but a vicarious virtue. Whether the dissentients consent or refuse to ask pardon for estimate which they have never committed. Mr. Grantsonne's intercession assuredly ought to pseudi. Theatrical deities, according to Horace, sometimes descended on the stage to unrawel complications which were not serious enough to require their intervention; but if they wested their superintered power, they at least untied the knot. It could scarcely have been expected that a famous crater and statement would undertake to settle the trade disputes of a little Welch colliery, but a special visit by Mr. Grantson and statement would undertake to settle the trade disputes

for the exercise of tolerance even by a body of Trade Unionists. His arguments were not perhaps novel, but good reasons are more common than ex-Prime Ministers. A king's face should give grace, and Mr. GLADSTONE is not a bad modern substitute for a king. If the colliers understood the bearing of his speech, they will have been flattered by the gennine astonishment which he expressed on the discovery that workmen could be in the wrong. It was perhaps less edifying to learn that wages could not be too high if they were spent well, or too low if they were spent ill. As the mode of expenditure is but remotely connected with the adjustment of wages, the audience may perhaps have vaguely suspected that a didactic moral episode was irrelevantly interposed in the middle of an economic argument.

Among other inducements to do justice and to love mercy, Mr. GLADSTONE warned the Aston Hall colliers that their oppressive conduct might perhaps furnish a plausible argument against the extension of household suffrage to counties. It was not clear whether it would also shake the deep-rooted convictions which have occupied Mr. GLAU-STONE'S mind for four, or perhaps five, years. When he introduced a Reform Bill in 1866, and when he moulded and enlarged Mr. DISRAELI'S Bill in the following year, he was not yet shocked by the anomaly of a difference in electoral rights depending on residence within or without the boundary of a borough. At a later period, finding himself suddenly in want of an explanation of his change of opinion on the Ballot, he extemporaneously proclaimed his conversion to universal suffrage, of which household suffrage in counties is the first instalment. Since that time the combinations of agricultural labourers under the tuition of Mr. Arch and his associates have strength-oned Mr. Gladstone's belief in the fitness of small householders for the county suffrage. He hastily assured the mutinous colliers that no member of the Agricultural Labourers' Union has ever been known to advocate or practise coercion of competitors in the market for labour. He has probably not studied the columns of the journal which is published by the Council of the Union; and even if he had been aware that it is the most libellous and the most revolutionary publication of the present day, he would perhaps have found no difficulty in explaining away any amount of mischievous falsohood. The farmers of the Eastern counties have drawn from their experience of the Union entirely opposite inferences to those which satisfy Mr. GLADSTONE. They well know that the agitators who direct the Union hold out to their followers the hope of confiscation as the most desirable result of the attainment of political power. A main reason against the transfer of the county representation from the present constituency to the farm-labourers consists in the facility with which demagogues may offer attractive bribes to the more ignorant part of the rural population. There is little danger in the demand for a redistribution of hud when it is addressed to the rubble of a great city. The farm-labourer alone sees his way to profit by a subversion of the rights of property, if he is once persuaded that it is feasible.

Mr. Gladstone took care to guard himself against the imputation of being ready to withdraw his support of household county suffrage merely because two or three hundred colliers were in his opinion guilty of unjust conduct. It is indeed highly improbable that during the remainder of his political career he will discontinue his rapid approximation to extreme theories of democracy; but a trivial incident occurring in his own neighbourhood and in connexion with his own property has suggested to him, apparently for the first time, the nature of the reasons which induce cautious politicians to hesitate before they extend the franchise beyond its present limits. The majority of the House of Commons which lately rejected Mr. Trevellan's motion thought, as far as it was not influenced by mere prejudice, that the expediency of conferring a vote or any other kind of power must depend on the use to which it will probably be applied. Those of the Aston Hall colliers who happen to occupy small houses in the county of Flint will, as soon as they obtain the suffrage, give their votes to the candidate who may profess the greatest devotion to the cause of workmen and of Trade Unions. Fourteen years have passed since Mr. Gladstone canvassed the county for a Conservative candidate; and porhaps, if the electors of Greatwich should prove inconstant, he may hereafter become the nomines of the colliers and farm-labourers of the members of the colliers and members are remained.

the proposed extension of the suffrage are propounded by optimists who foretell that the enfranchised workmen will be perfectly docile and loyal to existing institutions. Mr. Gladstone seems hitherto to have regarded the suffrage as a right, and not as a political instrument. He has evidently been startled by an instance of the tyrannical tendencies of trade combinations. A generous impulsible him to undertake the defence of the immissions diate victims of injustice; but he could scarcely persuade himself that the oppression which he demounced was not the result of accident or error. That men should use power, whether it is the effect of combination or of electoral privileges, for the promotion of their own supposed interests, or for the gratification of their passions, ought not to surprise a statesman of long experience. The disappointment of finding that a set of Welsh colliers were not superior to the ordinary weakness of humanity forced upon Mr. Gladstone's mind the painful stappicion, not that the despotic workmen might be questionable electors, but that their conduct would perhaps contirm the prejudice of those who doubt their fitness to exercise, in alliance with the small householders in boronghs, supreme and exclusive political power. There would be some advantage in inducing Mr. Gladstone to understand the position and the reasons of his opponents.

THE ARCHBISHOPS STILL IN COMMITTEE.

WHEN we pointed out to the Bishops a few weeks since how fatally they were sacrificing their personal self-respect and the prerogatives of their position to a fantastic deference for the two Primates, we very little thought how soon our warnings would be verified. The Ancheshops' Bill in its first state gave each diocesan the power at the head of a little Court of his own packing to harry his own diocese. The suffragans rose to the fly, and pledged their votes. The Bill as it stands, after Lord SHAFTESBURY'S and Lord CAIRNS's manipulation, confiscates the judicial attributes which the Bishops have ever held since the first rise of the English Church, some thirteen hundred years ago, in favour of a single lawyer to be appointed by the two Archbishops, only checked by the Government of the day. There is no exception. The stately prelate of London and the explaining of Durham have to be thankful for the same small mercies which are meted out to the most obscure. Welsh Bishop. An appellate Provincial Court which should be strong in itself and dignified enough to make resort to the Supreme Court of Judicature an exceptional rarity would undoubtedly be an essential ingredient in that thorough reform of ecclesiastical procedure which the Archusnors are working so hard to strangle. But the Provincial Court of the re-reformed Bill will combine the maximum of meddling with the minimum of dignity, while its place in the judicial system will be one of supersession, not appeal. Lord Shaffesburt empowered the Bishop to hear the case by himself and without appeal, provided both parties to the suit consented. But the injustice of a provision which would have enabled any three aggrieved parishioners, or some dictatorial dignitary, in concert with a partisan or careless Bishop, and in opposition to a frightened or penniless vicar and a bewildered congregation, to bind the parish or the whole Church by some noxions precedent, was so manifest that the Lords willingly accepted a restrictive provise suggested by Lord Gaer. By this the Bishop's judgment was indeed to be find. for that particular complaint, but so little was it to be a precedent for similar cases, that it was not even to bind the same people for the same things in the same place on any future occasion. This of course reduces the Bishop's jurisdiction to a burlesque, and leaves the Provincial Court for all practical purposes to be the tribunal of first instance for the whole land. The new Judge (under a salutary proviso as to security for costs, which the Metropolitans had not very willingly to accept) would henceforward be inquisitor-general of all the parishes, with power to hold his Court on the spot. This parishes, with power to hold his Court on the spot, provision appeals with peculiar plausibility to popular judices, but we doubt much whether its working we found satisfactory. Cheap and easy law is unquestions good thing below the point at which is fortune litigious but once it crosses that line is becomes a question become. Under the Bill, as it satisfa, any true debute on some matter of correspond which

by the perversity of the clergyman, the temper of any three parishioners, or the fusziness of some rural dean who wants to stand well in high quarters, been in-flamed into a law-suit, will result in the club-room of the "Three Jolly Pigeons" being metamorphosed into the Provincial Court of the Most Reverend Father in God the Lord Archishop of Canterbury, in the delivery by ex-fices (supposing there to be no collision) of his Lordship the Dean of Arches, and three or four barristers with blue bags and wig-boxes, and in the influx to the astonished "Figeons" of a swarm of those active young gentlemen who supply the reports and construct theology for the local weeklies. We know on the authority of Lord SHAFTESBURY, endorsed by the docile Archeisnors, that this process will ensure the peace of the Church; only we confess to being compelled to take the statement on faith.

The one personage completely snuffed out by this procedure will be the diocesan. The Judge, in whose making he has had no voice, holds in his hands the issues of peace or war through the diocese. Plaintiff and defendant will have their say by the mouth of the counsel whom they may select. The county newspapers will make the most of so rare an opportunity. The one man who will have no locus stands to plead his cause while the suit proceeds, and who will be compelled by considerations of decent city quette to hold his tongue after it has been concluded, will be the Bishop of the diocese. If we were not charitable, we might be tempted to feel some exultation at so unexpected a result of the episcopal abdication, when those twenty-four Bishops who so oddly struck their brother of Gloucester's imagination sat silent through the second reading of a Bill of which, as every one knew, no small proportion of their Bench very heartily disapproved. But personal punishment, however well deserved, is dearly bought at the cost of the permanent detriment of a great institu-tion to which the delinquents casually belong.

Lord Salisbury, backed by the present and past Chancellors, forced the Archbishors to accept an amendment which seems grimly humorous by the side of the remaining provisions from its simple fairness. law always has been that no alteration in the fabric or fittings of a church can be made without a faculty; but practice has long sanctioned a very elastic and tolerant application of the rule. Under the Bill, however, retrospective faculties would become a necessity in order to protect the existing order of things from malicious interference. But such faculties, with fees to pay on them, would be an enomous and most unjust fine on the clergy all round, and a totally undeserved windfall to the gentlemen who were lucky enough to find themselves perched in diocesan offices. The Archbishop of York could not see this, but the Lords thought otherwise, and he prudently abstained from Of course the Bishops may plausibly claim that dividing. they should not be compelled to grant a faculty for what appears to them unlawful because it may line no man's pocket. It is therefore possible that even this peacemaking proposal might indirectly foster the miserable ontburst of general litigation which will, we fear, be the practical result of the measure, supposing that the dog days help it to press its way over those seven-teen Bills which Mr. DISEAELI significantly, told the House of Commons were Government measures. At this very moment, when it might have been expected that policy would have dictated the utmost concileation, the Archbishop of Cantersury seems, if the Times is correct, the Archbishop of Cantersury seems, if the Times is correct, the Archbishop of Cantersury seems, if the Times is correct, to have unceremoniously ejected a plain cross from a church which he was consecrating, on some doubtful and merely technical pretext. If the new law is to be worked by its promoters in so harsh and Puritanical a spirit, the evils inherent in even the most tolerant administration of its provisions will be ten times aggravated.

The House of Lords will be engaged on Monday in dis-sening the Bishop of PRIERBOROUGH'S "nontralisation" clause and the somewhat extensive additions with which it has been weighted. This proposal attempts to reach that concordat on questions of worship which we have always advocated. But we fear that it seeks its end by a process which is at once too restricted and too rough-and-ready to

practice of standing before the Table at the Communical Service. But the Punchas Judgment, which was the cult protext for molesting the clergymon who value this prac-tice, was so completely blown out of the water by Lord Carens on Thursday week, that it is already for all practical purposes as dead as Julius Casas.

THE MANIFESTO OF THE LEFT CENTRE

because in a 1 to one to 1/4 below, recognition of the party and the par

THE Legitimists and the Orleanists have failed one after L the other to impose the wishes of their party on France. The Duke of Broatte has been ousted by a com-bination of the Extreme Right with the Left, and a Ministry is in office which is one of the oddest Ministries that ever existed; a Ministry which has no opinions and no passions, wishes for nothing, hopes for nothing, and fears nothinga Ministry which votes but does not speak, and if it votes with the majority takes no credit for itself, and if it votes with the minority takes no blame. The Bonapartists are still a very small party in the Assembly, and with the exception of M. Rounen are personally insignificant. The left are always paying the penalty of having the Extreme Left sitting on their borders. Under these circumstances the Left Centre, the party of M. THERS and M. DUFAURE, have thought the time come to give signs of their existence, to offer a definite policy for the considera-tion of the country, and to show that they have been right after all. They propose in the main that that should be done now which the victory of the Duke of BROGLER in the May of last year prevented being done then. M. Thiers was defeated and driven from office because he designed to set up a Conservative Republic. A year has gone by, and the Left Centre invites the world to observe that France is but where it was a year ago, only with a little more sad experience, and that the only thing to be done now, as then, is to establish once for all this Conservative Republic. The Manifesto is not signed by M. Thiers. The very great men of a party are loth to sign anything. There is something rather beneath the sign anything. There is something rather beneath the dignity of the "eminent man" in merely putting his name amongst a hundred others at the foot of a document. There are even persons who affect to know as a fact, and ossibly there may be persons who affect to believe, that M. THERS never saw or heard of this Manifesto before it was published. That there should be any protence of mystery about a document which simply embodies what M. THERS has said a hundred times is comical; but in France politics to be interesting must be mysterious, and the Left Centre naturally wish that their Manifesto, the great coup of their party, should be as interesting as possible. In one way it is only a reply to a previous Manifesto of the Right Centre, and the Right Centre wishes simply to organize the Septennat, as it is said, or, in plain language, to devise a temporary form of government to last as long as Marshal MacManon is President. The Left Centre steps forward, on the other hand, and says that the organized Government must be of some intelligible type, and that the only type that is possible is the Republic. A few words would, they think, do very much to put things in the right road; and if the Assembly would but pass a single article of a single law to the effect that the Government of France is a Republic under a President, and that the first President shall be Marshal MacManon, holding his office for seven years, then everything else would be comparatively easy. The Legitimists, thing else would be comparatively easy. The Legitimists, the Orleanists, and the Bounpartists would find the open field of battle closed to them, and would have to accept the new Government, unless they were prepared to conspire against it. The country would have confidence in the Marshal, and as the organization of his Republican Government would have been the work of his friends, or of men very well disposed to support him, he might reckon on being called on in future only to act with Ministries the general character of which might be expected to be fairly satisfactory to him.

If this Manifesto of the Left Centre had been merely an expression of opinion, it would not have had any great importance. It is really an appeal to the Right Centre to combine while there is time, and to keep out the Bonapartbe permanently satisfactory in regard to so delicate an organization as the Church of England. Anyhow, High Churchmen, for whose benefit the clause was supposed to have been devised, are precisely those persons who have not the slightest inducement to move a finger to get it. The the light Centre do not allow that the proclamation of the slightest inducement to move a finger to get it. The Republic is the right way of keeping them out. It is fally admitted on all hands that, if there was a general plants for different claimants is a limited immunity for the

there would be a large Republican majority, with a considerable Bonapartist minority, and only a few stragglers from the defeated ranks of the Legitimists and Orleanists. The Right Centre argue that, if such an Assembly was returned, the first thing that would happen would be that the Marshal would resign. A President would be named who would be acceptable to the Republicans, and then there would be a Republican Government of the old stamp. The violent party would get the lead, and would shock and alienate France. Of this troubled state of things the Bonanartist minority would take advantage. They would Bonapartist minority would take advantage. They would be ably led by M. Rounen, they would have the officials of the country with them, and Marshal MacManon might be easily persuaded to remember that he is the Duke of Magenta, and to return to the family of NAIOLEON some of the favours he has received from it. the Left Centre could answer to this that the Right Centre were entirely mistaken, and that moderate men of all partics, all who could properly take the lead in the administration of a Conservative Republic, would be sure to be returned, and would at once receive the support of a tractable and admiring Assembly, the reply would be a very good one. But the Left Centre do not pretend that anything of the sort would happen. They allow that a machinery must be devised and put in working order before the elections take place which will ensure the success of a Conservative Republic and the triumphant return of Conservative Republicans. They wish to set up a Second Chamber, on which frail reed they lean with estentations satisfaction, as if the uselessness of improvised Second Chambers were a secret that history had never revealed. They also wish to manipulate the suffrage so as to suit their purposes, to prevent some voting of those who now vote, and to group those who are to be allowed to vote in some convenient fashion. M. THERS nover dreamt of setting up a Conservative Republic by merely getting the Assembly to dissolve itself. He always insisted that the model of the Republic must be carefully framed beforehand, and then the rough material of the popular vote must be gently forced into the framework designed for it. Supposing this was done, is it credible that all would be peace and harmony in this best of Republics, with a ruling section of Orleanists, if not Legitimists, foisted into the Government by a machinery which the present reactionary Assembly had invented? These accidental Republicans would never be believed in, and would never believe in themselves; and the more extreme Republican party would declare itself ontwitted, and would strive to force these intruders into obscurity; and then to the Bonapartist minority would be added a minority who would at least be bound to the Bonapartists by having the same cuemies. Besides, as the Right Centre may urge, it may well be doubted whother the time for moulding the Republic into a Conservative form is not gone by. If this moulding had been the work of M. THERS, and if he had been the President and the first guide of the country amid the difficulty of its new situation, there was a chance that even Ropublicans would have got used to the notion of a Conservative Republic. But this was not to be. M. THIKES was deposed before he had time to carry out his designs; and it is a very difficult thing to attempt a year afterwards, without M. THIERS as President, what M. THISRS when President failed to do. What then is the solution? The Right Centre say that there is only one possible solution, and that is patience. France is going through a crisis, and no one can see what the future is to The best thing is to acknowledge facts, and to accept the inexpressible form of government that now exists.

Something might be said, no doubt, in reply to this reasoning of the Right Centre; but it is sufficiently good to make it highly improbable that the Left Centre will win the Right Centre over by mere arguments. But their Manifesto is much more than a summary of arguments, and it is because it is much more that it has attracted real attention and excited great interest in France. It is an announcement of a course of action. For the first time the dreaded word Dissolution has been introduced into the programme of men who are known to be moderate, prudent, and intelligent. The Assembly can do a great service to France, in the opinion of the Left Centre. It can relieve the country from anxiety; it can settle the vasual question as to the form of government. It can take precentionary measures against the abuses and errors which generally spoil the fortunes of Republics. But if it will not do this, if it persists in doing nothing, if it con-

tinually remains the scene of personal jesionsies and fatility intrigues, then at all hamrds its existence must be brought to a close, and the Left Centre will declare for a dissolution. The Left Centre in effect say to the Right Centre that, if there is a combination of their forces, the proper kind of Republic may be ensured, but that, if no such combination can be effected, the Left Centre prefer to take the risk of what the next. Assembly may do if left unfettered by the present Assembly, rather than allow the uncertainty that now weights on France to continue. That the Left Centre cannot by on France to continue. That the Left Centre cannot by mere voting being about the dissolution of the Assembly is certain; but they think with reason that the Assembly is drifting towards a dissolution from sheer incapacity to do anything that does not expose it to ridicule, and that an impulse given to it by a party including so many well-known men as the Left Centre is likely to accelerate a movement already begun. That this is so is acknowledged by the journals of all parties. They approve or disapprove the Manifesto, but they none of them pretend that it is merely the programme of a set of men who want a thing to be voted which they have no chance of seeing voted. Before the Buogne Ministry fell, and even before the persons who now hold portfolios came into prominence as head-clerks, the Manifesto of the Left Centre would have fallen dead on the French mind. That it should have been viewed as a most important political event clearly shows how much things have changed in the last six weeks. Perhaps, however, some of the interest attaching to it is derived from the exciting mystery which is found in one of its phrases. The Left Centre wish it to be understood that they do not deny that any Constitution which may now be made may undergo that revision hereafter which it is one of the inherent characteristics of Republican Government The facetious part of the Paris press has naturally made fun of this anticipation of the revision of a Constitution which as yet does not exist, and the more serious journals have set themselves to speculate what could have been the reason for inserting in the manifesto of a party what is either a mere platitude or an invitation to some persons ununmed to believe that they will get their way under a Republic to an extent which new secons invariable, to them. Probably the intention of these who incredible to them. Probably the intention of those who framed the document was to offer a last plank of communication and alliance to the Right Centre, and to awaken the belief that some day their friends of the Left Centre might, if there was no open quarrel, be able to give Republican institutions a turn of which Orleanists would approve. It could scarcely have meant more; but even this has been sufficient to inspire a doubt whother the Left Centre see their way as clearly before them as the confident and frank tone of the remainder of the document would suggest.

THE TWENTY-FIFTH CLAUSE.

EXCLUSION from office has set the members of the late Government free to speak and vote as they like on the maintenance of the 25th Clause of the Education Act, and Lord Frederick Cavenden and Mr. Lowe have taken the opportunity to dissociate themselves from Mr. Forster, and to hold out the olive-branch to the Dissenters. They probably think that, as there is no immediate prospect of a Liberal Ministry being called upon to frame an educational policy, this display of their conciliatory disposition can land them in no practical difficulties. Otherwise they would have done well to consider whether either of the substitutes for the 25th Clause which they propose is quite free from objection. Mr. Lowe says plainly that, rather than alienate voters, he would suspend the operation of compulsion whonever a parent chose to plead conscientious objections to a Board school as a reason for keeping his child at home. Perhaps, since the general election has brought out the working-man in the character of a Conservative politician, Mr. Lowe no longer thinks it necessary to educate his masters; but unless he is sure that working-men care as little for education as he does himself, it is hardly politic to take eyery opportunity of proclaiming his enlightened contempt for it. Lord Frederic Cavender suggests that the thirteen thousand children for whole suggests that the thirteen thousand children for whole Boards should in finiture be educated at the entire cost at the Denominational school managers. He does not start the Denominational school managers. He does not start the through Parliament to the report line.

promise. The Denominationalists are not in a mood to make concessions upon matters of principle. They have won their victory, and they intend to reap the fruits of it. They are irritated by what they regard as a wholly unreasonable sample on the part of the Dissentors, and what possible inducement can they have to tax themselves for the removal of this scraple? Indeed, if it were not for a literat hope that the Birmingham School Board will play the part of an educational drunken Helot, it may be suspected that the Denominationalists would accept Mr. GRAPTHAM's suggestion, and make the payment of fees to School Boards compulsory, instead of optional. They are not the least in the humour to make things pleasant for the Dissenters, and certainly they are not inclined to pay any money for that purpose.

The dissension among the Liberals on Wednesday does not promise well for the fortunes of the party. It is true that the main cause of the Liberal downfall was internal division, but there are times when statesmanship is better shown by recognizing and acquiescing in a division than by striving uselessly to heal it. This is eminently the case as regards the breach between the Dissenters and the late Government. Mr. Lows argues that the 25th Clause is a matter of infinitesimally small moment in practice. Therefore, he says, let us repeal the clause for the sake of peace and quietness. But there is no good in repealing this particular clause if other and larger grievances are left unredressed. If the Dissenters are driven nearly mad by being asked to bear their share of a payment which altogether amounts but to some very few thousands a year, is it to be supposed that when this demand was waived they would not be seized with similar scruples as to the application of the Parliamentary Grant, and as to the teaching of religion in School Board schools? Nearly a million of public money is spent every year upon Denominational schools out of the Consolidated Fund, and even under the COWPER-TEMPLE Clause a School Board school may be thoroughly Denominational, provided that the religious instruction is given by word of mouth, and not through the medium of formularies. Here, therefore, are two much greater violations of religious equality than the 25th Clause, and these can only be set right by the entire adoption of the Secularist programme. Mr. Lows is himself so free from sectarian susceptibilities that he probably finds it impossible to conceive their existence in others; otherwise he would feel that the attempt to reconstruct the Liberal party on this basis is absolutely hopeless. The Secularist system is reasonable enough in theory, and we have never denied that, if all parties would agree to carry it out, it might be worked more cheaply, and probably more effectually, than the Denominationalist system. But we have to deal not with the reasonable theory of Scoularism so much as with its unreasonable practice, and any hope there might once have been of Secularists and Denominationalists agreeing to divide the educational field between them is for the time The Liberal leaders will have therefore to make extinct. their choice between the class with whom Liberal principles are merely a synonym for the cut-and-dried formulas of an intolerant Nonconformity, and the class whose anxiety to see the people educated is strong enough to bear the reflection that education may sometimes include instruction in some form of Denominational religion. Most people will be of opinion that the latter of these two classes is very much the larger, but Mr. Lowe and Lord FREDERICK CAVENDISH are clearly of opinion that the strength of the Dissenters is best arrived at by taking thom at their own valuation. The immediate effect of their speeches will be to furnish those moderate Liberals who at the last election either voted with the Conservatives or not at all with what they will regard as a full justification for their condust. They will now be able to point to an exfor their conduct. They will now be able to poun to an ex-Cakinet Minister's speech for confirmation of their suspicions. We were afraid, they will say, that the late Government was not to be trusted in the matter of the 25th Clause, and Mr. Lowe's speech is evidence that we were right in our fears. His infinence in the Cabinet at least would always have been thrown on the wrong side, at least would always have been thrown on the wrong side, and it would only have required the convenion of Mr. Glandings to the same opinions to make Mr. Fourtur's retirement and a complete consequent change in educational policy quite inevitable. If Mr. Lows thinks it politic to thread this impression abroad, he takk the right means to attain the purpose when he spoke in favour of Mr. Russaan's Bill. These who hold that it is the alliance of the Dissenters, may

their counity, which the Liberal party has suffered from in the past and has to dread in the future, will not be disposed to admire his stateamannish.

Into the arguments by which the clause was attacked and defended it can hardly be needful to enter. The old misrepresentations of the effect of the clause were again repeated, and the old difficulties in the way of its repeat were again left unagewered. It was once more asserted by Mr. Richard that the 25th Clause compels one man to pay for the teaching of the religion of another man. A sneaker who knowing that the court of a another man. A speaker who, knowing that the cost of a child's education at a voluntary school cannot be put at-less than 9d. a week, and that of this the School Board is-only called upon to contribute 2½d., goes on asserting that the cost of the religious instruction which the child gets as part of his education comes out of the 2 d., and not out of the 61d. which is paid from other sources, must be either unable to see facts as they are, or determined to represent them as other than they are. The distorting influence of religious passion is so notorious that we have no difficulty in crediting Mr. RICHARD with the more complimentary alternative. But even gentlemen who misunderstand the 25th Clause might as well go through the form of meeting the objections to its repeal which are based on actual experience. Mr. Allsopp stated on Wednesday that in Salford when the Act was passed there was Mr. Allsopp stated on Weda positive excess of school accommodation beyond the amount required by law. But for the 25th Clause the School Board would have had to disregard this fact when considering the case of indigent children, and to burden the pockets of the ratepayers with the cost of new schools in order to spare their conscioness the burden of having to pay the fees at existing Denominational schools. The least Mr. Richard could have done was to offer on the part of the Salford Dissenters to hear the former load if Parliament would relieve them of the latter.

THE SUEZ CANAL.

AND THE PARTY OF T

THE first sign of activity which M. DE LEASEPS has given since the withdrawal of the threat that he would close since the withdrawal of the threat that he would close the Suez Canal is an interview which he has sought with the Emperor of Russia at Ems. It is not to be supposed that he has succeeded in altering the policy which the Rassian Government has adopted in concert with other Powers; but the effort which he has probably made sug-gests the possibility of future complications which ought, if possible, to be foreseen and averted. M. DR LEBRER new possible, to be foreseen and averseu. In the amount and appropriate that he had proposed not to close the Canal, but only to exclude vessels which might not pay the tolts which he demanded; but through his agent, if not in his own person, he certainly threatened to extinguish the lights and to withdraw the pilots and the staff of the Canal. The singularly acrimousous tone which he adopts towards the English Government is the more significant because be hints that he hopes for support both from France and Russia. A few years ago almost every Continental Government fancied itself more nearly interested than England in the maintenance of the Canal. It was thought that the commercial supremacy of the Mediterranean ports was about to be restored at the expense of modern and more distant seats of commerce. Lord Paumeneron's opposition on political grounds to the construction of the Canal confirmed the general illusion; and consequently, if it had been possible to liberate the Canal from tolls and all other charges, the opportunity of competing still more freely with English shipping would have been universally welcomed. It is by no means certain that foreign Powers are now equally anxious to facili-tate the use of the Canal. Experience has shown that English ships pay the greater part of the tolls, and that their owners and freighters would therefore be the chief sufferers from an increase of charges. It is true that sufferers from an increase of charges. It is true that vessels belonging to other nations would pay in proposition to their tonnage; but possibly interests of a different kind might be considered by some Governments as more important than the commercial considerations which would be exclusively regarded in Ringland. As long as the Canal Company stands alone, the menace of clasing the Canal will, even if it is repeated, cause little alasm. It is absurd that a body of private capitalists should, because they justly claim the credit of having opened a new maritime highway, he allowed to close it at their plantage. As a read, when it is opened for governly

traffic, is irrevocably dedicated to the public use, the Canal became from the first, subject to certain equitable conditions, the common thoroughfare of all commercial nations. If a dispute arises between the Company and the traders who use the Canal, it must be settled by some method less inconvenient than the arbitrary stoppage of the traffic. Certain ambiguities which are supposed to exist in the tariff have been authoritatively removed by the report of a mixed Commission which represented all the Governments concerned in the trade. It is true that the Company denied the competence of the Court; but, from the necessity of the case, a tribunal was constituted for the occasion. M. DE LESSEPS'S complaint that the Company was not heard LESSEPS'S complaint that the Company was not heard probably admits of explanation. As no municipal jurisdiction is applicable to the Canal, it is only possible to refer disputes to the representatives of the different Powers. The claims of the Company received ample consideration, and any grievance which may nevertheless have arisen seems to be without remedy. M. De LESSEPS relies partly on his own interpretation of the original concession, and principally on the moral right to sufficient remuneration which he supposes his shareholders to have established by the construction of the Canal. The to have established by the construction of the Canal. The joint Commission has adjudicated on the meaning of the tariff, and to some extent it has sanctioned charges which were not, in the opinion of the majority of the members, strictly authorized by the concession. M. DE LESSEPS takes to himself great credit for his former disregard of unfriendly forebodings. He always assured subscribers that they would receive ample remuneration for their outlay; and it can scarcely be said that these who relied on his judgment will be entitled to compensation if they find themselves disappointed. It is another question whether there are reasons of expediency which may entitle the Company to liberal consideration.

When Lord Dunsany lately asked the Government in the House of Lords to announce its policy with respect to the Suez Canal, Lord Densy replied with his usual prudence that there was no immediate necessity for action. The threat of closing the Canal had not been enforced; and even if M. DE LESSEPS had withdrawn his staff, the worst result which could have occurred would have been the employment of officers and servants who might in the first instance have been imperfectly familiar with their duties. The KHEDIVE, acting on the demand of the Porte, had been ready to take instant possession of the Canal, and to make due provision for the service, until the Company were prepared to resume their duties. It seemed reasonable to infer that trade would, in the event of future disputes, be not less effectually secured against the interruption of the traffic by the act of the Company. Lord DERBY further expressed the opinion that it would be impossible to induce the European Powers to purchase the Canal as a common property; and he implied that the acquisition of the works by England alone would arouse formidable jealousy. It would, in Lord Danny's opinion, be unjust and impracticable to purchase the Canal by compulsion, and the shareholders have not expressed any desire for a voluntary sale. On the whole, the Foreign Minister entertained the opinion, commonly held by his department, that there was no danger to be apprehended, and nothing to be done. It may be taken for granted that, in the absence of some change in the political condition of Europe, the Canal will not be closed even if M. DE LESSEPS continues to be dissatisfied with the existing tariff. The Khedive in such matters always acts as a loyal subject of the Porte, which in turn will not disregard the advice and wishes of friendly Powers. If the Egyptian Government were of friendly Powers. If the Egyptian Government were to form new political connexions, the Canal, or the traffic which uses it, might be seriously endangered. It is not improbable that if the dispute on the tariff had occurred four or five years ago, the Imperial Government of France might have undertaken to support the demands of M. DE LESSEPS, even at the cost of imposing a heavy tax on French shipping and commerce. Subsidies would have reconciled French shippowners and merchants to the increase of the tolls; nor would it have been easy for foreigners to interfere with the inequalities of charge which might have prevented due competition. Six or which hight have prevented due competition. Six or seven years ago the present First Lord of the Admiralty, then Secretary of the Treasury, entered into a negotiation with the Company of the French Messageries to carry the English mails to India; and, but for the vigilance of the House of Commons, he would perhaps have completed a contract which the foreign Company would take have been enabled to accept on low terms because it received enormous subsidies from its own Government. A repetition of the same policy of lavish bounties in the case of the Canal might have been combined with a boon to the Canal shareholders, who are principally French. Any great Power which for any reason preferred the interests of the Canal Company to the encouragement of trade might indirectly impose a heavy burden on English vessels using the Canal.

Pressure effectually applied at Constantinople or at Cairo Pressure effectually applied at Constantinopie or at Cawo might easily deprive traders of the security which seems to Lord Dears sufficient. There have been times when a Viceroy of Egypt was a mere dependent on France; nor is it impossible that Russia might in time acquire preponderating influence in Egypt. If the Khedive had during the late crisis declined the responsibility of maintaining the Canal, the lights would have been extinguished, the buoys would have been removed, and, as M. Dr Lessers expressly stated, the commerce of Europe with the East would have been remitted to the circuitous road by the Cape. Another and more probable contingency is that the increased dues would be paid under protest by English shipowners, while some of their competitors would have been guaranteed against loss by their respective Governments. Except for against loss by their respective Governments. Except for the actual or anticipated intervention of the Kuzdive, the Company would be able to dictate its own terms to those who use the Canal. It is not desirable to place exclusive reliance on the firmness of a potentate who might have motives for conniving at the policy of Governments which might be unfriendly to England. The equal use of the Canal by all nations will remain precarious until the terms on which traffic is to pass are settled by international convention. It seems not impossible that, as all Governments are now on friendly terms with England, a scheme might, notwithstanding Lord Dersy's doubts, be arranged for the joint purchase of the Canal. The share-holders would probably be willing to sell if they received a reasonable premium on the value of their shares in the form either of a capital sum or of an annuity. The ownership might be acquired either in equal shares, or in proportion to the respective interests of the different States in the traffic subject to the tolls. If the project were found impracticable, the Foreign Minister ought, if possible, to discover some alternative solution. The conclusions of the late Commission, or any tariff which might be substituted for them, might be embedied in a treaty; nor would it be impossible to agree on some tribunal to which future disputes might be referred. There is evidently a certain risk, although the passage of the traffic is for the present grudgingly permitted. M. DE LESSERS, an able man of business and a skilful diplomatist, is not likely to threaten the stoppage of the Canal unless he thinks that he can frighten the Governments which decline to recognize his proposed tariff. If he believes that he may count on political support, his expectations ought not to be disregarded. In this and in other matters the functions of a Foreign Minister are not exhausted when he has given a skilful answer to a Parliamentary question. The more important part of his duty is to provide against complications and inconveniences before they occur. DERRY may with great advantage employ himself in examining the whole question of the Suez Canal, and in taking precautions against the trouble which may perhaps arise hereafter.

CHURCH PATRONAGE IN SCOTLAND.

I ORD GREY'S insuperable objection to the provision in the Scotch Church Patronage Bill which gives the communicants the right of appointing their minister is so wide of the mark that he can hardly have been at the trouble of bringing his scruples to the test of facts. No one now denies that "taking the Sacrament" ought not to be "made a qualification for appointments," but it is stretching the meaning of the term "appointments," but it is stretching the meaning of the term "appointments" beyond all reasonable bounds to make it include the right of choosing your own clergyman. In this case the circumstance of being a communicant is simply taken as the ordinary test of church membership, and consequently as the best evidence of a genuine interest in the appointment to be made. There is much force in the argument against popular patronage in any form; but if popular patronage is once consequents. He patrons toght to be men who care for the membership Bill only applicable that is applied.

the Poer Law Guardians or the Town Councillors because it is the respayers that are concerned in the economical expenditure of the Poor-rate and in the prudent administration of manicipal affairs. When it comes to the distribution of purely ecclesiastical offices, the rate-payers as such are not affected by the choice made. If it is a matter of any moment to them who is elected, it will ordinarily be either because they are members of the Church, in which case they have a better claim to share in the election in that character, or because they have imported personal considerations into the transaction, in which case they are not fit electors at all. It may be objected that very good appointments are often made by private patrons who are not members of the Church. But this is because they have accepted the right of appointment as a trust, and have exercised this trust for what they hold to be the benefit of the parish. Lord Camperdown can hardly be so sanguine as to expect that the ratepayers will look at themselves in the same light, and will give a disinterested vote for the man whom they think best calculated to advance the spiritual welfare of a congregation to which they do not belong. The suggestion is the more strange because the acceptance of it would convert the Bill into a dull joke. The only reason for interfering with the present system of patronage is that it is distasteful to the members of the Established Church; and Lord Camperdown wishes to interfere with it for the purpose of substituting a system which would be infinitely more distasteful to them. The existing patron usually leaves the people free to choose their own minister, but there is no security that the ratepayers would be equally considerate.

The question whether the election of a minister should the question whether the election of a minister should be entrusted to the communicants, or to the congregation, or to the communicants regarded as a committee of the congregation, might as well have been kept out of Par-liamentary discussion. The only point which it is im-portant to ensure is that the electors shall be really members of the church; and the decision what shall constitute them members of the church is one that belongs ordinarily to the ecclesiastical authorities, and in certain cases to the courts of law. If the General Assembly is willing to relax the test of Church membership, Parliament can have no object in keeping it rigorous. If the General Assembly wishes to maintain a rigorous test, it is not the business of Parliament to relax it. As the question had been raised, it was probably best settled by the adoption of the Duke of ARGYLL'S amendment. There are many parishes, it seems, in which the minister is already presented by the scatholders who have attended the church for a year, and in these cases the mention of communicants only would have narrowed the constituency to no purpose. It will be within the competence of the General Assembly to affix a precise meaning to the words "other members "of the congregation," and as the practice of ex-"of the congregation," and as the practice of ex-cluding non-communicants from a share in the appointment of ministers has not hitherto prevailed in the Scotch Church, there is no reason to attribute to the General Assembly a desire to introduce it. It will be for-tunate if the addition of the words "and other members of "the congregation" removes the difficulty about the Highland parishes. The Duke of RICHMOND hopes that it will have this effect; but unless the position of the Established Church in some of these parishes has been greatly misre-presented, congregations will be almost as hard to find in them as communicants. In one large district the attendance at the parish church on Sundays is said to be limited to the members of the minister's family, and he is fortunate if he can get his servants to follow the example of his wife and children. The Free Church Secession carried off almost the whole population of five counties, and here, unless the change in the law of patronage should do something to heal the schism, popular election can be hardly more than a farce. This is not a state of things to which any special remedy can be applied. It is really a reproduction of one of the worst features of the Irish ecclesiastical ptern, before disestablishment; but insamuch as it only puters, before disestablishment; but insamuch as it only raised from corner of Scotland, it does not admit of being taken a realist in the same way. The unit of establishment can be seen than an entire country. A Bill to disestablish prevail to be seen as a seen a Bill to disestablish the Church of laser and in certain Welsh counties where Dissent is especially generalest. Happily the Scotch are usually willing input re-

to wash their dirty linen at home, and there is no fear that the spiritual condition of these Highland parishes will become a European scandal.

No reference has yet been made in the debates on No reference has yet been made in the debates on the Church Patronage Bill to the danger that the transfer of all the appointments to the communicants will have the effect of keeping in obscurity a class of clergy whom it is exceedingly desirable to bring into proper prominence. Popular election may be relied on to find out good preachers and strong partisans, but it is not equally trustworthy where a man's claim to promotion is founded on his learning and moderation. Yet these qualifications are not such as can safely be disthese qualifications are not such as can safely be dis-missed from the service of the Church; and so long as the connexion of the Church and the State is maintained, it would be a just reason for regret if any act of the State should help to make them raror. In every religious com-munion there are persons who are thought little of by the more violent members of their own body, and whose reputation is probably greater outside the communion than it is inside it. The Government is discharging a most useful function when it draws men of this type from the obscurity in which they would otherwise remain. It might be best if they could be appointed to some coolestical post which did not involve cure of souls, but as in the Scotch Church there are neither deaneries nor canonries to be disposed of, the only way in which the favour of the State can be conferred is by nomination to a parish. It will be difficult to acquit the Government of all responsibility if, as a result of the surrender of Crown patronage, the character of the Prosbytorian clergy becomes lowered by the consistent exclusion of every man who does not come up to some popular and arbitrary standard of orthodoxy or zeal. We are not propared with any suggestion as to the means by which this disaster might be prevented. But there must be some churches to the patronage of which the Crown might fairly assert a claim as the representative of the establishing State, and we can hardly believe that this claim would be considered unreasonable, even by the most strenuous maintainer of popular rights or ecclesiastical independence. It is to be supposed, whon a Church wishes to remain established, that it gains something by its poculiar relation to the State, and, so long as the State continues to give this something, it has a fair title to receive something by way of consideration. The right of correcting ecclesiastical intolerance by keeping a few nominations in its own hands would not be an extravagant concession for the State to demand.

THE LICENSING BILL.

T was said by Mr. Cross on Mouday night that when a man came to ask for a licence he must make up his mind to keep his house open as long as was necessary for the convenience of the public. It would be interesting to know whether Mr. Cross intended this as a statement of the law as it is, or as it is to be. The Act of 1872 imposes penalties on opening premises when they ought to be closed, but not on closing them when they are permitted to be open. If from the mere fact of the Legislature having fixed the hours of closing an obligation to open is to be implied, it would follow that before the Act 1872 every publican was bound to open at 4 A.M., and, before the present reign, he would have been bound to keep open perpetually, except during the hours of divine service on Sundays. It is, indeed, quite intelligible that the law should cast upon the publican a duty corresponding to his privilege. An attempt was made early in this century to subject an innkeeper who was licensed to let post-horses to liability to an action for refusing to supply them to a guest. It was contended with much force that the innkeeper, by taking out a licence, rendered himself liable to fulfil the objects of the licence, and that persons who underteck, to the exclusion of others, to supply the public with post-horses ought not to be allowed to exercise their privilege in a partial or capricious manner by serving one traveller and rejecting another. Such persons had under the capital of the persons had under the capital of the c taken a public duty, and public convenience required this it should be fairly performed. This argument did not prevail with the judge before whom it was urged, but, if the same argument were applied to the question as to the duty of keeping open public-houses, it might possibly be successful. We incline to think that it would prevail, but we must remark that this could only be on the assumption

that drinking is a good thing, whereas some of the proposals which Mr. Caoss appears to favour rest on the assumption that drinking is a bad thing. It would be instructive as well as amusing to hear a discusaion in the Court of Queen's Bench on the policy of the Licensing Acts, and there could be few more interesting or lively arguments than that which could be raised on an action or indictment against a publican for, let us say, failing to open at the appointed hour, be it 6 or 7 o'clock, on Sunday evening. The Sabbatarians and the Alliance would of course unite in a subscription to pay the publican's costs, so that, on one side at least, the case would be certain to be well argued. It would have to be conceded by the other side that the old law is against them. The statutes of King James I. regarded an inn in a town as an accommodation for travellers, and not as a tippling-house for /ownsmen. Consistently with these statutes we find that innkeepers have been held liable to action or indictment for failing to accommodate travellers, but not for excluding tipplers. Assuming, however, that the modern law requires that for general convenience publicans shall keep their houses open and be ready to serve all comors during the permitted hours, it would be difficult to enforce this requirement by action or indictment. The notion of claiming damages for having been delayed or wholly disappointed in getting a glass of beer is slightly grotesque; and upon an indictment against a publican for early closing it would be difficult to induce a jury to find him guilty, and if they did, the Judge would be greatly embarrassed in awarding punishment. It is perhaps conceivable that a bench of magistrates might be persuaded to regard early closing as disorderly conduct when they were asked to renew the licence, and might take this occasion to mark their disapproval of the practice of closing a public-house in order that the keeper of it and his family might attend church or chapel. These difficulties might of course be removed by the insertion in Mr. Cross's Bill of a penalty against early closing; but that expedient would be denounced and rejected.

The foregoing remarks may be useful as showing what uncertain ground Parliament gets upon by entertaining proposals such as that for altering the opening hour on Sunday afternoons from 6 to 7 o'clock. Legislation as to Sunday closing bogan on a sound principle. There could be no question as to the propriety of closing during the usual hours of divino service, and at an earlier hour in the evening of the day on which ordinary employment is suspended. The further step of keeping the houses closed all the first half of Sunday was generally approved. It was inconvenient that they should close nearly at the same moment as the theatres on Saturday night, but still the principle was acquiesced in even by those whose own practice was opposed to it. But here, we think, legislation ought to have stopped. An hour was snipped away on no principle at all by the Act of 1872, and it is easy after that to propose to snip away an hour or two more. Mr. Cross began by laying down that publicans were not to be treated as enemies, but as servants of society, and consistently with this principle he might require them to keep open "as long as is necessary for the "convenience of the public"; although it is not quite clear how he would enforce this requirement. But in allowing himself to listen to the proposal to substitute 7 for 6 o'clock as the opening hour on Sunday afternoons, he showed a weak desire to conciliate those who are the snowed a weak desire to concente those who are the enemies both of the publicans and of that part of the public which likes comfort and convenience, and dislikes fanaticism. It ought not to be necessary to enter into the question of convenience when the proposed change has nothing to recommend it except that it is a sop to a party that will not be appleased. But it is manifest that the large class who are not handalous would be denoised of any class who are not householders would be deprived of one We speak of hour suitable for taking their Sunday dinner. the metropolis, because it is more immediately under view, and without intending to suggest that it is entitled to more consideration than the rest of the country. Letters which have appeared in the newspapers show the annoyance which the change of hour would inflict on Londoners. An enting-house which solls beer would be closed altogether from y to 7 o'clock. An eating-house where iter is fatched for mustomers from an adjoining public house would be open for the supply of food, but the only accessible drink model be London water. Non-householders have been already deprived of one convenient drinks have been already deprived of one convenient drinks have been already deprived of one convenients drinks have been already deprived of one convenients drinks have been already. 4 they, time publicans, are re

as public enemies, who ought to be as much as possible repressed and hampered. There are also the unhappy foreigners who are doomed to spend Sunday in Landan, and who complain that it has been proposed to diminish still further the available mitigations of their misery. Whether this proposal is or is not finally adopted, we must join with Mr. LOCKE in lamenting that the HOME SECRETARY allowed himself to be led away during the discussion by crotchet-mongers.

Allowance would be made for the difficulties of the Ministry if they showed a desire to adhere to sound principles. But their conduct as regards Sunday can only be described as coquetting with fanaticism. In fixing the hour of opening on weekdays they might fairly make a difference between town and country. Several speakers intimated their opinion that the hour of opening in rural districts should be 5 o'clock, and it is easy to understand that, at least during six months of the year, that hour would be desirable. If this be required for the convenience of the country we do not see that it should be sacrificed to the fancy of the town. Mr. LARD and other employers of labour profess to think—and perhaps they are right in thinking—that their men do not work so well if they take here or spirits in the morning. work so well if they take beer or spirits in the morning. These employers can, if they think it worth while, exclude from their premises all men who are seen visiting the public-houses on their way to work. And if the workmen hold the same opinion, they can give effect to it by com-bination among themselves. But it is unreasonable to ask that legislation should supply the want of self-control of one class by imposing vexatious restrictions upon another class. The case for early opening in the country resembles that for late closing in London. There is a real and considerable hardship shown to exist, and the attempt to mitigate it by exemptions will probably fail. These two cases differ from that as to late closing in provincial towns, as to which, although there may be hardship, it is not sufficient to come out distinctly in the discussion on the Bill. We think that the hours most suitable to the country and small towns would be 5 A.M. to 10 P.M., and in large provincial towns we should propose 6 A.M. to 11 P.M. This we hold to be the maximum of restriction that is desirable, and we should prefer the more simple and liberal rule of 5 A.M. to II P.M. everywhere beyond the metropolis. Looking at the thing broadly, it is improbable that drunkenness would be facilitated by opening in the early morning or on Sunday afternoon; but our objection to further restriction in these respects is not only to the proposal, but to the spirit in which it is made. Mr. Russell Gunner has discovered that an omnibus runs on Sundays from the heart of London to some place in the suburbs, where the passengers are all received and entertained as "bond fide travellers"; and this he seems to think an abuse of the existing law. But what does he expect people who find themselves in London on Sunday to do, except to get out of it if they can? Legislators should try to conceive what the wants and wishes of the mass of the population really are, and not consider these questions from the point of view of a middleaged or elderly gentleman in easy circumstances who has a good house in town and another near town, and is a member of one or two clubs. At this season the Thames is covered on Sunday afternoons with boats, and rowing is thirsty . work. The hour proposed to be cut off would be sorely missed, and the windings of the river might involve publicans in difficulties as to "bond fide travullers." This shows the wisdom of letting things alone.

MR. RUSKIN ON LECTURES.

OHARACTERISTIC letter from Mr. Rushin has been made to Mr. Rushin to deliver a because the same been made to Mr. Rushin to deliver a because at Glasgow, he replied by emphatically declaring that the desire of audiences "to be audiences only" is becoming an "entirely postilisat character of the age." The multitude are in too great heate to be miss, in a same puts it, they expect a mean to kneed into small, sweet pills the knowledge which it has taken him half a lifetime to acquire, and to put it straight down their throats. This, as he want truly age, is not to be done; and he proceeds to condense as "antirely postilent and about make" the "modern forworking, smooth, removed the good Dickens, who was killed by the instability amonds of the mod, when he might have been maked. This is a limited backs and the modern between the modern for the mode, when he might have been maked.

pace, it gives a very of its later writings there ight into various antiment characteristic, and indeed, in a short store of Mr. Ruskin's mind. In all We have called the letter charac we have called the letter characteristic, this limited. In all his later writings there is generally a combination of chrewd insight into various median weaknesses with an exaggrated tone of entitient which leads him into pandon. We can saldom deny that he has hit a seal blot; but it makes him so engry that he can see nothing also for the time. Nobedy can deny, for example, that Mr. Ruskin had sound reasons for objecting to the frivolity of which undergradents life; but his summery remedy of converting young gentlemen into navvice second to show that his indignation was scarcely under the control of common sense. We may, in the same way, agree to a very great extent with his view of modern lecturing. Dickens, as we had occasion to remark in reviewing the last volume of his biography, did indeed fall a sacrifice to the public curiosity which had no consideration for the health of its seventre, and, it must be added, to that weakness of his own theretay which led him to place too high a value upon such rather unworthy housage. It is increasingly difficult for a man of true gamine to devote himself to serious and sustained effort in face of the demands constantly made upon him to produce rapidly and gamine to devote himself to serious and sustained effort in face of the demands constantly made upon him to produce rapidly and abundantly, and to be always capping his last performance. We are growing too excitable, and do not give a fair chance to we best workers. Moreover, popular lecturing is a very unsatisfactory made of preaching any serious doctrine. If an audience of a thousand people calls together at Glasgow to hear Mr. Ruskin deliver a lecture, we may perhaps assume that at least three hundred would come because they did not know how to spend the evening otherwise; three hundred more because they had been bullied by their friends; and another three hundred because they had heard some vague rumour about Mr. Ruskin's cloquence, though they had vague rumour about Mr. Ruskin's eloquence, though they had never read a line of his writings. The remaining hundred, though this is a very large estimate, might possibly know something of Mr. Ruskin as one of our literary lights; and something of Mr. Ruskin as one of our literary lights; and perhaps some ten might really come with the acrious intention of acquiring some new ideas. Meanwhile Mr. Ruskin has two or three lessons to enforce which seem to him so simple that, once clearly stated, they cannot fail to be accepted; and that, once accepted, they must profoundly modify the conduct of all upon whom they have been impressed. The audience hears Mr. Ruskin speak with his usual vivacity and elequence; it becomes enthusiastic, cheers him to the echo; and he goes away with the impression that he has really made some converts. A short time, however, is sufficient to undeceive him. The idle have been amused; those who had heard of Mr. Ruskin are gratified at being able to anhatitute a distinct nicture for the vague shetracamined; those who had heard of Air. Idisain are gratified at being able to substitute a distinct picture for the vague abstraction which formerly did duty in their minds; and those who have read some of his books feel that they will understand them a little more clearly than they did before. Most of these impressions will fade away pretty rapidly in Glasgow streets; but even if they were permanent, they would amount to very little. There are two classes of people upon whom it is not to be expected that a single lecture should make much impression. There are, first, the people of real intelligence, who have gradually thought out for themselves some sort of theory of the world, sufficient for their own purposes. It is not to be supposed that a single presentation of Mr. Ituskin's views, however elequent, would seriously affect the prejudices which have become ingrained in a thoughtful mind. Society would indeed be an unstable combination if arguments which can be stated in an hour would at once make converts. If men were thus at the mercy of a single syllogism, creeds would change as rapidly as the coloure of a kaleidoscope; and we should have no security that Archbishop Manning would not rise up tomerrow as the convert of Mr. Bradlaugh. But this pertinacity is luckily not confined to the intelligent. There is an incomparably larger class of people who are beneath argument rather than above being able to substitute a distinct picture for the vague abstraclarger class of people who are beneath argument rather than above it; whose minds are too fluid to retain any impressions; who will it; whose minus are too minu to retain any impressions; who will follow every step in a demonstration with perfect placidity, and then fall back precisely to their old opinions without the consciousness of having undergons any shock whatever. They will fully agree with Mr. Raskin in the evening that modern society is founded upon utterly wrong principles, and that a first step to reform would be the destruction of all railroads and the closing of retorm would be the destruction of all railroads and the closing of all coal-nunce. The next morning they will read with equal complicency a leader setting forth the mervellous progress of civilization, and applaud a speech in which Watt is described as the greatest of all benefactors of humanity. Between these two classes indeed there are to be found a certain number of impressionable next to be found as certain number of impressionable next. classes indeed there are to be found a certain number of impressionable people. There are the crockety people who are always on the look-out for a new idea, but who have an unfortunate tendency to being into discredit any fancy which they may happen to take up; and there are a certain number of youthin anthusinsts who have not yet developed a settled system of opinious, and who may be predisposed to follow an elegant and sympathetic leader. For these last persons, indeed, Mr. Ruskin is ant to be rather too bitter. The young enthusiast likes to-believe in progress, and is shocked at being told that the whole country is going post-basts to rain. Still, here and those, Mr. Ruskin may countre a preselyte, and indeed we must regard it as no small proof of his powers that he if a book and his powers that he if a book and his powers that he if a book to take to the spade and humant in the place of the our and the last. d the but.

of the lest then described would seem to be takenbly obvious, and fr. Realth apparently indees that a physical liftener is gramally a saling patient made. The only easient thing is that he absolut even had any fault about it. Mr. Baskin is too impelient, and berefeer indees a good deal of unaccountry disappolationals. He

owhere that he tried for ye d Turner, and thinks that he complains somewhere that he tried for years to make no counse men understand Turner, and thinks that he completely failed because they will not look even at Turner's drawings in the Seath Ka sington Museum. Mr. Ruskin, like every other teacher of mankin is destined to incomma disappointment if he expects that only people will accept his whole body of doctrime just us it exists its own mind. Any independent observer neight have though that Mr. Ruskin's books had really produced a very great effect understants. that Mr. Russin's books had really produced a very great effect upon opinion, although they have not made many converse prepared to accept his whole body of doctrine. An able writer may be well content if he has stimulated speculation, through the stimulus may have led to results which he never contemplated. To make people think, not to make them thinks just what he thinks, is the ordinary result of his labours, and it is a result of which anybody may be proud. Measured by that standard, we should say that Mr. Ruskin's writings have done a very great service, though his impatient temperament and his tendency to paradox have considerably injured his influence. If, on the same principle, he had only expected from lecturing what lectures may be reasonably expected to produce, he would probably not have condemned the whole system so unequivously. An hour's talk, even from an able and eloquem man, will not make stupid people clever or selfish people benevotent; but it may at times do as much good as one be often expected to result from an hour's work. It will make even the stupid realize the fact that there are regions of thought into which pocted to result from an hour's work. It will make even the stupid realize the fact that there are regions of thought into which they have not yet coared, and the selfish may become dimly aware that their mode of life excites disgust in the minds of some intelligent persons. The effect may be small, but, considering the entreme difficulty of effecting any serious change in the behits of thought of a whole nation, it much not be altogether coatemptible. temptible.

There are, indeed, as Mr. Ruskin says, two kinds of lectures There are, indeed, as Mr. Ruskin says, two kinds of sectures. The personal influence of an eminent toacher upon a small hindy of serious students who look up to him for guidance in a serious course of education is represented in some lectures. In spite of the changes introduced by the greater facility of obtaining books, it is probable that lectures of this sort will never be supersocied. A distinguished Professor at a University exerts an influence over his habitual hearers which he cannot exercise through his writings. Compared with this, the influence of sporadic lecturing in Royal Institutions and elsewhere must of course be trifling. And yet such lectures, much as they are misused by trifling. And yet such lectures, much as they are misused by charlatens, have some merits. The wonderful compound epithet which Mr. Ruskin has invented to describe them is not always appropriate. Sermons are generally abused at the present day; and yet there can be no doubt that many of the greatest religious teachers would have lost half their influence if they had been teachers would have lost half their influence if they had been unable to take advantage of the contagious excitement of large congregations. And in the same way, if a men has really something to say, this mode of utterance has its own advantages. Dickens's fectures were not lectures at all in the proper sense of the word, but dramatic representations of passages in his novels. It probably did very little good to snybody, and it contained the ment to himself when he setted a revolution. passages in his novels. It probably did very little good to anybody, as it certainly did great harm to himself, when he acted a revolting murder on a small stage. The curiosity produced was not healthful; and the great novelist was rather degrading his position when he consented to perform as a sensational actor. But other leatures might be mentioned which were probably serviceable in their day. The lectures, for example, of Coloridge, or Mr. Carlyle's lectures on Hero-worship, probably contributed to apread the general reputation of two eminent men more rapidly than would have been the case if they had been entirely confined to writing. Mr. Ruskin has chosen, for reasons satisfactory to himself, to publish the Fore Classifers in such a way as naturally to limit its circulation. If he consented to preach his lessons to a few public sudiences, he would probably find that his teaching would excite more attention these it can do at present. We do not believe, for a good many reasons, that the world is likely to wake up one morning and find itself it can do at present. We do not believe, for a good many reasons, that the world is likely to wake up one morning and find itself Ruskinite; but an evening or two spent in listening to a man who, rightly or wrongly, seriously believes himself to have an important message to deliver to mankind, would do nobody any harm, and might help to increase his rather limited circle of converts.

ARCHDEACON PHILLPOTTS ON PERIL OF IDOLATRY.

ARCHDEACON PHILLPOTTS ON PERIL OF IDOLATRY.

It has been said by a great writer that "prophecy is prospective history, and history retrospective prophecy." Whether the attempt to treat history in the prophetic spirit, or in other words to write prophecy backwards, has been much more successful them the attempt to write history by anticipation may perhaps be doubted, but it is at least equally common. And in an age like our own, when historical study has acquired a new prophecy and dignity, every man with a pet doctrine or arotaket to ventilate, especially if he be a man of one idea, in naturally anxious to find or to faction an historical basis for his theory. In an earlier generation Mixford devoted the sioning years of his life to establishing Tony principles by an elaborate exposure of his life to establishing Tony principles by an elaborate exposure of his life to establish writeral disconnection of the Athenian demonstracy; and since these involves has still more elaborated of the faction of Commons. We can had you woulder if leaver leading the faction of Commons. We can had been histories written to have Catholic histories and Protestant histories written to the same treet. And then, to take a tritrensample, the lighteries and Propagant histories written to

prove how blessing and cursing have in either case attended on the maintenance or the rejection of the true faith. Some thirty years ago Archdeacon Manning, as he then was, preached a Fifth of November Sermon at Oxford, in which the prosperity of "this Church and nation" for centuries past was measured by its advancing repudiation of "the dominion of the Roman Pontificate." In subsequent works the same author has undertaken to show that the same "providential acts" of resistance to Rome have in each case entailed heavy judgments on the country. It is, however, with another Archdeacon, less widely known to fame, who has supplied the latest example of this method of prophetic retrospect, that we are concerned to-day. Our readers are aware of the raid that has been made upon the Exeter reredos, and are also acquainted with our opinion on the matter, which prove how blessing and curring have in either case attended and are also acquainted with our opinion on the matter, which need not be repeated here. But in the official defence of his conduct which the learned and venerable prosecutor of the Exeter Chapter has just addressed to the clergy of the Archdesconry of Cornwall, he adopts a line of argument far transcending the legal and technical merits of the point at issue. On that branch of the subject indeed he declines to enter, and after a few words of explanation as to his personal reasons for the course he has taken, we are always at once into the deaths of a weat historical discussion. plunged at once into the depths of a vast historical discussion.

He looked upon the matter chiefly in a religious point of view. He maintained that throughout the history of mankind, wherever images of the character of that now under discussion had been permitted in churches, the worship of them sooner or later had invariably followed." And, as the context implies, a general corruption or destruction of Christianity had followed with it. Considering that, according to the Archdeacon—who is so far right mough—invariant have have now considering that according to the Archdeacon—who is so far right. enough—images have been very general in churches for upwards of fifteen conturies, this is of course rather a serious indictment, and it behaves us, if only in the interests of "our common Christianity," to examine the grounds on which it is based. The Archdeacon has kindly constructed for our assistance a little chronological table—we were going to say of Church history, but in fact it begins with the promulgation of the Ten Commandments "with especial dignity" amid the thunders of Mount Sinai, only to close with the sentence of Mr. Justice Keating in the Chapter House at Exeter. It is chiefly however to Church history, and especially to English Church history, that Archdeacon Phillpotts addresses himself, and we at all events must be content to keep within these not very narrow limits. tianity," to examine the grounds on which it is based. narrow limits.

very narrow limits.

There have been various opinions broached by Protestant divines as to when the age of miracles ceased, when and how the corruptions of Popery were first introduced, how soon the Church altogether apostatized from pure Gospel faith, whether during the long period of darkness which followed any faithful remnant—as for instance the Albigensus—handed on the torch of true religion, and the like. We have heard an Evangelical preacher pass at a bound from St. Paul to Bishop Ridley, finding no green spot for the sole of his foot to rest upon in the dreary interval. On the other hand the English Homilies, if we recollect aright, speak of the world being sunk for upwards of 900 years "in the filthy puddles of stinking human tradition," thus allowing some tive or six centuries of Christian purity before the crisis came. The Archdeacon of Cornwall steers a middle course. He allows 300 years of Christian faith and learning before the age of idelatry set in; an arrangefaith and learning before the age of idolatry set in; an arrange-ment, by the way, which has one rather awkward consequence. It throws not only the composition of the Ureeds and the four Ecumenical Councils, to which the Anglican Canons appeal for settlement of doctrine, but the immense majority of the Fathers, including all the more learned among them, into the idolatrous period, when learning is expressly said to have fallen into utter decay. The passage is certainly a curious one:—

It was certain that for the first 300 years after Christ, the best and purest period of the Church, in which learning flourished and civilization was in a highly advanced state, no images were permitted in churches. It was after the irruption into the west of the Goths, Vandals, and Huns, who, with their devastating bands, overran the fairest portions of Europe, destroying cities, burning libraries, and making havec of the homes of the inhabitants, while learning and civilization fell into utter decay—it was after this that images crept into the churches under the patronage of half-converted princes, and began to be worshipped. The East, after a chequered period of doubt, dispute, and disquiet, settled down at last into the admission of pictures, and he feared their worship also, while status were repuditated still.

The Vandals did not become Christians at all before the fifth century, when they mostly adopted Arianism. The conversion of the Huns began at the end of the eighth century. But let that pass. There is nothing to show that Goths, Vandals, or Huns had anything to do with the introduction of images, which, so far from symbolizing the decay of learning and civilization among Christians, was closely connected with its advance. It was, as Neander points out, the stern opposition of the early Christians to the esthetic religion of Paganism which made them the uncompromising opponents of all union of art with religion, and it was only by degrees that this repugnance were away. As to the patronage of "half-converted princes," it was such rude and ignorant Emperors as Leo the Issurian, who wickently forced his Jewish subjects to receive baptism, and his Constantine Copronymus, who were the great assailants of its ages. Whether the Archdescon attaches any weight to the Essimal distinction between pictures and status is not dear from the Revolution of Idages. The is evidently unaware that the iconoclastic of Essay, and the archdescon attaches any weight to the Essimal distinction between pictures and status is not dear from the status of the series will be accorded to the status of the Issurian, who characteristic status of the Issurian that the control of the status of the Issurian that the control of the status of the Issurian distinction between pictures and status is not dear from the companions of Ulyses. But he is evidently unaware that the iconoclastic of the Issurian work of the Issurian that control the Issurian that the control of the status of the Issurian that the original of the Issurian that the control of the status of the Issurian that the original of the Issurian that the The Vandals did not become Christians at all before the fifth

the Eastern Church synchronized with the commu

the Eastern Church synchronized with the commencement of a long period of intellectual stagnation from which she is only now allowly awakening. The last Greek theologian of any state was John of Damascus, who lived in the eighth century.

Having thus summarily disposed of the origin and progress of images or idolatry—for he regards the two as virtually synonymous—in the Christian Church, the Archdeacon passes rapidly over the long period of Pagan darkness extending from the close of the third century to the dawn, by aid of the printing press, of the "B. Reformation" in the sixteenth, which was signalized "in England as elsewhere" by the banishment of images from the churches. When however he comes to details, he wisely confines himself to England. He doubtless knows that the Reformation "elsewhere" is closely connected with the name of Luther, but churches. When however he comes to details, he wisely confines himself to England. He doubtless knows that the Reformation "elsewhere" is closely connected with the name of Luther, but he is apparently ignorant that to this day that most objectionable of all images, the crucifix—which he assures us was the special abomination of Bishop Jewell and Bishop Cox—stands on every Lutheran altar, whence it follows according to his own canon that Lutherans are "invariably" idolaters, and indeed, as will appear from a passage we are about to quote, not only idolaters but "Romanists":—

Daskers reigned for a long time till at length under God the open

Dut "Romanists":—

Darkness reigned for a long time, till at length, under God, the open Bible, spread abroad by the discovery of the printing press, came into all men's hands; and then the light of the glorious Gospel of Christ once more shone upon those whose eyes the god of this world had not wholly blinded. A great reaction took place, and it was to the process of this reaction to would specially call their attention. In England, as elsewhere, almost the tirat step taken was the banishment of images from the churches, and eventually, in the reign of Edward VI., they were swept away. Now, they should mark this in order to show what an inseparable connexion existed between images and Romanism.

To the halcyon days of Edward VI.—which, however, greater historians than the Archdeacon of Cordwall, who are equally sound Protestants, do not regard as a particularly brilliant period of our history—succeeded the reign of "Bloody Mary," when Bishop Bonner and Cardinal Pole immediately replaced "a crucifix or rood of decent stature" in the churches. This matter of the stature suggests to the Archdeacon the interesting inquiry whether stature suggests to the Archdescon the interesting inquiry whether the figures on the Exeter reredos would have been considered large enough, or whether Cardinal Pole would have required an image six feet long—like those in the reredos opened the other day at Worcester. He inclines however to think that three feet would have sufficed, and indeed sees reason to believe that the smaller the image the more grossly idolatrous the worship it is likely to receive. Did not Louis XI. of France, whenever he was about to do any specially wretched and dishonourable deed, worship one of the little leaden images he carried about in his hat? and why therefore should not the good people of Exeter worship the delicate figures on their own reredos?

Oh, the grovelling debasement of all the mental and spiritual powers when once men took to meddling with images, either keeping them about their persons or putting them in their places of worship to look at them there!

After this little parenthosis the sketch of English history is resumed. With Mary's death returned Protestantism and "the Ten Commandments," images in churches being "altogether and entirely forbidden"; with the exception, it should have been added, of the lion and unicorn, to say nothing of Moses and Asron, whose gigantic figures, more than six feet high, not unfrequently used to flank the inevitable decalogue, Second Commandment and all. And so for two reigns all was well. But then came Charles I., and "his Roman Catholic wife Henrietta and Bishop Laud"—the Archdescon does not seem to have heard of Laud's translation to Canterbury—"did pretty much what they liked, and then serain Canterbury—"did pretty much what they liked, and then again up came the images and with them a thinly disguised Popery."

This however was more than the people could bear. The king and Bishop Laud lost their heads, on account it would seem of these restored images, and for a time the Church Establishment was overthrown. But the people found themselves "pestered" by the Puritan sectaries (the Archdescon of Cornwall is evidently not partial sectores (the Arendescon of Cornwan is evenently nor partial to Dissenters) and restored Anglicanism, taking care how-ever to keep images out of the churches; and for awhile "all went smoothly, till another Papist, James II." succeeded to the throne and the evil policy of his father. His "Jesuit confessors" insisted and the evil policy of his lather. His "Jesuit confessors" insisted on his putting images back into the churches, and we are left on infer that on that account he was deposed. Why the Jesuits should wish to see images introduced into Anglican churches, as the language of the Charge implies, is not explained. If the Archdescon means that Roman Catholic chapels were opened during James's reign, which chapels no doubt contained the usual paraphernalia of Roman Catholic worship, that is quite true, but it is hard to see what it has to do with the introduction of images into the Church of England

Beaum Catholics of late years. Look at the Archhithen of Westminster, so called, once a highly respected archdences of the English Church, now the morest estellite of the Pope of Rome, ready to do his bidding in all things, whether to produce as articles of finish the Immanulate Conception of the Virgha Many, or the personal infullibility of his Hallmest. Aye, and worse than that, ready—(having once been in English clergyman, tolerably well acquilibiled with his Bible, he could hardly do it without some laward revulation of halling)—ready to crown an Image of St. Joseph, with the infant fleviour in his arms, in a church at the outskirts of London; and proclaim plemary indulgance from all their sins to all who, in a devout frame of mind, cheald make a pilgrimage thereto.

Whether Archhishop Manning became a Papist because he had learnt to worship images, or whether his belief in the Immaculate Conception and Papal Infallibility seduced him into image worship, does not very clearly appear. But we are distinctly informed that his "strange infatuation" can only he axplained "on the principle of God's blinding the eyes of those who believe not in the alone efficacy of the blood of Christ." Nor is this the worst. In the Archbishop's pro-cathedral are to be seen, besides Roman Catholica, many "gaping idlera," who go to look at the vestments and decorations and lights and incense and confession-boxes, till they come at last to think these things constitute "real religion," and become Ritualists or Romanists themselves. Nay, the Archdeacon knows of "educated young ladies" who already worship images in their own rooms, and may some day "at the behest of their confessors" come to worship them in church, if they can find any there. We must venture to observe however that if these misguided young ladies resort to Exeter Cathedral for the purpose, unless they go very close indeed to the altar, they will find the painted figures of the Apostles in the great East window much more conspicuous and available objects of adoration than the elegant but somewhat minute sculpture of the reredes. Yet, curiously enough, the Archdeacon, who feels bound in conscience not only to lift up his voice but "to spend and be spent, if need be, in the attempt to purpe the Cathedral of these miserable idols," does not seem to be at all moved to protest agilist the Saints in the painted windows, which are surely at least as conducive to peril of idolatry as the Greek fooms. Neither indeed does one quite understand, considering what numberless decorations far more demonstratively "idolatrous" than the Exeter reredos have been introduced into English churches and cathedrals during the last thirty years, how he can second it to his conscience to have held his pace so long. One special reason he does adduce, though it s

We are afraid we cannot help him.

It was pointed out at the time that, if the law relied upon for the removal of images from churches is still in force, it is equally applicable to the destruction of the illuminated missals in the Bodleian and British Museum. And if Archdeacon l'hillpotts is right as to the "everlasting obligation of the letter of the Second Commandment," the law cannot be complained of. But we should like to know whether he accepts the full consequences of his own theory, and, if not, where he draws the line. If images are idolatrous in church, they can hardly be innocuous in private houses, and indeed we have already seen that young ladies worship them in their bedrooms. Nor can it make any difference whether the likeness be in sculpture or in painting, or whether the subject be sacred or profime. All are alike forbidden by the letter of the Second Commandment, and were in fact held unlawful among the Jaws, and all alike are capable of being perverted to superstitious uses. We have seen an old woman in a foreign cathedral prostrate in adoration before the figure of the impenitent thief. There must in short be a clean sweep of our picture-gallories and our drawing-rooms as well as our churches, if we are to avoid all peril of idolatry. And perhaps even then the danger would not be wholly got rid of. There is high authority for asying that the Israelites, even when guiltless of any sin against the letter of the Second Commandment, "set up their idols in their hearts," and were severely consured for doing so. But with such high matters we shall not meddle here. It is clear that, on the Archdeacon's principle, Christian art, whether medieval or modern, could never have come into existence, and with the fall of the old Gods all that gives "sweetness and light" to the outward forms of religion would have passed away. He tells us indeed that "errain outward accessories to worship there must be "; but he prudently refraine from defining them except by the negative test that they must "assessed hamme

William Control

the Ten Commandments. So vigorous a protest has heardly been heard since the days when the mantle of Copronymus fell; see Praise God Barebones of pious memory; and unless some doughties: destructive shall arise to dispute his claim, the name of Archedescon Philipotta will go down to posterity, as the last of the iouncelests.

OUR SPORTS.

IT is curious to observe the sort of vapid purility into which the Times usually falls when it turns from the beatun track of politics to discuss any of the social questions of the day. There is a silliness about its articles on such subjects which one is almost driven to think must be intentional and deliberate. They seem to be written on the assumption that only wave silly mapple same for driven to think must be intentional and deliberate. They seem to be written on the assumption that only very silly people cars for articles of this kind, and that, therefore, the sillier they are the more suitable they will be for the class for whose entertainment they are provided. A highly characteristic specimen of these compositions appeared the other day on the subject of racing. The writer had been struck by the difference between the Derby and the Caks as regards the demeanour of the spectators, and found that the latter satisfied his ideal of racing without rowdiness. If alleraces, he thought, could only be conducted as quietly as the Caks, the Turf would soon become decent and respectable. The writer them went on to treat the question analytically, and to inquire whether there would soon become decent and respectable. The writer them went on to treat the question analytically, and to inquire whether there was anything peculiar in the circumstances of the Oaks to account for its superior decorum. He discovered "peace and pleasure" at the Oaks, and also a great many ladies. A larger proportion of ladies go to this race than to any other, and it is observed that there is also less disorder and brutality on the course than is usual at races. Consequently the presence of the ladies, it is suggested, must have somewing to do with the respectability of the meeting, and the writer proceeds to draw from this what he calls a "lesson, if not a moral." This lesson or moral is "not exactly that more ladies ought to attend meetings of this kind in order that racing should ought to attend meetings of this kind in order that racing should be more reputably conducted, but rather that racing should be more reputably conducted that ladies might be tempted to help forward its reform." And his conclusion is that "the difference between the Oaks and the Derby Day induces us to believe that, should the reform of our racing be taken carnestly in hand, it may possibly be forwarded by the agency of woman." A more extraordinary confusion of mind as to cause and effect it is impossable. ought to attend meetings of this kind in order that racing should possibly be forwarded by the agency of woman." A more extra-ordinary confusion of mind as to cause and effect it is impossible to imagine. Racing is to be refined by women going to races, but then women are not to go to races till racing is refined. In other words, the remedy is to be applied only when the patient is certified to be cured. It is expected that "with ladies at races we should seldom see animals cruelly over-ridden," and that "the roughs would be less likely to outrage decency." But then the writer's would be less likely to outrage deceney." But then the writer's meaning is "not exactly" that these things should be checked meaning is "not exactly" that these things should be checked by the attendance of women at races, but that they should be checked—how he does not say—in order to make it fitting for women to attend. He commerates some of the classes who make races what they are at present—the regular betting-men and their imitators, the publicans who play to their own gain into the hands of professionals and hangers-on of the Turf, and the great body of "reckless and feeble fools" whose rendezvous is the racecourse. The writer does not advise ladies to attempt to purify and refine racing while it is in the hands of these people, but he has brought himself to believe that these people will perhaps voluntarily sacrifice their interests and tastes and these people, but he has brought himself to believe that these people will perhaps voluntarily sacrifice their interests and tastes and absent themselves from the race-course in order that ladies may enjoy the sight of the sport. "What is imperatively wanted is some restraining influence that should raise the general tone." Without this restraining influence things must go on as at present, but then unfortunately the restraining influence cannot be brought to bear

unfortunately the restraining influence cannot be brought to bear until the tone has been raised. It would appear, therefore, that the prospect is a somewhat hopeless one. It is as if a doctor were to say, "Here is the only medicine that can do you any good, but you must defer taking it until you get better."

It is possible to conjecture how this jumble of nonsense came to be composed. The Times had a few days before found it necessary to speak severely of the Derby Day and the general condition of the Turf, and it wished to make amends by a civil word for racing in the abstract. It had also, in the course of duty, had to deal hardly with the political aspinations of women, and here was a chance of complimenting the offended sex on its mirral influence. Accordingly the women are told that they alone can reform the Turf, and then it turns out that they cannot begin their work in this direction until the Turf has reformed itself. The writer incidentally refers to a circumstance which operates in favour of the comparative decency and decorum of the Oaks. It is that the fillies that run have the capriose of their sex, and, as there is no possibility of counting on them, their competition gives rise to very little serious betting. If it had been suggested that the best way to reform the Turf would be to exclude colts and confine the races to fillies, there might perhaps have been some point in the article. It is obvious to every one who considers the subject that betting is the canker at the heart of the Turf, and that as it spreads the whole system will become one foul and losthsome sore. A nece is in itself a pretty enough sight, and, in so far as it is supposed to contribute to the improvement of the treed of horses, it has accommendable object. But the betting somes in to corrupt and ruin everything; to introduce dis-

of all concerned. Of the vast multitude of betting-men of all classes, only a very small proportion ever see a race or know anything of the horses except the names, and few of those who attend moses go for the sake of seeing the animals. There is a keen and subtle poison in betting which tends to weaken honesty and self-respect, to develop sordid passions, and to produce generally a state of excitement which is necessarily injurious to moral sanity. There is nothing in the race itself to provoke disorder; it is the foverish excitement of the betting, the anxiety as to the result, the exultation or disappointment with which it is received, which unsettle the mind and relax the restraints of sense and decency. It may be true that it is only a comparatively small part of the throng at a racescourse which is affected in this way; yet it is enough to give character and colour to the whole. The Oaks is one of several races at which, for various reasons, there is comparatively little betting, and which are consequently quietly and decently conducted. But wherever the betting runs high, not only the people present at the races, but all those who have put themselves in the way of being affected by the result, are subjected to influences which cannot fail to do harm. That races should be conducted in a more decrous manner merely in order that women may attend them is a very small matter. Even if all races were run as quietly as those on the Oaks day at Epsom, a great and terrible evil would still exist in the fact that these contests furnish occasions for reckless gambling to a vast multitude of people scattered all over the country. It is impossible to view without alarm the continuous and rapid spread of this miserable mania through all classes of the community down even to the lowest, especially when we trace its connexion with the melancholy increase of various forms of crime. It is not merely the Turf that is infected by it. Almost every sport is gradually being brought under the same noxious and debasing influence—

se missinatic atmosphere.

It is obvious that the sports of a nation must necessarily have an important effect on its general character, both physically and morally; and from this point of view the popular amusements of the English at the present day are certainly by no means calculated to excite comfortable reflections. The exercises of the Gracks were intended to impart strength, suppleness, and gracefulness to the human figure; they helped the mind by giving it a healthy body, and masculine virtues were also stimulated by a generous smulation. In our own country at this moment the idea of sport appears to be becoming more and more exclusively concentrated in the cambling which assumed the secondary of the complete strength of the cambling which assumed the secondary that the secondary the secondary that the secondary the secondary that the sec of sport appears to be becoming more and more exclusively con-centrated on the gambling which accompanies the exercises. Most of the people who are interested in racing knew little and care little about the horses, except as supplying a subject for their bets, and the same may be said with regard to bont-races, vacht-ing, cricket, and other sports. The Italians have a game which they call fly-loo, and which combines the maximum of uncertainty with the minimum of personal effort. Two pieces of sugar are placed on a table, or on the ground, and the question is on which piece of sugar a fly will first alight. The players are about as much interested in the propagation of flies as the ordinary English racing-men in the breed of horses, and their part in the game is equally passive. The tendency of English sport would seem to be to degenerate into mere gambling on the result of a contest to degenerate into mere gambling on the result of a contest to degenerate into more gambling on the result of a contest between trained professionals. There is only a limited number of persons who take an active part in the playing of the game; the rest merely look on; indeed most of them hardly take the trouble seen to look, and are content to bet on hearsay. It is evident that sport conducted in this manner does nothing for the physical improvement of the people, and its effect on the mind would seem to be chiefly to produce a certain sharpness akin to requery, and to cultivate sordid and unscrupulous capidity. Apart from the question as to the fix—and by a little effort of imagination, a substitute could easily be found for the vermin—hunting is an excellent sport, because it involves not only valuable physical trainexcellent sport, because it involves not only valuable physical training, but also the discipline of mental and moral qualities, such as quickness of apprehension, courage, decision of character, and so ing, but also the discipline of mental and moral qualities, such as quickness of approhension, courage, decision of character, and so on. Hunting is, in fact, only racing performed by gentlemen, not as a public show or as a means of gambling, but for their own private amusement. 'A steeplechuse affords just as much fun as hunting, and brings out similar qualities; but it is scarcely surprising, in the present state of the Turf, that gentlemen-jockeys should be going out of fushion. A peculiar significance has been discovered in the opening, under the patronage of the Prince of Wales, of a new pole club at Hurtingham, which has hitherto been devoted to pigeon-shooting. It is supposed that the object in view is that the shooting should be supplanted by the more manly sport. A pigeon match, we are tuld, and indeed the circumstance is tolerably notorious, is apt, even "under the more exclusive circumstances," to become a mere field-day for the bookmakem; and, it may be added, with the usual result as regards the honesty of the players. The game of pole has been welcomed on the ground that it is beyond the reach of such containstion; but there is no reason to suppose that this will be the case as long as it is made a subject for beavy betting. Ethis public has at least the advantage of being capital exercise for the accordance in the large will seem almplifies the tunk, and the physical effect in the large will seem almplifies the tunk, and the physical effect in

volved is little more than nominal. It is not difficult to enumerate the indispensable conditions of healthy sport. It should be an exercise not confined to a few professionals, but open to use many people as possible; it should tend to disvelop nearethe strength, elasticity, and graceful action, and at the same time time it cultivate courage, resolution, and the capacity of pranagily choosing the policy to be followed assid the resh of events; and it should be dissociated from betting. Rucing, heating, poin, shooting, rowing, and cricket are all good in their way, as long us they are pursued from a genuine love of pure sport, and not as a more prefext for pecunisry opeculation of the lowest kind. Howethis growing disease is to be met in a difficult quanties, but it is at least clear that coercive measures are out of the question, that the remandy is to be found in education and persuasion, and that opening in influential quarters would do much to premote a mean wholesome state of things.

THE ARMY AS IT WAS

THE boys of whom the British army is chiefly composed will doubtless grow into men, but by that time they will have been replaced by another set of boys. We can hardly venture to believe that the infantry of which Lord Sandhurst lately spoke would deserve Marshal Bugasud's praise, although "il n'y en a passe beaucoup" might still be truly said of them. Our army is still small in numbers, but we must doubt whether, under the existing system, or any system which does not cost more money, it can be good in quality. An experienced soldier, Colonel Stuart, who has lately published his Reminiscenses (Murst and Blackett), asks whether any one will pretend that in physical appearance the soldiers of to-day are equal to what they were thirty years ago, or even just before the Crimean war. "The truth is the men are not to be got. I saw not long ago four regiments in brigade, and certainly they were very different from those of the olden time. One Highland regiment that I had once snown as a most magnificent corps appeared all kilts and bonnet-cases." The writer was invited by a friend, lately inspecting field-officer at Liverpool, to come to his office and see the sort of recruits that are now taken. He saw forty, and such specimens of the human race! He thought that his friend and himself, although past the age of pugilism, could have licked them all, one down to there come on. At this rate we shall soon have Mr. Gathorne Hardy reduced to defending the proceedings of his office in Falstaff's words:—

Will you tell me how to choose a man? Care I for the limb, the thewes, the stature, bulk, and big assemblance of a man? Give me the spirit. Here's Wart;—you see what a ragged appearance it is; 'a shall charge you, and discharge you, with the motion of a pewterer's humaer; come off and on switter than he that gibbets-on the brewer's bucket. And this same half-need fellow, Shadow,—give me this man; he presents no murk to the enemy; the forman may with as great aim level at the edge of a penkrife. And, for a retreat,—how swiftly will this Feeble, the woman's tailor, run off! O give me the spare me, and spare me the great ones.

Colonel Stnart's language implies that the recruits he saw at Liverpool were not even strong, healthy boys, and it will be well for Mr. Gathorne Hardy, if he can, to learn to echo Falstaff's wish for "a little lenu, old, chapt, bald shot." Formerly the country was cheated by recruiting officers, but now we cheat curselves. None are so blind as those who will not see, and we shall doubtless disguise from ourselves as long as we can the ampleasant fact that men can only be got by paying for them. It is almost impossible, says Colonel Stuart, to obtain recruits from what was once the great nursery of our infantry, Ireland. Day by day the bone and sinew of the land is leaving it, and instead of filling our ranks as of old with the brave enduring Irish soldier, we shall perhaps some day find these very men arrayed in hostility against us. "If we want a good article, we must pay for it; and England will have to come down, and that in no small amount, before long, if she wants to have an efficient army."

Colonel Stuart was born under the colours of the 86th Royal County Down regiment, of which his father was some time Colonel. He served in that same regiment more than thirty-live years, and lately retired from the command of it. He may therefore claim to speak with some authority of what the army was and is. As he became a noted man for activity and strength, he can afford to report the comments made by the townsfolk of Newry on his boyish appearance when he first joined his father's regiment. They called him the King's hard bargain, and said "It's badly off we are for soldiers." A strapping Irishwoman ravished a kies from the "ama' darling." The boys that are now seen in the ranks are small enough, but perhaps not many women besides their mothers would call them darlings. Colonel Strart mentions several times the stature and strength of the men of his curps. The first victim of flooging after he joined the regiment was a fine-looking had of eighteen or nineteen years of age. His height was six feet three inches vary alight, yet muscular. He had been absent all night from barracks, and for this offence he received a parishment of three hundred lakes. He was a long time in hospital; came out, and deserted; was captured and sentenced to another flogging of the same amount, which he took without a sound under the influence, as was supposed, of a strong ascentic. Again he went for a long time to hospital, and as soon as he came met for the men made of the men was made, of the mental of the lates of the mental and got to America. This is

lind and discrett families to grow into salendid soldiers. But this unfortunity retrait hardly did a day's duty, and templated his allegiance to America with no very kindly resollection, it may be supposed, of England. The officers of the 86th, who administered this investional and bratal system, were for the most part. Scotchman, and they appear to have fully believed in the constant throughout his career to mitigate it. Yet even he keys down as an unquestionable rule that soldiers must be flogged by theft and making away with necessaries, and he tells us of an officer of high character who rose from the ranks, and used oponly to say of himself that he was never worth a d—n till he got three hundred lashes. Colonel Stuart's memory only goes back to a partied of mitigated severity, in which the punishments, although in modern eyes structions, appear lenient compared with those of Wellington's campaigns. Every company of his regiment had a subscription club which paid three or four pounds to a man who took his two or three hundred lashes without "giving tongue." took his two or three hundred lashes without "giving tengue."
If he gave tongue he would perhaps get a second thrashing from
his comrades when he came out of hospital. It is said that in a company of an Irish militia regiment every man but one had been flogged, and he was so stung by the reproaches of his company or he'd never have any pace in the company." A serious objection to this punishment is its inequality. Colonel Stuart mentions that the worst flowring he are were were required by a man who had the worst flogging he ever saw was received by a man who had the worst flogging he ever saw was received by a man who ambidied the drummers, and on the other hand it was difficult to prevent mitigation if the operators were so disposed. It is said that a Governor of Norfolk Island was obliged to do his own flogwing in order to produce any adequate effect upon the convicts. If ging in order to produce any adequate effect upon the convicts. If the punishment had continued in full force to this ingenious ago, the punishment had continued in full force to this ingenious age, we might expect that a flogging-machine would have been contrived for administering stripes of exactly equal force to the human back. In the worst flays there was always this practical limit to severity—that no soldier had more than one back. Even if adjoining territory was annexed to the dominion of the lash, it still often came to this, that there was nothing left to flog, unless the sugrestion were adopted of a soldier who said to his colonel on being taken down, "Now ye —, there's the soles of my feet for you left." There was in the 86th regiment a soldier who had been at Waterloo in the artillory, and who counted thirty-six hundred lashes during his term of service. "He took his punishment, even up to his old age, with the utmost indifference, not even putting his shirt in his mouth." We have now changed our plan entirely, and are willing to do everything for the soldier except pay him properly. Colonel Stuart, after describing a severe affray between his own and another regiment, says that the men of the 86th were noted for their immense size and strength, and after the lapse of many years they had not much degenerated. When landing in Bombay years afterwards, they were called the "Irish Giants." If we had such men now we should at least know better than to turn them into mere whipping-blocks. But when we consider what an Irish content are at a transfer in a general of the more of the sold at least know better than a Irish content and the sold and the second of the sold and the second of the sold and an another and the sold and a least the second of the second of the sold and a least the second of the sold and a least the second of the sold and a least the second of mere whipping-blocks. But when we consider what an Irish giant can earn as a "navvy," it is only wonderful that any of them should be soldiers. We can of course get young and silly boys, with heads full of romance and stuff, but we do not keep them when they become men. Another regiment distinguished for stature was the 25th Borderers. The colonel, born an Englishman, was so much a Scotchman that, if possible, he would not have an Englishman or Irishman in the corps. "They wore certainly in point of appearance the largest men, not even excepting the 87th and my own regiment, that I had ever met. So handsome a set of lads as their Light Company no other corps could produce." While the mon were flogged the officers drank and fought duels. The major of the 86th regiment was tried by court-martial for being drenk on duty and acquitted. It was thought that the authorities had chosen the only day out of three hundred

and sixty-five that he happened to be select.

A soldier of a Highland regiment was sentenced to receive two hundred lashes for telling the officer inspecting his company that he, the officer, "had noe mair brains than a kail runt." The colonel, however, remitted the punishment, probably because he agreed in opinion with the soldier. We have read, in another book, that some soldiers of a Highland regiment, raised about a century ago, were flogged for objecting to est matton. The real objection, we need hardly say, was not so much to eating mutton as to being charged for it. Many disputes arose as to the terms on which new regiments had been missed. Sir Allan Cameron, who raised the 79th regiment, was told by the Dake of York that he would dust them. Bir Allan answered that that was more than the King date do. The Duke replied, "then he would send them to the West Indias"; to which Sir Allan again retorted, "You may send them to Hall, if you like, and I'll go with them." The hereux of flogging was interspensed with Indicases occurrences. At Besindom all the companies of a camp had been empited into a shallow pond; a soldier on his way to the place of panishment jumped into the middle of this sligh, and the culouel, finding that no one in the regiment dared to follow the sulprit, promised to let him off his flogging if he would come out of the pond. Sint before the 18th regiment embashed for India these beothers liked in it. The clear, who was about transpeture, atond 6 ft. I in.; the next inother, a wary hastisoms lad, 6 ft. 3 in.; and the opening the power of its the power of t

A, a straight

adventurous steps another way. The 19th negiment, which defected Jollahand, being ordered kome, four buildred men actual tested for other regiments. They were nearly all links. Two of them being temporarily under Colonel Stanst's command were brought before him for lighting in the tests. As used add he was as good a man as the other, Colonel Stanst ordered the Provents engreent to take them to the outskirts of the camp and let them have it out. This decision was greatly approved. The loss of this regiment from cholers at Kurrachee was eccount only to that of the unfortunate 78th Highlanders. When the 26th regiment was ordered to Kurrachee in 1844, "the corps composed almost entirely of Irishmen, in height and appearance might have computed with their gallant countrymen of the 87th, their average height exceeding 5 ft. 9 in." After being sent to Moultan and brought back to Kurrachee, the cholese broke out in June 1846, and within ton days the regiment buried 385 men, women, and children. The finest and most powerful mess were awept away. 77 grenadiers and light company men, the pick of the corps, were among the victims; and out of 37 grandiers who perished, only two were rear-rank men. In the battalion companies the finest men were also the victims. Contrary to established belief, the drunkards did not suffer in an equal proposition to their better conducted comrades. The 78th Highlanders, "a magnificent corps," lost in a short time upwards of 500 men, and were a regiment only in name. During this fearful mortality only 4 officers of the whole Kurrachee force died, and no one of them belonged to the 86th. The reason is tolerably obvious. The officers were better supplied with food and drink. In providing for the soldiers' meals both in India and at home there has been during the last thirty years a great improvement, and indeed the full-grown alle-budied soldier is getting to be so scarce and valuable that every care ought to be taken to preserve his health. Ireland yields, we forn, only a limited supply of giau

WHITSUNTIDE IN VIENNA.

OF all the great cities in Europe, Vienns is perhaps the best worth seeing at Whitauntide. Elsewhere the citizens have their Whitauntide amusements very much to themselves, and the better-to-do of them find their way out of town to enjoy the charms of early summer in the country. Paris merely makes an ordinary fete of the season and nothing more. If there is a good deal of buying of presents going forward in the town, if the theatres are full and the cales do a fair business, yet a great many of the people are away making heliday in the adjacent woods of Boulogue or Vinconnes; or they are clustered round the tables in the andless gardens and restaurants on the sunny cotessus that slope down to the Seme. Frankfort is gone out to the baths on the Tamus; the Perliners have crowded the excursion trains to Spandau; the people of Dresden have taken steamer on the Elbe-for the Saxon Switzerland, and accommodation is to be had neither for love nor money in the little 1 on in the charming valleys. Vionna, on the other hand, fills instead of emptying, notwithstending the extreme heauty of its more remote environs. The neighbouring country invades the town, and the Austrian Corresponde of the Times explains the reason in a letter published a few days back. Religious belief is still slive among the Austrians, and the dwellers in the districts that surround the capital are among the most devout of hereditary Catholics. It is they who swell those long trains of pilgrims that traverse in the season the streets of Vienna, with crucifixes and banners and triumphant songs of devotion. They still believe devoutly in their village priests, and, having a firm faith in the efficacy of absolution, they are punctiliously regular in their attendance at the confessional. They hang pictures of the Madonna over their walls, and pin small cros to their bed-heads, and train up their children carefully in the way in which their own fathers have walked before them. Whitsan-Day and Whitsun-Monday are the days that have been con-secrated from time immemorial to the great coromony of confirma-tion. Naturally on that solemn occasion the pious possents follow the genial teaching of their Church and combine immeent pleasure with their religious rates. They take the children, in the first place, to the church, where the business of confirmation is disposed of with all due decorum, although there is a contain appearance of lifeless formality about it. Then, when congregations are dismissed towards the mid-day disner-hour, they gregations are dismissed towards the mid-day disner-hour, they are left free to make a day of it, and they certainly have the happy knack of enjoying themselves. The citizens join in the fun; for them the arrival of those energy crowds in their pisturesque local costumes has all the frashness of a never-cessing attention, and besides there is profit in the proceedings of this annual fair, where there is so much buying, eating, and drinking. So Vienna at Whiteuntide is a great eight to see, and it is as well worth your while to time your visit to see it as to arrange to be at Rome in the Holy Week, or at Ober Ammergae during the time of the Passion Play.

Color almost averations describes more the resetter, and this

mammergan curing the time of the Passion Play, only almost everything depends upon the weather, and this year, as lest, the Amstrians have been unfortunate in that respect less advantage than Vienna according as the elements are favourable or the reverse. When the sur is faight and the sir belong, there is a general sense of exhibitation, are favourable assembled from the dawback

of the dust, and are proof against the olours from the open gutters. The peasants who have come up to stare shout them find well enjoyment in the nevelty of the crowded thoroughfares, where they are jostled about to their hearts content. The streets of the old town are still lined by the gayest shops, and on that special occasion they are made more impasseble than usual by long lines of temporary booths. If the crowding is overdone, and the country people want breathing space, they have only to go and gape on the magnificent boulevards, where each block of buildings seems almost a palace even to those who are familiar with the splendours of Paris; while of course they wind up the afternoon in the Wurst Alliee in the Prater, and all Vienna gathers in it to meet them. On a wet day, on the other hand, all is as dismal as may be. The kennels are running with mud on each side of the narrow streets; there is mud everywhere on the stones to the depth of inches; pavements, if any, are narrowed down to mere pretences; every one drives who can afford it; it is a perpetual effort to save yourself from being crushed under the wheels of the carriages, and it is out of the question escaping the muddy showers that bespecter everything up to the first-floor windows. There is a continual drip of dirty water from the broad overhanging caves; every one of the peasants unfurls his great blue or red umbrells in a frugal attempt to save his Sunday clothes; and it may be imagined what are the pleasures of locomotion in that struggling, awkward, and frightened mob. The little spaces for all freeco refreshments at the corners of the streets, screened off usually by fir-trees set in painted boxes, are of course made altogether untenable by the downpour. Those who desire to recruit exhausted nature must crawl into the low, confined beer-houses which are sufficiently stifling at the best of times. Out upon the boulevards there are no places of entertainment within the compass of poor people's means; while in the great fair that is being h

Their conduct under trials like those of the present season is the more praiseworthy because they so thoroughly enjoy fine weather when they have it. On a fine Whitsun-Day the city resounds with merriment from earliest dawn. It resounds, too, with the cease-less roll and rattle of the wheels of broken-springed omnibuses and springless waggons. All the year round no city can show such singular specimens of antiquated public vehicles as Vienna. Many of the omnibuses plying to suburban villages are painted in the rough, and tied up with string to save them from tumbling to pieces; they are dragged along by pairs of bony carthorses attached rudely by traces of rope. Now these conveyances are crammed outside and in, and there would soon be a dead lock at the barriers if the officers of the octros were as severe as usual in their search for comestibles. But the omnibuses carry only a small contingent of the invading hordes. Most of the peasants travel in their private waggons; the one grast sleek horse, treated as a respected member of the family, trots along loosely secured to one side of the swaying pole, jingling the chimes of bells on his head-stall, and waving off the flies with the green boughs with which his collar is adorned. All these einspanners drive straight to the destinations where their masters have been in the way of putting up from time immemorial—to the Stephansplats, the Judenplats, the various market-places for fish, flesh, and fowl. The people unpack themselves, and those who have religious business on hand march their blue-jacketed or white-garbed offspring straight away to the cathedral. Most of them begin their round of amusements by kneeling before the altars in prayer, and then they can give themselves up to their innocent pleasures with a clear conscience. As we have said, the great rendezvous on the occasion is under the trees in the "Sausage Alley in the Prater. The Prater has been a good deal cut up of late years, and the clearings in preparation for the Great Exhibition have left treese

mireshing and enlivening in the slanting sunleams, for there is naturally a great deal of eating and drinking and smoking going forward. The Austrians have vest capacities of showption, and drinking promotes appetite, and the digestion of heavy viands memorially fatiguing to all classes, and even peasant nature must succumb at length to the excitement of battles, of Reichaholish and sieges of Metz, with their discharges of veritable ordinance and their charges of actual cavalry—to the feats of the circus and performing Polar bears, and the smallest men and the stought ladies in the world. Admiration helps hunger, and as the popular name of Wurst Allée implies, eating is a prominent feature in the entertainment. But it is impossible to avoid remarking and admiring the extreme propriety with which everything is conducted, even in the chapest and commonest restaurants. The narrow benches and the small tables, set out as thickly as possible in the open air, are crowded to what appears extreme discomfort. In the most fashionable dining places in the city it is difficult enough to catch the ear or eye of a waiter, and here in the Prater it is well nigh impossible. Hungry families have to wait on indefinitely in faith, and, yet, if they are impatient, they scarcely show it. Certainly they drink a great deal of beer, but seemingly they are all the better and brighter for it. They listen to excellent music; for if the instruments are often cracked that invite you to the showman's booth outside, the performances at these open-air restaurants are always above par. And as one alooks on at those Whitsuntide excursionists enjoying themselves so heartily, it is impossible not to wish that some of our friends at home might borrow a leaf from the book of the Viennese.

ROBBING THE POOR.

THERE is no hope of a satisfactory adjustment of the difficult and important question with regard to the relations which ought to be established between the Friendly Societies and the Government, unless the extremely unpleasant and disgraceful circumstances of the case and in a property of the case and the constant and disgraceful circumstances of the case and in a property of the case and in t cumstances of the case as it now stands are fairly and boldly cumstances of the case as it now stands are fairly and boldly faced. The question at issue is really nothing less than whether the provident savings of the poor should be allowed to run to waste, either plundered by regues or muddled away by fools. It is a question of money affecting all classes of the community, but it is also a question of much more than money. It appears that at the present moment the poorer classes of this country actually subscribe almost enough, if it were properly invested and administered to make moor relief unnecessary or at least and administered, to make poor relief unnecessary, or at least to reduce it to a comparatively small fraction of its present amount. Unfortunately, however, the greater part of the fund is amount. Unfortunately, however, the greater part of the fund is absorbed by requery and mismansgement; and the consequence is that a large proportion of the subscribers to Friendly Societies make a sacrifice for nothing, and that the country has to pay over again for their relief in times of sickness and distress. It might possibly be cheaper for the country to suppress all Friendly Societies at once, and to give the members a right to assistance from public funds. In that case the poor would at least be the richer in that they would not be robbed of their subscriptions. On the other hand, however, there can be no doubt that it would be much better, both for the lower classes and for the country at large, that the there can be no doubt that it would be much better, both for the lower classes and for the country at large, that the former should be encouraged to practise habits of thrift and foresight, and to preserve the self-respect which is secured by a provident independence. About four millions of persons are members of Friendly Societies, and many more are interested in them as wives or children of members; and between eleven and twelve millions of money is at stake in these institutions. It is impossible, therefore to every report the melantholy gravity of the feet that therefore, to exaggerate the melancholy gravity of the fact that a great many of these Societies are in a state of quite hopeless insolvency—in other words, that the savings of about a third of insolvency—in other words, that the savings of about a third of the population of the country might almost as well be thrown into the sea. Perhaps, however, the worst feature of this deplorable state of things is that these rotten and delusive, if not fraudulent, Societies have been established under the guarantee of a Government certificate, which, though it only certifies legality, is not unnaturally supposed to certify financial soundness as well. Under the existing system all that the Registrar can do is to see that the rules of any Society which applies for registration well. Under the existing system all that the Registrar can do is to see that the rules of any Society which applies for registration are not contrary to law, but the law does not comern itself with its solvency. Consequently a Society which from the very outset of its existence is necessarily a delusion and, a snare, its scale of payments being utterly inadequate to provide the benefits which it promises, may obtain a certificate, stamped with the royal arms, which is popularly accepted as an authoritative assurance that it is entitled to confidence. It is true that the Registrar testifies only that it is an institution in accordance with the law, but the poor in their ignorance have hitherto failed to comprehend that an institution can be legally set up, under a Government certificate, for the express purpose of plundering them of their hard-earned wages.

earned wages.

That this is the actual condition of the majority of surviving Friendly Societies is asserted by the Royal Commission which has recently inquired into their affairs, and is substantially each mitted by the Changaller of the Exphaguer as the heats of his proposed Bill. Sir Stafford Northcote, however, asserted to anxious in his success to try to qualify the diagrams and delayer of the abstantian. He superiord that when it was said that more of

these Societies were insolvent, it was desirable that the meaning of the word should be slearly understood. We think so too, but fir Stafford by his suphemisms scarcely helped to this understanding. He gave the following example:—If a Society having a thousand members adopted certain tables, invited certain payments, and promised certain benefits, it was clear that, if the payments were insufficient, and if no new members came in, it would ultimately fail to fulfil its engagements. If, however, any considerable number of young members were brought in, the fact might be for a time concealed, because the money of the young men would go to pay the allowances to those older men who were coming on the Society's funds. And thus the Society might suspend its insolvency for an indefinite time. Sir Stafford admits that such a Society could not be said to be in "a healthy condition," but this is altogether too mild an expression. It is evident that such a Society as he described would be insolvent from the beginning, and that its only chance of staving off a collapse would be by deluding young members into joining. In this way the older members would push off insolvency from themselves upon the backs of their younger victims, but the Society would be insolvent all the same; only swindling would be added to insolvency. The question for Parliament is whether Societies of this kind should be allowed to go on ensnaring fresh sets of subscribers whose only chance of getting relief is to persuade others to join. Every year, of course, the funds of the Society must become more exhausted, and the only question is on which set of members the blow will fall. There is another point upon which Sir Stafford Northcote made a remark which seems to provoke criticism. "Excellent," he said, "as the Friendly Societies were in themselves, they were doubly and trebly excellent in that they were the result of voluntary action, and even if one could imagine a better system of management than in many cases they adopted, it would be preferable t

The Bill of the Chancellor of the Exchequer is certainly a disappointing one, and it would be a misfortune if it were to be hastily passed. It may possibly prove in the end that it is the best measure which can be obtained, and it would at least introduce considerable which can be obtained, and it would at least introduce considerable improvements on the present system. Still it would be a pity that a Bill which would perpetuate so much mischief should be passed merely for the sake of seeming to do something at once. The Commissioners have held a long and minute inquiry, they have accumulated a large body of evidence, and they are themselves divided as to their recommendations. Under such circumstances, it is surely worth while to wait for the results of full public discussion. The choice lies between introducing some small amount of reform on the instant at the cost of giving permanence to some of the worst evils of the existing system, and of submitting to a little delay in the hope that means may be discovered of carrying a larger and more thorough reform. What is proposed is that the Registrar should continue to certify What is proposed is that the Registrar should continue to certify only, as at present, that there is nothing illegal in the constitution of the Societies which he registers, at the ame time publishing sound tables of premiums and benefits which it should be optional for the Societies to adopt or disregard. His certificate is to be limited strictly to the legality of the rules, and is not to contain any warning as to whether the constitution of the Society is or is not in accordance with sound actuarial principles. It is left to the Society itself to decide whether it will conform to proper principles of finance, and to the public to accertain by its own study of the Government tables, and by comparing them with those of any particular Society, whether the latter can be trusted to yield the promised results. It is obvious that this will leave things in pretty much the same state as at present. If an honest, well-meaning Society desires to put itself on a stable footing, it can now easily obtain the guidance of a competent adviser. On the other hand, nothing but utter bewilderment can be expected to result from an artisan or labourer sitting down to study a complex and cabalistic-looking body of assurance tables. It is true that the Societies are to be compelled to keep accounts in a certain form and that a prevent account of the funds is to be as true that the Societies are to be compelled to keep accounts in a certain form, and that a proper separation of the funds is to be enforced. The payments, for example, made on behalf of life assurance or annuities are not to be allowed to be diverted towards the expenses of management, which is, it seems, rather a common practice at present. These are improvements as far as they go, yet they will do little to elucidate actuarial calculations for a brickleyer or agricultural labourer; and it would surely not be too much to expect that the Registrat about company the for a processor or agricultural into over; and it would surely not be too much to expect that the Registrar should compare the tables of the Societies with his own tables, and give a distinct warning when the latter are set at defiance. It has been suggested that, as sound tables are only one element of financial stability, it would be misleading to guarantee the latter without also guarantee housest and compatent administration. But the guarantee housest and compatent administration. t would be misleating to grazanthe the latter without also guaranteeing housest and competent administration. But the question is ally whether the Government should do as much as it can do or a listle. It would containly seem that, if the Government takes past itself the responsibility of deciding under what circumstances a friendly Society can easely be carried on, at ought not to shrink rom the natural and logical supplementary duty of saying whether mot its financial rules have been compiled with. Without this

help, its tables will be little less than a mockery for the class for whose benefit they are supposed to be provided. There are very few, even among educated men, who are capable of applying this sort of information for themselves. The most serious question, however, is whether it should be lawful for Bouleiss which are only a snare and a mockery, and which from the nature of their constitution cannot possibly be anything also, to be set up at all, or to continue to exist, under a Government continuate. There are various formidable objections to Government interference with private enterprise; yet it would hardly be tolerated that, say, a bridge or a railway, knewn to he from its peculiar construction necessarily unsafe and liable to break down at any moment, should be certified as proper and lawful by a Government official; and this is really the state of the case with regard to the Friendly Societies. It is not a matter of controversial opinion whether many of them are unsound; they are known to be unsound, and it is only a question whether they will give way to-day or to-morrow, and whether one set of subscibbers or another will come to grief. It is simply and absolutely impossible that they can continue to keep faith with their subscribers. Why then should they be permitted to delude frosh victims by false promises? Sir S. Northcote said very justly that the sooner a Society found out its mistake and had the courage to apply the remedy, the sooner would that Society be placed upon a sound footing. In that case it would surely be equally in the interest of the Society and of the public to compel it to apply the remedy if its courage should be deficient. There can be no doubt that this would be a very serious step, and that the Government in undertaking it should be sure that it had the support of a strong public opinion. But that is the more reason for not throwing away a good opportunity in idle and impationt haste.

THE ROYAL ACADEMY.

VI.

FOREIGN painters this year are few and far botween; indeed, for some time past their contributions, both in size and in number, have become small by degrees and beautifully less. This is partly owing to the not unnatural jealousy of our native artists, it being rightly felt that an English Academy should primarily be reserved for English talent; partly also it is due to the growing disinclination of French and other painters holding high rank at home to trust themselves to the tender mercies of our Academy. Even the personal overtures made to a select number of Continental artists no longer obtain favourable response; thus this season the six "Honorary Foreign Academicians" are all absentees. There can be no doubt that, what with the wholesale demands of the Kensington International Exhibition, and three or four commercial (falleries besides, foreign artists have latterly been pretty well pastered; but when the International bazaar is finally closed at the end of the present season, let us hope that London will be once more reinstated in the good opinion of the art capitals of Europe. From the causes we have mentioned the pictures to be noticed from abroad are neither numerous nor important. M. Edouard Frère has been for some time in decline, and the greatest painter of Norway, M. Tidemand, is not at his best in "A Norwayian Wedding" (641). The common naturalism and the heavy opacity of Northern schools are here more pronounced than ever. The nation best represented is the Neitherlands; of what a country composed of sandbanks, shallow seas, dikes, and windmills is capable we have good indication before us in the contributions of M. Alma Tadema (now naturalized in London), of M. Mesdag, M. Bource, M. Israels, and M. Heyermans. "The Doctor's Visit; a Dutch Interior" (658), by this artist, has been filly hang as a companion to the "Anxious Family" (665), by M. Israels. It is evident that the two artists have much, if not everything, is common; in choice of subject both alike love to dwell among simple cottagers an

With the exception of M. Exner, a Dane, none of these contemporary painters are wholly strangers to our Academy.

Pictures of low life, which perhaps not inappropriately had their origin in the Low Countries, are now widely diffused throughout Europe, and if a census were taken of all the artists in the world, it would be found that the majority are on the side of genre painting. In England certainly the number of artists who can paint-domestic scenes tolerably wall seems to defy calculation; and yet, judging from the Academy, there are comparatively few who are satisfied to a first number dower, in fact, here than in Germany or France. Mr. Webster, E.A., is still one of the best; he continues, as in "The Prompter" (315), to revel to his heart's content in mischief-making hoys, and one distinguishing characteristic of our English school, as here shd elsewhere exemplified, is its well-heart elsentiness. While in Scandinavia, Russia, and Naples the new of sony is a luxury almost unknown either in nature or in art,

ere in England, on the contrary, the characters who enter into pictures are both in their persons and their clothes well washed. Mr. Nicol, A.R.A., was in former days one of the few artists among as who recognized the value of dirt; but even he now conforms to social and sanitary requirements, as may be seen in the decorous figures of decently-dressed old men in "A Dander after the Rain" (256), and "When there's nothing else to do" (351). Here great is the change as to cleanliness, for in former days no model, we suppose, entered this painter's studio who had washed within a month. For the most part the tendency of our native art has been to rise from the lower strata of society into the middle and the higher classes: but in fact all three classes are properly present in the Acas are both in their persons and their clothes well wa from the lower strata of society into the middle and the higher classes; but in fact all three classes are properly present in the Academy. The total number of these subjects is so great that we cannot do more than enumerate the chief. "The Rightful Heir" (675), by Mr. G. Smith, is true to the traditions of the Wilkie school. Mr. G. B. O'Neill has several pretty and popular little pieces, such as "A Little Better" (34); the artist exemplifies our remark that the English is a cleanly and well-scaped school. Also could be taken managing and "The Right's Nest" (1286). remark that the English is a cleanly and well-scaped school. Also capital in their respective ways are "The Bird's Nest" (1386), by Mr. J. Clark; "The Address to the Young (688), by Mr. J. Morgan; "May it please your Majesty" (1022), by Mr. C. Green; "Friends of Flowers" (716), by Mr. Martans; "The Dinner-Hour, Wigan" (676), by Mr. Eyre Crowe; "An Easter Holyday" (727), by Mr. Aumonier; and "Four-in-Hand," by Mr. Eagles. Mr. Barnard's "Crowd before the Guards' Band, St. James's Park" (684) attracts to itself a crowd. There are usually one or two pictures in every Academy Exhibition that get around one or two pictures in every Academy Exhibition that get around one or two pictures in every Academy Exhibition that get around them curious spectators, just as a Punch and Judy performance in the public streets never falls of gaping admirers. The clever picture before us is in point of intellect on a level with street conjuring and minstrelsy. Here is a riffraff of pickpockets, nuvvies with pickaxes, and old men on wooden legs, all attracted by the Park land. In point of art the composition may pass as a parody on Mr. Pinwell and Mr. Frederick Walker; there is also a suspicion of Mr. Frith. We are sorry not to be able to close this list of genre and naturalistic work, for the most part preiseworthy, without consuring a meretricious, not to say vulgar, manner, which reaches its vary worst in "Tired" (350), by Mr. A. Johnston, and "Crossing the Heath" (376), by Mr. E. U. Eddis. Yet we are bound to acknowledge that the Academy seldom gives encouragement to this cheep and easy sort of thing.

Mr. Lewis, R.A., and Mr. Frank Dillon are again the most brilliant yet literal exponents of the land of Egypt. "Eavesdropping" (437), by the latter, is one of those interiors with lattice windows, Oriental tiles, and soft silken divans which are becoming under the inroads of Western civilization more rare year by year. The artist is particularly happy in his treatment of colour under flooding sunlight. Of such effects he has long been studies. Shu and colour may be said indeed to be the keypoten. obtain under nooting stimight. Or such effects he has long been studious. Sun and colour may be said indeed to be the keynotes of Orientalism in art, as will be seen by the next picture in the Catalogue, "Old Walls at Algiers" (438), by Mr. Ditchfield. This work is truly artistic by its breadth, its sketchiness, yet completeness. These rare qualities ally it to the French treatment of African and Asiatic subjects rather than to the English.

Animal-painting is for the moment at a discount, possibly from two opposite causes. Some people persist in the opinion that the art died with Landseer, while others, having recently had too much of a good thing, first in the Academy and then in the rooms of Mesars. Christie, would rest content not to see a horse or a dog for another twelvementh. And indeed they may be well saved the pain and trouble, for in fact there is in the Academy scarcely the pain and trouble, for in fact there is in the Academy searchy a picture of animals worth looking at. That which may be called the "School of Noah's Ark" is now in the ascendant. Take as a proof the choicest quadrupeds of Mr. Cooper, R.A. (419), and of Mr. Anadell, R.A. (186); the commonest carvings in wood are not more hard or motionless. But Mr. Cooper has, if possible, and the possible of the bit Mr. Cooper has, if possible, the more hard or motionless. But Mr. Cooper has, if possible, surpassed himself in a big bull (713). We never before realized the horror of the situation, "A Bull in a China Shep." Cannot the Academy set apart a room which might be known as the "Menagerie," Academy set apart a room which might be known as the "Monagorie," under the express understanding that Academicians should there, as elsewhere, have the pick of the best places? A few works in which the brute creation plays a conspicuous part may be briefly mentioned. Mr. Briton Itivere again follows Sir Edwin I americans of endowing animals with human intelligence, affections, and antipathies; and the consequence is that in "Apollo" (260), charming the beasts of the forest by his lyre, the God is less than a man, while the lions and the lynxes pass into hybrids which nature abhors. Mr. MacWhirter escapes these dangers by sticking afflectionately to his favourite denkey, for once, by way of change, "Out in the Cold." (648). This old acquaintance was last seen in the Academy on a stormy see-shore. Mr. H. Hardy has fairly won the line by a capital composition, "Ulysee Ploughing with Horse and Bull the Sea-shore" (710). Nature is here submitted to art treatment; the action and the play of lines may indued have been suggested by the Elgin frieze, which affineds some of the noblest motives for the painter of animals.

Marine painting has suffered decline since the wooden walls of England have given way to ironcleds. Turner and Stanfield, who preferred a sail to a paddle-hox, and a sky full of wind to a boiler language with steam, have no successors. Strange to say, the count is all that foresteen by our artists. And even when, he was of expenditure, a grand study of a atom, such as Rr. Heavy Monagon is all that foresteen by our artists. And even when he was a strange to say, the count is all that foresteen by our artists. And even when he was a strange to say, the count is all that foresteen by our artists. And even when he was a strange to say, the count is all that foresteen by our artists. And even when he was a strange of expenditure, and colour, because the provided. under the express understanding that Academicians should there, as

landscape (1408) by Mr. Hulme which has received preference could scarcely have been injured if threat to the ceiling.

could scarcely have been injured if threat to the seiling.

The usual outery is raised that landscapes have been badly served, but the answer might be given that, had they been better its quality, they would have met a happier fate. The simple fact is, that the chief cause for complaint is, just as in figure pictures, that the worst landscapes when coming from Academicians or Associates usurp the best places. In the present year the oldest frequenter of the Exhibition is taken aback by a considerable number of less than medicore landscapes prominent on the line, and apparently by some unknown artist or artists. On referring the Catalogue the alarming fact is declared that Mr. O'Neil, A.R.A., whose figure abortions we have for and Mr. Thorburn, A.R.A., whose tigure abortions we have for years striven to rescue from oblivion, have suddenly betaken themselves to the study of stocks and stones.

The only artist who in our day has passed unscathed through that trying ordeal, the transit from figure to landscape, is Mr. Millais, R.A. And his success in "Scotch Firs" (68), the noblest study of nature in the Exhibition, depends greatly on his treating landscape on the same principle as ligures. These trees stand firmly on the nature in the example as figures. These trees stand firmly on the ground, and lift their heads proudly into the sky; they are shadowy, and lift their heads proudly into the sky; they are shadowy, solemn, stately as armed men marching slowly across country. The companion picture "Winter Fuel" (75) is more assailant in colour and in bravurs of brush; the dash and fling are desperate and deflaut; but the work is just saved from excess by moderating passages which are sober in truth, cool in colour, and strong in realistic study of the fuel from the forest loaded on a cart to be carried away for winter fuel from the forest loaded on a cart to be carried away for winter use. The girl—a little Red Ridinghood—esated among the silvery branches of the birch-tree illumines the scene as a fire lit in a forest. Mr. Millais, from his pre-Raffaellite period when he painted "The Vale of Rest," down to the present moment, has always thrown intention into landscape. And it is such intentional interpretation which gives purpose and power to the pictures of Mr. Peter Graham. But the fury of the storm-lasted waves on "Our Northern Walls" (20) is formless; drawing and significant detail are wanting. The artist is more himself in "The Misty Mountain-ton" (404); he seldom fails of postic insight into the Mountain-top" (494); he seldom fails of poetic insight into the grandeur of the elements.

Mr. Vicat Cole, A.R.A., is indeed a highly privileged person; a goodly number of square feet in a first-rate position is year by year assigned to him, and all that is needful on his part is to repeat, what he has oft before repeated, a sylvan scene from "The Heart of Surrey" (111). The painter suffers a common fate on election to Academic honours; he is tried in the school of prosperity; but when he was a mere probationer years ago in the Dudley Gallery, we recall by the same hand landscapes closer in study, and more skilled and thorough in workmanship, than the present somewhat pretentions performance. Mr. Leader, at one time the rival of Mr. Vicat Cole for Academic distinction, has now Mr. Leader, at one to fight his way as lest he can for a place somewhere between the floor and the ceiling; yet he has never done better work than in "Dewy Morning on the Mountains" (505), and "A Fine Day in Autumn" (563). Also among studies of what may be termed diurnal Attunn (503). Also among studies of what may be termed diffrage changes in nature, "Late in the Imy" (536), by Mr. Pickering, is admirably true. To these may be added "Spring" (937), by Mr. Waite, and "Winter" (987), by Mr. Wortley. Our artists, it becomes obvious, are now giving themselves with advantage to "the aspects of Nature"—that is, they study the anatomy of mountain and finally the grant that are the specific of the left and finally. tain or of rock, the growth and colour of tree, leaf, and flower, under effects of light and of atmosphere; and thus landscape art is passing from the dry transcript of fixed facts to the more contional interpretation of transient phenomena. Also among the best landscapes of the year must be enumerated "The Pass of Cateran" (2), by Mr. Smart, "Passing Gleans" (91), by Mr. Hering, "Woodcutters" (528), by Mr. Linnell, sen., "Kent. Weald" (481), by Mr. W. Linnell, jun., "Charcoal Burners" (574), by Mr. Beavis, "Picardy" (606), by Mr. Davis, A.M.A., and "Roturning to the Fold" (1365), by Mr. O. W. Herbert.

In conclusion, we incline to manne as the landscape of the conclusion.

In conclusion, we incline to name as the landscape of the year "Summer Noon in the Scilly Isles" (130), by Mr. Brett. The foreground is strong in rock-drawing, the middle distance radiant in the dancing ripple of a blue sea under sunlight, and the sky into which the far-off distance retires is full of light and atmosphere. This scene off the granite-bound coast of Cornwall might pass for an Isola Bella in the blue Mediterraness. The artist seizes upon truth, and makes it beautiful; he reconciles realism with idealism; he is nearly as literal as when he gainted in his pra-liafficellite days the "Val d'Aosta" flut with more experience he knows better how to bring his materials under art treatment.

THE ITALIAN, OPERAS.

WE are now once more half way into the Opers season, and yet WE are now once more half way into the Opers season, and yet scarcely a single unknown work has been produced, scarcely a single unknown work has been produced, scarcely a single unfamiliar one revived. We had to make the same complaint about this time last year, and would rather not have been compelled to make it again. But there is no alternative. Our managemeet to obeget that Italian opers is no longer, as was formerly the case, a luminous hanguet propared exclusively for a privileged few. The excites part of the season especially has for very many years rathed in a great diagram on general public support. The distance of the d

shiedshie thing. The surrest means of ettracting the attention of hat large section of the community recognized as "the music-oving public "is to stimulate caricalty by the production of new works. We do not mean works composed expressly for the par-ticular theates, but works which, by reason of their unfamiliarity, may pass for new just the same. These, too, should be of an exceptional character, differing as much as possible from what belongs to the conventional repertory. The class we now refer to cares little for operas in which the prima donns of the prima to cares little for operas in These are exceptions it is true; but such comes annually forward. There are exceptions, it is true; but such exceptions may be counted upon the fingers of one hand. Don Giorgans, the Barbiere, Fidelio, and the Floure Massice are accentexceptions may be counted upon the fingers of one hand. Pon Giovanni, the Barbiera, Fidelio, and the Flaute Magice are acceptable at any time, provided there be only a decent "ensemble"; but it is not so with Luciu, the Sunnambula, Norma, Linda diChamouni, the Troustors, Transista, and the like. These depend materially upon the sogrames and tenors (soprames more particularly, since capable tenors have become rarer and more rare), whose names, during the stirring months of May, June, and July, are on the lips of every amateur pretending also to the dignity of connoisseur. To say that the "upper ten" of opera-frequenters care very much for music, even operatic music, solely on its own account, would be to say that which is palpably untrue. They are chiefly attracted by certain vocalists, in the absence of whom their visits to the opera would be few and far between. It will be urged that the everture to Leonors, usually played between the first and second epera would be few and far between. It will be urged that the everture to Leunova, usually played between the first and second acts of Fidelio, is almost always encored. True; but whence proceeds the encore?—from the gallery and gallery stalla, undoubtedly. There sit, for the most part, the arbitrar of what is intrinsically good; just as the orchestra and "shillings" imperatively lay down the law at the Monday Popular Concerts. Why not tampet these genuine anatoms with music anited to their tests. not tumpt these genuine amatours with music suited to their tests, rather than invite them, year after year, to a worn-out repertory in which they can take but small interest. Instead of bringing out untried aspirants with Lucia, the Traviata, &c., as though to show that, wanting some "bright particular star," nothing can be done with such operas in the sensational way—it would be more done with such operas in the sensational way—it would be more prudent to employ the early part of the season in the production of less hackneyed pieces, and to reserve Donizetti, Bellini, Verdi, &c., for the "stars,"—who, by the way, seem never over-willing to appear in anything clse, and assuredly not over-anxious to make acquaintance with what is outside the ordinary pale. If the operatic season were divided into two periods, the ante-stellar period and the stellar period—the period when smateurs go to the theatre for the music itself, not for the fascinations of any perticular singer, and the period when the world of fashion, inditheren as to the merits of the work to be presented, is mainly seduced by the fact that Patti has to sing such and such a part, or Nilsson by the fact that Patti has to sing such and such a part, or Nilsson such and such another—a clear gain would accrue to both sides. But, to end this digression, let us briefly recapitulate what has eccurred since the Opera-houses threw open their doors for the sesson of 1874.
To begin with Mr. Mapleson, as having been this time earliest in

the field, we may state at once that his company is as strong as it was last year, the only material loss from among his principal singers being Mle. Marimon, who has gone over to the great theatre in How Street. Mr. Mapleson, moreover, has engaged several artists hitherto unknown to England, some of whom have even chance of becoming established favourites. He has the same fine orchestra, under the same conductor, Sir Michael Costa—whose motto, after that of De Rohan, is "Costa suis." The chorus, as was the case last year, is numerous and powerful, but

decidedly capable of improvement.

The first performance at Her Majesty's Opera was Rossini's The first performance at Her Majesty's Opera was Roman's Semiramide. Against this no objection can be raised. In Mile. Tietjens the director possesses a "star" shining with undiminished lustre from the beginning to the end of the season. Mile. Tietjens, though Garman, is now the only acceptable Semiramide on the Italian boards, which says little for Italian singers, who appear to have set aside the master born to crown an edifice the first stone of which was laid by Cimarosa and Passiellian and Capatilla and Capati "lucida midera" until the Sun of Italian melody caused their light to pale. Then Madame Trebelli, though French, is the best Areace now to be had; while Signor Agnesi, also French, if not by any means another Tamburini, is about as efficient a representative of Assur as in the actual state of things could easily be named. Shortly afterwards—passing by the inevitable Trocutors, in which one Leonors looks so like another that it is somewhat difficult to distinguish them—Mile. Tietjens next appeared as "Fidelio"—a very different kind of Leonora to interpret. In this noble chacter she again stands alone, more conspicuously so, indeed, than in Semiramide, or any of her purely Italian assumptions. About her impersonation of Beethoven's cherished heroing we have spoken so often that we shall not trouble our readers with a new description. On the occasion of which we speak she enjoyed little advan-tage from the talents of her chief associates—a more incompetent Florestan than Signor Urio, or a tamer Pizzro than Signor Cataland having rarely been witnessed. Hard Found Behrens, who (like Signor Cataland) is one of Mr. Mapleson's most recent acquime, acted Rocco well, but made very little effect with the sic. The veice of this gentleman is one of the heaviest of me, and it costs him no little trouble to force it into subsee, and it come him he mute troume to love it into sub-lion. Norme, an opera which, its merits taken into con-sention, enjoys a longevity wholly inexplicable, followed To due course. Here once more we have to say "vergogna!" the Italians, seeing that a part originally created by it famous Pasta (for whom Hellini expressly whote it) can

only now, eince Grini's doath, most with an adequate in a German. Whatever may be thought of Name abstract musical point of view, it is unquestionably admittalian classic, and, for that mason alone should soft ignored by modern Italians. The other characters. Alle. Tistjens, up to the present time, have a third "Leonors"), in the Presents: Valentine, Counters Almaviva in the Name of Figure ; and As the heroise of the Figures she is seen and As the heroins of the Favorske she is seen and heard to me vantage than in most other parts belonging to her repertury this for reasons evident as first sight. Mile. Tietjens we original Margaret when Fauet was produced in an Rulian at liter Majesty's Theatre (1863); but she would hardly housed to play Margaret now; and that which diverts has M. tiouned's Margaret abould with equal force divert her Donizettis Leonors. In the other characters we have mane than an interest and appeared by in that of the means Honizetti's Leonors. In the other characters we have a may set rivalry at nought, and sepecially in that of the m Lucrosia, her delineation of which constitutes her Grist's ledged successing. That all the ledged sucremor. That all the operas in which allie. Tietjens is the conspicuous figure were repeatedly given may be taken to

Having thus briefly disposed of Mr. Mapleson's perennial "star who might fairly complain that her manager now never brings by forward in Medes, lphigenie, and in other parts which not lon won her such renown at Her Majasty's Theatre, and showe there was still in her a mine of wealth unexplored—we ma there was still in her a mine of wealth unexplored—we may turn to other matters and begin our general survey of the incidents of the season. Alle, Lodi, first of the new consers, made her agreemence in the florenmbula, achieving at the most a master status. Have many Amines have we known, creating a moment's excitences, and theu vanishing, to be seen and heard no more! Mile. Lodi is one of these; and it would be filling our columns to no purpose if we said more about her. She has talout, doubtless, but not by any means enough to estaify an audience some of whom may remember Mailbrun, and most of whom know l'atti and Albani. Immediately after the Someonbula cause Lacie di Lammermeer, with a Lucia in Alle. Vallaria whom we cannot credit even with a Lucis in Alle. Valleria whom we cannot credit even with a success d'estime, inasmuch as she is wanting in all the indispensable qualities for the successful accomplishment of so responsible a succès d'estime, inasmuch as she is wanting in all the indispossable qualities for the successful accomplishment of so responsible a task. When it is added that Mile. Lodi subsequently appeared as Glida in Réguletto, and Mile. Velleria as Lady Emishetts in Martha, with results differing in nothing from their previous easys, the bearing of some of the arguments in our presmble may be understood. The almost worn-out operas just named are generally produced later in the season, with prima donnes of recognized talent and wide popularity. Then, and then only, do they become attractive. Why not keep them for the fashionable term, and bring out the nevolties and revivals early, instead of at the fag-end of the season, when the high-class dilettanti, estimated with what they have heard, are making preparations for their with what they have heard, are making preparations for their summer trip abroad? Had Mr. George Wood, who showed such remarkable enterprise during his brief management of Flor Majesty's Opera, produced Wagner's Fliegends Hollander at the beginning of the season, it would have brought money to the treasury, in lieu of—as was actually the case, despite an admirable performance under Signor Arditi—being played to comparatively empty benches. And so might it have been with Lee dear performance under Signor Arditi—being played to comparatively empty benches. And so might it have been with Lee deax Journées, the comic meatorpiece of Cherubini, which two years ago Mr. Mapleson gave just at the wrong time, when nobody who cared about such music was there to hear it. We cannot too often dwell upon this subject, or too carnestly advise operatio managers to suit their entertainments to the tastos of those likely and able at the time to putronize them.

Mile. Lodi being indisposed, and counselled by her medical advisers to return to her native Luly, the part of Gilda, at the next performance of Itigalette, was sustained by Mile. Risarelli, which made people exclaim—"Poor Mile. Lodi! what a pity she was obliged to go away!" After which no more need be said of Mile. Risarelli.

of Mile. Rigarelli.

of Mile. Risarelli.

The next debut was that of Mile. Marie Roze, as Margaret in Faust; but as it was well understood that Mile. Christine Nilsson would somewhat later make her appearance in the same character, it was positively crued to Mile. Roze, a charming singer and a charming actress, as her-performance of Susanna in Mozart's Figure amply proved. But what induced the manager to force comparisons between her and one of the most accomplished singers and extractions of the day it is not some to understand force comparisons between her and one of the most accomplished singers and actresses of the day, it is not easy to understand, Mile. Roze acquitted herself ably, as she always does, and was warmly encouraged by the audience; but here was another and a cogent reason why some less familiar opers should have been prepared for her. Mr. Bentilam was the Fanet, a character afterwards to be assumed by Signor Campanini—which placed Mr. Bentham, an English anateur who has recently been study—in a good recogning at small thesters in Table companion. ing and performing at small theatres in Italy, very much in a similar predicament. Faust, having been played twice with the same cast of the two chief characters, was laid eside for awhile. Then we had another abortive endeavour to make something out of nothing. Mile. Imagene Orelli, an American lady, attempted the part of Violetta in the Travista, and made so little impression the part of Violetta in the Transle, and made so little impression that she was not called upon to repect it. Here, for example, is another opera which is absolutely nothing without a prima donna out of the ordinary way. We have had quite enough of the Translets and its detactable story, no doubt; nevertheless it always finds secuptance when backed up by a competent Violetta. The debut of Mile. Singelli may be said to have opened the finishionable assess, ampiciously. This young lady, a Belgian,

won her first laurels in Paris, where she took the position for-merly occupied by Mile. Marimon at the Athenee. Since then she has been singing at Brussels with distinguished success; and now she comes to London, in the bloom of her youth and beauty. Mile. Singelli is unquestionably a most attractive person, and so consummate and natural an actress that if she did beauty. Mile. Singelli is unquestionably a most attractive person, and so consummate and natural an actress that if she did not sing a note she would gain the sympathics of an audience. But she am sing and does sing in the most charming manner. She has a flexible soprano voice of agreeable quality, and thoroughly well trained. Her execution, if not yet irreproschable, has every chance of becoming so, provided she perseveres in those studies which have already advanced her so far. We entertain sanguine hopes of Mile. Singelli, for which we think her performances of Caterina (Les Diamans de la Couronne) and Lady Enrichetta (Martha) are fair guarantees. Mr. Mapleson may be complimented on his version of Auber's sparkling and genial opera; for though, apart from Mile. Singelli's Caterina, the only character well represented is that of Don Enrico, to which the versatile and always ready M. Naudin does full justice, the design of the composer is respected, the dialogue is cleverly and unobtrustively set to accompanied recitative by Signor Gelli, and the orchestral accompaniments are played as perfectly as could be imagined, under the direction of Sir Michael Costa. The opera has been given several times, always with increasing success; and we are much mistaken if Mr. Mapleson has not discovered in Mile. Singelli an artist destined to render him substantial services. Her Martha was quite as good as her Caterina, and her delivery of the "Last Rosa of Sununer" in Italian was covered in Mile. Singelli an artist destined to render him substantial services. Her Martha was quite as good as her Catorina, and her delivery of the "Last Rose of Summer" in Italian was faultless. The performance of this opera is generally attractive; Lionel is Signor Campanini's best part (Gennaro notwithstanding); and no one sings the music of Nancy, such as it is, with more point and refined taste than Madame Trebelli.

The first appearance of Mile. Christine Nilsson was the gala night of the season. It had been expected that this accomplished lady would make her début in the long promised opera of Balfe; but, Il Talismano not being in a sufficiently forward state of preparation, Faust was substituted. Margaret was the second part

paration, Faust was substituted. Margaret was the second part undertaken by Mile. Nilsson (at Her Majesty's Theatre, 1867), and it has ever since been looked upon as one of her most deeply studied and highly finished performances. We are entirely of studied and highly finished performances. We are entirely of this opinion, and inclined to go even further, and to proclaim it, although undoubtedly built upon the assumption of Madame Miolan Carvalho, who created the part at the Théatre Lyrique, the most picturesque Margaret we have seen. The acting is per-fect, and few artists have rendered the music of M. Gouned in a style so chaste and unaffected as the gifted Swedish songstress, who moreover looks the character as no one else does, or has over done in our remombrance. We could have wished for Milson a more sympathetic purtner than Signor Campanini; but even this somewhat apathetic tonor ("silver-voiced," it may be, or "golden," if the epithet be insisted on) was warmed up to something in the semblance of enthusiasm by the example before him—an example in which simplicity of expression and impassioned carnestness were happily combined. In short, Mile. Nilsson returns to us, not only as we have known her, but in all respects improved. Young as she is, she has her, but in all respects improved. almost attained the acmo of her art.

Ilmost attained the acme of her art.

The most recent performance of the Huguenots introduced to an English audience M. Léon Achard, formerly of the Opera Comique, now of the Grand Opera, Paris. This gentleman, though an artist in the truest acceptation of the term, hardly possesses the physical means to enable him to do full justice to such a trying part as that of Raoul de Nangis. His forte lies in another direction. But as every real artist has ambition and aims at the highest honours, it is not surprising that M. Achard, like M. Roger and athers before him, should have longed to quit his humbler station others before him, should have longed to quit his humbler station in the Rue Choiseul for a more imposing position in the Rue Lepelletier. He has done so, with what ultimate success remains to be seen. Our impression of his performance in the Huquenots was, on the whole, not quite satisfactory. That it exhibited great ability cannot be doubted, any more than that, as an actor, M. Achard outshines many a Raoul blessed with more bundant resources. His reception was generally favourable, and in the great duet with Valentine (Mile. Tietjens), despite certain nevitable shortcomings, he completely took his audience with din, achieving an honourable and unquestionable success to which he whole house bore testimony. Another new tenor (Mr. Maplenon seems indefatigable in his search after premiers sujets) made his appearance shortly afterwards as the Duke in Rigidette. We have seen so many Pukes that we scarcely know one from another, and only proserve a vivid rememberance of one—the unequalled Mario. Signor Gillandi, the latest new comer, is evidently a French, num; his style of singing is French, his bearing and mode of action are French, and his voice, one of great capability, is French. Nevertheless he has studied the Italian method to obvious advantage. He both acts and looks the character well. In "La Domna b mobile," which he sang with great spirit, he overs, see bunch appended others before him, should have longed to quit his humbler station Nevertheless he has studied the Italian method to obvious advantage. He both ucts and looks the character well. In "La Donna mobile," which he sang with great spirit, he obtained a genuine success, and in other part. of the opera was much applicated. What more we have to say about Mr. Mapleson's new engagements must be reserved for another occasion.

A line must suffice to record that Balie's long-expected opera, Il Talienseno, was brought out on Thursday, with complete and well-merited success. The honours of the ovening were for Mile. Christine Nilsson, whose impersonation of Edith Plantagenet, the heroine, was something to remember. The other leading characters were sustained by Mile. Marie Rose (Berengaria),

Signor Campanini (Sir Kanneth), and Signor Rota (Richard Cour de Lion). For a first performance anything more estisfactory has not been heard; and how much of this was owing to Sir Michael Costa need hardly be said. We shall return to the

In our next number we shall endeavour to give some account of what has occurred at the Royal Italian Opera since the opening—a fortnight later than that of Her Majesty's Opera.

FRENCH PLAYS.

THE departure of Mile. Favart from the Princesa's has been succeeded in the first instance by the arrival of M. Got, another leading member of the company among whom Mile. Favart has long been distinguished. The two plays in which he appeared, Le Gendre de M. Poirier and Mercadet, had been already appeared, Le Genare de M. Lorrer and Mercanet, and osen arready made known to English audiences by the performances given here by the Comédie Française three years ago. M. Got's representations this year suffered as Mile. Favart's did by contrast to former ones, where every part was filled by a first-rate artist. The plays in which M. Got appeared can succeed better by the adequate realization of one central figure than those which were chosen for the performances of Mile Favarts and therefore the love of the realization of one central figure than those which were chosen for the performances of Mile. Favart; and therefore the loss of the harmony which distinguished the same plays when given by the company of the Théâtre Français was less felt in his case than in hers. This applies more especially to Mercadet, wherein the spectator's whole interest centres in the clever schemer who is represented by M. Got. In his hands Mercadet assumes such an air of confidence in himself and in the brilliant plans by which he is cerried away such a cerial nature whose assumes such an air of confidence in himself and in the brillians by which he is carried away, such a genial nature whose promptings are for a time frustrated by circumstances which arise to spite him, that the listener forgets all the less plassant points of his character, and sympathizes fully with his eagurness to bring his ideas to a successful issue. Mme. Pasca, who has succeeded M. Got as the star at the French theatre, is less known in England than either M. Got or Mile. Favart. She made her first appearance in M. Mario Uchard's La Fianmina, a play which has been produced before in England, and which was brought out at the Franchis seventeen years are with a cast including the names. the Français seventeen years ago with a cast including the names of Geffroy, Delaunay, Got, Bressant, Mile. Stella Colas, and Mile. Judith, who then interpreted the part which gives the play its name. The piece is cleverly and carefully written throughout, and at times rises to a high degree of merit. Yot it exhibits in parts a dryngs which only the exertions of such artists as those named above could prevent from becoming overpowering.

named above could prevent from becoming overpowering.

At the rise of the curtain the spectator is introduced to a celebrated French painter who bears a name which is rather humorously suggestive to English cars—Daniel Lambert. His son, Henri Lambert, is with him. He is a poet, and has just made a success with an elegant little piece at the Théatre Français; but, as is the manner of poets, he is not satisfied with his success, and is no better satisfied with the condition of the stage. "Ce que le public aime aujourd'hui," he says, "est précisément ce que je ne puis faire. Comment peindre ce monde qui n'a pas posé devant moi? La fantaisie est exilée; on ne rève plus au théâtre à l'heure qu'il est, la réalité s'en est emparée, et même cette réalité-là n'est pas toujours éditante. Les courtisanes se sont glissées dans le boudoir des duchesses; Marco remplace Agnès, Sylvia, Ophélie, boudoir des duchesses: Marco remplace Agnès, Sylvis, Ophólie, Desdómone, ces douces héromes qui rougissaient au mot d'amour." This passage is interesting in relation to late events at the Théâtre This passage is interesting in relation to late events at the Théatre Français, of which we spoke not long ago. Between 1857, the date of Henri Lambert's indignant protest against the degrading tastes prevailing at that theatre, and the present year a higher tone regained the supremacy which it seemed to have lost. It may be hoped, therefore, that the return to the same tastes which now prevail is only a passing indisposition of the public mind, which will yield now, as it did then, to the wholescome influence of writters who are strong enough to produce tastes which now prevail is only a passing indisposition of the public mind, which will yield now, as it did then, to the wholescome influence of writers who are strong enough to produce emotion without invoking the aid of the hospital or the Divorce Court. The speech of Henri Lambert just quoted may be understood partly as an excuse from M. Mario Uchard for the motive of his own play, which is not altogether a pleasant one. La Fiammina is a celebrated singer, who, at the opening of the play, has just arrived in Paris in company with "Georges Dudley, pair d'Angleterre," who for some years has been her protector, and who bulieves that she has been separated from a brutal husband. He does not know that the husband is Daniel Lambert, and much of the first act is taken up with the emotions of the Lamberts caused by the father's revelation to the son that his mother is alive and in Paris. The expression of these emotions is probably intended to be an edifying example of filial and parental affection; the effect which it produces is somewhat mawkish. It is difficult to see any particular merit in a son entertaining more regard for the father who has loved and cared for him from his earliest infancy than for the mother whom he has never sen; and the speech of Henri Lambert to his father, "Allons, ma serve, viens déjenner," which is meant to be a pathetic conclusion to the act, seems to an English audience positively ludicrous. The discovery that La Fiannmins is the wife of Daniel Lambert and the mistress of Lord Dudley leads to various complications; to Hastri Lambert's involving himself in anaryses to defend his mother's requirements. that La Flammina is the wise of famile Lambert and the misuress of Lord Dudley leads to various complications; to Heard Lambert's involving himself in quarrels to defend his mother's reputation, and to his proposed marriage with the daughter of an old family friend being broken off. La Fiammine, Ending that her presence produces amplicated encouragements to every one except Lord Dudley.

resolves to escrifice her own happiness for her son's, and, by her declared resolution to break off her relations with Lord Dudley at ce and to retire into obscurity, poace and happiness are restored

once and to retire into obscurity, peace and happiness are restored to her family.

The opportunities afforded to an actress by the part of La Fiammina are not many. One emotion prevals throughout the play, and the leading part would, in the hands of any but a great artist, run the risk of being monotonous. Mine. Pasca, from her first entrance, which occurs in the second act, produces a strong impression. There is an air of abstraction about her, a history of sorrow in her face and manner, which fixes the spectator's attention upon her even before he knows to what causes the interest which she excites is due. Honeath the pleasant graciousness of her manner one discerns the constant presence of a hidden memory, which is startlod from its concealment when she is brought face to face with Henri Lambert, her son. In this act Mine. Pasca's power triumphed in a remarkable manner over a difficulty clumsily put in her way by the author. She has to leave the stage twice within a short space of time under exactly the same conditions, looking back intently at the son whom she has recognized, while she is unaware that her identity is revealed to recognized, while she is unaware that her identity is revealed to recognized, while she is unaware that her identity is revealed to him. Here was a fine opportunity for an anti-climax, but Mme. Pasca's acting has in it so much truth of feeling, so much depth of tragedy, that without resorting to any trick of effect, she made the second exit even more impressive than the first. The greatest scene is the last, in which La Fiammina comes to her husbands attails with the view of mains here are formed in the husbands. studio with the view of saving her son from a duel in which he is involved on her account. While she is there the son enters, and then ensues a scene of humiliation and tenderness on her part, then ensues a scene of humiliation and tenderness on her part, which, after she has declared her resolution of self-sacrifice, is responded to by a cry of "Ma mère!" from him. The look at her son with which she disappears leaves the spectator sharing the emotion of the woman. The same look has been given at intervals all through the play. Such is Mme. Pasca's power that no sense of repetition is produced. The faculty of concentrating into a single look a passion of which the elements are complicated is one of Mme. Pasca's most remarkable estributes. She is distinguished Mme. Pasca's most remarkable attributes. She is distinguished also by a grace of movement and gesture which has the appearance

also by a grace of movement and gesture which has the appearance of being perfectly spontaneous, and by a clearness of utterance absolutely free from affectation which few artists possess.

L'Article 47, the other play in which Mmo. Pasca has appeared, resembles La Flammina in so far that the appearance in it of Cora, the heroine, is brief, and that her emotions have little variety. In the second and last acts she is not seen at all; in the first she has but few words to say; but a good occasion for the representa-tion of suppressed passion is given by her presence throughout the act in the court where her former lover is being tried for an attempt to murder her, and for a theft of which, impelled by a desire for revenge, she has falsely accused him. They have had a tempestuous scene, in the course of which he has fired a pistol at her, and the scar left by the wound of the bullet is a source of constant torture to the woman who has been proud of her spotless beauty. It may here be said that this firing of a pistol at his mistress on the part of the young man excites apparently no feeling of repulsion in M. Adolphe Belot, the author of the piece, or in his characters. On the contrary, he is represented as an exemplary young man who has unluckily made a slight mistake in a moment of natural impatience, for which he ought to be punished very lightly, if at all.
While the jury are deliberating over their verdict one of the by-While the jury are deliberating over their verdict one of the hystanders observes:—"A Paris ou dans le Midi l'accusé serait acquitté, mais en Normandie on ne sait pas . . . à Rouen vous avez le sang calme, reposé. Vous êtes plus lymphatiques que sanguins, et vous n'êtes pas aptes à comprendre et à excuser ces emportements de la passion qui peuvent faire tout d'un coup d'un très-honnête homme un criminel." One does not expect very exalted or right-minded views of life from the author of such novels as M. léclot's. It is pleasant to find that, in spite of the dramatiat's evident sympathy with this young man who has fired a pistol at his mistress because she threatened to mit him, the exigencies of the play demand that numishment to quit him, the exigencies of the play demand that punishment should overtake him. The jury take a grave view of this sudden burst of passion which has converted an excellent man into a criminal, and sentence its unfortunate victim to five years of penal servitude. On his return from working out his sentence he esta-blishes himself under an assumed name in Paris with his mother. A charming young girl falls in love with him; her love is returned by him; they are married and live in the greatest happiness. Unfortunately the girl's father has a passion for gambling, and one night takes his son-in-law to the house of Madame de Champe habit of playing. Medame de Champe is not be in inches habit of playing. where he is in the habit of playing. Madaine de Champa is no other than Cora, and on seeing Georges du Hamel again her old passion for him returns, and, finding that his love for her is dead, she determines to destroy his wife's happiness if she can. deed, she determines to destroy his wife's happiness if she can. She forces Georges to come and play at her house night after night by hanging over his head L'Artele 47, which provides that every forget is liable to police supervision for the whole of his life. She threatens to reveal who Georges really is to the police, and thus to break up his happiness and his wife's for ever. One night the wife tracks him to Cora's house; he confesses what his relations wife tracks him to Cora's house; he contesses what his relations with Cora have been, what her power over him consists in. After a first movement of repulsion the wife clings to him, and they go away together. There have been hints given at intervals that Cora is utterly possessed by the fixed idea of getting Georges into her power. Her friends have said justingly that it is a kind of midness, and the words have produced an under effect. Now, as Georges departs, he tells Cora that she is mad, and left clone she

actually becomes so. Her thoughts wander, and love actually becomes so. Her thoughts wander, and love all coherence; the dread of madness comes upon her; suddenly the thought of revenge recurs to her, and by its influence has brain is cleared for a space. She sits down and writes a letter demonstrate Georges to the police. As she gets up she asses a vision at him entering at the door looking at her as he did when he told her she was mad. She starts back in horror; she implores him not to look at her; she rushes round the room trying vainly to escape from the phantom who, she cries, has come to take her to a madhouse. Finally, with a wild call for help, she falls senseless. This is a scene which nothing but great power, cultivated with great art, could save from being repulsive. The same tragic intensity which Mme. Pascs displayed in La Frammina was employed by her in another direction in the part of Corn. Both characters carry with them a secret thought which Frammina was employed by her in another direction in the part of Corn. Both characters carry with them a secret thought which separates them from the world by which they are surrounded. Mme. Pasca, with but little change in her appearance, conveyed an entirely different impression of the nature of this thought in each case. Cora is both more violent and more controlled than La Fiannuins. It may be supposed that the continual pressure of command over fierce passion leads to her madness in the end. The existence both of the passion and of the force by which it was subjugated was never lost sight of by Mme. Pasca. Her acting was as full of meaning in the first scene, where she sits a long time without speaking, as in the unad scene. The play is a bad one from every point of view, faulty in construction, visious in tone, and soldom more than mediocre in dialogue. It is to be regretted that the actress has not appeared in a play worthy of regretted that the actress has not appeared in a play worthy of her throughout. The merit is her's of having raised her part in such a play as L'Article 47 to the level of her own powers.

THE OAKS.

A LTHOUGH the race for the Oaks was just as easily won as that for the Derby—both being, in fact, carried off in a common center—it was by far the more interesting of the two. The moderate quality of the Perby horses is shown by the circum-The moderate quality of the Perby horses is shown by the circumstances of a roarer running second, and a cripple—for Atlantic was to all intents and purposes a cripple on the day of the race—running third. It is of course no very wonderful feat to run away, at the end of a mile and a half race, from a roarer and a cripple; and though no horse could have beaten his field more signally than George Frederick, it must be remembered that he was much distressed at the finish, partly from being still not thoroughly wound up, and partly because his action is laboured and tiring. It is a very different thing to run away, like Apology on the Oaks day, with equal cases from a far superior field; and her hollow victory entitles her to quite the foremost place among the horses of her year, whether colts or fillies. Seldom, indeed, do we see three such mares as Apology, Miss Tote, and Lady Patricia, all equally well trained and in equally fine condition, come to the post to take part in the same race. These three almost monopolized the attention of visitors to the paddock; and the comparisons the attention of visitors to the paddock; and the comparisons drawn between them and the twenty who two days before had been subjected to a similar inspection were by no means to the adventage of the Berby horses. Lady Patricia, whose first appearance on an English racesourse this was, created quite a sensation. ance on an Inglian racecourse this was, created quite a sensation. She is indeed a splendid mare, long and powerful, and was trained to perfection. The only objection made to her was that, if anything, she was rather too long behind the saddle, and doubts were expressed whether an up-and-down course would be altogether suitable to her. But how she would stride across the flat at Nowmarket 1 between the same of In Ireland she enjoyed, as a two-year-old, a career of unbroken triumph; but so little is known in England about the form of Irish horses, and there is such a prevalent impression that Irish arisn norses, and there is such a previount impression that Irish flat-racing is very poor stuff indeed, that few people took much account of her five victories last year. It was her own grand appearance that won her a host of friends, and the impression produced on the minds of those who saw her in the paddock was shown by her rapid advance in favour during the hour immediately preceding the race. Both Miss Toto and Apology had, as a matter of course troops of outpusing the past and help and the paddock. of course, troops of enthusiastic partisans, and both were in capital or course, troops of entinusiastic partisans, and both were in capital condition. There had been for some days adverse rumours about Apology, but they were happily dissipated on the day of the race by the appearance of the marc, who was walking about in the paddock coolly and calmly, and without a vestigs of excitament. Indeed, considering the season of the year, and the intense heat of the day, it was remarkable to see cleven fillies so well behaved both and at the medical way. both in the paddock and at the starting post. The supporters of Miss Toto and Apology were equally confident about the chances of their respective favourities, but we think there can be no doubt that Apology is the finer-looking mare of the two. She is not only more lengthy, but she has a more lasting appearance, while Miss Toto, though wiry and muscular, is deficient in length. The trainer of the French mare, however, had an unmistakeable line, trainer of the French mare, however, had an immistakeable line, through La Coureuse, of what she could do with Apology, and he was satisfied of Miss Toto's ability to win. We have always been of opinion that Apology won the One Thousand more easily than a good many people imagined, and that she would have won further the further she went. To heat Apology, we should have said Miss Toto must be 10 lbs. better than La Coureuse over a mile and a half course, and the result of the Oaks would seem to show that her powers must have been overestimated, though we admit that the crusi disappointments which she met with during the more were sufficient of themselves to account for her defeat.

The eight remaining candidates attracted comparatively listle attention, though there was more than one quite worth looking at. Blancheflour is a nice racing-like filly, and sister to Ryahworth is believed able to accomplish great things in private, but, being cursed with the temper of her brother and others of the family, she certainly does not exhibit any particular provess in public. Memoria also is a wiry-looking filly, but we were surprised at the support accorded to Princess Theresa, who seemed to us the weedlest-looking of the eleven. Take them altogether, however, they were above the average of an Oaks field, and might be profitably backed against eleven of the horses that ran in the Derby on the preceding Wednesday. Miss Toto was the solitary absentee from the parade in front of the Stand and the preliminary canter, in which both Apology and Lady Patricia gave great satisfaction; though it struck us that the latter went rather short. The canter over, the ten competitors proceeded without delay to the starting post, where they found Miss Toto awaiting them, and as they behaved as well as the Derby houses did two days before, the starter was able to despatch them at the first attempt. It is, we should think, an unprecedented circumstance for both the Derby and Oaks to be run without a single fulse start, and the absence of and Oaks to be run without a single false start, and the absence of delay is most welcome to the spectators who remember how grieveasily their patience used to be tried when there was a Lady Elizabeth or a Tambour Major—the latter, if we recollect rightly, wound up his antics by sitting down on his haunches like a dog— in the field. It would, however, have been still more unprece-dented if both Derby and Oaks had been run without some mischance happening to one or more of the candidates during the race; and a very prominent candidate, Miss Toto, was the victim of untoward circumstances in the latter race. She was cannoned against and very nearly knocked down at the top of the hill; and she was shut out of her place and thrown out of her stride at the bottom of the hill. We should have thought that the course was bottom of the hill. We should have thought that the course was wide enough for eleven horses to steer clear of one another; but the turns do the mischief, as it is of course an object to avoid the outside bends. At Newmarket you very seldom see horses disappointed during a race. Whatever chance Miss Toto possessed was utterly annihilated by these two accidents. We confess that we do not think she would have won under any circumstances. Apology made nearly the whole of the running, left her field behind her just when she pleased, and won by just as much as she pleased, finishing full of running, and without a sign of the distress exhibited by George Frederick after the Derby. Yet from the ease with which Miss Toto overhauled Lady Patricia, who had occupied a prominent position throughout the race, at the last, and made up a large amount of lost ground, we can easily imagine ease with which Miss Toto overhauled Lady Patricia, who had occupied a prominent position throughout the race, at the last, and made up a large amount of lost ground, we can easily imagine that, if she had had a free course, as Apology had, there would have been a fine race, and perhaps a close finish, between the pair. But, in nine cases out of ten, the excuses made for besten horses are not justified by subsequent running, and until we see Miss Toto defeat Apology, we shall not believe in her ability to do so. The defeat of Miss Toto is the crowning blow, after a succession of severe disappointments, to M. Leftwer, whose stable at the beginning of the season seemed strong enough to carry everything before it, but has been signally worsted in every sudeavour to secure any of the great prizes of the year. Apology will now divide with George Frederick the post of favourite for the St. Leger, which, if it were reduced to a match between the two, would be unusually exciting—the contest between North and South, between the horse and the mare, being just one in which Yorkshiremen most especially delight. Last year the pair met at Doneaster in the Municipal Stakes, and George Frederick won; but Apology's powers have been slowly maturing—as a two-year-old she was only once successful—and we have great faith in her over a distance of ground; while George Frederick, though he may improve much between now and September, gives one the idea of being a horse who would tire very much at the end of a long and strong-run race.

The general racing of the week was undoubtedly superior to that for which we usually look—or rather which we do not usually take the trouble to look at—in the Dorby week. That really great horse over his own course, Tangible, wen two races, in the second of which he bent Oxonian at weight for age. Kaiser, giving lumps of weight away to a moderate field, had no more difficulty in winning the Rous Stakes than Lillan had in securing the Queen's Plate, which, as usual, attracted only two runners. It was in

It was in consequence of the casy success of Mr. Savile's colours in these two races that his sister to Ryshworth, who was currently reported to have beaten both Kaiser and Lilian in a trial, came into favour for the Derby. Had Kaiser and Lilian beaten anything of importance in their races, there might have been some justification for the support awarded to their stable companine justification for the support awarded to their stable companine in though her unhappy temper is quite sufficient to upset all paper a deulations. More creditable was the victory of Oxonian in the Craven Stakes, as he gave no less than a stone to Glaucus and Negro, the latter of whom must have undergone the same deteriorating process that seems to have affected so many of M. Lefevre's houses. The High Livel Hen-licap produced a good race between The Monk, Lilian, and Mont Valerien, Mr. Merry's lightly-weighted three-year-old winning cleverly at the finish. The Special Oxp—with five bundred sovereigns added—astracted a good field, including Couronne de Fer, the second in the Derby, and Rastretter, who was well up with the house placed in the Perby habited George Frederick. Among the remove was also Glaucus, The Frederick, Sister Helen, Chingachgook, and Thurdes.

people who give such unpronounceable names to their house deserve to be disappointed—had got it at his mercy, he overpowered his rider, and had to be centent with second place in consequence, the totally neglected Thunder profiting by the accident to come in the Treacher beat Couronne de Fer for third place, and Restrator was now here. Rostrevor was nowhere. A more striking commentary on the moderate quality of the Derby horses could not have been desired, especially as the mile of the Epson Cup course was much better suited to Couronne de Fer than the longer distance of the Derby course. There was some fair two-year-old racing during the weak; and in the principal event of this class, the Woodcate Stakes, Ladylove had her revenge on Chaplet for her defeat at Newmarket. Lord Hartington's filly was beaten by a good deal more than the 5 lbe. which Chaplet unsuccessfully attempted to concede to Lady-love at Newmarket; but we hardly think the Woodcote field was love at Newmarket; but we hardly think the Woodcote field was on this occasion up to its usual standard. Perhaps Grey Palmer, a son of The Palmer and Eller, will show in better colours at some future time. The speedy Lady Glenorchy was done out of the Stanley Stakes through a disappointment such as in a half-mile race cannot possibly be recovered, but she secured the Acorn Stakes from Ursula without difficulty. The French stable was successful in one or two minor two-year-old races; but on the whole we must wait till later for two-year-old faces; but on the class. Ladylove is undoubtedly a very fair animal; but there was no Mansworth or Sunshine among the two-year-olds at Ensom was no Marsworth or Sunshine among the two-year-olds at Epsom this year.

REVIEWS.

DRAMATISTS OF THE RESTORATION.

DRAMATISTS OF THE RESTORATION.*

EXPENSIVE reprints of the works of our old dramatists, good, bad, and indifferent, are all the order of the day. Mr. Russell Smith, in his carefully conducted series, has given us Lyly and Maiston; Mr. Pearson, in rather a haphazard style, has followed up with Decker, Chapman, Brome, and Heywood Mr. Hazlitt is printing a new "Dodsley" in at least twolve volumes; and an enterprising, if not very judicious, firm in Edinburgh consider themselves fortunate in securing the services of Messrs. Maidment and Logan to edit a critical edition of the Dramatists of the Restoration in as long a series as a select but liberal public may be inclined to purchase. They commenced with Sir William D'Avenant, and, in order to please the taste of their subscribers with varied food, have, to use a racing phrase, chequered the running with volumes of those distinguished writers Wilson and Crowne.

Wilson and Crowne.

"Sir William D'Avenant's Gondibert," said Pope to Spence,
"is not a good poem if you take it in the whole, but there are a
great many good things in it," and the same criticism will apply
equally well to his dramatic works. It is not our intention, howover, at this time to offer any detailed criticism on his merits as a writer either of peems or of plays, but simply to call the attention of our readers to the manner in which the editors are discharg-ing their duties to their employers and their subscribers. Charles Lamb somewhere speaks of the "noble practice" prevailing among the Elizabethan writers of combining their powers; but the remark is made with less than the usual discrimination of that delightful essayist. A combination may be very noble when Flotcher and Beaumont, or Chapman and Ben Jonson, make up the partnership; but it sinks into a more firm when Hopkins and Sternhold, or Martin and Day, or Brady and Tate, are the contracting parties. But although we are of opinion that it is better on the whole that each literary labourer should feel the full sense of an undivided responsibility, the happy example of Messrs. Clark and Wright with the invaluable "Cambridge Shakspeare" had inclined us half to believe that a practice little to be encouraged among original writers might be attended with felicitous results in editing the works of others. It struck us as a plausible idea, for instance, that one might read aloud while the other made a note of variations; or that, in Hox and Cox fashion, one might be able to pass the hours of daylight in the Bodleian or the Advocates' Library, while the other, having only the evenings at his disposal, might burn the midnight oil in revising and digesting the next of his conductor. It agreeinly never entered into our based notes of his conductor. It certainly never entered into our head that the halt would try to carry the blind, or the blind endeavour to lead the halt. Messrs. Maidment and Logan, however, have gallantly made the attempt, and with the result that might have been anticipated. They have both fallen into the ditch, and all that can now be done is to try our utmost to prevent others from falling in on the top of them.

The blunders into which one genuinely ignorant and alovenly editor of an old dramatist may fall are great in variety and infinite in number; but when two combines their efforts, the result would appear to be not merely the double, but the square, if not the cube, of what the powers of either would have been superately capable of achieving. The author is somewhat in the position of a patient who calls in two doctors of different ways of thinking, and takes the medicines of both. The last state of such a man is considerably werse than the tirst. In this assumed case, however, the victim has a certain amount of freedom of choice, but an unlucky decreased author is

Decements of the Restoration, r. The Dramatic Works of the Wil D'Avenant, with Prefeteny Mescole and Notes by James Mallimete W. H. Legnis. Editherghe W. Paterson. London & Sitheren. & Vols. L. M., M., Marie, Marie

handed over gagged and helpless to the tender mercies of the operators. In editing one of our old poets two courses are open. One is to reproduce the ancient text serbation of hieration, and the other to modernize the old spelling, to correct palpable misprints, and to rearrange the lines wherever the carelessness of the old compositors may render the process necessary. The editors of P'Avenant have chosen the latter course, and we think their choice would have been the right one if their shillities had been equal to the undertaking. Whether they are or are not so, the reader shall judge for himself. In the last of their volumes there happens to be a play called The Fair Favourite, in the arrangement of the lines of which the old printers have been more than usually capricious. The editors in several places have done their best to amoud this, and it is therefore fair to conclude that where no attempt at improvement has been made, they must have deemed it either unnecessary or impracticable. In the course of our reading this play (vol. iv. p. 217) we came upon the following three lines:—

ORANOST. Can you find nothing, Lady, In this face that may direct You to remember it?

The measure at once struck us as something peculiar, but, remembering that Upton had demonstrated Shalespeare's

Where hast thou been, sister?

to be a perfect line in itself, and indeed a beautiful specimen of the "trochaic dimeter brachycatalectic, commonly called the ithyphallic," we were prepared to receive the above three lines as an equally perfect specimen of the "trochaic tetrameter catalectic closing with a trochee and a semiped, what the Greeks call kutakleis—a measure very proper to the character of Polonius, a droll, humorous old courtier"; and we were in the act of asking ourselves whether Oramont would answer this description, when the words suddenly shaped themselves as it were into

Can you find nothing, lady, in this face. That may direct you to remember it?

So also the lines (vol. iv. p. 252):—

Sir, you perfume me with your Epithet. I fear you have not sent to Milan Yet for the carkanet of pearl,

which Upton might have convinced himself were "of the anapestic kind, consisting of anapests, spoudees, and dactyle, and sometimes the per procedumasticus," became

Sir, you perfume me with your epithet. I fear you have not sent to Milan yet For the carkanet of pearl.

We could adduce scores upon scores of lines—we may say hundreds upon hundreds—equally calling for rourrangement, but two more specimens must suffice (vol. iv. p. 262):—

Look on her, Heaven! Since you are Mollified with such a pitcons sight as this, I Hope my Justice now would not be stylis! Divine but rather human tyranny. This ring Unto the provest bear! it shall suffice, &c.,

which—we feel we are almost insulting our readers by suggesting it—should of course be read :—

Look on her, Heaven! Since you are mollified With such a piteous sight as this, I hope My justice now would not be styled divine? But rather human tyranny, &c. &c.

Our last specimen is from vol. iv. p. 278, which we select as showing the utter nonsense which these editors make of a beautiful idea by their peculiar punctuation:—

Kino. Thy constant virtue hath so
Vanquish'd me, that all my rash rebellious
Finnes grow pale and sickly now. Near ev'ry
Beam thine eyes most carelessly do shed,
Tapers before the sun at noon, look
Not so alter'd and eclips'd.

How differently it reads, both as to sense and harmony, when properly arranged:—

Thy constant wirtne bath so vanquish'd me That all my rash reballions fiames grow pale And sickly now near every beam thine eyes Most carelessly do shed. Tapers before the sur At most look not so alter'd and colips'd.

From one end to the other of these volumes we fail to see a single trace of familiarity, or even moderate acquaintance, with the literature of the period. This ignorance is curiously illustrated by some of the editors' changes of words which they imagine to be wrong; and of these we can only give a couple of examples. The word up at end of a verb is still used amongst us in the cases of est up and escallow up, but in former times it was by no means confined to these. Hen Jonson makes Bobadil say of a hostile army that "two hundred days kills them all up by computation," and his arrant Dick Brome has a scheme to "kill up rate and mics."

His Captainship laster a priest, and laughs at wellook, But rawine up his fly-blown laush or matters.

These fudicious editors change this into "ravius on," although they might have remembered that Shakapeare uses the very expression in Machali:—

Thritices embition that will seein up. Thine own life's mount. In Love and Honour (vol. iii. p. 163) a word had dapped out in a line in the first edition, which they have replaced thus :--

The Prints may be [restor'd] unto your lets,

pointing out in a note that "atten'd" was inserted in the second version of 1673, and so making it evident that they were integrated rance of the sense in which the word "atone" is constantly used by our old writers. To stone is to reconcile, but the word stone ment, in the course of ages having come to mean the sacrifice by which atonement was effected, has led away the verb along with it. The following "improvements" have not even the dubious plea of ignorance of the old language to be offered in their defences—

In mighty minds the pleasure's more sublime. To give than to powers, freely like clouds. That uninvited still their treasure shed. In pleatous flowers,—Vol. iv. p. 224.

Bring me a fig in September, and I'll As seen take a lease of his life as of That dragon's.—Vol. iv. p. 151.

Clouds shedding forcers, and figs having lives, somewhat pussess us, and on turning to the original edition, which the editors profess to follow, we found showers instead of the former, and fly instead of the latter. Among other freuks of editorship they seem to have given general instructions to the printer to reject all espital letters at the beginning of words. Thus D'Avenant's Flothsteh becomes "pick'd-hatch," his Bedlam "bedlam," and his languest in two cases degonet. In the one case we are told at the found the page that it means "a small hand-pistol—a tire-enter," and in the other a note is taken verbatim, without acknowledgment, from Isaac Reel, and made nonsense of by the addition "Dayon has been used by Chaucer and others in the sense of a slip or piece of blanket. Hence Dayonet may have been in use to signify an schembers elothed in rug." Dagonet was neither a pocket-pistol, nor clothed in rug, but one of Arthur's knights clad in armour, with two squires to attend him. In the News from Plymouth there is a Dutch skipper called Bumble who speaks broken English, and in the original folio addresses everybody as mire Here. This is perfectly intelligible, but it cases to be so when printed, as it always is, "mine here," without the capital H.

We have apoken above of a note being taken from Isaac Reed,

We have spoken above of a note being taken from Issac Rood, and this leads us to mention that one of the plays, The Wits, was included in Bodsley's collection, and, as the present editors have not hesitated to appropriate the labours of their predocesors, comes before us in a very different state from the remaining seven-teen pieces. As in some instances the initials of the true owners are affixed to these notes, the reader is led to believe that those which are unmittaled are the work of Messrs. Maidment and Logan; but a little acquaintance with the gennine handiwork of those gentlemen will soon enable him to distinguish what does or does not belong to them. Nobody, for example, would accuse Steevens, or Rood, or Collier of the following notable remarks. One of the characters, Sir Morgley Thwack (printed by them Thawck), exclaims:—

Cosm'd in my youth! cosm'd in my age.!
When I was young
I was arrested for a stule commodity
Of nuterackers, long gaps, and assing tages.

The note to the words in italies is:—"May not this mean [arrested] for a common prostitute who had stood in the Pillory, convicted of snaring birds with a gig (or decay made of gooss feathers), and of cheating at dice play?" We are thus given to understand that Stale commodity—Common Prostitute; Nutcrackers = Pillory; Long gig = Docoy made of gooss feathers; and Coating tops = Falso Dice; each individual word being ridiculously misunderstood. In Measurs for Measurs, Pompey in the prison mays:—"First, here's young Master Rush; ho's in fur a commodity of brown paper and old ginger, nine score and seventsen pounds;" and in the same way Sir Morglay Thwack relates that in his youth he was once "in for a commodity of unferaclers, whyping-tops, and peg-tops." The word gig, still preserved in our "which-gig," is defined by Bailey to be a "horn top for boys to whip," and Coargrave interprets the French word toughs "a gig or casting-top," so called, we presume, from the manner in which it is thrown by the caster. Again, in The Steps, an ensign says to his captain:—

Can you not gull the State
Finely, muster up summunition; casescles stuff'd with straw
Number a hundred and forty must dead page.
And thank Heaven for your arithmetic.

The editors ask whether by "desd-pays" is not meant "arrears of pay !" They are equally ignorant about a word in the second line, which ought to have been printed

Finely; muster up ammunifion-rassucks stuff if with straw.

Soldiers still call the boots provided by Gevernment "ammunition boots," and in this solfiame scene an "ammunition chases " and a "dull ammunition blade" had already been spoken of, but without effect upon these editors.

Astronding as is their ignorance, we are inclined to look upon their innocence as still more remarkable. In Love and Hunsur (vol. iii. p. 104) Vasco, a solonel, says:—

Kon could not commit her to an cunuch
With more subley. If the Great Tark leave ma,
Houset Antenet, he would trust me in his Sucachin,
By this hand, without defailting one grain beneath the waste.

They are not aware that " waste" is the old form of " waist," but

they hasten to inform the reader that defalking is "abating in reckoning" i. So also in The Wits, where Mistress Shore exclaims "Gossip Queasy, what a good yer would ye have!" we are told that Goodger is a name for the Devil in Devoushire. In other that Goodger is a name for the Devil in Devonshire. In other forms of ignorance Messrs. Maidment and Logan similarly display their superiority over ordinary editors. In The Play-house to be Let, Brentford is mentioned, and we are informed in a note that it is "now commemorated chiefly by Cowper's ballad of John Gilpin"! Southey and Itayley and Grimshawe and Brace seem all to have conspired to omit the verse in which this commemoration, takes place; but Cowper is not the only poet of whose works they seem to possess a unique edition. They have a Wordsworth which includes a poem called "Heartleap Wall" (the Scotch for Well) and a Byron in which Don Juan and Beppo (vol. i. p. 31) are cut down into "sestines," or "stanzas of six lines." They have also a Pope which proves that the little nightingale of Twitnam was "one of the ghouls who fed upon the deceased laureate's brains"—i.e. upon D'Avenant's. Now Pope is a writer of whom they ought to speak well, for he is the only man we can remember who has asserted that the act of misquotation in itself implies the pessession of a certain amount of learning, and never surely have there been such inveterate misquoters as this pair. They misquote Scott, they misquote Cibber, and, above all, they make a hash of our good friend Popys. On the Stantard of them. and, above all, they make a hash of our good friend Pepva. On the 8th April, 1668, according to them, Pepva records:—"We saw the Unfortunate Lovers—an extenordinary play." We turn to the immortal "Diary," and the verdict is "no extraordinary play methinks." On the previous day, according to them, "Mrs. Knipp tells mo that my Led Continuing in middle in the law that the continuing in middle in the law that tells me that my Lady Castlemaine is mightily in love with Hart of their house. . . . that the thing is most certain, and Bech Meadale only privy to it." We turn again to our Pepys, and discover that "Hart" is Jacob Hall, the rope-dancer, and "Bech Meadale" is Beck Marshall. Even when they copy correctly they choose the wrong passage to transcribe. They have the 1826 "Clarendon" before them, and tell us that Charles I. gave D'Avenant a "sharper reprehension than was usual for him to give to any other man." Had they taken the trouble to look at the bottom of the page, they would have seen that Clarendon's genuine words were that the King "gave him more repreachful terms, and a sharper reprehension, than he did ever towards any other man," which is infinitely stronger than the other. This curious itch for blundering is not confined to the English language. Nom de plume becomes with them nomme de plume; and they throw accents about in the most liberal manner. tells me that my Lady Castlemaine is mightily in love with Hart cents about in the most liberal manner.

Mr. Maidment, as we have always understood, is particularly learned in pedigrees and the history of the peerage, and we had a right therefore to expect accuracy on these points if we found error on every other. Perhaps, therefore, it is the other partner who is responsible for the following strange misstatement. They to speaking of the well-known story of Ramsay switching Philip Herbert over the face on the racecourse at Croydon, and say:

James, whose aversion from duelling is notorious, was the only person who approved of the pusillanimous conduct of his well-featured favourite. He was raised to the peerage in token of the monarch's approbation of his adoption of the Royal maxim Beati Pacifics, Blessed are the Penceful. Ramsay, for appearance sake, and to appease the English mobility, was banished the Court for a short time, and upon his return was presented as Viscount Haddington of the Kingdom of Scotland. Thus Philip got his neerage for submitting to be switched, and Ramsay his for switching him. In 1620 Ramsay was created Earl of Holderness in England.—Vol. iii. p. 6.

This roads circumstantially enough, but it is incorrect from beginning to end, as a few dates will show. The switching took place at Croydon in March 1612, and Philip Herbert's patent as place at Oroydon in March 1612, and Philip Herbert's patent as Earl of Montgomery bears date May 1605, nearly seven years previously to it. We have not the means at hand of ascertaining the date of Ramsay's elevation to the Scottish peerage, but we suspect it was still earlier. At any rate, he was "John Lord Ramsey, Viscount Haddington" in 1608-9, when Ben Jonson wrote the Masque upon his marriage, and the probability is that he was ennobled by James shortly after he had slain the Earl of Gowrie with his own hand at Perth in 1600. No historians a biographera have ever explained the cause of this quarrel or biographers have ever explained the cause of this quarrel between Ramsay and Pembroke, but a flood of light is thrown upon it when we find from the Calendar of State Papers that at the time of the switching they were rival candidates in "begging the estates" of Sir Henry James, who had refused the oath of illegiance, and whose goods and lands were valued at 1,600% or 1,700% per aunum.

After our account of the manner in which Mesers Maidment and logan have performed their duties, we are sure our readers will thank us for telling them that, besides the ordinary copies which are procurable for half-a-guinea a volume, they may perhaps be not too late to secure one of the 150 printed on large paper, or be not too late to secure one of the 150 printed on large paper, or of the 30 printed on Whatman's paper, or perhaps even one of the priceless 4 which are impressed by hand upon velium. The four volumes already published contain 1573 pages among them, and we are not going beyond the mark in saying that critical editors, such as Gifford and Dyce and Collier, would pronounce that a blurder per page is considerably below the average number to be found in them.

Since the above war in type, the fifth and concluding volume has made its appearance. We have only turned over the leaves but have seen enough to estimy us that the editors are consistent to the last. For example, they give the title of the original issue of The Purpose, and using a whole page to it. There are not

five lines in all, but they contrive to make three blunders. printer's name is wrong; the publisher's name is wrong; and the date is not what it ought to be.

ZINCKE'S SWISS ALLMENDS.

SOME information may by an effort be dug out of this book, but the spade has to make its way through a thick depth of twaddle, and sometimes worse than twaddle. Mr. Zincke really went to Switzerland with a purpose. He went to see and learn something, and not simply to say how near he had been to breaking his neck. He went to learn something about the common land, the folkland, the ager publicus, which still survives in many parts of the Confederation. And a man who goes with a rational purpose like this, even though he may not be at all equal to dealing with the subject in its fulness, is sure to pick up something which is worth preserving. Mr. Zincke has picked up enough about the Allmends to have made a good article; but unluckly he would make a book. So, besides the Allmends, which we are not at all sorry to have, we get the "Walk to see them," for which we have not the least wish. The name is enough; we know the thing of dreariness which is coming when a man looks out for a lively title. We must tell Mr. Zincke plainly that, though we take an interest in his subject, we take no interest in his personal adveninterest in his subject, we take no interest in his personal adventures. We do not care to hear about himself and his guide, and his inns, and his wife and his wife's maid and the small boy, whether dressed in blue or in the cantonal uniform of the school at Aigle, or in pure gold, for we guess that the golden figure on the outside with his hat on a stick represents the small boy and not Mr. Zincke himself. We might have guessed that a chaplain in ordinary to the Queen would have something of fashion about him; so he need not have told us that, when at home, he dines at 8 P.M., but we are sincerely sorry to hear that he does not breakfast till 10 A.M. These he calls "regular hours and regular work"; we had fancied that most of those who do regular work breakfast we had fancied that most of those who do regular work breakfast earlier. We really do not care to have it thrown in our face in every page how very well satisfied Mr. Zincke is with himself, and how very little he knows of the language and history of the country through which he is passing. We have our suspicious of every man who, going through any country, talks about its language as "patois." The man who sees "patois" in Allemannic High-Dutch would most likely see "bad French" or something of the kind in the lingua d'oc of Toulouse; he might even have some ugly name for the Nether-Dutch of the oldest England. But we have further suspicious still of the man who goes through a we have further suspicions still of the man who goes through a

we have further suspicions still of the man who goes through a German country and drags in French words at every step.

Mr. Zincke sets out by going to pay a visit to a Professor of the University of Basel at his country house. In—shall we say the patois?—of Mr. Zincke, the Professor becomes "M. Heusler, Professor de Droit," and presently, by a flight further south, he is made to take his rillegiatura (sic). Every Rathhaus or the like is an Hôtel de Ville, even in Altdorf itself. Mr. Zincke's baggage is a say and a malle; he pays his guide so much four converse and sac and a malle; he pays his guide so much tout compris and sometimes gives a bonne main, and he talks about the Bureau de Statistique du Département fedéral de l'Intérieur. He gots to Bern, and, to the confusion of all ecclesiastical geography, finds a "cathedral" there. And, to the confusion of temporal geography, he also "orders un early dinner at the Schweizer Hof [sic], a large new hotel, the back balcony of which commands an admirable view of the mountains of the Bernese Oberland." Mr. Zincke does not tell us whother the early dinner showed what he calls in another place "a savant cultivation of the stomach," but we heartly trust it did; still Mr. Zincke should remember that it is not of the faintest importance to any human creature, save himself not of the faintest importance to any human creature, save himself and those who may be called on to act professionally in the matter, when, where, or how Mr. Zincke dines. But he has surely confounded Bernerhof and Schweizerhof, and a faint curiosity is raised as to the hour of the early dinner, for the hour at which many members of the Federal Assembly dine at the Schweizerhof would doubtless seem very early indeed to a gentleman whose "regular hour" is 8 F.M. Indeed it would be quite impossible for the Swiss legislators to dine at all if they did not get their breakfasts somewhat earlier than the rogal chaplain's other "regular hour" of 10 A.M. Mr. Zincke himself seems to have at last grappled Swiss legislators to diffe at all if they did not get their breakfasts somewhat earlier than the round chaplain's other "regular hour" of 10 A.M. Mr. Zincke himself seems to have at last grappled with this last fact, for, when he gets to Glarus and has to go to a man in authority there, he goes to him—no, "he presents himself at his door"—at 8.30, for he "knew that at that time a Swiss man of business—every one here is of course a man of business—would not be found still loitering over his breakfast." He takes with him "an English barrister, whose acquaintance in the does so fortunate as to make at the Glärner Hof, and who was familiar with German." We see the advantage of this acquaintance in the dots over the a in Glärner. Had Mr. Zincke been so fortunate as to make the acquaintance of the English barrister sconer, he might have learned that there are dots in the name Zürich also, and that the river Aar need not be lengthened into Aare. In Mr. Zincke postor again, perhaps to make up for the needless a which our German friends add to some English names, a Landammann than he should have. At the very hadding he goes to Barn—"by the first morning train," for a Landammann than he should have. At the very hadding he goes to Barn—"by the first morning train," for a Landammann than he should have. Some Confidentian is and he

Swiet Affinends and a Wall to me them; being & Bested Mouth in tenitonal By E. Bertum Blacks. Landon: States, Elder, & Co. 1874.

adds, to show perhaps the deference which a royal chaplein commends among republican magistrates, "I knew it was awaiting my arrival." The letter was to "request all Landammans and other official people, wherever in the country he might go," to help Mr. Zincke in his researches. Really we must explain that a Landammans, the chief magistrate of a sovereign commonwealth, is not to be jumbled up in this way with "other official people." The royal chaplain and Vicar of Wheretead would himself not like to be mistaken for his parish clerk or even for his curate. At Glerus Mr. Zincke has "a letter to the President of Glarus," and we have a comment, "I take President to be new style, and that, formerly, the title of the chief magistrate of Glarus was Landamman." The style must have been changed very lately indeed if it is not still; but our doubt is whether it was the Landammann of Glarus that Mr. Zincke went to see. There are Presidents of various degrees in Switzerland as well as elsewhere, and Mr. Zincke may have fallen into the same mistake as a well-disposed rural household who showed to a college officer from Oxford, who chose to call himself "the Dean of Wadham," the same respect which they would have shown to a bearer of "Very Reverend" honours.

A graver fault than all these is the bitter and ignorant contempt with which Mr. Zincke always speaks, or rather always goes out

with which Mr. Zincke always speaks, or rather always goes out of his way to speak, of the religion of the country through which he is passing. We are quite ready to hear about the Allmends; we do not want to hear Mr. Zincke's twaddle either about Romanism do not want to hear Mr. Zincke's twaddle either about Romanism abroad or Ritualism at home. It is worse still when he goes out of his way at once to display his own gigantic ignorance of the history of the country of which he is speaking, and to utter stupid calumnies against one of the greatest benefactors of that country. What name in Swiss history better deserves reverence than that of the holy Nicolas von der Flüe, who came forth from his hermitage to preach peace and goodwill to Confederates likely to fall asunder, whose exhaptations brought about the Covenant of Stanz, and whose work lives to this day in the fact that Freiburg and Solothurn are still members of the Everlasting League? Perhaps it is too much to expect the comfortable and self-satisfied Perhaps it is too much to expect the comfortable and self-satisfied English parson, royal chaplain, and Vicar of Wherstead, who breakfasts at 10 A.M. and dines at 8 P.M., to feel much sympathy for the anchorite who held no benefice, who had no place at court, whose meals were doubtless a good deal simpler and less "regular" than breakfast and dinner at Wherstead Vicarage. But he need not stop to vilify the saint and patriot. Let this stand as a specimen of what an English clergyman, who we trust can excuse the saint and patriot at the stand as a specimen. himself on the plea of invincible ignorance, dares to write of the man who saved his country from the curse of discord:—

man who saved his country from the curse of discord:—

He a saint! Heaven save the mark; and some day send the simple folk of Unterwalden better ideas on what goes to make a saint. This saint was me only because to indulge a morbid crotchet, at all events a mistaken and mischlevous idea, he deserted his family, and the duties he owed to them, to his neighbours, and to himself, to live in solitude, and mortification, in a cave; and who gave out, as vouching for his sanctity, that for eighteen years heaven had supported his body with no other food than the sacramental wafer, received once a month. This was what made him a saint. Why, there is not a rural pavish in England without its poor Hodge, who is a better man, a truer saint than he; and who, if at last he were to break down under the strain on mind and body he is now manfully sustaining, and attempt what invested this old crazy ascetic with the halo of sainthood, would be bid by the law to maintain, and not to desert, his family. And who, if he were to defend his dereliction of natural duty by the assertion that heaven was keeping him alive without food, would be regarded as belonging to the same class of impostors as the Welsh fasting girl.

Then there comes some more stuff about "poor Hodge." We

Then there comes some more stuff about "poor Hodge." We wonder whether Roger is a very common name at Wherstead. It

wonder whether Roger is a very common name at wherevery certainly is not in other places.

And now, at the end, for a little about the Allmends themselves, about which Mr. Zincke does, also quite at the end, tell us a little, after a slight approach to the subject when he took his letter to the President, or whatever he was, at Glarus. At Glarus "the chief object" of Mr. Zincke's visit was "to hear, from another Swiss authority, another account of what is meant in these cantons by the word Corporation." If Mr. Zincke had told us what German word he meant by "Corporation," the object of his researches would be somewhat clearer. We suspect that the word that he had in his head was Verein. For he talks of "a corporation for educational purposes possessed of four alpes, and another for the encouragement of singing." And directly after he calls this last the "singing Verein, or corporation." Of such "corporations" as a sum that in them "these is nothing political in a encouragement of singing." And directly after he calls this last the "singing Verein, or corporation." Of such "corporations" as these, he truly says that in them "them is nothing political in a legislative or administrative sense," and that "in these cantons the idea of a corporation must be kept quite distinct from that of a municipality, or of any directly political organization." So in England the governing body of a school, though the school may be endowed with land, and still more a voluntary association for singing, is something quite different from the borough or parish in which the institution may be placed. But we agree with Mr. Zinche that "the subject was inexplicable," and that "confusion has become worse confounded "whap we read the following:—

The conclusion I had been wishing to come to, on account of its similarly and intelligibility, was that a corporation has no direct political pipel whatever; that it is a body either of old burgers, or of Beleasen, originally the Metocol of the old Greek republica,) endowed with perpetuity, which diding landed property often for some definite object; and that it is ignot from the commune, insemuch as that is the political entity, which submones all the old bergers for economical purposes, that is for the administration, such enjoyment of the numbered, of the communal landed supplier; and which now embrances both the old and the new languar for explicitly will absinistrative purposes a with, of comma, a great markey of sent exceptions and inclusions in the different cautons, and in their respectives. This, however, he hald us would not be opposed the

Glarus; but he quite delled in his attempt to show why it would not correct, or what would be correct.

If Mr. Zincke would translate his vague English and Franch words into the natural language of Swiss politics—since Greek has gone out of use, one is tempted to say the natural language of all politics—if he would tall us whether he saked about a Versia or a Generate or what, there would be some hope of getting at his meaning. As it is, we are as puncled as the President at Glarus alasaly was olearly

clearly was.

At the very end of the book, cropping out among a west deal of chatter, we do get Mr. Zincke's notions about the Allmends, which show that there are mements now and then when he ceases to chatter and really stops to think. And Mr. Zincke too quotes "M. Emile de Laveleye, a learned writer," which makes us think for a moment whether M. de Laveleye build conscient tiously return the pat on the back to the slandwar of Nicolas von der Flüe. Luckily, we have M. de Laveleye's last article in the Fortnightly Review alongside of Mr. Zincke's book." In that article he does not enter into the question whether the system of the Allmend, that is the preservation of part of the land of every Generale, commune, or parish as fulkiand or again publicus, can be brought back again in countries where it has and for making it an invariable rule in new settlements in America, Australia, or anywhere else. To our mind the great difficulty everywhere is the presence of the class of pirosco or Beinassen who are sure to arise. The old story of populus and plebs comes up again everywhere. In the Allmend system each householder among the burghers has his allotment of the common land to till; he may turn so many cows into the common measure: he may cut so much wood in the common wood. This nonlead to till; he may turn so many cows into the common pasture; he may cut so much wood in the common wood. This of course in no way interferes with the existence of private property, bookland, alongside of the folkland; but here is the folkland, in which every member of the community has his right, and which In which every member of the community has his right, and which gives every member of the community something to start with, something to fall back upon. Mr. Zincke argues that the acquisition of wealth by other means will destroy this right. A man may cut wood in proportion to the size of his house; that would be, in the primitive state of things, in proportion to the size of his family; a man who has got rich will build a big house and so get a greater share of wood. He will also want hired labour, and so will destroy the primitive equality of conditions. But the system of folkland does practically go on when there is great inequality of conditions. Take for instance Glarus, which is probably just now the most remarkably placed community in the world. Here is a manufacturing community which is a pure democracy—where, to put it shortly, the legislative power is in democracy—where, to put it shortly, the legislative power is in the hands of the workmen. If they want a Ten Hours' Bill, or any other hours' Bill, the Glarus workmen need not petition for it; they have simply to pass it. With our notions we should think such a society must be in an endless state of revolution, confiscation, what not. But, as a matter of fact, it is not. The folkland saves it; the primitive theory of property is the conservative element in the primitive democracy. The Glarus workman is not merely a workman; he is also a sharer in the common folkland. He has no need to run after new theories of communism, while he has a primitive communism of a better kind. We may add that Mr. Zincke's last chapter, No. XVI., is quite worth reading. But M. de Laveleye's article should be read with it.

GEORGE ELIOTS POEMS.

WHEN George Eliot took the world by surprise with the Spanish Gipsy, the first effect was a kind of intellectual resentment among critics. They were not content with denying that the new poem was successful, but they proceeded to show all manner of excellent reasons why it could not have been successful, but they proceeded to show all manner of excellent reasons why it could not have been successful that within the present century there had been at least one illustrious example of the combination. Some said it could not be poetry because it was philosophy, forgetting that philosophy has been transfused into poetry by a series of the masters of the art from the author of the Book of Job downwards, and that in particular much of the classical dramatic poetry of the world is surficiently philosophical. Some said it was too difficult, forgetting that the questions presented by real life are very difficult, and that a dramatic exposition of complicated motives is not likely to be very faithful if every caroless reader can at once understand it. a dramatic exposition of complicated motives is not likely to be very faithful if every carsiess reader can at once understand it. Others confined themselves to objections of a more legitimate kind against the mixture of narrative and dramatic forms, and various other matters in the execution of the work. But all this did not prevent the Spanish Gipsy from making a deep impression on readers who cared more for poetry than for critical dogmatism. They came to the conclusion that, whether George Rilot ought to have written poetry or not, she had, in fact, written a very considerable poem. And the critics themselves unconsciously admitted it by the very stringency of their indomenta. Opponents as well as admirent treated the book, not as the adventurous pastime of a novelist, but as the first flight of a new poet. The success which at first seemed doubtful has now been assured by the more deliberate verdict of the class whom critics profess to represent. Sufficient proof of this is afforded by the

The Legend of Junal, and other Posses. By George Ellot. Ediabases and Landon; Blackwood & Sons. 1874.

ouriosity and eagerness with which the subsequent poems which

curiosity and eagerness with which the subsequent poems which form the chief part of the present volume were received on their first appearance. We consider, then, that we are dealing with the work of a poet of established reputation, and we need not argue with any who think otherwise.

The most important of these poems are the Legend of Isbal and Armgart. Widely different as they are in subjects and in treatment, we find that the thoughts developed in them are in truth the same. They are both philosophical poems of the sort especially distasteful to certain readers, and they are both founded on the same philosophical doctrine. Under the two forms of the legendary inventor of music and of the modern prima donna, George Eliot has given us profound studies of the artistic temperament, the conditions of artistic life, and what we may perhaps call artistic inorality. The lesson of both poems is that the true artist must renounce his individuality. He must live for his art and not for himself; he must not look for his reward to any gain, either in goods or in fame, which can come to him perany gain, either in goods or in fame, which can come to him personally. He must have faith in results which he cannot see, and that faith must make his work its own reward. Jubal returns to his ancient home after centuries of wandering, and finds a new generation celebrating a feast in his honour, with such music as he had only dreamt of. When he tries to make himself known, they had only dreamt of. laugh at him and drive him out as a madman. Old and worn out he lies down to die; but the vision of his own past comes to console him with the thought that his life had reached its perfection in giving mankind the gift of song :-

This was the lot, to feel, create, bestow,
And that immeasurable life to know
From which the theship self falls shrivelled, dead,
A seed primeval that has forests bred.
It is the glory of the beritage
Thy life has left, that makes the outcast age:
Thy limbs shall lie dark, tembless on this sed,
Because thou shinest in man's soul, a god,
Who found and gave new passion and new joy
That nought but Earth's destruction can destroy.
Thy gifts to give was thine of men alone: Thy gifts to give was thine of men alone:
"Twas but in giving that thou couldst atone
For too much wealth amid their poverty.

In Armgart the situation is more complicated, and the trial imposed on the artist is harder. At the beginning we see the singer returning exultant from her decisive triumph in a leading part. She speaks as one thoroughly devoted to her art, and indeed believes herself to be so. She rejects a noble suitor, even though he admires her musical genius and would leave her free to follow its impulse, because, if accepted, he could not give her full sympathy, but only what she considers a cold acquiescence. But this devotion to art, high and passionate as it is, is not free from the leaven of individual pride. This is shown by various subtle indications such as George Eliot excels in, which produce their general effect at once, but which it takes a second or third reading to appreciate in detail. It also appears in the value which Armgart sets upon the external symbols of success. She professes to take pleasure in these things simply as a tribute to the power of famusic as embodied in her, but it is obvious that her feeling is not really unselfish. A certain amount of selfish glory is indeed con-In Armgart the situation is more complicated, and the trial imreally unselfish. A certain amount of solfish glory is indeed considered by most people to be only natural in the first moments of triumph, and would even be tolerated by most philosophers. But George Eliot's stern and lefty doctrine of self-sacrifice seems to have no room for it. At any rate the artist's pride receives a crushing blow in the conclusion of the poem, where she finds that her life has been saved from a dangerous illness at the price of destroying her voice. Her discovery of the loss is sudden and complete, and her first impulse is to think life not worth having on such terms. Again, most people will be inclined to say that an artist would be more than human if the shock of such a disan artist would be more than human if the shock of such a discovery did not at first make life seem wholly unprofitable. However, Armgart is seriously rebuked by her attendant cousin, hitherto a meek and obscure person. She passes from a state of extreme rebellion into a state of extreme reaignation, and determines to go and teach music in a small town. It seems to us that in this poem the philosophy of self-renunciation is somewhat over-strained. George Eliot seems almost to think that nobody's life is worth living for its own sake, and that to take pleasure in the good things of one's own life, which one can hardly do without being squaible to losses, is an act of treason against the social conbeing sensible to losses, is an act of treason against the social constitution of mankind. The excess of Armgart in this direction is happily corrected by the later poem of Stradium ins, where George Ehot gives us a brighter, and, as we think, a truer, view of an artist's just pride in his work.

The subject is gracefully introduced, as if suggested by one of Herr Joschim's violin soles. In our admiration of the composer and the player we are bidden not to forget Stradivarius. Then comes a dialogue between Stradivari,

That plain white-auroned man,

and one Naldo, a painter, whose artistic principles are lax, and whose performances mostly rest in the stage of promises and sketches. The true workman's delight in good work for its own make is a mystery and an absurdity to him, and Stradivari is roused to defend it with much spirit. The boldest and most striking supposes of the controversy is as follows:—

Then halds: "The petry kind of inne At best, that comes of making violine; And saves no messes, either. Thou wildings To purgetory none the less."

"Twee purgetory here to make th

And for my fame—when any master helds
"Twixt chin and hand a violin of miss.
He will be glad that fitradivari lived,
Made violins, and made them of the best.
The masters only know whose work is ges
They will choose mine, and while God giv
I give them instruments to play upon,
God choosing me to help Him."

What is

"What! were God At fault for violins, thou absent?"

"Yes; He were at fault for Stradivari's work.

George Eliot's Stradivari hits the true mean. Nothing will tempt him to do work that is not of his best, but he does not pretend to be indifferent as to what becomes of his work; he knows Nothing will that, if it were lost, it would be a loss to the world, and for that devotion to it. The one idea which, as we have endeavoured to show, is worked out in different ways in *Jubal*, *Armgart*, and *Stradivarius*, is itself only a special application of a much wider doctrine. The scientific truth that the welfare of the individual must yield to that of the race is true in a higher sense as an ethical

and political precept. No modern writer has seen more clearly than George Eliot the necessity of insisting on this doctrine, or has developed it with more insight and versatility.

The word versatility may strike many persons as inapplicable to George Eliot's writings. We can say nothing here of her proceed works, but in her peems, few as they have been, she has shown as their and commend of versions as they have been, she has shown as their and commend of the proceed the same of the process of t choice and command of various moods such as few of our living poets can claim. In Agatha we have a simple and charming idyl quite free from metaphysics, and with no more moral than the reader likes to imagine for himself. Still more remarkable is that tale in verse entitled How Line Lovel the King. A romantic story in ten-syllable couplets is the last thing one would have extend the first poet of the start of the star story in ten-syllable couplets is the last thing one would have expected George Eliot to write, but she has written it with beauty and facility; and if the condensed gravity of her habitual manner is not altogether forgotten, we find a little composure by no means amiss in the face of a modern school of garrulous and unbridled verse. A love-song which occurs in the poem is perhaps the passage which departs most from George Eliot's usual type. An extract from this will show that she need not fear meeting Mr. Morris on his own ground in

Morris on his own ground: -

O Love, who so didst choose me for thine own,
Taking this little isle to thy great sway,
See now, it is the honour of thy throne
That what thou gavest perish not away,
Nor leave some sweet remembrance to stone
By life that will be for the brief life gone:
Hear, ere the shroud o'er these frail hinhs be thrown—
Since every king is vassal unto thee,
My heart's lord needs must been loyally—
O tell him I am waiting for my Death!
Tall him for that he lottle such royal power. O tell him I am waiting for my Death!
Tell him, for that he hath such royal power,
Twere hard for him to think how small a thing.
How slight a sign, would make a wealthy dower
For one like me, the bride of that pale king
Whose bed is mine at some awitt-nearing hour.
(to to my lord, and to his memory bring
That happy birthday of my sorrowing
When his large glance made meaner gazers glad,
Entering the bannered lists: 'twas then I had
The wound that had me in the arms of Death.

A Minor Prophet again is so different from the other poems that we may call it eccentric. It begins with a quaint description of a vegotarian enthusiast (in which there is a good incidental stroke of scorn at the pseudo-scientific jargon of spiritualism), and the result of his visions of a blessed vegeturian future is thus summed

Boys will be boys, but dogs will all be moral, With longer alimentary canals Suited to diet vegetarian. The uglier breeds will fade from memory, Or, being palsontological, Live but as portraits in large learned books, Distasteful to the feelings of an age Nourished on purest beauty. Earth will hold No stupid brutes, no cheerful quoernesses, No naive cunning, grave absurdity. Wart-pigs with tender and parental-grunts, Wombets much flattened as to their curtour, Perhaps from too much crushing in the ark, But taking meskly that fatality; The serious cranes, unstung by ridicule; Long-headed, short-legged, solenn-looking curs, (Wise, silent critics of a flippant age); The silly straidling fools, the weak-brained geess Hissing fallaciously at sound of whests-tailed allaciously at sound of whests-tailed geess Hissing fallaciously at sound of whests-tailed allaciously at sound of whests-tailed geess All these rude products with have disappeared Along with every faulty human type.

mething of an American character in th

There is something of an American character in the grate suggestion of the wombat having get flattened in the Ark. after this the tone of the poem curiously changes, and it seds quits serious and meditative speculation. It is dated 1865—a instance of a poet having literally fulfilled the pedantic and per ironical Horatian precept of keeping work nine years in store. Among the few remaining pieces we have to single Brother and Sister. This is a continuous poun, half n tive, half reflective; in form it is a series of Shakages somets. The practice of using the somet in this way has consumed on the ground that a somet quick to be sometime. Since his it is insuranced by antitioned by authority, and the sometime and hardles appears to the carefier and hardles against to the carefier and hardles against the first against the same lines.

pression throughout, and its generally modern observe place at least interrupted by a touch of true Shakuty of expression thre n incy:

> pers were send to all my after good; nt gladeou, through eye, one, and to ally as warmth a various food ish the sweet shill of loving much. For who is ago shall room the earth and find: Beausies for loving that will etrice out love With sudden rod from the hard year-pressed a Ware reasons sown as thick as stars above, "In love must see them, as the eye sees light: Buy is but Number to the desicened sight.

We conceive that some unconscious reminiscence, possibly suggested by the associations of the metre, has here brought about a hander effect than could have been obtained by any duliberate implation of Shakepeare's writing in his someta.

It may occur to our readers that we have performed only half the office of a critic; for we have spoken of the excellence of George Mijot's work and said nothing of its faults. Our answer is that we think it a critic's duty to dwell on merits which are of a in a reconstraint at a first relance rather than on defeats in a reconstraint. casily appreciated at a first glance rather than on defects in execution which are comparatively triffing. The criticisms we refrain from making are in this case both obvious and unimportant. Moreover, George Eliot is not one of those careless or perverse writers who have to be constantly reminded of their faults; and when we have in our hands the good work of a careful artist, we may indulge the natural desire to let no petty questionings disturb our

STR GEORGE LAWRENCE'S FORTY-THREE YEARS IN INDIA.

THIS is a most interesting book. Sir George Lawrence has had more than a common share in the events which make up the Indian history of the last half-century, and he appears during the whole period of his service to have kept a diary. This has now been compressed and brought into readable shape by Mr. Edwards, late of the Bengal Civil Service, himself the author of a most interesting narrative of thrilling adventure and escapes during the Mutiny. How much of the present work may be due to the author and how much to the editor we cannot tell, but the result is a book which bears the impress of that accuracy as to dates and facts which can only be obtained by recording them at the time, without the tediousness of a journal pure and simple, and which is so interesting from tirst to last that few persons who take it up will be able to lay it aside till they have read on to the end. We have merely one small criticism to offer at starting. The rank ascribed to the different officers mentioned in the book is not always what they held at the time of the events described. always what they need at the time of the events described. The present General James Abbott, for example, was not "Major" Abbott when he made his celebrated journey to Khiva nearly forty years ago. There are, we think, one or two other slips of the same kind, small blemishes which might be corrected in a subsequent edition.

Sir George Lawrence, the eldest of the family of distinguished brothers, strived in India in 1821 as a cornet of cavalry. His first seventeen years of service were quite uneventful, passed in the ordinary routine of Indian centonment life, with occasi moves from one station to another, until 1838, when the 2nd Bengal Light Cavalry, of which regiment Lawrence was still lieutenant and adjutant, was ordered to form part of the force assembled for the occupation of Afghanistan. The Bengul army appears at that time to have been in the lowest state as regards discipline and organization, although the fact was not discovered till affective and the state and the state are stated as the state and the state as the s till afterwards. It had outlived the days of Lord Lake and the great Mahratta war; for many years it had not been op-posed to any worthy fee; and any incompetent old general, pro-vided he had served in the Peninsula, was thought good enough to command it. Indeed it cannot be said to have been commanded at all. It took care of itself. It is the faction to ascribe the decay of the Indian army to the Afghan disasters, but this appears to be mistaking cause for effect; these disasters would not have occurred if our military organization had not been in a wretched coccurred if our military organization had not been in a wretched state; they were merely the storm which blaw down the rotten branch. The first advance into Afghanistan, through the Bolan Pass, under Sir John Keane, reads more like the retreat of a besten army than the unopposed advance of one which had not really opened the campaign. Such was the want of discipline, and the preposterous way in which the order of march was organized, or disorganized, that one officer, of the 16th Lancaw, took forty servants with him, "although prohibitory orders had been reiterated, limiting the number for each officer"; camp-followers were murdened almost within the camp, while others died of star-vasion on the way; the letter-poets were out off, and large quantities of laggage and storm had to be destroyed to prevent their becoming a pasy to robbers. Arrived before Churnee, for the capture of which no-passparations had been made, the gates were blown in by a happy impiration and audacity of the engineers, and the British portion of the force stowned the place with characteristic gallanters. For this campaign the leader, who appears not to have limitated any signs whatever of gatestalship or conducts, and to be made of the new bright-spinode in it, the capture of Ghunnee, was not in the alightest degree due, was raised to the places.

philipson of Postpolico Fours to India. By Lieutenant General ngs Lawrence, E.O.S.L., C.R. Felted by W. Schwarle, H.M. E.C.L.

On reaching Calmi the troops took up their pinitic bin surrounded by hills which commanded it, of heir wives and children from India, and business outcomed as if there were no need for political and nations—in fact, just as it might have then if the encountry miles of Orientes. The minute street which follows and discharge of the street of the contract of the cont been within two which follows reads as frushly now as # th aster which follows reads as frushly now as if the event had beened last year, and no one was more computed to describe it to Captain Lawrence, who was at this time military equation to Envey, the unfortunate Sir William Bluonaglicus; as in one pied this confidential post, his marrative has a special value, and some important respects throws a new light on the event. We may be say that "vacillation and incapacity ruled in our milit councils, and paralysed the hearts of those who should have so with energy and decision"; but we do not draw the same inform the event which he does, that it has "respect down to now country a stigma from which, in the East of Country and the same from which, in the East of Country and the same property in the first piece, it has been the first to exaggerate greatly the extent of the disease. The Britanny" which was massacred at Cabal consisted of one bettelly "army" which was massacred at Cabal consisted of one battalium a British infantry, six hundred strong; one battary of European horse artillary; three regiments of Bengal native infantry, comprisin about two thousand men; part of a regiment of Bengal native cavalry, and some irregular troops of sorts which had been rates for local service. The whole of this small force might have be for local service. The whole of this small force magaz have now destroyed without any sensible shock to British power if they had died fighting like men, instead of being shot down miserably as defenceless mob. In the next place, it is educed inconscivable the any such combination of folly as then characterized our precedings should ever be repeated. Lord Auckland, the weaker Governor-General ever sent to India, displays from first to less the extremes of rashness and supineess. To send a force of the statement of the statement of the statement of the statement of the sentences of the statement Afrhanistan at all, with the Punjab and its large unruly Site army intervening, was an act of radness; but, this having best done, not a single reasonable precaution was taken for the safety of the force, while Lord Auckland absolutely insisted to requiring a poor incompetent gouty old gentleman to take the command of the troops there against his wish. Sir G. Lawrence indees speaks of General Elphinstone as a "skilful soldier, well versed to speaks of General Elphinstone as a "aginti solder, well versed a all branches of his profession, and a naturally brave man, cool an andaunted in danger," although now prestrated in mind and bod by severe and protracted illness; and this is the only piece of talk sentiment which distigures the book; for as to this well-most whittewashing, it must be observed that Elphinstone not only gave whitewashing, it must be observed that Elphinstone not only gave. no sign of skill or coolness in danger, but that his conduct from to last seems to have been conspicuous for the absence of eithe quality. Every military fault that could have been committed h the general in command appears to have been exhibited, while, as t what is said about his characteristic virtues having been obscurs by illness, even a man suffering from gout might have died in th field at the head of his troops.

It was in truth not the enemy, who showed themselves a contemptible fee in actual fight, nor the Cabul snows, for there we no necessity to have encountered them, which effected the ruin a Elphinstone's brigade; but the weakness and incapacity of the British leaders, and the consequent demoralization of thuse is: British leaders, and the consequent demoralization of those immediately under them, and the indiscipline of the troops. Sir G Lawrence endeavours to defend his immediate chief, the unfortunate Envoy, from a share of blame in the affairs which brought about the disaster, but here he seems to us to show a no unnatural partiality. Sir William Macnaghten certainly manifeste a degree of personal and moral courage which was in striking contrast with the bearing of the two senior military officers but for the total want of prevision displayed in our arrangements for occupation the head of the local Government. It surely the person most responsible. Thus our author apologiess for Magnaghten's omission to occupy or destroy the forts in the saist Magnaghten's omission to occupy or destroy the forts in the neigh bourhood of the Cabul contament, and which completely com-manded it, because Lord Auckland declined to sanction the manded it, because Lord Auckiand declined to amotion their purchase, repeatedly proposed by him, on account of the expense list a strong man wielding such powers as were extrusted to the Envoy during the occupation of Afghanistan would not have allowed a matter of detail of this sort to be supposed that, if he has tant authorities in India; nor is it to be supposed that, if he has suffered his proposal with sufficient urgancy, the Governor-Georges would have taken on himself the responsibility of withholding assert to a measure absolutely necessary for the safety of the Beitish marrison. Again, it is acid that Blacongisten "protested" would have taken on himself the responsibility of withholding assent to a measure absolutely necessary for the safety of the British garrison. Again, it is said that Macnaghten "protested against the insune arrangement under which the Commissariat store were "located outside the entruched position, as being highly dangerous, but was informed that there was no room for their within the cantonments, which was all required for harmacks. But in a matter of this sort it was the duty of the Ravey no movely to protest, but to order distinctly what should be done; the general's business was morely to command the troops, not to show with him in the responsibility of the measures needed for the occupation of the country; and firmness on this head the the most necessary when the head of the faces was a poor, worm-out it man, brought in by favouritism from the half-pay list. It is income necessary when the head of the faces was a poor, worm-out it man, brought in by favouritism from the half-pay list. It is income necessary when the head of the faces was a poor, worm-out it man, brought in by favouritism from the half-pay list. It is income necessary when the head of the faces was a poor, worm-out it man, brought in by favouritism from the half-pay list. It is income outwhile that Lord Lawrence, for ensumple, if he had been in Max neghtan's place, or Sir G. Lawrence himself, would not have acte diffusestly. Being what he was, a man with many fine qualities but unequal to the situation, it is not exprising that Macnaghte did not take the step most ungually needed, of superseding on it commends, and Shelton the second it commends, and appointing some competent officer to succeed them. Had this been done, the whole course of events would probably have been different. But indeed there was hardly a time, up to the actual culmination of the final catastrophe, when a different and happier turn might not have been given to them. If the Bala Hissar and the city had been occupied and retained immediately after the first outbreak of rebellion; if, failing this, the forts which dominated the cantonments had afterwards been occupied; if the country in rear had been kept open, so that supplies could have been brought in; if, in short, a bold front had been shown in any one way—if, even at the last, when the miserable retreat had actually commenced, and the treachery of the enemy was declared, a move backwards had been made on the Bala Hissar—even then, in Sir G. Lawrence's judgment, a position could have been taken up there for the winter and the force

But these reflections have carried us away from the subject of our notice. In this miserable affair Captain Lawrence was among those whose conduct stands out in bright contrast to the imbecility and weakne and others. How he became a prisoner on the occasion at 5ff William Macnaghten's murder, escaping a similar fate by the strangest fortune; how he was afterwards liberated and became a second time a prisoner; of the trange scenes passed in captivity, where some of the weakne and time for petty grumblings, human nature being the same nature everywhere; of the curious mixture of savagery and politeness exhibited by their captor; how Lawrence was sent as an envoy into l'ollock's advancing camp, and, his mission proving unsuccessful, had to return like another Regulus, of his own will into the hands of his enemies; how eventually the prisoners obtained a rescue through the treachery of their gaoler, just as they were on the point of being sold into hopeless captivity beyond the frontiers of Afghanistan—for an account of all these events we must refer the reader to the boan account of all these events we must refer the reader to the boan demanding better treatment for his fellow-prisoners; or helping the forlorn women and children on their dreary marches; or running races with the Afghan guards; or, finally, acting as distributor of the scanty rations, and settling the little squabbles incidental to close packing and want of occupation, Lawrence's manly, straightforward character and sterling good sense stand out conspicuously. No one can read the book without being very favourably impressed with the writer's gallant and kindly character, and his determination and good sense.

It was Major Lawrence's fate to become a second time the prisoner of a barbarous for when the Silb course.

It was Major Lawrence's fate to become a second time the prisoner of a barbarous foe, when the Sikh army revolted from British domination in 1848, and he, as political agent on the Peshawur frontier, was cut off with his wife for the time from means of succour by his countrymen. Here again the respect which his character had inspired among the native leaders stood him in good stead, and he was well treated on the whole, although his life all the time hung upon a thread. Finally, as chief political officer over the extensive Rajpoot country, Colonel Lawrence, as he had now become, played an important part during the Mutiny, when his firmness, courage, and popularity with the native rulers of those territories were largely instrumental in preventing the extension of anarchy into that part of the country. With the restoration of peace to India terminated an eventful and highly honourable career, and the narrative of his share in the suppression of the Mutiny brings to an end this very interesting volume.

DR. CHANNING AND MISS AIKIN.*

In 1826 Dr. Channing sent to Miss Aikin his work upon Milton's character and writings. She acknowledged the gift in a letter which opened a correspondence lasting until his death, in 1842. The writers agreed that the correspondence should belong to the survivor, and it accordingly passed into the hands of Miss Aikin, and was left by her to her niece the present editor. In a letter written by Dr. Channing in 1839 he says that he would be glad to have his own letters back "to guard against the possibility of their being published." His reason is the very sound one that they often expressed crude notions which did not accord with his deliberate judgment. It seems, however, that in the opinion of Miss Aikin and her successors this prohibition was not meant to apply to the letters as a whole, but only to particular parts of them. Accordingly Dr. Channing's nephew and Miss Aikin's niece have agreed to disregard it, and the consequence of their decision is the appuarance of the present volume. We confess that we feel inclined to sympathize with Dr. Channing's view, and should have thought it better to obey his wishes implicitly rather than to assume that his objection would only apply to the parts which have been omitted. In such matters we hold it to be the sound principle to incline to the side of undue suppression rather than to the side of undue publication. The world is already sufficiently deluged with valueless correspondence; and when a writer of distinction has a genuine feeling that his letters do not fairly represent him, it seems to be very questionable whether his wishes should be disregarded. Besides this general objection, we cannot say that the substance of the volume tends to reconcile us to a breach of the rule. There is in it, indeed, nothing which is discreditable either to Dr. Channing or to Miss Aikin.

Here and there there are obviously hasty utterances, and there are a good many expressions of opinion which might probably have been qualified if the author had had the fact of publication before his eyes. There is, however, nothing very flagrant; and our objection is merely based upon the opinion that the intrinsic value of the letters scarcely justifies their present appearance. They are not sufficiently remarkable, that is, either from literary merit or from the light which they throw upon the character of the correspondents, to make it worth while to violate the general law which should maintain the confidential character of private letters.

the general law which should maintain the confidential character of private letters.

Having said thus much, however, we may admit that, as the letters have been published, they are worth turning over. The characters of the writers are sufficiently known. Dr. Channing was a man of great eloquence and ability, and shared the general desire of cultivated Americans to follow the movements of English thought and political activity. Miss Aikin, though we can hardly give her a very high place amongst our female authors, was a woman of much literary eminence in her day; and as her religious tendencies inclined her to look up to Dr. Channing with great respect, he naturally trusted to her for information as to the matters which interested him. Her character comes out rather amusingly in some of the letters. By birth and education she was a strong Unitarian, and shared to the full the prejudices common amongst her class. She speaks with intense dislike of the chief religious schools of the day. She hates the Evangelicals and the High Churchmen about equally; and she consoles herself for the rise of the Oxford achool by regarding it as a kind of set-off against the Clapham sect. She hates the bishops heartily, and clooks forward with eagerness to a disestablishment of the Church, which in her eyes was the embodiment of the evil element in English politics. She naturally considers herself, therefore, to be a good reformer, if not a Radical; and yet good solid British prejudices come to the surface every now and then in rather incongruous connexious." When Dr. Channing expresses the ordinary American view of European politics, she fires up in defence of the English aristocracy; and, though admitting private letters. then in rather incongruous connexions." When Dr. Channing expresses the ordinary American view of European politics, she fires up in defence of the English aristocracy; and, though admitting theoretically that all manner of sweeping changes are necessary in our Constitution, she evidently holds that all English ways and institutions have somehow a vast superiority to the products of that democratic state of society of which her favourite reforms would naturally hasten the advent. In the last letter of the correspondence she becomes almost angry at some remarks which Dr. Channing had innocently made as to the relative charms of English and American women. She assures him, not as it which Dr. Channing had innocently made as to the relative charms of English and American women. She assures him, not, as it would seem, quite politely, that when he was in England he saw but little society, and that of an inferior kind, and insists upon the a priori probability that the metropolis of the British Empire, "the first city in the world for size, for opulence, for diffusion of the comforts, accommodations, and luxuries of life, as well as for all the appliances of science, literature, and taste," should provide better manners than can be found in an American State capital. There is more patriotic pride in some vehement reformers than they would be altogether willing to admit. In some other matters, however, Dr. Channing seems to be more just to Englishmen than Miss Aikin. She evidently had some hearty dislikes which did not quite satisfy an observer removed from the sphere of little than Miss Aikin. She evidently had some hearty dislikes which did not quite satisfy an observer removed from the sphere of little personal prejudices. She speaks, for example, very contemptuously of some distinguished men, such as Mr. Carlyle, Scott, Wilberforce, and Coloridge; and Dr. Channing in each case protested very sensibly against her rather presumptuous judgment. English prophets indeed frequently have more honour in America than in London; and we feel that Miss Aikin, if not exactly jealous of eminent compatriots, was very apt to be carried away by party praiudices.

prejudices.

The interest of such opinions may not be very great; but it is curious to look back upon the views which were expressed by the spectators of that period of history which is least familiar to most of us, and which yet has the strongest influence upon us—the history, namely, of the last generation. Running over these pages, it is half melancholy and half ludicrous to observe the eagerness with which some questions were agitated forty or fifty years ago in the full hope of a speedy solution, which have certainly not got themselves finally settled. Dr. Channing was an ardent believer in the uniform progress of the species, and we are not surprised to find him exulting in 1831 over the marvellous speed with which the French nation had become politically educated, and evidently holding that the revolution of that year was giving a final answer to the great questions of the century. Miss Aikin is equally enthusiastic about the Reform Bill. It is to be a new Magna Charta, and the King is worthy of his people. "A patriot king!" she exclaims, "once in a millennium is such a phenix seen upon earth. Alfred was our last." But, though the Reform Bill is to put everything straight, she becomes frightened at intervals. A dreadful visitation, she says in 1832, is approaching the country. Thousands will be interrupted. But far worse may be anticipated. Our over-population, it is true, may be remedied, but by what a remedy! In short, the cholera is coming; and Miss Aikin evidently expects that it will slay its millions. Neither the cholera nor the Reform Bill did all the evil or all the good that was expected from them. There were other difficulties on the horison, from which, however she anticipated a speedy deliverance. In 1834 she comments on the solving dangerous about them. It was plain that the stream is nothing dangerous about them. It was plain that the stream is nothing dangerous about them.

the journeymen themselves in the first place, and then on the nation. This is so clearly perceived that they (the Unione) have found no sympathy anywhere, and the delusion amongst themselves is subsiding, or will subside." In 1836 she has another good place of news to announce. Dr. Channing had sometimes spoken of the evils resulting from the great measure of poverty in our large cities. "I am happy to acquaint you," she says, " that this great evil is rapidly diminishing." The Foor-law has restored the independent spirit of the poor. The spread of education is rapid, and the people themselves are demanding it. Some wretched Mr. (iilus, as she says in another letter, had maintained in a speech that Prusaians were better educated than Englishmen, and that we abandoned our poor to shameful ignorance. "In England such a misrepresentation as this would not describe as the small and decompositions." our poor to shameful ignorance. "In England such a misrepresentation as this would not deserve refutation"; but, as people might not be so well informed in America, she points out for Dr. Channing's benefit how much we have already done, in spite of her bugbear, "the bench of bishops," and how speedily we shall distance the slavish Prussians. Some people are of opinion that the evils thus noticed have not vanished quite so speedily as Miss Aikin anticipated. Certainly Dr. Channing entertained hopes equally destined to frustration. He thinks that a reign of peace is setting in owing to the extension of commerce, and that, if war is kept off a little longer, public opinion will be overpoweringly strong against it. And yet, to do justice to Dr. Channing, we must remark that this is perhaps one of the passages which he would have regarded as expressing a crude opinion. Miss Aikin afterwards refers to an able lecture in which he argued that trade would not put a stop to war, inasmuch as it encouraged selfishness. This cera stop to war, inasmuch as it encouraged selfishness. This cer-tainly is a more considerate opinion, and has been better con-

tainly is a more considerate opinion, and has been better confirmed by subsequent history.

Both Dr. Channing and Miss Aikin made grievous errors, but they were errors eshared by many others, and errors on the generous side. Both of them show a warm interest in the great movements of the time, and a worthy estimate of their importance, though a very inaccurate judgment of immediate results. In this sense the correspondence is creditable to both writers, in spite of occasional absurdities. If we are disposed to laugh at them, perhaps we might remember the principle that he who is without sin should cast the first stone, and our most profitable conclusion might be that, in all probability, the fears and the hopes expressed by eminent writers in our own day will in great measure turn out to be as vain as the anticithe fears and the hopes expressed by eminent writers in our own day will in great measure turn out to be as vain as the anticipations of the last generation. The reform of the world is a very slow business, and if some people were not unduly sanguine and others unduly doleful, we should probably carry it out with less energy than at present. Without further remarks upon this point, we will conclude by noticing a rather curious criticism by Miss Aikin on the style of Prescott's History. She finds fault with him for his neologisms, and especially for his talking about a "border forcy," and describing artisans as "operatives." These, she thinks, are words which would not be used by an Englishman who had mixed in good society, and one advantage of an aristocracy is that it sets a standard of taste which preserves the language from such innovations. If the use of such phrases were the worst outrage upon English introduced from America, we could submit very placidly to their evil influence.

TAYLOR AND CREST'S ROME.

AN almost unique lot has befallen this well-known and most AN almost unique lot has befallen this well-known and most useful book—namely, to be prepared for a second edition by one of its original authors more than fifty years after its first appearance. It was as long ago as 1821 that the first edition was published in two volumes at the high price of eighteen guineas. Of course the book became out of print, in spite of its costliness, for it supplied a want that nothing else has met either before or since. Mr. Taylor, having survived his coadjutor for many years, revisited Rome quite lately as an octogenarian, and made arrangements for bringing out a new edition of the book with which his name had been so long and so honourably connected. He had revised the work in presence of the editions therein described, having regard further to recent discoveries in the topography and archeology of Rome. He was not spared, however, to see the completion of his undertaking. The new edition was about half-way through the press when its author died about a year ago. His son, the Rev. Alexander Taylor, Fellow of Queen's College, Oxford, and Chaplain to Gray's Inn, has now finished the task, and has thus furnished a worthy monument to his father's honoured memory.

finished the task, and has thus furnished a worthy monument to his father's honoured memory.

The special and peculiar value of Taylor and Oresy's work is that it gives not mere artistic aketches, but detailed geometrical drawings and measurements, of so many of the chief monuments of ancient Rome. For all practical garposes these working drawings, as they may be called, are invaluable. Fifty-three years ago, when the hook was first published, photography had not been even thought of. Every one knows the worthlessness of singust all architectural drawings and engravings of that date. Photography has accusated us to absolute accuracy of outline and detail, and it is not till one examines an old book, or an eld portfolio of prints, that one appreciates the greatness of the delit which architectural art owns to the sun's pencil. It magnined some country in Mr.

Taylor to reproduce with literal exactness the stehings and disgravings of half a century age. The illustrations in this new edition seem to have been for the most part printed from the original plates, without any change beyond an occasional retouching of worn or damaged places. Occasionally—as, for instance, in Plate Ixili., which gives a parapootive view of the heights and cascades of Tivoli with the Temple of Vests on the brow of the precipice, and again in Plate critir., in which the Colosseum is the subject—we cannot but compare these uld-fashioned illustrations, considerably to their disadvantage, with the exquisite photographic views of the picturesque places that are so familiar to us. But in the large majority of cases the measured drawings of these two accomplished architects reassert their own value. No one could make use of a photograph, as he could of drawings of these two accomplished architects research their own value. No one could make use of a photograph, as he could of these accurate sections and elevations, in order to reproduce the building or to study with severe accuracy its most minute mouldings and details. Here again the republication of this work is opportunely timed. When it first saw the light the Cothic revival of our days had not yet begun. The first, or nearly the first, Gothic church of Sir Charles Harry, St. Peter's at Brighton, was not built till 1823, and it was tifteen or twenty years after that date before the Pointed styles had fairly come into general use for all ecclesiastical buildings. We do not say that modern Gothic has now run its course and is likely to perish from among us. But at any rate a broader eclecticism of architectural style is now prevailing; and in the really magnificent outburst of street archivailing; and in the really magnificent outburst of street architecture which adds so much interest to the great new thorough-fares of the City, there seem to us to be some indications of the possible formation of a general characteristic eclectic style, borrowing some features from all its predecessors, and reviving and renewing, in particular, the best traditions of the Renaissance. Be this as it may, our rising architects cannot afford any longer to be ignorant of the real principles of the antique classical styles; and the new edition of the standard work before us will be welcome, we hope, to many professional students. It is still as necessary for the exact study of the architecture of Rome as the work of Stuart and Revett is for that of the architectural remains of Greece.

Resett is for that of the architectural remains of Greeces.

We proceed now to give some description of the contents of this beautiful volume. There are a hundred and thirty plates in all, of which the last, No. cxxx., is in reality the introduction to the whole, and takes its place accordingly first in the book. This, in fact, is a ground-plan of the larger part of the Roman Forum, extending from the Capitol to the Colosseum, and northward to the Temple of Mars Ulter and the Forum and Column of Trajan. to the Temple of Mars Ulter and the Forum and Column of Trajan. It is altogether a new plate, lithographed from a new drawing by Mr. Taylor, and showing the many recent discoveries in the topography of the Forum made of late years. This gives it a pseudiar value at this time. We cannot help wishing that the old plate had been reproduced side by side with the new one for the sake of comparison. It is, of course, impossible without the aid of a plan to give any satisfactory account of the recent excavations. Nor indeed does Mr. Taylor do more than indicate them in his ichnography. Throughout the volume indeed the letterpress is quite subordinate to the geometrical drawings; and we note several misprints, such as Sta. Maria Mayives for Maggiare, and one or two wrongly spelt Italian words, which have been allowed several misprints, such as Sta. Maria Magners for Maggiors, and one or two wrongly spelt Italian words, which have been allowed to pass uncorrected. There remains one feature in this interesting plan of the Forum that deserves special notice. We mean the comparative elevations of the chief structures of ancient and modern Rome. We doubt whether it is generally known that St. I'eter's Rome. We doubt whether it is generally known that St. I'eter's covers a larger space than the Colosseum, and that its outer walls are of about the same height as the walls of this famous Amphithester of Vespasian. Within the section of St. Peter's this plate gives a section of our own St. Paul's—which Mr. Taylor calls "our metropolitical church." Contrasted in this way, the dimensions of St. Paul's seem puny indeed, and the faults of Wren's sham dome are painfully conspicuous. All the buildings illustrated in this work are shown to scale in their comparative magnitude in this irreductory plate, and those of them which belong to Rome itself are laid down in their relative positions in the general ground-plan.

are laid down in their relative positions in the general ground-plan.

The first structure that is illustrated in full detail is the Arch of Titus. Ten plates are devoted to it, each of which has some explanatory letterpress. Here we have an opportunity of comparing the ruined condition of the arch, when Messrs. Taylor and Orcey first measured it, with its present restored state. It may be doubted whether "restoration" may not be as mischievous in a classical arch of triumph as in a Gothic cathedral. Next in order comes the Triumphal Arch of Septimius Severus, to which nine plates are assigned. First we have a perspective view of its east side, towards the Forum, and then a plan, showing the coffers of the soffits of the three arches, &c., with proper elevations, sections, and full details, drawn to a scale of one quarter of their actual size, and, lastly, careful details of the has-reliefs. The next six plates illustrate the so-called Arch of the Goldsmiths. In the inscriptions and the sculptures of this structure it is still possible to trace the name and figure of Gets, though both are known to have been ensed by the order of Caracalla. Thence the reader is taken to Ancons, where remains an arch of triumph erected in honour of the Emperor Trajan on occasion of this completing the harbour in A.D. 116. Four plates suffice for the fall libustration of this structure, which is of small dimensions, semiplising a single arch, which is not more than ten feet high, and was never intended for carriages of any sort to pass under. The last of the series of triumphal arches here figured is that of Caracantaine at Rome, the most magnificent as well as the best

^{*} The Architectural Antiquities of Bane. With Our Mondred and Thirty from and Manuscrements taken in 1827, 1828, and 1829. By Gange Edward tyles and Edward Crosy, Architectus. Son Edition, including the more count Dispersion. Landon: Landon: Landon: 8 (c), 1874.

preserved of the number. The bas-reliefs used in the arch were taken from a much earlier use that had been erected in honour of Trajan, but afterwards demolished. The details of the parts that are of Constantine's own date are sufficiently rude and coarse.

Of much greater interest than these arches is the Pantheon, which is fully portrayed in fifteen or sixteen plates. The authors give a careful and judicious history of this famous building, and their restoration of its presumed original condition is highly instructive to every real student of architecture. For massive simplicity of conception and yet sublimity of effect the Pantheon is absolutely unrivalled. The exterior of the Albert Hall must have been intended to reproduce the general effect of Agrippa's temple, but has utterly failed to do so. We have often wondered that no one has yet thought of copying the Pantheon exactly for the purpose of an auditorium. We may remark, in passing, that Mesers. Taylor and Oresy's geometrical drawings of the Pantheon to concentrate incontestably superior to those of Canina, in his Temple Cristians. The Temple of Antoninus and Faustina is of less importance. We pass thence to Tivoli, where the circular peripteral Temple of Vesta, one of the most perfect genus of ancient architectural art, affords matter for eight plates. The building is shown in its present ruined condition as well as in an imaginary restoration. In the latter state the architects have most properly given it a low conical roof, guided thereto by the precedent afforded by a medal of Augustus, in which a circular temple is shown with a roof of this kind, and also by a bas-relief preserved at Florence. They might have remembered that at the time of the first restoration of one of the four remaining round churches of England, that of St. Sepulchre's, Cambridge, which was affected more than thirty years ago, much controversy was excited as to the proper manner of roofing it. Happily the conical shape was adopted, on the authority chiefly of numerous manuscript illuminations of mediaval roofs of this kind. Recently Mr. St. Aubyn has added a roof of this shape to the atill more famous round church of the Temples of Mare Ultor at Rome, and of Jupiter Tonnas. There are but fragments of these; but it has been possibl

WINWOOD READE'S ASHANTEE CAMPAIGN.

attend a military expedition for the entertainment of newspaper readers are variously qualified. Some of them are prosumed to be familiar with the organization and equipment of the British or of foreign armies, and with the method of field and slege operations. Others profess an enthusiastic political sympathy with the national or partisan cause to be served by the warlike force to which they are attached more as culogists or apologists than as reporters. A third class are disposed by previous studies at home or observations abroad to look rather at the country and the people through which lies the campaign they are sent to describe. Of this class is Mr. Winwood Reade, whose imagination, early kindled by perusing ancient and recent histories of African travel, has impelled him more than once to long solitary rambles and residences in the western parts of that Continent. The African Shatchbook and Savage Africa have shown not only his large acquaintance with the literature of this subject, and some powers both of disquisition and romantic fiction, but a fair degree of personal experience. This was gained by him several years ago in places tolerably remote from the route of the late march to Coomassie. He had sojourned with the Fans up the Gaboon river, under the equator, and he had gone inland from Sierra Leone towards the sources of the Niger. On the Gold Coast, midway between those distant localities, he had visited the two extrames of the territory called by this name, consorting with French officials on the Assinic river, and with German evangelical and industrial missionaries from the hills behind Access to the Volts. But he had no particular knowledge of the Fantses about Cape Coast Castle, or the affairs of the literature of the Remains and Governor Winnists, who had be a marked the later than a marked as the rest of use little more literature of the laterature of

ter Changeign. By Wiewall Charle, the State, Million, Selfer, Se Co. 18874

being somewhat conversant with the African character in general, and with the native liabits of thinking and feeling. From this ingredient the present volume derives a cartain flavour of lamous inferest which is sometimes lacking in the acont authentic passing of diplomacy and strategy, or the mechanical details of comparing. The author has too a brisk, forvible, and pointed appropriate with the literary skill to present a rapidly moving succession of scenes and figures. Mr. Winwood Reade's "Story" is at laint readable, whatever may be the value of his information and his opinions.

opinions.

We need scarcely dwell upon his anthropological theories and speculations on the prec-historic or dimly historical conditions of western Africa. The opening chapter, which begins with the picking up of stone implements here and there, proceeds to tall us how the natives of the Gold Coast, though inhabiting a furest, see civilized beyond other African bushmen through their possession of the precious metal. Iron manufacture, in this author's view, is essecivilizing than a fureign trade, whether overland or massission attracted by those "golden sands" which are, with "palmy wins," the bounty of Nature to "the naked negro," several degrees needs of "panting at the Line." It may be granted that gold was at first the lure which brought the slips of European adventures there, as it may have drawn the inland traffic of Carthage, and perhaps of Egypt, many centuries before, into some channels of circuitous commerce with this obscure region towards the Atlantic shore. The famous "aggry beads" of glass mosaic are thought to betoken such an ancient connexion. It further seems a likely argument that, without some kind of fereign trade, the monopoly of a ruling class or race, or of a territory advantageously situates, an immense time would clapse among savage mankind before there could be a sufficient concentration of wealth and intelligence to form a powerful kingdom. A staple trade and a revenue appear indispensable to the growth of a State. Bu. It is to the slave trade, not to the export of gold or other natural products, that the empires of Ashantee and Dahomey owe their existence. Under French, Dutch, and Portuguese, the mainspring of West A frican political progress was the profitable game of man-hunting, and the supply of prisoners of war to a foreign market. There is no essential difference in this respect between the rise of the Ashantee power and that of Dahomey, which is not a gold country.

progress was the profitable game of man-hunting, and the supply of prisoners of war to a foreign market. There is no essential difference in this respect between the rise of the Ashantee power and that of Dahomey, which is not a gold country.

The hasty and superficial sketch given by Mr. Reade of the European settlements on the Gold Coast, and of the transactions between Cape Coast Castle, Elmina, and Coomessie, adds nothing to our previous knowledge. His remarks on the private character of Mr. Muclean, and his conjectures about the death of L. E. L., might with due regard to propriety have been spared. He morely skims over the disputes and intrigues of the last ten or twenty years, but more especially of the last two years, and the circumstances under which the Dutch forts and factories were ceded to Great Britain. These transactions have been more precisely related by Sir John Hay, in a compilation from the Blue-books of last Session. Mr. Reade's account of the seizure of the German missionaries beyond the Volta in 1869, and their captivity of three years and a half at Coomassie, was furnished by one of the sufferers, and has already been published in the Times. The only contribution of an original character that he makes to the German country and people except those amongst whom he was sent by the Times last September. His particular errand was to report the movements of a British military force; and this is a business which he does not pretend to have ever witnessed or studied before. Neither British colonial policy, such as it was on the Gold Coast, nor the peculiar institutions of the Ashantee kingdom and its vasaal provinces, appear to have much occupied his mind. An undefined experience, as we have remarked, of African humans nature was therefore Mr. Reade's qualification for the tests he has performed. It has anabled him, with a turn for picturesque and vivacious description, to present a few entertaining steetches of Fautee and Assin life in time of war, as well as of fighting scenes and campaigning

all the cenericus degration with which he pursues the commander of the recent expedition.

A literary civilian who had passed much time in Africa, supposing him to be a man of discretion and cound judgment, might possibly know better than Sir Garnet Wolneley how to negotiate with the Ashantees; but not how to fight, or how to carry the stores of an army. There is no point, however, on which Mr. Winwood Reads in refuctant to import his harshly emphasized instructions and corrections. He began early with the personal tuition of Sir Garnet when they were fellow-passengers on board the Academic from Liverpool to Cape Coast Castle. He enachades to be sure, with the patronizing remark that Sir Garnet, when he had got the British regiments fairly started on the send to Coemassic, "displayed ligh talents for organization and command." It is a testimonial of no slight value to massit of any general that "during five action months he mayor suffered a disease." We have even find attichetion, suscendering what used to be the contraction of the military systems, in the manuscus that there is a start of our military systems, in the manuscus that there is a start of our military systems, in the manuscus that there is a start of our military systems, in the manuscus that there is a start of our military systems, in the manuscus that the same and the start of our military systems, in the manuscus that the same and t

sthought," who again is "light-hearted," and "offer improvident." Reportheless, Hir Genesi was guilty o moldicilles proceedings, " and "strongely" made the inteless in country. He showed pitials weekness a m graffity of tamps. In diplomacy, as might have been at taken Mr. Winwood Reads into his counsel, fooled "like a child," and behaved with ridicula It into he hand that in the hand with ridicular the Ge was befooled "like a child," and behaved with ridiculous "vacillation." It is to behaved that in the next compaign of a British force in any part of the world, the Times' Special Correspondent will be admitted at afficie a member of the head-quarters' staff, and invited to every council of war. Sir Garnet Wolseley, to judge from what he says of these commiscient gentlemen in his Soldier's Tocket-Book, would not quite like the improvement. But it might save his future conduct from many "a ludicrous flasto," as Mr. Reade puts it, and often spare him the invention of a "shallow device." In the composition, more especially of such a "screamer" as his proclamation dated Cape Coast Castle, October 30, addressed to all the kings, headesse, chiefs, and tribes of the Gold Coast, the General might have asked help of the newspaper reporters.

Mr. Reade is a Captain Peu; but he would hid us take notice that he can, when he pleases, enter the field as a Captain Sword.

that he can, when he pleases, enter the field as a Captain Sword. At the skirmish of November 3rd, a mile from Abrakrampa, he cays, "Lord Gifford, Lieutenant Pollard, and I walked at the head of the column." But there took place what he calls "a panic deet," when both the opposing parties ran away from each other; so that "Lord Gifford and I were knocked down and run over." Two or three days after this we behold the valiant Times Correspondent, with an officer and thirty soldiers of the and West India regiment, charging at the double to clear off a crowd of Asbantees. He saw the enemy on this occasion for the first and last time visible in considerable force on open ground. "They ran down the hill like mad, and, with their naked black bodies, resembled a herd of wild animals." Next morning, stack codies, rescained a nerd of wild animals. Next morning, attended only by his native African servant, facetiously called "Mr. Edward Lake of Bornu," our author went out before breakfast and "stalked" an Ashantse, whom he thinks he actually shot, to the admiration of sailors looking on from the roof of the Westo the admiration of saliors looking on from the roof of the Wes-leyan chapel. On a subsequent occasion, near Mansu, it fell to the lot of his prowess with an Enfield rifle to kill, as he believes, "the only quadruped bagged in the Ashantee Expedition." This was a little brown beast at the top of a tree, pronounced to be a species of hyrax. But in the great battle of the war, at Amosful on January 31st, Mr. Reade had the honour of being hit with slugs three times in five minutes not quite as he had but the three times in five minutes, not quite so hard as he had hit the hyrax and the stray Ashantee. "' Rough work this for a civilian!' said one of the soldiers; and I saw them all eyeing me with an air of puzzled cursosity." In this self-conscious attitude, seldom neglecting to report his own sensations, the all-accomplished Special Correspondent fights and writes his way through the bushfighting and village-burning days of Amonful, Hecqua, Ordahsu, and
so on, till he walks into Coomassio with the Highland regiment. Sir ciarnet Wolseley rules after him on a mule into the captured city, but only to "squander away his brief and precious time," before his "compulsory return," which, but for Captain Glover's advance, would have looked like "a retreat." Such is Mr. Reade's view of the campaign he has accompanied. By his criticism, in particular, of Sir tiarnet's tactics in the battle of Amoaful, he shows either an inborn and untaught genius for the military art, or a charactoristic reliance upon his own superior ability in all concertable

Several passages of what is nowadays prized as "graphic" writing occur in this volume, which has the merit also of being smaller than those of Mr. Stanley and Mr. Henty upon the same topic. Half an hour may be agreeably spent over two or three descriptions of marching and fighting scenes; that of Glover's attack on the river island of Duflo in 1870, Sir Garnet's martial enade to the villages near Elmina on October 12, and the entrance of our troops into Coomssale. But the amount of fresh information here contributed upon a subject of recent practical interest is much less than ought to have been furnished by a sactised author conversant with the study of African geography ad history. Mr. Winwood Beade might have made a really and history. Mr. Winwood Heads might have made a really useful book if he had not been so eagerly ambitious to display his capacity for those problems of warfare and diplomacy which he never had the opportunity to learn.

There may have been some proceedings of Sir Garnet Wolseley's

There may have been some proceedings of Sir Garnet Wolseley's which may properly become matter for discussion in connexion with Captain Brackenbury's authentic record of the General's acts and of his reasons for them. But it is prumature and needless to debate them with Mr. Winwood Reade. The merits, at any rate, of a magacious choice of staff officers, and of skilful handling of troops in the field, cannot be denied to fir Garnet. His reputation as a soldier is certainly far above the censures of a literary rambler in quest of African sensations. The strategy by which the Ashantees were compalled to quit the Protectarate may indeed claim less credit from the fact of hunger and disease having contributed to enforce their retreat. But if this ultimate result was partly due, as Mr. Heade admits, to their expulsion from the neighbourheed of Elmina and their rebuff from the fertified post of Abenkranpa, the British Ganzal deserves some praise for it. As for the aspectiment of his order, while on the maich through the Adams country, that our soldiers when they not armed parties of the aspectatory should not be the first to first provious from its allegious in surface. Expedience the first parties of detactions the magainst provious from the first provious from its allegious in the magainst deserves some passes are all provious from the first provious from t

Correspondent of this tremendous knowing power is too formidablean engine to be sent out with a small expedition to the Gold Coest, Its performances alarm us much as that of the Gathing gua which frightened an Ashantee spectator to death at Praham. What a mercy that the Times did not print all that its Correspondent has always to make dent has chosen to write!

CIVIL SERVICE.

WE were, we will own, not a little disappointed when a VV found that the two volumes before us were not a treation the Civil Service of the country, but an ordinary novel. So to on the Civil Service of the country, but an ordinary novel, and we have have heard of people who, on taking out of a library the Inversions of Inricy, have been somewhat disconcerted on finding a series of dialogues on the English language. We had looked for a little interesting reading—a general review, perhaps, of the whole Civil Service, with classrooms tables aboving the number of whole Civil Service, with elaborate tables showing the number of men employed in each department, the average pay they receive, the grievences under which they suffer, and the hopes in which they indulge now that the tide of the Conservative reaction is at its height. We thought that, likely enough, the whole question of competitive examinations would be fully discussed, and we more than expected to find in the author, whom we assumed to be a Civil Servant, their eager advocate. We felt sure that under a Civil Servant, their eager advocate. this system many a man must be appointed who is utterly in-capable of discharging the duties of his office, but who asverthe-less has a kind of literary smartness which would soon display We were greatly disappointed, as we have said, to itself in print. find that we had to deal, not with first and second-class closis, with heroes and heroines. No grocer's buy over cared less for these than we do for these ladies and gentlemen. We have tried them every way, as the parson of the story tried the rebblis, young and old, tender and tough, and, like him, we have had enough, and more than enough. But of all heroes and heroises we care least more than enough. But of all hoross and horomos we care least for those who, like the people who figure in the present story, cannot be understood without a considerable amount of previous study. If we are to study all the complications of genuclegies, let us in these days of examinations study those which we can hope to turn to some practical account. Furely, if we have never yet been able to keep in our memory what kind of a cousin Fleery VII. was to Richard III., we may be excused for declining to follow an author through the complicated table of kinship of his good and wicked heroes. Why, by the way, should not our noveliets join with the "Crammers" in filling young men's minds with what is called history? We do not setur to the historical novel, which has already been well worked. Why should not Mr. Idetado, for instance, the author of Civil Acresios, have as constructed the isnully tree of his novel that his readers who shithfully studied all its complications would have found the mandres separated structed the lamily tree of his novel that his readers who is studied all its complications would have found themselves not only by understanding the developments of his plot, by the possession of a considerable stock of sound known lie might surely have so arranged his story that the relatibetween the various claimants to the great estates about been exactly the same as the relationship between the veclaimants to the Crown of England in the Wars of the Rossa has not done so, however, and as we saw that there was no to be gained by mastering all the complications of the fi tory of his herees, the Hauphtons, we have left these comuli unmastered. He had shown us his characters before he up his family tree, and we found them so little interesting the dackined to study with him their ancestors from the year paths present contary. We were contented with knowing the present century. in Sir Comer Ilaughton had been hanged by mil certain our comer threspiton had been hanged by mattake in 1995, and that when the story opens, some ten or twelve years ago, there was a great question to whom all the family grangery would in the end come. For one of the Hangittons had made one of those wills which find the novelist almost as much work as the lawyer. The wicked here Hangi Hangiston thus explains it to one of the two ladies to whom he wishes at one and the same time to be engaged:—

The Count, Sir Henry's father, you know, entailed the estate on the male sie la cistait of Sir Minry willing it sway; but then if his Henry aftern my littler, all the moining would go equally between her and sec.

^{*} Chall Service. A. Morel. By J. T. Listado, dentier of "Mearin Rys-tal," Ro. - 2 vols. Landen : Honey S. Sing & Co. 1804.

Sir Henry, however, was married to a young wife who keeps all? his relatives away from him, and gots him to make a will in her favour. He dies, and there is some fear that his 12,000L a year—that, if we remember rightly, is the sum he can will away—will person out of the Haughton family altogether. This would in itself him afforded ample material not merely for a two-volume, but even for a three-volume, novel, had only Hugh been as virtuous as the threatened loss of a constant and the state of the threatened loss of so great a property almost demanded. Unhappily, the moment he came upon the stare we saw that he was a villain, for he showed "a row of very white teeth" whenever he smiled. How it happens that a man who in amiling shows very white teeth should be a villain, we can no more explain than can the naturalist explain why people who have from birth white hair have also pink eyes, or why cats which are entirely shite and have blue eyes are generally deaf. We scoopt it, however, as an undoubted fact on the authority of this whole tribe of hevelists, and we never take shares in any the whole tribe of nevelists, and we never take shares in any Company till we have first made a careful study of each director's teeth. It is not, we would point out, the mere possession of white teeth that proves a man to be a villain. For this mysterious correlation to exist the white teeth must be displayed in smiling. bn, Hugh was a white-toothed smiling villain and utterly unworthy of inheriting 12,000% a year whenever the machinations of Sir Henry's crafty wife should have been defeated, so some one else had to be found to come into the money. In Grace Haughton, with her eyes "of that peculiar grey, occasionally emitting a violet light, which always reminds one of the South of Ireland," was found all that was wanted. This kind of eyes has only been of late years found out, but from a somewhat wide reading of modern novels we can see that violet eyes and virtue always go together. Whether this violet light is emitted, or comes flashing or dencing, or renders, when flashed out, glances of tenderness more tender, in any case it is the very opposite of the white teeth.

As Grace, though she could inherit the money, could not be a

baronet, and as Hugh was too wicked to be even a wicked baronet, an heir has to be found to the title as well as to the fortune. What an old deed found in a box does for Grace the discovery of a secret marriage does for Gerald Fitzgerald. Though we saw at once that Hugh was to lose the property, it was not till close upon the end of the first volume that we had the least suspicion that he was to lose the title. Wicked baronets are so very common that the severest postical justice does not require the loss of a baronetcy. A row of ine white teeth, a smiling face, and the blood-red hand have often enough been found together. But all of a sudden an old family nurse was introduced into the story, and we saw it was not for nurse was introduced into the story, and we saw it was not for nurse was introduced into the story, and we saw it was not for nothing that the hero, Agmond Gwynne, was sent to lodge with her. She it was who had nursed Fitzgerald, and she knew his history. His mother had been deserted a few months after her marriage by her husband, and had died in giving her son birth. As he had married her under an assumed name, all trace had been lost of him. But Sir Henry's death led to a great clearing up of mysteries. For Hugh's father, now Sir Stephen Haughton, came over mysteries. For Illign's lather, now Sir Stephen Linguistic, came votation of the fact of the faithless husband. Sir Stephen, either because he had also recognized her, or because he was now in the way considerately and at once had a fit and died in her house. In a few weeks wire and at once had a fit and died in her house. In a few weeks wire and at once had a fit and had have killed off and now there was Sir Henry and Sir Stephen had been killed off, and now there was Sir Henry and Sir Stephen had been killed off, and now there was Sir Hugh. He enjoys his baronetcy no longer than his father, for in the action that he brings against Sir Henry's widow everything comes out in the most dramatic manner possible. Old deeds and registries suddenly turn up, old witnesses are produced, the lawyer on the losing side "pushes his wig to one side, then to the other," and the lawyer on the winning side "arranges the set of his gown and smoothes down his bands," while the judge "rubbed his nose." The jury—and herein they are unlike ourselves—follow the case, and in the and the wicked Hugh is shown to have no claim to anything and smoothes down his bands," while the judge "rubbed his hoes. The jury—and herein they are unlike ourselves—follow the case, and in the end the wicked Hugh is shown to have no claim to anything in the world except his white teeth and his salary in a Government office. Agmond marries Grace, as he fully deserved, for if she had violet eyes and a fortune, he had a good heart, and was "five feet eleven in his socks." We ought to feel sorry for Adela Kendal, who, like every one else, was most treacherously treated by Hugh, to whom she had been secretly engaged. She certainly deserved a better husband than she in the end got; but then we had been so bored by her "sleepy eyes," which appear over and over again, that we did not care what became of her. Mr. Listado is one of those writers who can never introduce a character without menthose writers who can never introduce a character without men-tioning at the same time some physical peculiarity. The hero, by the way, is always "caressing his moustache," unless indeed he is either lighting, smoking, or throwing away a cheroot. These sleepy eyes play a very important part in the story, and though at first in league with the white teeth against the lady of the violet light and the gentleman who is five feet eleven in his socks, in the end come over to the right side. We ought to have mentioned that the cause of virtue is materially supported by a man who is end come over to the right side. We ought to have mentioned that the cause of virtue is materially supported by a man who is famous for his unkempt masses of hair. It is clear that the touthbrush and the comb must have come in about the time when the

golden age went out Accurate as Mr. Listado may be which he describes the correla-ce that axists between popularities of the body and qualities of in mind, he is strangely insecurate when he deals with the Civil series. Not only does he make one of his characters at one and is settle lime a junior clerk in a Government office and a bar-series in manufact, but also before long he gives him a sent in Par-security while he gives a brother clerk a weak's holiday so that a manufacture in Ireland, not only to vote for his thread, but the manufacture him in his converse. Ten or twelve presents

at the date of his story, the Oivil Servi ought to have known, and even new they are notific any part in convessing. When his relaters find his inaccurate, they may well mistrust him in his des inaccurate, they may well mistrust him in his descri Government office. Inaccurate people, happing, are dull people, and to this rule Mr. Listado is no except people are not listened to, and dull writers are not re their inaccuracies do not get a wide circulation. What n readers can they be who, when they come to a few pages of such talk as the following, do not either pitch the book across the room in a passion, or let it fall to the ground in a slumber?—

in a passion, or let it fall to the ground in a slumber?—

"But, mamma, that's precisely where you make the mistake," said the young lady." "You set far too high a value on our knowing Hugh. You see his mother has never called."

"But she will some day, I'm sure, and if she doesn't, she's no great less. Hugh will be head of the family soon. So that's all we want."

Grace Haughton laughed slightly, and said, "Well, we'll see," as she resumed her book. Her mother worked away until the fretch look laft her face, and a more thoughtful expression gradually stole over it, and at length hands and work again dropped idly into her lap, and she said to her daughter, "Grace, I don't believe there is anything whatever between Hugh and that little Miss Kendal. I don't indeed."

"I loo't you, mamma?" replied the young lady, mechanically.

"No. I've heard there is really nothing whatever in it."

"I never thought there was," said Grace, turning over a leaf.
"I'm sure Hugh is much too sensible a man to think of such a thing," continued the elder lady. "With his prospects, you know, it would be quite throwing himself away—quite."

throwing himself away—quite."

"I would not altogether say that, mamma," objected her daughter, lowering her book. "Miss Kendul is very pretty, and they say she will have a great deal of money."

For ourselves, as we read such a passage as this, our wonder is, not how any one keeps awake to read it, but rather how any one kept awake to write it. Does the modern novelist, like the mythical undergraduate before his examination, swallow a few cups of strong undergraduate before his examination, swallow a few cups of strong green tea before he begins to write, and sit at his deak with a wet towel bound round his forehead? Or, on the other hand, so far from going counter to nature, does he every night seek drowsiness for himself as well as for his readers by practising the art of composition? We can readily believe that some physician learned in mental diseases has prescribed for his patients with overwrought brains, not novel-reading, but novel-writing.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

- CLAND WORKS IN INDIA.

ALISBURY, when he finds things going wrong, is possessed with a notion that there must h way of putting them right; and, like many other able men, he thinks that the simplest and easiest way of putting wrong things right is to find an able man, and pay him for putting them right. He does not like the way in which public works are carried onevel they are the way in which public works are carried one of his the way in which put into the Court in andia, and his remedy is to which of the Governor-General some one understands public works, and will, with the power, have the capacity to introduce a new and better system. Take many other departments of Government, the Department of Public Works in India has grown up as occasion arose, and in a form determined almost by hazard. In the time of Lord Dalhousis there was no such department at all—all works that had to be executed were in those days reated as a part of military engineering, and were done by the Military Department. But every year has brought a fresh accession of work to be got through, and responsibility to be incurred or evaded. Twenty years ago there were only twenty-one miles of railway in India; now there are Nine millions sterling have been spent on irrigation; and, even before the present famine made it evident how much the food of the masses must depend on the distribution of water, projects for new irrigation works had been entertained which would have involved a further expenditure of eighteen millions; and now that the warning given by the famine has been taken to heart, the VICEROY has had under consideration a vast scheme which would use an outlay of forty millions sterling. Then the 6,000 miles of railway are to be increased to 15,000, and only 3,000 miles of this excess are even laid out; thirty-six sillions is to be the total expenditure, and about four millions is to be expended in the next four years. These are great projects, and will, no doubt, benefit India enormously in the long run. But, unfortunately, neither irrigation works nor railways pay in India. They pay something, but they do not, as a rule, pay anything like the interest of the capital expended on them. If such very large sums we to be spent without any prospect of immediate reters, they ought, as every one will admit, to be most refully spent. Every penny should be jealously watched, it the utmost pains should be taken to make accurate timates beforehand, and to keep the outlay within the estimates. This is a matter of the very greatest importance. We are going to lay the burden of a very heavy exection on India, in order to benefit India a little gradually, and very much, as we hope, hereafter. This is a dually, and very much, as we hope, hereafter. This is a proof of our foresight, energy, and greatness in the art of governing, which we offer to the natives of India as one of the justifications of our spanse, which we ofter to the natives of india as one of attitionations of the presence among them, and of our alling them, to change their old ideas and habits, and tours. Host native gould probably prefer a cheaper government, in the taxes, and less movement builts, with a greater risk of death or sickness, and allow them to have their own foolish way. We oring their condition, and on making them gif improved. If, as they began to underi. If, as they began to under-country under English rule, it de country und delong of their country under English rule, is ar to them that the money exacted by taxation, for their supplied benefit, had been wastefully d that they could to have got their gain at a the mough effect, the feeling of attachment to had homest admiration for it, will, it may be taken mough weather than sould be glished.

has determined to act, "He thinks that he has facts of a very specific and definite kind, by which he man judge of the mischief which the existing sloventy and confused system has caused. He laid with the table of the House of Lords returns showing the relation between original splinates of the Department of Public Work the actual expenditure during the last three years. The returns show that in no less than 300 cases the expension ture has exceeded the estimates; or, if we are to take to gross sums, nearly seven millions have been expension the estimates. Nor has Lord Salmaust shruling the estimates. from descending from general remarks to very precise details, or from speaking his mind very freely as to the laxity with which the supervision of the Government has been exercised. A bridge called the Kenahan Bridge has been recently opened for traffic, and Lord Satisfury was roused to wrath when he discovered that the Indian Gevernment had merely expressed its satisfaction at this bridge having been completed, and that no notice had been taken of the very large sum by which the satisfaction at this expenditure had been in excess of the estimates. "history of this undertaking reflects little credit upon "any of the officers concerned" in the opinion of Lord Saliburar. So long ago as 1866, when Lord Saliburar office as Lord Crambours, an accident cooling by which over a million of contract that the opinion of the contract of the which over a million of rupees was lost on this bridge. A new site was chosen, new estimates were made, and in the usual course of things the expendi ture was double what the estimate came to, that the bridge is finished, it has cost more the Indian Government is authorized to samption one undertaking, and Lord Samenus completes on that no report was sent to or required by the Gove showing the causes of the increase of charge while works were still in progress. This, however, is nothing It is what follows that is important. Lord SALE thinks that the Indian Government should do someth show its sense of the wrong that has been don mark of its displeasure ought to be inflicted on the are responsible for so great a mistake. Punishment is dealt out unsparingly to those public servants who not done their duty better, and the Government Viczeov is rebuked for not having in the first seen that such punishment as was due was inflicte is, no doubt, a very strong consure, and shows thoroughly zealous and carnest Lord Salisbury is censure does not have very much effect unle ported by the opinion of those with whom the consured have to do; and we are not sume the officials of the Public Works Department in hind think themselves so much to blame, or will be themselved the Anglo-Indian public so much to blame, as it

clear to Lord Salisbury's mind ought to be the three in Lord Salisbury obviously takes for granted that there is in overy case an ascertainable maximum sum which misch ought to cost, that public servants ought to find out which that sum is, and should be punished if they miscalculate. But this assumption is widely at variance with superiment. There is always something anknown and unknown he indicates the cost of works, especially in such a country as indicated as a large of the Holyhead Breakwater if he thinks that Government efficiels can be infallible, or the history of the Settle line if he thinks that one of the shrawdest Boards, with a set of the keenest profusional men to help them, can always forces the future in India there are, as Lord Lawrence pointed out, constant while of the wildest physical disturbances. Rivers suddenly

Sir Henry, however, was married to a young wife who heeps alle his relatives away from him, and gets him to make a will in her favour. He dies, and there is some fear that his 12,000 a year-pass cert of the Haughton family altogether. This would in itself on the same afforded ample material not merely for a two-volume, but first as if the three-volume, novel, had only Hugh been as virtuous as own contractor, but it of so great a property almost demanded public officials who make the same upon the stage we saw that he tractors' margin; but when the acutal regy white teeth "when-works commings, the necessity of the contractor amiling shows begins to show itself. The contractor wishes to keep applain self safe, and the official wants to see the works taken in hard on his recommendation. But they pursue the same Vert hard on his recommendation. But they pursue the same end by different means. There is always the margin to come in, whether it comes in at first or last. The only effect which Lord Samsbury's strictness would produce would be that officials, in order to avoid censure, would contemplate future works with the eyes of a contractor They, like the contractor, would put on the margin in the first instance. They would allow for contingencies. They would add 1,000l. or 2,000l. a mile to the estimates they made for railways. Then, if disserter occurred and they made for railways. Then, if disserter occurred and wages went up, they would be all right; their communities would be justified. They would seem wise and knowing men who had guessed exactly rightly. If they had luck on their side, if no disasters occurred, if labour was always If they had luck on available, and wages remained unchanged, they would plume themselves on having done the work more cheaply than was supposed possible; and would ask to be rewarded for the skill and science they had shown. . Sometimes it would happen that one man made the estimates and another man carried out the works; and if the second official executed the works below the estimates of the first, he would gain a great amount of totally unmerited glory. To send an able engineer or contractor out to take his place in the Council would do some good. An able man, if he has tact and good sense, and wide experience, must do good in one way or another. But he would be himself under the same temptation as his subordinates. He must either sanction high estimates, or run the risk of being disgraced or recalled. Whether it is expedient to enlarge the Viceroy's Council is a different question. If the Council would then be unwieldy or difficult to manage to a degree that would cause the Vicercy serious embarrassment, this is an additional reason for not having recourse to the plan which Lord SALISBURY proposes; and it may be guessed, from what was said in the House of Lords, that both the Vicerov and the Indian Council in England see great practical inconveniences in the enlargement of the Vicercy's Council, or in the substitution of the Head of Public Works for one of the actual members of the Council. But, as Lord Samesury justly says, he is not bound to please or to be directed by the Vicercy or the Indian Council here. If the creation of an additional member of Commoil is the true means of seeing that India gets full value for the enormous expenditure on public works which is contemplated, the SECRITARY of STATE must think of what is bost for India, and nothing else; and he, having the ultimate responsibility, must make such changes in the system of administration as he considers indispensable. But it may be very advisable that Lord Salisbury should consider in the first instance whether the appointment of any one to any post can get rid of the difficulty which is inherent in the plan of carrying out works by a Government—namely, that the officials charged to make estimates, if they find that low estimates falsified by the result are not regarded favourably, will simply make high estimates, and so provide against contingencies

THE VOTE OF THE FIFTEENTH OF JUNE.

If the National Assembly were an accurate representation of national feeling, the vote of Monday last would show that Franco is no nearer the end of her misfortunes than she was three years ago. A majority of four in favour of a particular form of government, reduced by subsequent corrections to a majority of one, proves nothing heread the absolute incapacity of the body thus equally divided to establish any form of government. Taken by itself, therefore, the vote is the best possible justification of the wondard of the Right Centre. Where parties are exactly belleviced there is nothing to be done except to wait. cought to have known, and even one that are notificated any part in convexing. When the factors and his description of a factor of the factors of the factor

"But, manina, that's precisely where you make the mistake," aid the much more has has sever called."

You'll have the continued a value on our knowing Hagh. You much more has has sever called."

You'll have the learning about the continued of the doesn't, she's no great low. From these facts the Learning soon. So that's all we want."

Erom these facts the Learning and said, "Well, we'll see" as the vote in the Assembly, and that, if it may must be freshel look left have bulwark against an Imperial reaction, it must be freshel look left have been conclusions. Whatever else is doubtful, it is clear that certam enough. Whatever else is doubtful, it is clear that delay in determining what the form of government shall be serves the purpose of the Bonapartists. It enables their learning to preach with continual reiteration that the Empire age? I would not all retigient which can command the second is the only Government which can command the second is the only Government to give their first vote. Royalists would rather live under the Empire than under a Bepublic. Bepublicans would rather live under a Monarchy consecrated by universal suffrage than under a Monarchy consecrated by universal suffrage than under a Monarchy resting on Divine Right. Norther of them will ever consent to yield to the other; consequently the only hope for the country lies in the establishment of a Government to which both will yield. This, no doubt, is the substance of the Bonapartist preaching, and it is near enough to the truth to make it a very useful weapon in the hands of indefatigable and unscrupulous missionaries.

The other conclusion of the Loft Contre is unfortunately not so unimpeachable. The Republic, they think, can be organized even by a majority of one vote, because as soon as that vote has been obtained, a dissolution will give the successful party all the strength it lacks. On the whole, this reasoning is perhaps sound, but there is still something to be said in behalf of those members of the Right Centre whom it has failed to convince. Left Centre speak of organizing the Republic, they mea organizing it in a Conservative sense. It is the Republic of M. THIERS that they have in view. But when the Republic is organized, it must govern and govern through the agency of particular men, and for the realization of particular ideas. The Right Centre declare that, if they could be sure that these men and these ideas would be the men and the ideas of the Left Centre, they would acquiesce in the proclamation of the Republic, not indeed with enthusiasm, but still not without hope. But if the Republic is to be Conservative, it must be founded by the Conservative party, and the support of the Conservative party implies the support at least of the Moderate Right. If this is withheld—and it is certain that it will be withheld—the makers of the Republic will be the Loft and the Loft Centre, and in this cos the Conservatives will only command about one-third of the entire vote. Does this offer any guarantee for the triumph of Conservative ideas? The fallacy of this argument, if there be a fallacy, lies in the assumption that the Conservative party in the country will show itself as in practicable as the Conservative party in the Assembly If this should prove to be the case, the forebodings of the Right Centre would be fully borne out. An Am bly in which the Bepublican majority was composed of extreme and moderate politicians in the proportion of two-thirds to one-third would have little chance of erganizing the Republic successfully. Extreme ideas would be preclaimed, extreme measures would be adopted, and in the end the Conservative sentiment of the country would be thoroughly conservative sentiment of the country would be as alarmed, and the path of the Bonapartints to pow be made clear. But there is still hope that the re dissolution would be greatly to strengthen the element in the Republican party. There was a ti-this could almost have been counted on, because the ate to power popularity of M. Triums would have secured the re a majority as much pledged to give effect to his go the majority returned to the House of Germone is the majority returned to the House of Germone is

to deny constituent topublic from its hands. In part the steady, if irregular, development in M. as of a spirit of moderation and compromise which nas hitherto been lamentably wanting to the Republican counsels. But this change in the temper of their leader would hardly have worked a corresponding change in the temper of his followers if they had not seen that a mode-rate Republic is now within their reach, while an extreme Republic is more than ever beyond their reach. In the days when they denied the competence of the Assembly to erganise the Hepublic, they hoped that a dissolu-tion would give them an Assembly more after their own heart. The general drift of the partial elections seems to have disabused them of this notion, and they are now willing to take such a Republic as they can get, and to take it from anyhody who will give As yot it is doubtful what the Assembly will do when M. CARIMIR PÉRIER'S resolution comes back from the Committee of Thirty. The report of the Committee will almost certainly be unfavourable to its adoption, and in that case the majority of last Monday will probably bring it forward as an amendment to the counter-resolution presented by the Committee. If they cannot succeed in winning over more votes from the Right Centre, the dead-lock can only be legally ended by a dissolution. But then the consciousness of this may influence the Right Centre in the direction of concession. The victory of Monday could not have been won without the aid of a contingent from the Conservative side, and now that it is seen how hopeless the organization of the Septembate has become since the Left Centre have declared for the Republic, it is possible, to say the least, that a further contingent may sollow the example of the first. That the Left Contre have not given up this hope is shown by the reiteration of their appeal to the Right Centre to make common cause with If the appeal was not without its fruit when the Republican party was in a minority in the Assembly, it may be yet more fruitful now that a minority has been changed into a nominal majority. The curious story told by the Times' Correspondent yesterday shows how impossible any reconciliation between the Right Centre and the Legitimists has been ever since October. The obstinacy which made the Count of CHAMBORD adhere to the White Fing after Marshal MacManon's declaration that, if the Pricolour were displaced, he "could answer neither for order in the streets nor for discipline in the army, es "the Chassepots would go off of themselves," will equally prevent him from abdicating in favour of the Count of Paris. Yet without this abdication the prospects, such as they are, of the Orleanist party cannot be realized till the Count of CHAMBORD'S death, and he is of the order al men who live to a green old age. This consideration must tend to shake the resolution of the Right Centre to hold aloof from the Conservative Republicans, and if it has this effect on only a fraction of the party, a working majority will be secured in favour of the Left Centre policy.

RAILWAY PROPERTY.

FILE rapid decline is the value of railway stocks which commenced five or six months ago continues with accolerated speed. The traffic receipts first coased to show the customery percentage of increase; in the course of the spring they become stationary; and of late they have follow short of last year's returns. The inevitable much of the diminishing activity of trade had been formment; but hopes had been contextuined that the fall in the pairs of coal and iron would in some degree compensate for

because y to beam..... yest Companies at at present of inproductive or hundred miles of authorized lines are now any nuncred miles or authorized lines are now feess of construction; and fine cost of labour and materials has in almost all cases greatly advanced since the estimates were framed. The practice of paying interest out of ordinary revenue on capital expended on new lines is perhaps financially legitimate, although few private capitalists would be either able or willing to adopt the greatern. The Chairman and are also contains the greatern. willing to adopt the system. The Chairman of one considerable Company, who protested against the sacrifice fin-posed on actual shareholders for the sake of a future benefit, was compelled by threats of litigation to suffait to the provailing rule. Careful students of balance-sheets may satisfy themselves as to the engagements of different Companies, and as to the probability of an earlier or more remote return. Another drain on the resources of Railway Companies is caused by the constant necessity for expending large sums of money on the improvement of stations and of other accommodation for traffic, and on the increase of rolling-stock. In spite of recurring clamour, the capital account, far from being finally closed, in annually and necessarily reopened; and although the incressant outlay is prudently and almost necessarily incurred, it for the most part produces no immediate return. It is not an uncommon enterprise to lay down twenty miles of sidings in a single year, or in the course of five years to expend a million on waggons and engines.

Those who have invested their money in a com-mercial enterprise have no right to complain of the varying fortunes of trade. Some capitalists, large and small, seek for fixed interest with ample security for principal, while others are induced by circumstances or temperament to engage in more or less speculative enter-prises. Ordinary shareholders, if they were uniformly reasonable and prudent, ought both to have left themselves a margin of income above their expenditure, and to endure with fortitude the periodical depressions which alternate with seasons of prosperity. They were seriously disappointed by the stationary or diminished dividends which resulted from the unprecedentedly large receipts of 1873. and they may perhaps not bear with uniform equanimity the still more unpleasant experience which awaits them; but, if they desired to exempt themselves from risk of fluctuation, they ought to have contented themselves with the moderate interest of Consols or mortgages on land. Until lately railway debenture stock might have been included in the list of safe and unambitious inventments; but some measures which have lately been proposed by amateur legislators threaten the very existence of railway property. It is a cause for constantly recurring surprise that attacks on any special kind of property are for the most part resented and opposed only by the section of owners which happens to be immediately threatened with Rich traders not unfrequently counter spoliation. projects for the partial or total plunder of landowners, who in their turn are sometimes ready to court a charp sopularity by tampering with the vast sums invested by all classes in joint-stock enterprise. Select Committees of the House of Lords have been known to overrule contracts in the supposed interest of the public; but for the most part the private legislation of Parliament is conducted with due regard to vested interests. Preachers of Socialism make the most of the procedent of legislative expropartion in support most of the precedent of legislative expropagation in supports of their attacks on the right of ownership of lands or goods. If they could succeed in establishing the proposition that property is, except in a moral or figurative same, hald in trust, they would have no difficult in deducing the coupling. sion that the community at large as costsi que trust has nothed the substantial interest in the fund and the right to modify for its own benefit the conditions of the trust.

Parliament, acting on behalf of the nation, had an undoubted right to determine the conditions on which capitalists should be invited or allowed to construct railways; but, when the money has been received and spent, t is an abuse of power to alter without compensation the erms of the contract. Mr. Carren, formerly an eminent

Sir Henry, however, was married to a young wife who keeps all fis relatives away from him, and gets him to make a will in her that, if we remember rightly, is the sum he can will away will an out of the Haughton family altogether. This would in itself in theory gravely a not so great a property almost demanded. Commission was created. The sound was wear and the stage we saw that he Houses had in the former year recommany white teeth when thouses had in the former year recommany white teeth when the provisions of the Railway and Canal Transcriptain.

Act of 1854. By the Act of 1854 every Company whose it was ground in a slumber?—

But, mamma, that's precisely where you make the mistake, and the stage we may be a self-was and to this rule Mr. Listado is in exception. What mans their inaccuracies do not get a wide circulation. What mans the following, do not either pitch the book across the readers can they be who, when they come to a few pages of in a passion, or let it fall to the ground in a slumber?—

But, mamma, that's precisely where you make the mistake, and the stage we may be a slow pages of the same and the stage we are the same and the Act of 1854. By the Act of 1854 every Company whose line formed a part of a continuous railway communication was bound to afford due and reasonable facilities for receiving and forwarding the traffic. The Act of 1873 for the first time extended the meaning of the technical phrase "facili-"ties" to include through rates to be allowed at the request of any other Railway or Canal Company. The clause, if it had been operative, would have placed at the discretion of the Commissioners the entire revenue of every Railway Company in the kingdom; and probably the officers of the Board of Trade who framed the provision believed that they had induced Parliament almost unconsciously to repeal the schedules of rates which form an essential part of every Act which has authorized the construction of a The Joint Committee had expressly reported that the proposed tribunal could not revise the authorized rates and charges of the Companies unless it were "in"vested with absolute and arbitrary powers, which is out
"of the question." In the following year the Government of the day gave the Commissioners the very powers against which the Joint Committee had protested, without even provoking Parliamentary opposition. The determination of the amount of a through rate without reference to the Parliamentary tariff is equivalent to a repeal of all existing tariffs. The only limit on the discretion of the Commissioners is that they are not "to compel any Company "to accept lower mileage rates than the mileage rates "which such Company may for the time being legally be charging for like traffic carried by a like mode of transit "on any other line of communication between the same points." The provision, when translated into English, means that, on a route compounded of the lines of two Companies, the rates shall be the same as on a competing

The inaction of the representatives of the railway interest in the House of Commons can only be explained by their injudicious reliance on their own special knowledge as contrasted with the ignorance of their official and logislative assailants. The newfangled tribunal could, for the purpose of affecting railway property by granting through rates, only be set in motion by the Companies against one another; and experienced administrators justly foresaw that no Company would be inclined, for the purpose of obtaining immediate advantage, to facilitate the general depreciation of railway property. The consequence has been that the clause relating to through rates has been adead letter; and indeed the Commissioners in the course of eight or nine months have scarcely been called upon to decide as many cases of any description. Nevertheless it is but a shortsighted policy to permit the establishment of a mischievous principle on the ground that its operation will be baffled by practical difficulties. In the present Session Mr. Warr moved that through rates to be fixed by the Commissioners should be granted on the application of any ten persons who might be interested or aggrieved. Freighters, as such, have no motive beyond their general interest in the security of property for regarding the rights guaranteed by Parliament to rail-way shareholders or creditors. If a Company which has a legal right to levy a shilling or two on a certain kind of traffic can be compelled to carry it for a penny, the traders profit at the expense of railway proprietors as obviously and as unjustly as the disciples of Oddes and Bradlaugh would profit by the division of the land, or by the transfer of manufacturing capital from the owner to the workman. Mr. Canten remarks, "It is not too much to say that no part whatever of the 600 millions actually laid out would than apart in railwant on actually laid out would we been spent in railways on such conditions." Warr and his supporters can only reply that the money has luckily been spent, and that it will be so much the bester for reightern if they can transfer the proceeds to their own paskers; yet they forget that a Company, although it

line owned by one of the two Companies. In cases where there is no competing line, the Companies are apparently without protection

without protection.

"But, mamma, that's precisely where you make the mistake," said the "But, mamma, that's precisely where you make the mistake," said the tells the arrolling her has never called." To or 20 pencir, same day, I'm sure, and if she doem't, she's no great less missioner may think it was alightly, and said, "Well, we'll see," as she will not forget his disinterested bent has less the term will not forget his disinterested bent has less than the profit her than the process of the provided way until the fretful look left her will not forget his disinterested bent has less over it, and at length cannot deny that he has received full warning profit her durchter, better look himself to his rent roll and his receipt." better look himself to his rent roll and his receipt below

THE AMERICAN CIVIL RIGHTS BILL.

THE American House of Representatives lately passed Mr. Summer's Civil Rights Bill, which will probably be rejected by the Senate. It is surprising that such a measure was not adopted soon after the close of the war; and it is still more strange that it should be now introduced. unless it is intended as a tribute to the memory of Mr. Summer. The Bill purports to extend the legal equality of the white and coloured races into all departments of social life which can be reached by legislation. If it becomes law, coloured men will be entitled to admission into the churches will war correspond to the reaches and respond to churches, railway carriages, omnibuses, and rooms in hotels which are now exclusively occupied by whites. A more important and more plausible enactment opens public schools on the same conditions to children of all colours. It is also provided that throughout the Union negroes shall be eligible to sit on juries; nor could Mr. Sumner have regarded as an objection to his proposal the fact that coloured garded as an objection to his proposal the fact that coloured jurymen in some of the Southern States have habitually perpetrated monstrous injustice. It is for the people of the United States to judge how far they will endure the meddling legislation from which no community has hitherto been more happily exempt. If the white population decline to frequent churches or theatres which are frequent quented by negroes, no law can overcome their repugnance; and it is highly probable that the tendency to social persecution would be stimulated by legislative attempts to enforce toleration and equality. It was natural in former times that the missionaries of emancipation should endenyour to redress the balance between the races by strenuous denials of the distinctions which were artificially exag-gerated by the institution of slavery and by its conse-quences. After the war the philanthropic partisans of equality were reinforced by the politicians who regarded the slaveholders as rebels and enemies, and the freedmen as allies. The amendment of the Constitution by which the States were prohibited from founding political distinctions on differences of colour was suggested both by the sentiment of which Mr. SUMNER was the chief exponent, and by the supposed expediency of giving electoral power to trustworthy supporters of the Union. The legislation of the time was largely affected by passion and resentment, and the results have been in many respects a retaining the of the time was largery ancient by passion and resonances, and the results have been in many respects unsatisfactory. The lapse of years has greatly modified both the popular feeling against the Confederates, and the enthusiasm which was once entertained for the victims of Southern oppression. The Civil Rights Bill is probably the expiring flash of an cheelete form of shills of the confederates. of an obsolute form of philanthropy.

It may be doubted whether the Republican party will gain anything by the sudden revival of its real for the rights of the negro. The majority has often shown signs of dissolution, but the coloured voters, whether in the North or in the South, are not likely to adopt democratic politics. A bribe is wasted on a faithful adherent, and the limit Rights Bill will adjust a more empress than it will politics. A bribe is wasted on a faithful adherent, and the Civil Rights Bill will alienate more support than it will secure. The stanchest Republicans will neither accept social equality with the coloured population nor allow their children to frequent schools which are open to negroes. The feeling of repugnance has in some parts of the United States been modified by political causes, but the feeling or prejudice of colour, though it may have been aggressiant by the existence of aliency, is also sustained by a sustained

Lupend Tho , will ption. intercourse with the aristocratic selfishness, for rank entertain the strongest prerank entertain the strongest pre-course people. The Irish are the most the negroes, partly because they through an instinctive antipathy which they are not suffi-ciently sophisticated to conceal or to control. No legislation will make an Irishman treat a negro as a comrade. It is true that legislation often influences public opinion, but only on the condition of not directly opposing it. An artificial channel may regulate and divert the current of popular feeling, but it will scarcely cause it to flow in an opposite direction.

There is much difficulty in ascertaining the result of the political equality which was several years ago conceded to the negroes. In the Northern States the coloured citizens are too weak in numbers and influence to produce any perceptible effect on the course of politics. The Southern freedmen have shown universal eagerness to exercise their new privileges; and in some States they have for the time acquired undisputed supremacy. In default of political experience, they have accepted the leadership of Northern adventurers who, under the cant name of "carpet-baggers," are more odious to the white population than the upstarts who were lately their slaves. The more invotorate Northern philanthropists have the malignant satisfaction of witnessing the ruin of South Carolina, which was the first State to commence the unfortunate secession. At the end of the war the State contained about three hundred thousand whites and three hundred and fifty thousand negroes; so that the amendment of the Federal Constitution conferred on the inferior race the control of the representation. Moderate Republicans assert that, by exercise of tact and good humour, the whites with their superior faculty of organization might have maintained political ascendency without opposition from the newly enfranchised electors. Perhaps it was found difficult after defeat and economic ruin to preserve perfect equanimity; and it is at least uncertain whether the negroes would not in any circumstances have preferred the large promises of Northern demagogues to the influence of their former masters. The control of the State passed absolutely into the hands of the freedmen and their leaders, and the result has been almost unprecedented corruption and oppression. A large part of the white population has migrated to Texas; and, unless a political reaction occurs, a State once among the proudest in the Union will rapidly drift into the condition of a South American Republic. In other States, where the negroes have not acquired absolute supremacy, rival factions have contended for their favour; and in some instances they have appealed to the Federal Government for support. The riotous proceedings in Louisiana and Arkansas were described with pardonable examination as sivil wars. The far English to all the content of the far English to a sivil wars. and Arkaness were described with pardonable exaggeration as civil wars. The few English travellers who have lately visited the South are generally impressed with helief in a feeling of discrimination. belief in a feeling of disaffection, which appears to thom as bitter as that of Ireland or of Poland. On the other hand, sanguine Americans allege that the existing anarchy is transient, and that the defeated Confederates have already been in a great measure reconciled to their defeat and to its masquences. The strongust argument in favour of this pinion is to be found in the revival of the cotton cultivaopinion is to be found in the revival or the cotton cutiva-tion, which now products as much as on the eve of the Civil War. Labourers who grow crops worth many millions of money cannot at the same time be exclusively occupied with the practices of misgovernment. The experiment of negro supremacy or equality will pro-hably be interrupted before it has been exhaustively tried. It is only under the patternage of the Republican majority and the Reducil Government that the superior race has

vitable resution. will form an alliance on the basis of restoring the ney have been lately deprived. wulty in discovering plausible reasons for the or practical disfranchisement of transituencies which have proved themselves grossly corrupt and incompetent. The Civil Rights Bill, if it should, contrary to expectation, pass into a law, will furnish additional agguments for a return to a more natural condition of southy. The compulsory admission of coloured children to all public schools will inevitably cause the withdrawal of the children of the will inevitably cause the withdrawal of the children of the white citizens, who will then complain that they are deprived of the ordinary facilities for education. It is asserted that a destructive overflow of the Mississippi has been caused by the embezzlement by negro politicians of the funds appropriated to the maintenance of the river banks, The Governor of South Carolina, having been indicted for fraud, lately called out the coloured militia to prevent his arrest. The Legislature of the State, in which the taxnumerous landed estates for non-payment of taxes. inevitable retribution will probably be attended with much injustice and oppression. Even in America legislators are bound to attend to facts, and to understand something of buman naturo.

M. ROCHEFORT.

THE last new arrival on our hospitable shores is the once famous M. ROCHEFORT, and as it is our wish to say something civil to every guest, and it is difficult to think of anything else on which to congratulate him, we may wish him joy of the remarkable improvement which appears to have taken place in his health. While it was still uncertain whether he would be really sent into exile he was exceedingly ill, and his friends or partisans loudly asserted that it was simple murder to send so frail a being to New Caledonia. But change of air seems to have done him much good, and exile itself must have been as bearable to him as exile in New Caledonia can be to any one. He was treated in what is technically called the style of a first-class misdemeanant, and was allowed to walk and swim until at last he walked and swam away altogether. The news of his escape excited a momentary interest at Paris, for its seemed hardly worth while to send a condemned politician. to the other end of the globe if he could get back again so. easily. Passing through the United States, where the New York Herald opened its facile columns to his vituperative pen, he at last made his way to Iroland, and appeared in that well-known Fenian stronghold, the city of Cork. But the people of Cork feel that they must draw the line somewhere. It is all very well to talk in a playful manner about hated and despotic Governments, and to call attention to the flame of liberty that burns in every true Irish heart; but when it comes to welcoming a man whose associates have made themselves notorious by acts of pillage and marder, and by admiring those impulses of freedom which end in the assassination of an Archbishop, Fenianism thinks twice-before committing itself. Accordingly M. Rockstown, the great Rockstown, the hero of the Lanterno, the foe of the Empire, the terror of a despot, was actually hissed at-Cork, and had in dismay to seek the safe shelter of his: cabin. After his Irish experience, he must be very glad to find himself in England, where no one will hise him, ornotice him, or care a button whether he is dead or alive, Fortunately for him, he comes just in time to notice and observe the astonishing improvement that has taken place in Leicester Square, and he will find in that one dismalquarter a place where he may sit down comfortably among flowers, and fountains, and statues. It will be a sort of counterfeit of his beloved Paris for him, and he will be able to enjoy as much as he pleases the grim thought what a very short time it would take his friends the Communists, if they had a chance, to reduce the square once more to its ancient state of chaos. In old days, when he was at the top of his celebrity, he had to flee from Imperial wrath to Brussels, and being unwilling that Frenchmen should be deprived of the pleasure of reading new numbers of his LasBir Henry, however, was married to a young wife who keeps all the relatives away from him, and gets him to make a will in her favour. He dies, and there is some fear that his 12,000l. a year that, if we remember rightly, is the sum he can will away will be any part in canvassing. When the relativester Squarket ample material not merely for a two-volume, but taining practically wheches novel, had only Hugh been as virtuous as the fall wheches against through the the stage we saw that he here is not the slightest use in his pure white tasks when their inaccuracies do not get a wide circular readers can they be who, when they come their got the sort in England. He must write in Frontin, when they can be talk as the following, do not either pitch the few Englishmen who could understand what he meant the few Englishmen who could understand what he meant would know too much about him to care what he said; and as to the French in England, every French refugee is of his own special shade of political opinion, and has a natural and profound contempt for all other refugees. But if he could but fill a few busts, let us say of Bossurt or Férence, or the present Bishop of Ouldans, with a decent amount of copies of a very violent and irritating pamphlet, and could ensure their reaching Paris, he might live to dream a bright dream, and, as he moved about Leicester Square, might say proudly to himself that after all he was once more mischievous.

The French Government would be bound to stop his busts getting through, if their officials were not taken in by the venerable and innocent features of the occlesiastics in whose interior so alien a freight was reposing. If a pamphlet from his pen were to reach Paris, and be reprinted there, it would be instantly suppressed. Proceedings have actually been taken against two French newspapers which have reprinted M. Rocherour's effusions in the New York Herald. The Government cannot in such a case help itself. It would be immediately accused of complicity, of having a sneaking tenderness for ROCHIFORT, of all people in the world, if it let him have his say. But if it could have a free choice, it probably could not do anything so disastrons to him as to let him write and publish whatever he pleased. He would find his public in a very inappreciative mood. The French, and especially the Parisians, may not know exactly what they wish for, or what political opinions eight to prevail, but they are perfectly clear about one thing, and that is, that they do not like the Commune. As to other people there may be doubts. This may be said for them, and that may be said against them. But as to the Communests, there is no doubt about them at all. During the greater part of the best them. befof term when the Commune ruled in Paris, the ordinary Parisian had no very strong feeling against his strange rulers. There was something flattering to his vanity in the notion that Paris was holding out against France, and after his experience of the Prussian siege, a siege during which there was always plenty to cut seemed a mild form of calamity. When the Government troops entered, there was a state of perhaps uccessary confusion, there was much harbarity shown, and many innocent persons were secrificed to the thirst for vengeance. There was thus awakened a feeling of pity for the Communists and of irritation against the Government, which for the moment did much to check the indignation with which the conflagration of the public buildings would have filled the decent part of the Paris population. But now that time has rolled on, the details of the history of the Commune and of its suppression are forgotten; but a per-petual testimony to its criminal folly is brought every day before the eyes of Paris in the dismal ruins and gaunt shells of what once were buildings that made Paris proud. France, too, as well as Paris, has to hear fresh taxation in order that the burnt buildings may be restored, and grumblers who once used to read the productions of M. BOCHETORT WITH Involy satisfaction would now only be reminded by a new efficient from his pen of the dreadful amount which he and his friends have cost them. It is true that M. ROCHEFORT was only a Communist of the feebler and more innocent type. He did not want to have anything te do with petroleum and the shooting of hostages, and he had been at one time a member of the Government of the Fourth of September. But everything that can be th on this head for M. Rochevort only makes him a the nearer M. Gametta; and purhaps, of all persons in mana, it would be M. Gametta who would be most d and most injured if the Government now allowed M. Bookson to write and publish what he pleased.

"Let us welcome nobles into our party." M. Gamesta lately said to his political friends; and M. Roumwort, if he solid again obtande himself on the attention of Paris,

ought to have known, and even now have are not like any part in canvassing. When his readers find his a inaccurate, they may well mistrust him in his desired Government office. Inaccurate people, happily, are dull people, and to this rule Mr. Listado is an except people are not listened to, and dull writers are not rethair inaccuracion do not get a wide circulation. What their inaccuracies do not get a wide circulation. readers can they be who, when they come to a few page talk as the following, do not either pitch the book across in a passion, or let it fall to the ground in a number?— What r

daily ha "But, mamma, that's precisely where you make the mistaka," said changed in a lift "I've set far too high a value on our knowing Hugh. to French thought. I way, I'm sure, and if she docen't she's no great to French thought. The sure, and if she docen't, she's no gress intellectual things, in literabulation. So that's all we want."

young men are rising to take the said, "Well, we'll see the officials have been bred up in the wall in frettal lock is leonism, and France is the slave of its officials. It and at good many political lessons have been learnt and in dan been taken deeply to heart. The Commence alternation of the said that t been taken deeply to heart. The Commune showed once for all in a most unmistakeable way what comes of listening to such writers as M. ROCHEFORT, and of letting a set of ignorant, narrow-minded, cruel fanatice get the upper hand of society for a moment. The history of the Government of the Fourth of September has demonstrated how impossible it is for men, even when reasonably honest and able, to administer affairs on a great scale without any previous training or any practical knowledge of the art of government. The collapse of the Legitimists has brought home to the French mind that the remedy for the national misfortune so long and persistently preached by a clique of the highest social position is no remedy at all, and that there is no shelter for France under the wings of a Heavensent King and an Infallible Church. If something could but be established more respectable than the Empire, the bulk of Frenchmen would like it to be established. If nothing better is to be had, then perhaps the Empire must be accepted. But there is nothing like enthusiasm for the Empire, no belief in any Saviour of Society, not a grain of confidence in Napoleonic ideas, no illusion, no desire for mysterious utterances at banquets, no thirsting for the excitement of possible European convulsions. If the Empire is restored, it will only be accepted as a tired travoller accepts a place in a third-class carriage rather than not go on by the train at all. What could M. ROCHSFORT say to his countrymen when they are in such a mood? He could swear by all his gods that the seats of a third-class carriage are hard, that babies cry, that oranges and gin leave an unpleasant smell. The poor travellers know all this perfectly well. They have no romance about them for M. ROCHLEGET to destroy, no hopes of splendour and comfort for him to dispel. If he was abusive, they would quite agree with him, but they would not imagine that the author of the abmive language could do them any good. Formerly, when he attacked the Empire in its days of glory and seeming soludity, he was attacking something substantial on which he could make an immediate of the could make the could he could make an impression. There is nothing he could make an impression. There is nothing now for him to attack on which he could make any impression. How, for example, could any one attack the present French Ministry? It is impossible to slap a pound of butter in the face. Violence and abuse meet with no success at all unless that against which they are directed inspires terror or affection. ROCHEFORT has come back, but he has come back at the wrong time. He has no longer any place in the work of French politics. Leicester Square is, we may humbly hope, more attractive and salubrious than New Caledonia, but this change for the better is the chief improvement in his position that M. ROCHEFORT has secured by this heroic

THE ARCHBISHOPS THROUGH COMMITTEE.

THE ARCHRISHOPS have at last carried their Bill through L. Committee, although, after the bad precedent of other important measures, it has been professedly left to the Report to bring it into what its authors consider working order. As we anticipated, the Bishop of Pattersonouse had to withdraw his "neutralization" clause, in face not only of those who did not been it wall constant. of those who did not love it well conor races who did not love it well enough, who loved it so much too well as to welcom teelly sometimest layerage for a general Charles with interest conversely, the Thick tedly survenient leverage for a gu In closing with when council

... clause, ... question was

explained the successive trans-النير has undergone under the foster-Lord Shaffesbury, that we hardly think it mry to repeat the story. On one point, however, so mr as the expressions of its promoters mean anything, no change seems to have been made in its scope. In its first shape, as the Abchbishors very plainly said, it was, under pretext of a measure for regulating Divine worship, in reality a Bill for stamping out what it suited the prelacy to call Ritualism. As Lord Shapteshuey's the prelacy to call Ritualism. As Lord SHAPTESBURY'S changes have been accepted, and nothing more has been aid upon Ritualism, it is reasonable to conclude that the Primates are satisfied that their new instrument will not be inferior for its appointed work to the one which they have been compelled to discard. So the policy of the measure as a piece of intended anti-ritualistic legislation remains unchanged. On this we have only to remark that it used to be an axiom of law-making that, when you enacted your punishment, you were bound to define your crime. But whenever an appeal has been made to the ARCHBISHOPS to justify the urgency with which they demand their Bill by explaining the offence which they desire to remove, they only answer by demanding that what they call their discretion, and what bystanders might be tempted to say was their autocracy, should be made absolute. We will do what the Archrishops have been unable and unwilling to do, and plainly state what the Ritualistic grievance is; and in so doing we shall, for the sake of accuracy, borrow the words of Dr. Pusey, who read an elaborate paper on the subject of the Argunanors' Bill at the late meeting in St. James's Hall. There has, in his judgment, been "a good deal of Hall. There has, in his judgment, been " unadvised language" on the part of Ritualists. He goes to the root of almost all the existing trouble in taking the to the root of almost all the existing trouble in taking the position that, "what is revived should not be revived as "matter of private judgment." The force of habit in older worshippers "has not been enough thought of. "To one habituated to simpler devotion, an elaborate "ritual is something displeasing and abstracting—a "sight which he gazes on, but in which his soul "takes no part." There may, of course, be reasonably an argument on what constitutes elaborate ritual, for that which would he alaborate in an measthair for that which would be elaborate in an unseathetic age becomes comparatively simple in one which has taken up the cultivation of the arts. But the fact remains that confessed errors of judgment have been committed in matters as to the regulation of which the Bishops are primarily responsible. If the Bishops had accordingly undertaken the correction of ceremonial excesses in a judicial spirit, they might have secured the willing cooperation of many who are most resolutely opposed to their actual legislation. They preferred to act vindictively, and, as men commonly do who shape their policy in that spirit, they both forgot history and overlooked human nature. The practices against which they begged Parliament to arm them with exceptional powers were no isolated and well-marked system in direct antagonism to the law and the practice of the Church of Ragland, but only a rank but rare efflorescence, in a number of places which would hardly fill a side of note-paper, of a development which has been going on, in that Church during all the time of, the living generation, as part of that general awaleming of the Church of England to which, to do them justice, the Bishops have, with few exceptions, given more or less encouragement. If the Bench generally could, like the Bishop of Durman, plead that they had save encouraged man or thing within the Church of England that was not of the structure Event Glarch by raising a made dog or cry against an undefined Church by raising a made dog or cry against an undefined operation of many who are most resolutely opposed to their

ag the vestments which the first Reference Prayer-Book seems to authorize him to wear cannot help drawing his own conclusions when he sees his Bishop carrying that pastoral stuff which belongs to his office by the same doorment. The Churchwarden who heard the Archbishep of CANTERBURY base the necessity of the Bill upon the Bishop of DURHAM's persecution of a clorgyman for merely standing before the table, and who was afterwards present when the LORD CHANCELLOR characterized the judgment on which that prelate relied as difficult to be reconciled by "any layman or perhaps any lawyer" with a previous one of which he had himself been author, and the Bishop of Petersorougu follow suit by an attempt to get rid of the judgment altogether by a side wind, might well inquire what had become of the calm and charitable fairness which ought to stamp the office of spiritual fatherhood. Such an episode as the same Frimate forbidding a cross because it was moveable and stood upon a stone ledge over the communion table, after the Privy Council in 1857 and 1860 had especially decided that a similar cross under similar circumstances was legal—because moveable and disconnected with the table-at least showed that the most exalted memories might trip. It is not, on a broad view of the case, too much to say that the only honourable retreat now open to the Archibenors is to rest content with their apparent victory in their own House, and not risk their barque on the cross billows of the Commons. The fact that they have contrived by their policy to alarm and irritate one of the great parties in the Church—including the very men who would under other circumstances have worked more effectively than they can ever hope to do to keep ritual excess within bounds while it is still manageable—without having really gained the confidence of the other side, is sufficient condemnation of their course. The Church by the most authoritative voice which it possesses has recommended the very reasonable plan of reforming and simplifying the old and recognized Church Courts, which there would be as much time to effect in 1875 as there is no time in 1874. The Ritualista, as shown by the address which Dr. Pusay delivered to the and in their name, confess, and are ready to amend, their mistakes; and moderate men who never sided with those Ritualista claim a liberal concordat which should leave them all that they could reasonably expect, with a similar indulgence towards other parties and simpler tastes. A general feeling has grown up for the reconsideration, according to existing circumstances, of coremonial prescrip-tions stamped with the characteristics of a very different state of society. Some of the very matters most keenly in dispute are again before the Courts of Ecclesiastical Appeal, with the prospect of being considered under a higher sense of responsibility and a deeper approxistion of their importance than that which characterized some former trials. The only obstacle in the way is this one inconsistent, hasty, patched, and irritating Bill, which, if it ever reaches the House of Commons, can never hope to secure the time and consideration which the importance of its objects demands. It would be obstinacy, not states. manship, to force it on.

- THE SCOTCH AND IRISH PERRAGES.

IT may be hoped that the Committee on the election of Scotch and Irish peers may succeed in discovering some mode of correcting a flagrant anomaly. When the Union with Scotland was established, it had perhaps not been foreseen that the representative peers would all belong to the same party. Any elective system, large or small, which is founded out the votes of a single constituency must necessarily fail to effect its peoper objects. In France the election of a long list of members by a single department places the whole representation at the disposal of the local majority. No member can be elected for Paris unloss he

Sir Henry, however, was married to a young wife who keeps all his relatives away from him, and gets him to make a will in her favour. He dies, and there is some fear that his 12,000, a year pain out of the Haughton family altogether. This would in itself that fifty, in pre-volume, novel, had only Hugh been as virtuous as hought that it would be of so great a property almost demanded return of docile peers. The came upon the stage we saw that he troubled itself to select the representative arry white teeth "when or for Scotland. For many years the classical amiling shows appointed by the Duke of Wellington, and after applied to English Duke of Wellington, and after applied to English. The Conservative leaders were probably at a lord Derby. The Conservative leaders were probably at the lord Derby. The Conservative leaders were probably at the lord Derby. The Conservative leaders were probably at the lord Derby. Lord Derby. The Conservative leaders were probably a competent to make a choice as the electors; but the absurdity of giving to a single Englishman the power of returning all the representatives of Scotland and Ireland could never have hear contemplated by the formal order. returning all the representatives of Scotland and Ireland could never have been contemplated by the framers of either Union. A Liberal Scotch peer is the only male inhabitant of Great Britain who can justly complain that he is permanently disfranchised. Even a Conservative Bismingham ratepayer may hope that the turn of his party will come; but the Irish and Scotch peers will never abandon their Conservative principles. Lord Rosenery may perhaps induce his Committee to recommend one of the numerous methods of representation which have been devised in modern times for the protection which have been devised in modern times for the protection of minorities; and it would not be difficult to obtain the assent of the House of Lords to some plan of the kind. The risk of transferring the control of the House to the Liberal party is too remote to be worth considering. The numerous creations of late years are not unequally balanced, and as the Liberal measures which still remain assume a more extreme character, an aristocratic assembly becomes less and less favourable to innovation. The younger successors to the peerage who represent the most powerful Whig families are continually swelling the ranks of those whom their fathers opposed. The Conservative party could bear with equanimity a larger infusion of Liberslism than any which is likely to result from a change in the machinery of Scotch and Irish representation. The descendants of Prit's Irish peers, some of whom belong to purely English families, hold with few exceptions the political opinions which were rewarded in the persons of their ancestors. Those among them who belong to Ireland resent the alliance which the Liberal party has ever maintained, notwithwhich the Liberal party has ever maintained, notwith-standing some, interruptions, with the priests and the legitators. The Scotch peers again are necessarily heads by old families, who will rarely be inclined to popular or democratic opinions. A reform in the mode of electing representative peers in both countries would be ex-tremely easy, and it would have no practical effect in altering the halance of parties altering the balance of parties.

The only reason which could have induced the Duke of RICHMOND to refuse his essent to Lord Inchiquin's motion must have been the conventional and useful hesitation of every Government to pledge itself hastily to any proposed innovation. It is possible that there may be formal or technical objections to an Address to the QUEEN requesting her to abstain from the exercise of a statutable prerogative. A similar question was raised in 1868 when an Address was suggested with the object of preventing the presenta-tion to vacant benefices in the Irish Church until Parliamont had decided the question of disestablishment. It was justly contended that the Ministers, notwithstanding an Address to the Crown by the House of Commons, would still be bound to advise the Queen to perform a function entrusted to her by law. The case of the Irish peers is weaker, because the creation of a peer after the extinction of three former peerages is wholly discretionary. The Crown must fill up a biahopric, but in theory all the peerages in the three kingdoms might be allowed to expire without a breach of constitutional duty. There remained the question whether Parliament is entitled to interfers the exercise of the prerogative. .. Lord Inchiquin avoided the difficulty by proposing only to request the Crown to consent to the introduction of a Bill for the abulition of the prerogative created or defined by the Irish abolition of the prerogative created or defined by the Irish Act of Union. As it would have been impossible to show that the motion was inconsistent with proprietly, the Duke of which Recursors relied on the peculiarly inviolable nature of the liberal liberal Union. There as no doubt that it is right to watch with rightance any proposed alteration of the terms of a company provided it affects the conditions an which affects the continuation of the liberal liberal provided it affects the conditions an which affects the bear marked masses that the continuation of the liberal liberal provided it affects the continuation of the liberal liberal provided it affects the continuation of the liberal li

in a passion, or let it fall to the ground in a slumber?

But, marama that's precisely where you make the mistake," and the summer of the state of high a value on our knowing Hugh. You ment of the same day, I'm sure, and if she doem't, she's no great loss, order. It is quite for the family soon. So that's all we want."

and higher kind of the same and if she doem't, she's no great loss, and higher kind of the lightly, and said, "Well, we'll sae," as the of the day is too insignificant to be a sure of the day is

The number of Scotch peers who are not also peers of the United Kingdom is comparatively small. When it is contended that Scotland has now proportionately a smaller representation in the House of Lords than at the date of the Union, the complaint may be answered by a reference to the large number of Scotch families which now occupy hereditary seats. The whole Lody would long since have been absorbed if Scotch peerages had generally been limited to heirs male. As the most recent Scotch peerage must be more than a hundred and seventy years old, there is now a strong probability that, on every failure of succession in the male line, collateral heirs will be forthcoming. It would probably be convenient to admit all the remaining Scotch peers to the House of Lords, if the change would terminate the anomaly of the present but, as long as there are Irish representative peers, little would be gained by an abolition of the elections at Holyrood. It is impossible to provide seats for more than a hundred titular peers in addition to the present body; and it therefore only remains to improve the machinery of representation. It is satisfactory to know that nearly all the Irish poers would prefer their present inter-mediate form of existence to the functions which they are invited to assume in Mr. Burr's prospective Parliament in Dablin. The history of the Irish pours before the Union is not for the most part glorious; but their successors in the present day are loyal and prodent, and they have no desire to resume the interrupted jobs of their successors. The proposal that they should be qualified to sit for Irish constituencies would involve an additional technical inconsistency; but it might be adopted without serious inconvenience. In the late discussion in the House of Lords, some of the speakers naturally referred to the hardship inflicted on Irish peers who, belonging to the misority, have no chance of election as representatives, while they are debarred from entering the House of Commons members for counties or boroughs where they may possibly be popular. The member returned for the borough of Galway at the last general election succeeded almost at the same moment to an Irish peerage, which for the time excludes him from political life. It is unlucky that when the priests and the demagogues for once fail to prevent the election of a man of rank, the creditable choice of the electors should be rendered abortive. The number of peers who would find scats in Ireland would always be ingionificant.

The simple but imperfect remedy of patting at and to the creation of Irish peers ought to be adopted without hesitation. Any grievance which may remain it happily endurable, and it weighs on a small section of the community. A pertain number of English country gentlemen who have chanced to inherit nominally Irish preseque enjoy social precedence, and their chaptes of entering the House of Commons is in some degree improved by the littles which distinguish them from their neighbours. On a liberal estimate it magnifies entirely antique of family and fortune are confidentially in the later had been eligible for Parliament have responsed that the later had been eligible for Parliament have responsed that the later had been eligible for Parliament have responsed that the later had been eligible for Parliament have responsed that the later had been eligible for Parliament have responsed that the later had been also been the parliament and the second of the later and the parliament of the parliament of the later had been also as the parliament of the later and later had been the parliament.

erpoil in the whole of the and closing public-houses in the metro-and separated from the conveniences of home, are specially interested in a liberal provision for refreshment at night and no neglect levels and a regression of the convenience of home, are night, and no prudent legislation could disregard their wants. This shows the fallacy of supposing that any place wants. This shows the fallacy of supposing that any place or district could be allowed to isolate itself from the tountry generally. The difficulties of regulating the liquer trade, have been dwelt upon as an argument for abolishing it, and it must be conceded that these difficulties increase with every attempt to add to the stringency. Of regulation. Speaking broadly, we may say that the hours might, although we do not say that they should, be different for town and country. The House of Commons had get as far as this when the difficulty emerged of settling which is as this, when the difficulty emerged of setting which is town and which is country, and this is to be referred to the magistrates. Then it is said that Mr. Casss is proposing to do indirectly that which he declared it was the principle of his Bill not to do directly. The magistrates are not to fix the hours, but they are to look at the circumstances of the case, and decide which of two rules as to hours shall apply. It may, however, be observed that the question as to hours might arise everywhere out of London, whereas the question whether a place be town or country cannot in very many places be reasonably doubtful. All magistrates are liable to be influenced by ression and regulation but indement cannot fluenced by passion and projudice, but judgment cannot with equal case in all cases surrender itself to feeling. Although there may be no liability to formal appeal, yet some magistrates are likely to hesitate before deciding anything that can easily and clearly be demonstrated to be wrong. Suppose there is what in ordinary acceptation is one town situate partly in a borough and partly in an adjoining parish, and suppose the population of the parish to e slightly under, and that of the borough to be over 2,500, then, under the Bill as it emerged from Committee, the hour of closing in these two parts of one wown would be different. Mr. Choss has proposed to empower magistrates to make the hour in these two parts of one town the same, and if they proceeded reasonably they would do so. If they proceeded unreasonably, it would be difficult to control them, but they could not, without knowing that they were doing wrong, advert to considerations which would be legitimately entertained if their duty were to fix the hour. Mr. Choss suggests that his term "populous " place" may be interpreted by reference to existing law, and he mentions a case in which a new trial was ordered by one of the Courts because the judge had not sufficiently defined for the guidance of the jury the word." town." It is probably not unknown to Mr. Cross that in the North of England villages hardly perceptible by the baked eye are called "towns," and a bewildered stranger may hear natives talk of the "fown-end" before he has discovered that it has a beginning. But in the South and West of England-there are many undeniable towns to which, even for the sake of closing public-houses an hour earlier, Hir WILTRID LAWSON himself could not refuse the title, and Willrand Lawson himself count not remove and people. In which yet do not reckon above two thousand people. In these cases there ought to be no difficulty. But we believe that in Johnson's Dictionaut "town," is defined to be "any "collection of houses larger than a village;" and if we were asked to define "village," we might answer, "any collection of the definition of t "of houses smaller than a town." The definition of "town" propounded by one of the judges, and approved by the offiers in the above mentioned case, was "a place con-taining a number of houses congregated together—an inhabited spot where the occupation is continuous." The "inhabited spot where the occupation is continuous." The obvious question arises, what numbers of houses, world suffice, and this is surely the same as saking for a distinction between a town and wildigs. But although this distinction may not be easy to state in words, it is not very difficult to make in that. Probably there are not many places as to which a jury would beginn bong over the question whiches a railway passed though a town, and magistrates are although a town, and magistrates are although a town, and magistrates are although a time the part of the questions which arise will for the next part be in obscure places where they will be left to be actifed by local intelligence.

Meduesday's ...y complain. proceedings of Whitcased prevalence of drunkenare made some allowance for the deener of that holiday. The Royal Humane brandy and water to persons rescued from ng, and if a spark of jollity lingered in any of the rho cherished it ought not to be treated as an enemy of man-riad. If the return of parties from the country on that lamp and dismaid day was attended by "noise and con-fusion," it does not follow that they were drunk, and perhaps they were only persons eminently capable of jollity under adverse circumstances. Some of those who drink east make most encise, and an experienced officer has ately stated, as the result of forty years' observation of ately stated, as the result of forty years' observation of Scotch and Irish soldiers, that on an equal quantity if whisky the former are quiet and will stand upight if no one pushes them, while the latter hout, sing, dance, and roll about. We object, therefore, to noise and confusion being treated as proof if drankenness. Even a Band of Hope singing "Brave Sir Willeld Lawson" might be unpleasant to drowsy sers, and "the disturbance of peaceful people" furnishes ground for closing public-houses in good time, but scarcely or shutting them up altogether. "Many members," said Sir Willeld Lawson, "would remember that hot July when they came down night after night to go into the details of the Licensing Bill," and probably supported them. of the Licensing Bill," and probably supported themselves by cooling but slightly intoxicating drinks. This smembrance would properly determine many votes against be Permissive Bill. The reference to Belgium and other irreign countries does not help the Bill, because the obserration of an ordinary tour must be that where there is ittle visible drunkenness there is an enormous amount of brinking. The Germans may perhaps resemble that Scotch regiment which could go through evening parade successfully in the absence of any disturbance to the perpendicuarity of the right-hand man. They carry liquor well recease they have constant practice. A coloured gentlenan with a long name delighted Exeter Hall by demanding a Permissive Bill for India, and we expect this proconsi to be adopted about the same time that beer gardens thall be closed in Germany. A benevolent lady established
Workman's Hall, and thereby afforded an excellent
possing for a public-house over the way, which frustrated
be good work of "improving the minds" of working-men.
The members of this interesting class are supposed The members of this interesting class are supposed is in inapalits of passing a public-house without drinking a their way to work in the morning, and to succoumb to the e amptation, while struggling to improve their minds, a work in the evening. I cahaps if the henceolent lady included an imitation of a club smoking-room in the Workman's Hall, the rivalry of the public-house are been quite se formidable. The assumption day may be disputed that all inhabit

Sir Henry, however, was married to a young wife who keeps all favour. He dies, and there is some fear that his 12,000£ a year that, if we remember rightly, is the sum he can will away will arrests? Tarmaded ample material not merely for a two-volume, but allow a considerable manna, novel, had only Hugh been as virtuous as allow a considerable manna, novel, had only Hugh been as virtuous as whole country must lead to a constant a property almost demanded. The House of Commons was row and the stage we saw that he to bewilderment and irritation by a ver: white teeth when was tolerably clear what the House meant, and a smiling shows so, the difficulty of expression would not be insular when was tolerably clear what the House meant, and a smiling shows so, the difficulty of expression would not be insular when was tolerably clear what the House meant, and a smiling shows so, the difficulty of expression would not be insular meaning a when at least for the present, of the suggestion as to grocers' licences, which would really amount to the creation of a now and valuable monopoly. The author of this suggestion is alarmed, as other persons probably are, at the alleged interest at a proper's shop. But it is one themselves with spirit at a proper's shop. But it is one thing to show an evil and another to mind a remedy.

THE EDUCATION VOTE.

THE most satisfactory feature of the Education Vote is its amount. Whether the nation gets full value for the money expended may be doubtful, but every addition to the annual outlay represents or prepares the way for a solid educational gain. This year's increase is partly due to the appointment of five new Inspectors, and Lord Sannon declares that this is only the forerunner of a similar increase in years to come. So far as new Inspectors are needed by the establishment of new schools or the acceptance of Government aid by schools already in being, the appearance of this item in the Estimates is matter for congratulation. But Lord Sandon seemed to explain it not only by the fact that there are more schools to be inspected, but also by the need that the Inspectors "should be able, not merely to go through the dry work of " examining the children, but should have sufficient "time to form opinions as to the complete working of the schools, and at the same time to advise the "teachers and encourage the children." It is to be hoped that this does not foreshadow any essential departure from the theory of an Inspector's duty which was embodied in Revised Code. School Inspectors are now a very large body, and as their numbers grow it becomes additionally important that the Government should have that guarantee that they are earning their money which the dry work of examining the children alone affords. Any opinions that they may build upon this basis of ascertained fact will be exceedingly valuable; but it will be quite possible for a man of quickness and intelligence to form and express opinions as to the working of a school which have little or no relation to the proficiency of the children in elementary subjects. Even under the present system of dry examination there is an phyious difference in this respect between the reports of one Inspector and another. In some there are suggestions which are really useful because they are founded on accurate knowledge of what the children can do and cannot do. In others there are general discursive remarks which might be valuable if there were any means of determining whether they are true. If Lord Sandon means to invite the Inspectors to favour the Department with their opinions on the complete working of schools, he will do well not to relax the security which he now possesses that these opinions will be worth their cost.

Lord Sandon passed lightly over the statistica relating to the attendance of children at school, and made no mention of those relating to the standards in which they are examined. This last set of figures is, as usual, the most discouraging of all. The Report of the Committee of Council states that, "whereas out of 752,263" scholars, as many as 364,090 anght to have been examined in standards suited to the capacity of children above ten years of age, only 127,884 were presented in these standards, while 233,535 were presented in standards suited for children of soven, eight, and nine years of age." The conclusion drawn by the Department from these figures is, on the whole, sound. "Earnest efforts," they say," will have to be made by every available means to separe wand analyses the attendance of children at subsoil." It must be remembered, however, that improved the attendance of children at subsoil."

ought to have known, and even now they are not side any part in canvassing. When site values find him any part in canvassing. When site values find him any part in canvassing. When site values find him this description of Government office. Inaccurate people, happily, are office will people, and to this rule Mr. Listado is the exception. But people are not listened to, and dull writers are not read, so that their inaccuracies do not get a wide circulation. What manner is readers can they be who, when they come to a few pages of such talk as the following, do not either pitch the book across the recoming a passion, or let it fall to the ground in a slumber?—

in a passion, or let it fall to the ground in a slumber?

"But, mamma, that's precisely where you make the mistake," said the on the last has never called."

"You set far too high a value on our knowing Hugh. You attended half "mamma day, I'm sure, and If she doesn't, she's no great loss in the best class a family seon. So that's all we want."

non-inspected schools limitate, and said, "Well, we'll see," as the This is the simple but suffice away until the fretful look left her shortcomings of our educational system? "wole over it, and at length not educated, because they do not come to school to her daughter, no improvement worth mentioning in educational results in improvement worth mentioning in educational results and when we speak of the increase in the Education Vote as being the lost feature in it, it is because, in proportion as the nation is taxed for the education of children, it is likely to grow discontented at getting so little for its money.

Upon the question of compulsion Lord SANDON spoke like a man who has not yet thought out his case. He described the country as "drifting into a law that no child shall go "to work under ten years of age." Upon a matter of this "to work under ten years of age." Upon a matter of this moment the country has no business to let itself drift into any law, good or bad; but, apart from this, it is evident that a law which kept children at school until they were ten, and made no provision in the way of half-time or otherwise for their continuance at school after they were ten, would give the form of compulsion without the power. This is why the recent munits about the children of configuration. recent minute about the children of outdoor panpers is so unfortunate. It suggests a doubt whether the Education Department under its new chiefs is alive to the utter worthicsness of any education which ends before the child has really mastered a single radiment of knowledge. Lord SANDON'S defence is that children above ten can contribute to the support of their parents. It is quite true that this defence raises a most important question, but the solution of it will not be brought nearer by the limitation of school attendance to an age below which they have not the ability to contribute to the support of any one. If the machinery of compulsion is to be brought into play, and the annoyance of working it inflicted, it would be well to have something to show for our pains. The dilemma something to show for our pains. The dilemma whether a parent's duty to educate his child or a child's duty to support his parent ought to take precedence lies at the threshold of all reasoning on compulsion, and it is to be hoped that by next year Lord Sandon will have come to some clearer conclusion on the subject. It will be well if by that time he has dismissed the notion that night schools are "an agency well suited to the present educa-"tional emergency." Under a proper system of attendance at day schools there would be a useful place waiting for night schools. The boys who had left the day school at thirteen would naturally go to the night school in order to carry on their education from the point at which the schoolmaster left it. But unless that point is fixed late enough, night schools will become substitutes for day schools, instead of supplements to them, and in this latter aspect they can do nothing but mischief.

Before the House went into Committee on Monday Lord Educad Fitzmaneics revived an old suggestion of Mr. Hibbert's on the plea that it might allay the grievance created by the 25th Clause. He proposes to make it a condition of admitting voluntary schools to a share of the Parliamentary grant that one-sixth of the expense of maintaining them shall be provided by voluntary contributions. We have always argued that the true answer to the objection that it is a violation of conscience to make a ratefayer contribute to religious teaching of which he disapproves lies in the denial that under the 25th Clause any ratepayer does so contribute. The school fee barely pays—in a majority of cases probably does not pay—for the secular instruction given in Denominational schools; and if this is so there can be nothing left over for the expenses of religious instruction. Lord Educate any religious instruction. Lord Educate any religious instruction.

just where the

CASUISTRY.

LERE is an interesting paper by Provost Casenove in the Contemporary Review for this month on a subject which has before now been discussed in our own columns *, and which deserves more attention than it is apt to receive, at least in this country, at the present day. The author has entirely it would be more correctly described as supplying illustrations from various sources of the universal recogni direct or indirect, of the need of such a science, and touching, without exhausting them, on some detailed points of casulatical inquiry. For different reasons, partly theological, partly historical, partly connected with peculiarities of national character, casulatry, like "Jesuitham," with which it is often confounded, has long had a very bad name among Englishman. Yet, as Mr. Cazenove points out, the unquestionable and not very uncommon fact of a conflict of duties anticipally received the existence of or seeming conflict of duties sufficiently proves the existence of "cases of conscience" which must in practice be settled in one way or another, whether systematically, or—as is sometimes recom-mended—by "common sense," that is by rule of thumb. We say a "sessing conflict of duties," because of course where a lower obligation is superseded by a higher, the formes has really censed or—as is sometimes recom-by rule of thumb. We say to hind; but then it is precisely for deciding which is the lower and which the higher in a given case that a science of casuistry is required. And accordingly its necessity has been distinctly recognized by Aristetle, Plate, Cicero, and all the chief moralists of antiquity. It is examplified historically in the choice of Secretes to obey the or inner law of conscience rather than the law the State, and dramatically in the pious resolve of Antigone to dis-regard the royal mandate which forbade the burial of her brother. Nor is it at all true to say that the existence of such problems ignored in the Bible; many casuistical questions indeed, as we should now call them, are discussed by St. Paul. And the difficulty, as was natural, made itself felt at a very early period of Church history, the new rule of life introduced by Christianity having greatly increased the complexity of moral obligations. Provest Casesove, however, is not always happy in his illustrations. He calculations, in not always happy in his indicatrations. In the ages of persecution Christians were sometimes detected by their being found redolont of wine early in the morning, and that hence it was debated whother the danger might be avoided by substituting water for wine in the calculation of the Eucharist. But this is no question of casuistry, and have no was a salary to the contemporary according to the are no real analogy to the contemporary controversy about name of guilt incurred by the likeliation; it was treated as a ensure of guilt inc stion of pure theology, and decided in the negative on the ple ground that wine is by divine institution countial to the d calabration of the rise. And so, on the other hand, a prejudice is often raised against casnistry by referen or offensive details of cases in dispute, where the absurdity really lies not in the ensuintical discussion, but in the supposed religious. obligation which gave rise to it. Thus, for instance, a controversy broke out the other day among the necessa at the Cope, as to whether a particular kind of cray-ay were in the habit of esting was unclean. One party in the affirmative on the ground that esting spid-in the Koran, and that a creyfish is, coronnal moies of spider; while their opponents seferred the i ebidden in the K nonially at aphder; while their orrested the Cape Museum, who assured a species of spider. The dispute so doe hecause to our notions the in sents referred the h cause to our notions th tel probabition. Assuming that it is n bibition. As es not full under the " made

But to return to Provest Cassaove. He sightly insists that there is nothing emissively Catholis or exclusively Christian in the misses of casulatry, which has in that been taught by hunther manufacts and Protestant divisors as well in by Jamine; while over them lept do not decree all the hord things that here been add

compalled to be essentially those engaged in amplication, note there is an obvious advantage in having shane or caprice of the moment when an amorgancy arises. To may, he instance, as is frequently said or implied, that it is always as absolute duty to speak the truth, but that there are cortain occasions "when a man cannot belp talling a lie, and would not be a man it, and he must trust that the sin will be forgiven him, though he commits it ever so deliberately, and is sure under similar elementations to commit it again," may be called a common advantage he only another form of the Irish vertilit, "Not puilty, but steeming tready method of treating moral problems afford any guarantee far superior practical morality. East maintained in theory that falsehood is never permissible under any circumstances; but his conduct is an awkward comment on his doctrine, for when involved in difficulties with the hing of Prussia, it is well known that he "lied tremendously." Most likely, if he had adopted a less impractically rigid theory, he would have been more acrupulous in its application. If it has almost passed into a proverb that mun are unsafe judges in a same where their own interests are concurred, still less can thay be trusted to decade on the spur of the noment intriosts meral problems where their judgment may, and often must, he warped by a strong has in one particular direction. Most of us, with the hims intentions, are apt to go wrong when we take the law into our own hands. And that is what is practically meant by rejecting

all systems of casuistry. There is one particular branch of the subject, however, to which we mainly desire to call attention in communion with the Comtemporary article, and that in the hope of inducing the writer to work out more fully in detail some points, rather indicated than discussed in his present easily, with which he is evidently well qualified to deal. He observes truly enough that "there is no qualitied to deal. He observes thuy shough that "there is no field in which casuistry occupies so large a space as that consensing promises and truthfulness." And it is also by speculations of this sort that the science has been chiefly discredited in popular estimation. If the courser with of Exeter Hall revol in such vite travesties as the Confessional Unmasked, educated assailants like Mr. Kingsley are pretty sure to funne their indictment against the cassisis on the score of their playing fast and loose with the sacredness of truth. Yet it is a fact that nearly all writers who have astered on the inquiry have recognized the necessity of admitting so exceptions to the strict rule of venerity; and indeed Protestant russ ists have usually been more liberal in their concessions then the Roman Catholic rivals. 1st. Augustine, like Kant, seems to alk exceptions to the general law; but it must be remembered that he is a very voluminous author, and is not always consistent with hi colf, and moreover that he speaks with some diffidence. The Fathers for the most part sanction a relaxation of the rule for a weighty cause, such as self-defence, charity, the honour of God, and the like; and a similar view is advocated by such Protestant writers as Johnson, Milton, Nauderson, Jeremy Taylor, Paley, Hallam, and under certain conditions by Archbishop Whately. The Latin moral theologisms do not usually allow direct lying. except in one particular case to be noticed presently; but the equivocation, or play upon words—for the term agreeness not convey quite the same idea as its linglish equivalent-evasion to be in many cases permissible. And in last mass sons avail themselves largely of this permission in ordinary.

Dr. Newman remarks with much force that "the greatest schoeversion is the House of Commons, and the hustings is anoth for would any one seriously blame the Prime Minister being asked by the artist to whom he was sitting what was the latest news from France, replied, "I don't know; I have not seen the papers." But it is by no neems only in political life that such immunities are claimed. "Modical men," as Mr. Cazenove puts it, "may be said to lead a life of casuistry;" and still more is this trace of lawyers, who are protected by their profession in guarding the isoryers, who are protected by their profession in games seets of their clients. It is sometimes said that in Ps entries physicians are the real confessors of the people, he observe in practiced as a religious ordinates the rais of uion is prurtised as a religious undis ad communications must obviously be extended to p fessor has the same sort of duty to his positent as a client. And accordingly it is maintained that he not city it is m by abbeliately, and if necessary deny on cath, all not be hen learnst through the confessional only, i deny atmonsory, what he has been through the control to be practised at an bound to do so. And, if confession is to be practised at an ignot the point under discussion here—this appears necessaril follow. Nor is it much to the purpose to argue, as is often dithat the execution of justice might be kindered and the some atmost of crime facilitated by such a principle of action. For it was a manufacture of action or action and the second would be revealed in confession. sciple of action. For it

Sir Henry, however, was married to a young wife who keeps all favour. He dies, and there is some fear that his 12,0002. We dies, and there is some fear that his 12,0002, year appares l'armine the Haughton family altogether. This would in itself and room for here lead to lovel, had only Hugh been as virtuous as cases also, always of course appears a property almost demanded. Or are we to say that, while equivocations alice. To take are willing shows if so, what is the ground of the distinction? To take are aliling shows if so, what is the ground of the distinction? To take are aliling shows if so, what is the ground of the distinction? To take are aliling shows if so, what is the ground of the calm and Christian death of another. When the invalid asked for news of her sister, she replied, "It is all well with her." The statement was true to the speaker's mind in one sense, but was understood, and meant to be understood by her listener in quite another. In other words the latter was just as much deceived—presumably for her own good—as if she had been told a direct falsehood, and this is held to be justified by "the law of benevolence." But suppose the invalid had pressed her question more closely and had asked if her sister was recovering or was worse, would have been a direct verbal untruth, but the same impression would have been a direct verbal untruth, but the same impression would have been a direct verbal untruth, but the same impression would have been a direct verbal untruth, but the same impression would have been a direct verbal untruth, but the same impression would have been a direct verbal untruth, but the same impression would have been a direct verbal untruth, but the same impression would have been a direct verbal and it had been told a direct falsehood, and this is held to be justified in denying the authorship of the Waverley Novele: and it had a duty to his friend and none to his wife. friend of his authorship of an anonymous book, and questioned about it by a third person, he should feel bound to answer that he did not know; he had a duty to his friend and none to his questioner. There is certainly a good deal to be said for this view of the matter.

The common formula of "Not at home"—which Paley defends "a word of second intention," and simply means "engaged."
Objections may fairly be raised to it on the score of possible harm to servants, just as Dr. Newman considers it wrong to tell lies to children "because our example will be a very bad training for them." But this is next of a wider deficulty as to the railor inthem." But this is part of a wider difficulty as to the reflex in-fluence of our actions on others, and has no exclusive application to the duty of truthfulness. A religious man who is no Subbatarian may for instance feel bound to abstain from certain pursuits or amusements, innocent in themselves, on Sunday, on account of the moral or spiritual shock which his conduct might occasion to others. It is perhaps on this sort of ground that equivocation is defended when direct falsehood is condemned, as being less likely, if detected, to outrage the moral sense of those on whom it is practised. But it may be worth remembering on the other hand that a habit of direct lying, and, from the greater forethought and skill required, is more likely so, weaken truthfulness of character. A good man might hold lying to be lawful under certain exceptional circumstances, but he would never become an habitual liar; he might gradually slide into habits of equivocation very perilous to genuine sincerity of mind, almost before he was aware of it. At all events there is nothing absurd on the face of it in saying that there are cases where lying is no sin, as there are confessedly cases where killing is no murder. And if this be once admitted, a further question may be asked—whether under such circumstances direct lying is not morally preferable to an ingenious use of equivocation. We may say, broadly that Excellen morally incline to this view while the speaking, that English moralists incline to this view, while the Latin theologians take the other side, but the problem deserves more careful treatment than it seems hitherto to have received.

distinguished writer of our own day has summed up his a distinguished writer of our own day has summed up his indictment against casulatry as a whole by saying that "it makes that abstract which is concrete, scientific which is contingent, artificial which is natural, positive which is moral, theoretical which is intuitive and immediate." His objections under these various heads require a detailed examination, but the general upshot of the argument is to admit the inevitable occurrence of "cases of conscience," and to leave everybody to settle them pro renate for himself. We have touched on the obvious weakness of this apparently simple solution, and so far the Contemporary excepts would evidently agree with us. But the subject may be profitably remitted to his further consideration.

THE LAST NEW CLUB.

ONE might think we had clube enough already, with all those that are afloat, but still more are projected to supply what is vaguely called a pressing social need. The shouting, singing, free and easy club of artists and Bohemians, the grave dialectical club of politicians and scholars; the silent business-like club where whist is treated as one of the important occupations of life, and substantial sums of money change hands over the rubber as methodically as on settling-day in the House; the bustling, noisy, betting club where Turbes discuss the merits of the favourite in language of strange construction, and where each member is in archiving presention. Terfites discuss the merits of the favourite in language of strange construction, and where each member is in exclusive possession of the "straight tip" which will "bring him home," and warrant his "putting on the pot"; the mere club which is nothing but a club—a place for convenient dinners, for the newspapers and magazines, a mod address for the miserable backelor, and a safe retreat for the plant and a safe retreat for the last a onght to have known, and even new they are nativities onght to have known, and even new they are nativities any part in canvassing. When the readers find him in his descriptions inaccurate, they may well mistrust him in his descriptions of covernment office. Inaccurate people, happily, are effect, dull people, and to this rule Mr. Listado is an exception. Jeople are not listened to, and dull writers are not read, so their inaccuracies do not get a wide circulation. What many people are not listened to, and dun writers are not read; and their inaccuracies do not get a wide circulation. What manual readers can they be who, when they come to a few pages of a talk as the following, do not either pitch the book across the re in a passion, or let it fall to the ground in a slumber?—

But, mamma, that's precisely where you make the mistake," said the spectators work in the never called."

You set far too high a value on our knowing Hugh. You very outset, the details to mean, and if she doesn't, she's no greet loss and the work of the committee waster. So that's all we want."

as walking over burning ploughshared and said, "Well, we'll see," as the the conditions of ineligibility must either be said the fretful look but her the conditions of ineligibility must either be said. the conditions of ineligibility must either be some mental look left her many doubtful elements, or so rigid as to peril my it, and at length success of the scheme by exclusiveness. In either case, her daughter, majority of women care to submit themselves to the chancel that rejection, with the slur that will be assumed to be implied in that rejection? Men are accustomed to this kind of thing, and are not that the it but women are not accustomed to it and are not accustomed to it. hurt by it, but women are not accustomed to it, and are sensitive; and it is scarcely probable that the lady candidate for admission into the epicene club who has been blackballed by an overwhelming majority will accept her denial with as good a grace as the ordinary man in the same position. She will feel that it is someordinary man in the same position. She will feel that it is somehow a disgrace, an imputation, a slight; and her friends will feel so too, and will resent her rejection as an insult. The explanation that she is not considered a clubable sort of person will carry no weight with it, and no one will be able to fall back on the impersonal objection of her profession and its already redundant representation in the club. And, this being so, we question whether the nicest women will care to subject themselves to the various processes of carryaging discussion inquiry, and possible various processes of canvassing, discussion, inquiry, and possible rejection incident to club membership. Those who are not so uice are not so desirable.

Then, are unmarried women to be admitted? If so, what is to be the lowest age of membership? It seems scarcely fair to allow the married coquette of nineteen a right which she is sure to abuse, and forbid the staid spinster of twice her age a privilege which she would have neither the wish nor the temptation to turn to evil uses. But if unmarried, women are to be members at all, we cannot see how if unmarried, women are to be members at all, we cannot see how it would work to make a distinction between them and the wives, either in age or personal appearance. Yet, again, if girls of twenty-one or so, young, pretty, and engaging, are to be members, there will be little peace laft in the homes of those lady members who own light-minded lords, also members; and the door which will be opened to jealousy, prying, scandal, and suspicion, will be very wide indeed. Even if a definite age sounding safe enough is to be sot, we still do not quite see that absolute security which of itself would disarm all suspicion and put an end to doubt. The mature siron is as dangerous, all things considered, as the youthful one; and a handsome, clever, well-constituted woman of forwing better the weight of her metal, and how far it carries. It would scarcely do, however, to make the qualification for spinster meming better the weight of her metal, and how far it carries. It would scarcely do, however, to make the qualification for spinster membership consist in confessed homeliness for the sake of keeping the peace among the wives, or to enact that part of the ceremony of admission should be a solemn oath taken against flirting. Yet, where pretty women and pleasant men are mixed up together it the same façon of a club, there will be flirting as surely as there is flirting now under more difficult conditions. Sex is a great fact, let the new school which wants to create a third gender say what it will; and we cannot believe that an epicsne club, where Dons Julia without the trouble of arranging an assignation beforehand, and lively spinstors may have an assignation beforehand, and lively spinsters may have unrestricted association with discursive Benedicts, will be the unrestricted association with discursive Benedicts, will be the safest kind of thing, looked at all round. It would be vary pleasant, no doubt; it would save the expenditure of both wits and falsehood; the old trick of calling at the pastrycook's for letters would be rendered unnecessary; and meetings that came, as it were, of themselves, and in the natural order of events, would excite less suspicion and afford more freedom than if they had to be planned for and precautions taken against discovery. Still, other interests have to be considered besides these, and perhaps those are the interests which would be most endangered under the proposed

Setting aside the obvious uses to which an epicene club might l turned, and to which there is no kind of doubt it would be turne turned, and to which there is no kind of doubt it would be turned in many instances, the question remains, are women for the most part clubable? We think not. Nervous and izritable, full of strange fancies, given to unfounded dislikes and rootless friendships, impatient of small annoyances, most women have little real command over themselves, and are ant to show their feelings with what would be a savage simplicity and directness but for the finery of mind and body to which they are given. When they dislike each other—and where there are a dozen women there will be a dozen constities—they have an infinite variety of ways of manifesting, their spite; we've unknown to men, and impossible in a society of men, but which would destroy the please of a community where there was no benegative hand to heap orden and settle difficulties.

ai ede îr nyhow and throw-. sects never have agre and envious stand on one , uy the sight of a splendour which they pending strength and means in the vain en-cen a mark set too high for them. There have been

no home rightly so called, who are alone and want companionship, who are poor and want better accommodation than they can afford without the co-operation of a society. And as it has been proved by experience that a women's club—or something like it—where the male element was excluded, was horribly dull and unsatisfactory, and the very hot-bed of strife, they wish now to try one which will admit men, and so give the homeless fair ones receiver without the need of chargeons or drawing-norm observations. society without the need of chaperons or drawing-room ob-servances. As for the ladies living in the country who want a place for their parcels, their case is simple enough. Whether it is worth while to try such an experiment as an epicene club in order to supply their demand and fulfil their need, is another

These, then, are the two classes of women for whose advantage the new club is mainly proposed. It seems hard to say a word of denial to either, and yet we would be cruel enough to deny both. If women want a club and a club-house, let them arrange the matter for themselves, as men have done. But a place where flirting can be carried on under cover of "going to my club" is not a thing that we wish to see established as among the recognized conditions of modern society. It is the thin edge of the wedge; and the wedge when driven home will destroy all that we hold to be valuable and beautiful in our English life. The truth is, this desire for an epicene club. is only one among many manifestations showing the revolt against privacy and domesticity in which some of our women are engaged. For some reason, the economic root of which is at present hidden, many modern women find home the most tiresome place, and home duties the most irksome occupations, in the world. They prefer almost anything to domestic life as it used to be in simpler times—that dife so full of tender associations, of strong affections, of powerful ties, of honourable activities. After having helped to ruin the old-fashioned servant and to destroy the old-isshioned system, they turn round on their own work, and plead the seyants and the tradespeople as the reason why they hate housekeeping, and why they prefer club life, hotel life, any kind of life that can be maned, to home life. But it is neither the cook nor the grocer that makes home life unpleasant to the discontented woman; it is her own failing in domestic qualities and domestic affections; it is the love of dress, the passion for amusement, the frency for notoriety, for excitement, for change, which have frency for notoriety, for excitement, for change, which have development of the new phase under which she is passing, a further and stronger protest against the natural order of her being. We cannot say that we wish it success; for we regard it as a dangerous experiment in which more is involved than appears on the surface.

SPEAKING OUT.

ithout any breach of truth. It is certain that in our days ment once speak out all that they think so largely as they did in some that these easy, for instance, the eixteenth century or the sevenmenth. But we should doubt whether there is so much direct ad cenericus instanceity now as there like been at some times of as world's kintery. One great point for those who take life, indep's line doubtless is that there are so many people new the disbelieve in Christianly; or at least in Christianly in a doubtless, who do not openly posites that dis-

unmon, not only o compared with certain to to set up an ideal standard. For

oto set up an ideal standard. For annex one might conceive that there would be or political disputes at all; if every man did not hit aght thing for himself, he would at least be ready to copt the right thing, as soon as the wise man set it before him. Let us look at the political case first. Men who wish to get into Parliament do not speak out their whole minds for fear that, if they do, they may not get into Parliament. Men who are in Parliament, and even in the high places of Parliament, leaders of parties and the like, do not speak their whole minds for fear that, if they do, they may lose their seats in Parliament or be unable to carry their measures through Parliament. And more than this, the habit of not speaking out the whole mind leads to not having any whole mind to speak out. Mr. Morley himself points out that men very often come in this way really to have no distinct opinions. They come to say whatever really to have no distinct opinions. They come to say whatever is the right thing to say, if not with any fervent belief in it, yet at least without any conscious unbelief. Now this will probably least without any conscious unbulief. Now this will probably happen more or less in all times and places, but there certainly are e of society and forms of government under which it is more states of society and forms of government under which it is more likely to happen than under others. The kind of insincerity of which Mr. Morley complains, the half-utterance of opinion, the half-formation of opinion, would seem to be one of the weak points of representative government, especially in its fully developed shape of government by party. It is not so likely to grow up, at least not exactly in the same shape, under a despotism, or under a pure democracy, or even under some forms of oligarchy. Under a despotism a man may hide his opinions either out of sheer fear or hecause he feels that it is no use to put them forward. But this is not exactly the state of mind of which we are speaking. Under a despotism also a man may not only hide the opinions Under a despotism also a man may not only hide the opinion which he does hold, but may profess opinions which he does not hold, in the hope of flattering the despot and getting something from him. Nor is this either exactly the state of mind of which we speak. It is something more distinctly and directly selfish. The candidate who keeps back half his mind lest he should endanger his election by speaking the whole of it, the Minister who keeps back half his mind lest by speaking the whole of it he should endanger the success of his measures and his own tenure of office, may, after all, act upon much higher motives than the man whose sols object is to escape the anger or to win the favour of a despot. On the other hand, we can conceive a really wise and well-disposed despot honeatly listening to a faithful counsellor who speaks out his whole mind. Such a man would have far less difficulty in speaking out his whole mind than the man who has to win over either the House of Commons or any one of the constituencies who being to choose it. In a despotism, then, we are likely to meet with something worse and something better than what we are speaking of, but not with exactly the same thing. So in a pure democracy, a man may be tempted to flatter the majority, to hide his real opinions, to pretend other opinions; he may do all this in order to please the corporate despot, just as the other man may do order to please the corporate despot, just as the other man may do
the like to please the personal despot. But the particular motives
which are brought to bear on an English candidate or an English
Minister would not have much effect on him. First of all, in a
pure democracy, where every free citizen is a member of the
Assembly, no man need be led astray by fear of not getting a seat
or of losing it when he has got it. He has his seat anyhow, and nothing but a judicial sentence or a special act of the Legislature can deprive him of it. Then again in a pure democracy Parliamentary in the can be upon office than it does in our mised from the common of the common to the common than it does in our mised from the common to the common than it does in our mised from the common than it does in our mised from the common than it does in our mised that mised the contract mised the contract mised that mised the contract mis the contract mised the contract mised the contract mised the co form of government. Of course Perikles, Nikias, Phôkiôn, he generals of the commonwealth, might lose their re-election next year if the Assembly disapproved of their speeches; but Kleon Kallistratos, Démosthenês, unofficial men, risked nothing but immediate popularity, which they had a chance of recovering another time. And we know very well that the Assembly as often voted according to the mind of the non-official as according to that of the official speakers, and we know also that neither the risk of losing office nor the risk of losing popularity did hinder men at Athens office nor the risk of losing popularity did hinder man at Athens from speaking out even when what they said was quite opposite to the wishes of the majority. In Achaia or at Rome, a magistrate risked much less than at Athens by speaking his mind, because he could not in any case be re-elected at the next election, and by the time that he was eligible to stand again public opinion might have come round to his views. In sommonwalthe of this kinds we may believe that public men really did speak out their hinds more freely than they do among ourselves. If a man spoke something other than his real mind, it was sure to be from distinctly corrupt motives, from more self-interest at least, even if it were not a sign of actual treachery or bribery.

In a moderate and regular oligarchy again the temptations to instancing, though greater than in a democracy, are different from what they are among ourselves. The excluded class, just as in a democracy, are as a sin a democracy, are therefore the ruling briber, though an oligarchy is so far heater than a despotion that mere personal flattery does not count

Sir Henry, however, was married to a young wife who knows all his relatives away from him, and gets him to make a will in her favour. He dies, and there is some fear that his 12,000% a year ap-which without the Haughton family altogether. This would in itself find room for here's null make an interest for a two-volume, but have the state of course supply had only Hugh been as virtuous as what he wery much like the supply had a property almost demanded. The state of course supply had a property almost demanded. The state of course supply had a property almost demanded. The state of the relationship is a property almost demanded. The state of the relationship is a property almost demanded. The state of the relationship is a possible of all the members of the ruling below the state and the state of the ruling to the relationship is a passion, or let it fall to the ground in a plant here. of all the members of the ruling To take and teeth" whenthe actual working of an oligarchy, though the setual working of an oligarchy, though the setual working of an oligarchy, though the setual death perfectly free, yet there is a tendency to clothe admillious to boards with great and irresponsible powers, even towards members of the ruling order. In Sparta or Venice it was doubtless the part of a predent man to be of the same mind as the Ephors or as in the Council of Ten. In Poland again, besides the narrow constitution of the ruling order, we find, within the ruling order itself, the tyranny of majorities and the tyranny of constituencies both carried to its extreme point. It is commonly believed that the maintainer of an unpopular cause in the Polish Diet ran some chance of being sabred, either by the majority of his fellow-legislators, or by his constituents when he got home. But then the Polish constitution, as has often been shown, ingeniously contrived to unite the evils of monarchy, of sristocracy, and of democracy, without the better features of any of them.

It does seem certain then that it is one of the weak points of our political system that it has a tendency to lead public men to an imperfect utterance of opinion, and thereby to an imperfect formation of opinion. It does so in a greater degree than other forms of government. The candidate must adapt himself to the temper of the electors; the Minister must adapt himself to the temper of the House. And in so doing, even if he does not say anything which he does not think, he cannot fail to keep back a good deal that he does think. No doubt in this there is evil, but it does not follow that it is unmixed evil. The candidate may be wiser than the constituency; the Minister may be wiser than the House. But, on the other hand, the balance of wisdom may be the other way. Indeed it has become a proverb that the House is wiser than any one man in the House. This is of course a passive kind of wisdom, which may hinder foolish measures, but which will not promote wise ones. But it is a wisdom which which will not promote wise ones. But it is a wisdom which sometimes is useful. In fact, a certain amount of mediocrity, a certain amount of faltering half-opinion, seems to be one of the mixed form of government. Where the weak points of our mixed form of government. Where the state is more strongly monarchic and where it is more strongly democratic, the Minister of the King, the popular orntor in the Assembly, can go more directly towards his objects than the Assembly, can go more directly towards his objects than the Minister who commands a majority in the House of Commons can. Still we should hardly on this account wish to full back upon the state of the appotism; and about pure democracy in a large State it is no use a sguing whether it is good or bad, because it is a thing which cannot bo.

On the other point, insincerity, or at least holding back, in the expression of religious belief, we cannot now enlarge. But at least men now are not more insincere than Greek philosophers who held that the people should be taught to worship the Gods whom they themselves had learned to disbelieve in. Men do not put insincerity in a form quite so shameless as the Pope of whom it could even be reported that he smiled on the wealth which "the fable of Christ" brought him. Men do not put it in a form so horrible as the Roman magnetrate who sent a Christian to the Bons for refusing to worship Jupiter, while he himself no more believed in Jupiter than the Christian did. It was held to be for the asfety of the State that men should worship Jupiter whether than believed in him or not Samuthing of the same facility in they believed in him or not. Something of the same feeling is perhaps still abroad; but at least it does not go so far as sonding men to the lions for speaking out what they think. Altogether each age has its good and its bad points. It is not a good thing in itself that men should be insincero, that they should keep back their real minds, either in politics or in religion; but it is better that mun should do so than that they should be so strong in speaking out their minds one way as to be ready to burn or ambowel the man who speaks out his mind another way.

ST. PAUL'S CATHEDRAL

THE world has lately been curiched by a large mass of controversial literature in depreciation of Mr. Hurges's design for the completion of St. Paul's? The Times gave the signal by publishing in a single day a protest from four dissentient members of the Committee, a letter by Professor Donaldson, and a leading article; the Paul Mall lost no time in following suit, and the Guardian has joined in the milie. The Telegraph, by the way, has also said something, but us the chief argument which it amploys is that the sixteenth century and the cinque cento are allowed upon the first professor profinent specific in the Mr. Burges is of a cheerful disposition, we wish the history of passing it over. The seconds again him Mr. Fargusson, Mr. Cavendish Bentinet, Mr. Children, and Mr. Fargusson, Mr. Cavendish Bentinet, Mr. Children, and Mr. Gambier Paury, is partly composed of a recital of facts, and partly of criticisms upon Mr. Burges's design blind on the partly of criticisms upon Mr. Burges's design blind on the Rose that the continuous lates are recital of continuous and partly of criticisms upon Mr. Burges's design blind on the Rose the piedge which was plant to be recital of continuous. THE world has lately been curiched by a large mass of cos

readers can they be who, when they come to a few page talk as the following, do not either pitch the book across in a passion, or let it fall to the ground in a slumber?—

possessing But, mamma, that's precisely where you make the mistake," said the spectators worker. You set far too high a value on our knowing Hagh. You set far too high a value on our knowing Hagh. You the last, the details writers I'm sure, and if she doesn't, she's no great loss.

an office, the details wellow I we sure, and if she doesn't, she's no great loss, and the committee well soon. So that's all we want, include a ploughshare the soon. So that's all we want, we'll see," as she that position and treatment is as to peril the fretful look left her might have remembered, haven as to peril the we'll see," as she might have remembered, haven in a to peril the west, and at length and unanimous act of that body of the chanceleft adjusted. They also harp on what they call Mr. Burges lied in that to accompany the model with drawings and eketchies not though the truth as we have been told in that the means though the truth, as we have been told, is that the mouth the models only, were ordered. Finally, they make a great plaint that no hint has been presented as to "the mode in with its mountaint that no hint has been presented as to "the mode in with its mountaint that he mode in with the mode in which is mountaint that he was a great that the mode in which is mountaint that he was a great that the mode in which is mountaint that the mode in which is the mode in which is the mode in which is the model in the it is proposed to ornament the dome"; as to which, we believe, the same answer would be given, that the body of which they ware, and we suppose still are, members, and not the architect, responsible for what has and what has not been ordered. are all able to see at the Royal Academy what the architect has to offer; but had his instructions included the simul-taneous preparation of the dome design, we imagine that the taneous preparation of the dome design, we imagine some Exhibition of 1874 must have passed away and the decoration of St. Paul's have remained as much a scaled book to the public as ever. The rest of these gentlemen's paper is composed of a series who Burces's design, which indicate that they do of criticisms on Mr. Burges's design, which indicate that they do not like what he proposes, but which are singularly deficient in the specific reasons for that dislike which we have a right to expect from gentlemen of such high pretension when they undertake to give the cue to public opinion. They are no doubt very lavish in their charges of "variety of decorative material," "crudaness and violence of many of the tints," "want of subordination," and so on, with a dexterous reference to that "Jesuit" art which they t know that Mr. Burges has been particularly cautious to avoid; but as they are very caroful not to particularise the por-tions of the work to which these comments apply, we can only accept them as expressions of individual opinion, and not as guides for the better execution of the work. They are obviously the first impressions drawn from a model in which all the colours are new freshly bright, in which-from the circumstance that the itself is only a section of the supposititious building—the strongest lights are thrown upon parts which will in reality be in the deepest shadow, in which opaque paintings necessarily stand furturanture to windows, and in which the serial or foggy effects of the sectual cathedral do not make themselves felt. Any colour which would tell in the real St. Paul's must look strong upon a sectional model, tell in the real St. Paul's must look strong upon a sectional medal, but of this the remonstrants do not seem awars. On one particular change indeed they are explicit—the substitution of marble for estance indeed they are explicit—the substitution of marble for estance as the ostensible material of the ground-story of the Cathedmi, which they particularize as "false construction," and therefore "false in taste." They may, or they may not, like the substitution, but to condemn it on principle as false construction is to condemn all panelling and all gilding—nay, all colour applied to glass. "Under this canon of taste, for instance, all malachite and all lapid lazeli would be excluded from art construction, for these two materials, from their continues and hardness, can only be need to lazuli would be excluded from art construction, for these two materials, from their continues and hardness, can only be used in the way of venecing. Let them prove that the Portland stone of St. Paul's will not in future, as in past time, absorb soot and become both grimy and strucky, and they may then dehate on its merits as compared with close-grained marble. No one beyond childhood would imagine that a marble-lined chamber was built all through of marble blocks, and therefore the adoption of that through of marble blocks, and therefore the adoption of t material as a surface living may or may not be ornemental, but is in no degree false, for it makes no attempt to deceive. There is, however, one charge which is so circumstantial 4

There is, however, one charge which is so circumstantial shat, as we believe it admits of a direct contradiction, we quote it to show how reckless men can become when they betake themselves to protesting:—" That the gentlemen selected by Mr. Burges to execute his figure subjects, and named to the Fine Arts Committee, instead of being the most sminant painters and southhors of the day, or these who have most studied the Italian masters of the sixteenth century, most studied the Italian masters of the sixteenth are artists comparatively unknown, and chiefly panel Gothic decoration." This, as it stands, is a weighty account the answer, we understand, is, first, that when the facentients most Mr. Burges, he had selected no one to one to start Combigure subjects and had named none to the Fire Arts Combaving in accordance with his orders mayely filled model with rough skutches of the general treatment as possed it pour five for idder; and, secondly, that now that his treatment has been approved, he has miscated and has more Committee scatte of the most emissant pointers and and the day," and flows who have "most emission the Buffley of the sixthesial content, "and these who have "most emission the Buffley of the sixthesial content," and that he has naturally because

not will on grim word with the wanted to say some-mil he wanted to say some-edizened." The result, we fear, was highed at then and for the whole term of the Professor goes on the control of life. But the Professor goes on to overwhelm urges with the good examples of "St. Peter's at Rome," and "St. Vincent de Paul at Paris." But St. Peter's and St. Vincent

St. Vincent de Paul at Paria." But St. l'eter's and St. Vincent de Paul are Popish mass-houses both, and yet Professor Danaldson has the effrontery to invite. Mr. Burges to borrow their harlot allurements for the bedizenment of our noble Protestant cathedral We cannot present to follow our critic through the somewhat leaders. One sentence, however, merits being preserved:—"The filling in of the flutes to the proposed marble shafts of the pillstem is a corruption due to the debased period of Roman art." We do not at all deny the truth of this proposition; we only very humbly add that the architect who perpetrated this corruption was named not Burges, but Wren.

We must do the justice he deserves to the writer of the leading article in the Times, when we say that he does not attempt the impossible task of reconciling the four protestors and their irrepressible backer. With a bold plunger into mythical history, he pronounces that the Executive Committee of St. Paul's has been witnessing a two years' "continual and inevitable struggle" between Mr. Burges and its Fine Arts Committee: the fact having been as we have heard runoured, that the Committee in question has met exactly three times, having on the first occasion sat for two minutes, and given Mr. Burgos unrestricted instructions to proceed, on which he constructed his model of the nave decorations, and on the second—while adjourning its formal decision upon that contribution-having ordered him with no restrictive limitations, to undertake the more important one of the choir; while its third and last occasion of mosting was the one recorded in the protest of the malcontents. In the intervening months we fancy that those whose brief the Times now holds mover troubled themselves by presence or by letter to cheer or to cri-ticise, to warn or to guide the architect, who ewed his appointment to a vote in which all of them had not been dissidents, while all had taken their share in the consequent arrangements. The re-maining article is mainly a second hash up of the Protest, with much artificial stress laid upon the cylls of spending the whole imaginary 400,000L upon one building. This argument struck us as peculiarly appropriate in the mouth of a paper which a very few weeks since was the warmest advocate for a new cathedral on a large and expensive scale at Manchester.

large and expensive scale at Manchester.

The Pall Mall writer, in happy contrast with Mr. Donaldson's hysterics, indulges in a bold, rollicking swing of art criticism which might have been worth analysing if his datum had not unluckily been that Mr. Burgos intended to dispense with the sid of artists of acknowledged fams. As this, however, happens to be just not the case, we fear that its criticism, with the brilliant percention about "John Stubbs and Thomas Noakes," must be docketed "coup manqué."

The Guardian critic, after some well-deserved remarks upon Professor Donaldson's "coarse," "abusive," and "unjust" language, dances off into supprestions as to "the ball-room or café typo," with similes of muslin dresses and blue ribbons, because he fancies that he finds in the nave "a white marble surface with bright blue

that he finds in the nave "a white marble surface with bright blue medallions," not having grasped the fact that the majolica intayings of the quasi-triforium (as bright blue as, and not brighter than, any plaque of Wedgwood's) lie considerably above the line at which the architect proposes to terminate the inerble coating. As to the treatment of the apec-roof, we can only say that the writer who either recollects the great traditionary "majority" which so often and so solemnly terminates the visits of some Besilica, and then can write "we cannot help saying that the representation of our Lord, pendent, as it were face downwards from the colling" (which means apwards through following the surve of the conch) "graduess a shock—almost a charles"; or who has written this amaxing sentence without imposing or remembering the existence of such representations, has markle to beam before he can set himself up to criticiae such a ladge as that of his. Respectively the empletion of 5t. Paul's. The critic says this indgment with an imposesive demunication of quarkles." (which he may be sureletive demunication of quarkles." that he finds in the nave "a white marble surface with bright blue

on monument at Brattle aroad ideas in regard to human nature "; an aroad ideas in regard to human nature, and it is a could that there was no want of breadth of view in the principle of the Universities of the universities of the universities of the same ground it may perhaps quite as reasonably be held that one man is as good as another, and better too. Still it must have required no small degree of courage to connect a demonstrations in honour of James Fisk, junior, with any form of religious week and Mr. Fisk's memory is not exactly of the sort that annils sweet and blossoms in the dust, and it might have been supposed that his blossoms in the dust, and it might have been supposed that his friends and associates would have preferred, if only for their own sake, that so unsavoury a relic should be stirred as little as possible. They have shown, however, that they are superior to such conventional considerations, and have come forward boldly to celebrate the virtues and good works of their notorious here. "Whether or not," says the New York Mercial, "James Fisk, junior, received credit during his life for such good qualities as he possessed, it is certain that in one place at least, now that he is gone, he is regarded as a dead divinity, or at least as having been very nearly godilias." That place is Brattlebore, "where young and old, rich and goory, unite in praise of their mighty townsman departed," and everywhere exhibit "busts of the dead man in the most conspicuous and honourable positions." As an additional tribute to his greatness, and an incentive to American youth to follow in his footand an incentive to American youth to follow in his foot-steps, and strive after the same kind of celebrity, an imposing monument has been erected in the cometery at Brattleboro. Mr. Fish's widow has paid for this memorial, but the people, we are told, have cordially associated themselves with her in honouring the becased. The regiment which the Colonel formerly commanded—the 9th New York—also marked in 9th New York—also marked its appreciation of his er by sending delegates to represent it at the cars— "Everything that affection, taste, and wealth could do character mony. was done, and the result was a ceremony, simple indeed, but fitting and appropriate." The monument, we are campaid by the some authority, "will challenge comparison with surthing of kind ever wrought by the genius of art." It consists of a man kind ever wrought by the genius of art." It consists of a marble shaft resting on a base, at each corner of which is a life-size female figure, representing one of the forms of enterprise by which Fisk rose to eminence—namely, navigation, the drams, railroads, and commerce. It would be interesting to have an account of these figures a little more in detail. These who know of these figures a little more in detail. Those who know anything of the kind of acones which used to be enseted on board the Colonel's steamer and at his opera-house will have no difficulty in understanding the sort of nymph who would most appropriately symbolize the character of these enterprises.

The dedication of the monument was accompanied by a religious

service which the reporter of the Herald calls simple, but which most persons, recollecting the circumstances of bisk's career, will probably consider somewhat startling. A Universalist minister, Mr. Harris, was judiciously chosen to officiate, and displayed that screne comprehensiveness which may be supposed to be characteristic of his unprejudiced faith. He evidently felt, however, that he was on rather delicate ground, and that it was necessary to proceed with great caution and to avoid details. The most significant part of his prayer was that in which he thanked God more separally for having given up "so broad ideas in regard to human character." He also prayed that the occasion might charate all present in he and purpose, "and that the Drity would remomber the regiment which our brother, Colonel Fisk, was the leader, and as they shall live over the pleasant and social lives which are theirs to unjuy, may the thought that he has gone out from them not be sad and couraging, but full of cheer and encouragement, and "-of all things in the world -" conduce to their better living." Colombilithcock next addressed the company, remarking that "it was customary to next addressed the company, remarking that "it was customary to erect tributes to the great," and that this was "truly a noble and deserved one to Colonel Fisk," who had "lised and died in the prosecution of labours which were of incalculable besefft to the action and to the world." He added that "the day was a most fitting one for the ceremony, being that set sport for the henouring of the nation's dead soldiers." Fisk, it need herlily he said, was a soldier only in name, and made himself popular with his regiment by converting drill into a pretext for drinking. After this panegyric, the band played "Nearer, my God, to Thee." Mr. Harris added a few general remarks on functional art, in the course of which he explained that he was not personally acquainted with "our brother," but that he had reason to believe he had "a great good heart."

It is accretive necessary to recall, as a comment on these pro-

It is scarcely necessary to recall, as a comment on th ceedings, the notorious reputation of the man who was thus com-memorated. That Fish was great in his own way nobody can deny, for he was certainly a very great scoundrel; he forged, swindled, and stole in the way of business, and his private life was a course of gross

the so-called rall

Sir Henry, however, was married to a young wife who keeps allowed in relatives away from him, and gets him to make a will in her favour. He dies, and there is some fear that his 12,000 a year—that, if we remember rightly, is the sum he can will away—will which with the Haughton family altogether. This would in itself people hate case, may avoel, had only Hugh been as virtuous as if irst of these measures—and the stage we aw that he day give rise to grave historican never bert — white teeth "when and philanthropist of Brattleboro'Cof. (So take all a waiting shows in his steps. It may be assumed that those who were immermentators in his steps. It may be assumed that those who were immermentators in his steps. It may be assumed that those who were immermentators in his steps. It may be assumed that those who were immermentators in his steps. It may be assumed that those who were immermentators in his steps. It may be assumed that those who were immermentators are not listened to, and dull writers are not read, a people, and to this rule Mr. Listado is me exception. The image of the control of the circulation when they come to a few pages of talk as the following, do not either pitch the book across the readers can they be who, when they come to a few pages of talk as the following, do not either pitch the book across the responsible for this monstrous and revolting ceremony were only a matter of the fall to the ground in a slumber?—

"But, mamma, that's precisely where you make the missake," as in his steps. It may be assumed that those who were immermentators with the date of his steps, and to have known, and even now then a say part in canyassing. When his readers him in his description. Government office. Inaccurate people, happly, are office and page of the stage we saw that he dull people are not listened to, and dull writers are not read, a people are not listened to, and to this rule Mr. Listado is me caregidary. In a sure of the following of the control of the control of the control of the control of the c in his steps. It may be assumed that those who were immediactat responsible for this monstrous and revolting ceremony were only a comparatively small body of people; but it is to be feared that Mr. Harris's "broad ideas in regard to human nature" are practically accepted by many who would be shocked by the open effrontery of their limits or such an occasion. It is evident that Fisk could never application on such an occasion. It is evident that Fisk could never have attained the position he occupied in New York without the tacit countvance of persons of respectable character, who secretly nave attained the position he occupied in New York without the tacit counivance of persons of respectable character, who secretly admired his smartness, and who were very willing, if they got a chance, to stand behind and share the plunder; and there is no reason to suppose that if another Fisk were to rise up to-morrow, his rascalities would not be regarded with similar complacency. A narrow view of human nature would perhaps lead to the conclusion that persons who aid and abet this sort of villary are morally quite as bad as the rogue who plays the cards for them; but it is the advantage of a broader system of philosophy that it balances the daring and cleverness of the freebooter as a set-off against his deviations from conventional morality.

Nor is this breadth of view exclusively confined to America.

Englishmen are always ready, when a Fisk or a Tweed is carrying everything before him on the other side of the Atlantic, to console themselves with the reflection that, though we may be bad enough in our way, at least such things could not happen here. It may be true that the frank and brutal scoundrelism of a Fisk could hardly be reproduced in our tamer and more straitened society, yet the same poison may be found working under somewhat modified conditions. The secret of Fisk's success lay not merely in his impudence and boldness as the leader of groat swindles, but in the support he received from men who, having reputations at stake, could not engage openly in such enterprises, but were quite willing to co-operate under safe cover. The convenience of an agent of this kind partly explains the good-natured view which is taken of his acts. It may be doubted whether even in London a floater of bubble companies, no matter how disreputable his antecedents, how notorious his practices, need anticipate much difficulty in finding a backing of respectable people if he can only show that he has skill and courage, and that there is something to be made by his help. His backers might be shy of mixing themselves up with him personally, but they would be quite ready to follow in his wake, and accept what plunder came their way. And, if he were discreet, a speculator of this kind might even push his influence much further. Fisk's scandalous habits and contempt for appearances naturally cut him off from decent society, and in this country would no doubt have proved an insurmountable obstacle to his progress. An English Fisk would know the advantage of cultivating the proprieties, of the same poison may be found working under somewhat modified "华bo Fisk would know the advantage of cultivating the proprieties, of affecting the patronage of art and literature, of advertising his public spirit. His name, on one pretext or another, would be public spirit. His name, on one pretext or another, would be constantly in the newspapers. He would become a public character, seek a pedestal in Parliament, and indulge in even higher aspirations. His success might excite jealousy, but no matter what men might say of him among themselves, he would be too useful, he would have too many indirect and secret confederates in his speculations, to fear exposure. When reguery is seen marching so halter and enimenhantly it is necessary to remember the support boldly and triumphantly, it is necessary to remember the support which it derives from those "broad views in regard to human nature" by which Mr. Fisk's friends and admirers justify the monument in commemoration of his honoured name.

MEMBERS AND REPORTERS.

FORMERLY members of the House of Commons used to be exceedingly angry with reporters for attempting to take down their speeches, and more than thirty resolutions on the books of the House express the furious resontment which was felt at this impertinence. Nowadays, however, the complaint would seem to be reversed. Last Session Mr. Mitchell Henry brought forward the prievance of members who think that they are not sufficiently reported, and proposed that the country should be taxed in order reported, and proposed that the country should be taxed in order to satisfy their sense of their own importance and the value of their utterances. It may be doubted whether it is really a kindness to a certain class of speakers that they should be reported at length; but it is perhaps a more essential question whether the public should be compelled to pay for what it does not want. It may be assumed that if no newspaper can be persuaded to report the speeches of these gentlemen, it is simply because newspaper conductors are under the impression that there is no market for such a commodity. The truth is, that at present most people get quite as much of the Parliamentary debates as they care for, and if fuller reports were to be published, they would certainly

people are not listened to, and dull writers are not read, so their inaccuracies do not get a wide circulation. What manus readers can they be who, when they come to a few pages of a talk as the following, do not either pitch the book across the roin a passion, or let it fall to the ground in a slumber?

The report in artemso is of course, as its name implies, are
The report in artemso is of course, as its name implies, are The report in extense is of course, as its name implies, a second report of everything that is said, including all the interruptucal expressions of applause and dissent, and all the little incidents of the sitting. A speech in the Assembly, if it excites any interest, usually becomes more or less a chorus, and the sentences of the speaker are broken up and interlarded with continual interjections from other members. All this is supposed to be sixthfully reproduced in the official report, although it is to be faithfully reproduced in the official report, although it is difficult to understand how any merely human stenographer can possibly report half-a-dozen persons all speaking at once. Copies possibly report half-a-dozen persons all speaking at once. Copies of the full report are supplied to any newspapers that ask for them. Proofs of the speeches of members who do not claim the right of revising them are given out sheet by sheet at Versailles during the process of printing; and when' the whole impression is completed, it is sent to an office in Paria, where copies can be obtained on application. This report is published in the unofficial part of the Journal Official of the morning after the sitting, but, as far as we can learn, nowhere else. In the event of the sitting being protracted beyond eight o'clock in the evening, which is very unusual, the report of the latter part of the evening, which is very unusual, the report of the latter part of the debate may not appear in the Journal Officiel till the next day but one. The other newspapers content themselves with the abridged reports. The full analytical report is a summary of the report is azienso drawn up by the chief of the staff, with the aid of nineclerks. It must not exceed two columns and a half of a large-sized newspaper in length. The short analytical report is a still more reduced summary, limited to a column in length. Both these reports are placed gratuitously at the disposal of the Parisian reduced summary, limited to a column in length. Both these reports are placed gratuitously at the disposal of the Parisian and provincial press. The stenographic staff is directly employed by the Assembly, and the contract for printing the reports is given to the lowest bidder at a public sale. The official shorthand writers have desks close to the tribune, but no accommodation is provided for non-official reporters in the body of the Chamber. The newspapers, however, are allowed to send to the galleries representatives, who furnish a general account of the proceedings. Under the Empire a newspaper was bound to publish one or other of the official reports without alteration or to leave the subject alone; but now each paper can give a summary of its own.

alone; but now each paper can give a summary of its own.

In the same way there are official stenographic reports of the debates in the German Reichstag and the Prussian Landtag, which appear a few days after each sitting, and are distributed among the members. They can also be obtained by the public at a cheap rate. These official reports, however, do not exclude private enterprise. All the more important German newspapers procure reports of the debates from a company known as the "Kammercorresponof the debates from a company known as the "Kammercorrespondens," but these reports are usually very inaccurate, and even the newspapers which use them are sometimes driven to complain of their deficiencies. The Kolnische Zeitung has a well-organized staff of reporters of its own, and its reports are consequently of a superior character. The Austrian Reicharath has an official staff of shorthand writers, for which it contracts with the Director of the Stenographic Bureau. The reports are revised by the Director, and the most important speeches are also corrected by the speakers. They are further checked by members of the Reicharath chosen for the purpose. These reports are lithographed, and supplied gratuitously to members, and they can also be purchased by the public. For the convenience of the newspapers, the Director of the Stenographic Bureau, under the authority of the Government, but at his own expense, provides a more prompt and less voluminous report. These shorthand writers take notes by turns in the Chamber, and them read them off to assistants, who write down the result in Indian ink oh strips of prepared paper, which are fastened together in sheets, and sent for printing to the lithographic press. The Vienna papers can thus begin publishing their reports during the sitting of the Reicharath, and finish them within three hours after its conclusion. Each journal edits the report according to its party views, and the greater or less importance which attaches to particular persons or subjects. The full reports of reporters attached to each Chamber, whose reports, after his published in the official Greatte. In Italy there are official reporters attached to each Chamber, whose reports, after his denz," but these reports are usually very inaccurate, and even the

e observed a nave never been either speaking his speech printer. Speeches actually ... the printer. precedence in the order of publication, seing postponed until they can be printed with-accessing the length of the day's reports. There is a rule that members can withhold for correction their dea rule that members can withhold for correction their deivered speeches, and have them printed, not in the order of debate,
nut subsequently as isolated addresses. It would thus appear that
he Congressional Globs is a sort of organ in which members
an publish essays on any subject under the fiction that they
there part of a debate. "This practice," says the writer of the
nemorandum forwarded by Mr. Thornton, "has several advanages" among which may, we suppose, be included the relief
which the House enjoys of not having to listen to a bore—"but,
t any rate, one disadvantage, that of allowing a member's
peech to go forth to the world without a previous opportunity of
ceply in the House." As a rule, the reports of Congress in the
American newspapers are extremely brief, and it may be doubted ceply in the House." As a rule, the reports of Congress in the American newspapers are extremely brief, and it may be doubted whether the Congressional Globe is much read except by the gentlemen who contribute padding for its columns. The reporting of he debates of the Canadian Dominion Parliament is left to private ffort, but the Nova Scotian Assembly votes 2,000 dollars a year or getting its wisdom duly recorded. A similar practice has for or getting its wisdom duly recorded. A similar practice has for everal years prevailed in Prince Edward Island. Generally a the North American colonies official reporters appear to be emloyed only in special cases. In the Australian colonies official eporters are almost universal, New South Wales and Tasmania using, in fact, the only exceptions. In Victoria the debates are penng, in fact, the only exceptions. In Victoria the debates are operted by three stenographers, who receive fixed salaries from the invernment. The printing is done at the Government printing effice, and the reports are published in weekly parts, each of which is usually contains the debates of the week before. Queensland lise indulges in three reporters, who, when the Legislature is not itting, can be turned on by the direction of the Speaker to any their ich. It is attaid that the usuation of such contains the second of the speaker to any other job. It is stated that the practice of supplying members with proofs for correction, which was tried for a time, worked so insatisfactorily and created so much expense and delay, that it nad to be given up. New Zealand has six reporters of its own.

In South Australia reporting is done by contract; proof slips

re furnished to members, and no charge is made for alterations, provided the slips are returned by a certain hour.

It will be seen that Mr. Mitchell Henry and his friends, who are inxious to have an official system of reporting, are provided with variety of precedents in favour of their proposal; and it will naturally be asked why, if these arrangements are found to be necessary and convenient in France, in Germany, in Austria, in Italy, in the outed States, and in many of our own colonies, they should not use be adopted in this country? It is important, however, to observe the various circumstances under which the practice of employing official reporters has arisen, before jumping hastily to the conclusion that it is desirable to make any change in our own system. There is, of course, the greatest difference between a Legislature aying to get itself reported simply because, unless it did so, it would not be reported decently, or perhaps at all, and a Logisla-iure providing an official staff to do for it what is already sufficiently well done by private enterprise and without any cost to the sublic. It is probable that in most of the colonies there would be public. It is probable that in most of the colonies there would be no Parliamentary reports worth speaking of unless special arrangements were made for them at the charge of the Legislature. Sewspapers there are still in their infancy, and reporting is an expensive and troublesome branch of journalism. Without some insistance, therefore, a competent staff could hardly be maintained. In New South Wales, however, where newspapers are more advanced, there is no need of official reporters. The contract with the Congressional Globs in the United States may also no doubt be traced, at least in its origin, to the pressure of necessity; and be traced, at least in its origin, to the pressure of necessity; and the same may be said of the German system. As to France, it can hardly be doubted that the object of the Government in securan hardly he doubted that the object of the Government in securage a monopoly of Parliamentary reporting was due rather to salousy and distract of the press than to a keen desire to promote the circulation of this sort of literature. It is obvious, however, but none of these reasons exist in this country. The newspapers upport the debates homeity and accountely, and the Government his no reason to hold them in hampicion. Official reporters are mightyed by Parliament to hissish detailed reports of the propositions of Select Committees, and also of all debates on passions of Privilege; but the reason of this is simply

money in doing or crotchety members, they may reasonably be asked to provide them at their own expense. It must be remembered that the British Parliament sits longer and gots through more talking in a year than any other legislative body in the world, and a verbatim report of its debates would be something too tarrible to contamplate. There is nothing to prevent any member who wishes to have his utterances set more fully before the world from starting a newspaper for the purpose or publishing his speeches in pamphlets; or a number of members might form themselves into a co-operative society for this purpose. It is extremely improbable that their speeches would ever be read in this form, but still they would have the gratification of seeing them in type, which would be all they could hope to gain from an official system of reporting. As we said before, the difficulty is to get people to read what they do not want to read. This is one of the things that cannot be accomplished even by an Act of Parliament. The logical course for the discontented orators would be to propose that the newspapers should be compelled, under penalties, to report everything they said, but the only result even then would be that the newspapers would be shunned. There is another point which ought also to be considered in regard to official reports, and that is the amount of controversy and discussion to which they would necessarily give rise at every sitting. Half the time of the House of Commons would be taken up by rectifications of the reports, and the revision of proofs by members would also introduce some alarming complications. As a compromise, however, it might be reasible to of proofs by members would also introduce some alarming complications. As a compromise, however, it might be possible to offer to print at the cost of the country any speeches which members would be good enough to refrain from delivering.

MR. COOK AND THE DRAGOMANS.

THE Egyptian dragomans have been pouring out their complaints against Messrs. Cook and the organizers of English tours, at the close of what, we presume, has been an unfortunate season for them. For the moment, as far as Egypt is concerned, the season for them. For the moment, as far as Egypt is concerned, the question can have little interest for the travelling patrons of Mesers. Cook and the dragomans, although six months hence it may concern them seriously. No man goes to the land of the Pharachs in the dog-days, and few people have the courage to linger on there among the tembs like the late Lady Duff Gordon. But not a few of us are dreaming of expeditions to the Continent during the approaching summer and autumn, and in connection with this Egyptian controversy it is worth while to consider how far tourists are indebted to the system which Mesers. Cook have introduced. indebted to the system which Mesers. Cook have introduced. Probably not many of our readers would hesitate over their answer.

"Gook's excursionists" have long been synonymous with all that is held most objectionable and most disagreeable in our foreign associations; they rank in our memory with drenching days, unexpected remands to quarantino or the shriveling blasts of the scirocco. You have been making yourself comfortable in an hotel not overcrowded, looking out on the grey waters of the Rhine in languid enjoyment of the familiar view, or across some Swiss lake to the snow-covered mountains. You have found the landlord attentive without being obtrusive, and the waiters cordial almost to obsequiousness. You have struck up relations with them, and obsequiousness. You have struck up relations with them, and arranged for your own table in the window at breakfast, where your coffee has come up hot to time with cutlets dressed to perfection. You have found plenty of elbow-room at the table d'hôte, and if it pleased you to dine later, there were no sour faces at the proposal. You have been settling down into that delightful lenses-aller life which one leads in the hotel one is making a home of. This soun-domestic life is the arone delightful as you know you may move on the moment the fancy takes you. You have began projecting expeditions in the neighbourhood, and forming pleasant plans for the morrow on the strength of the comforts of the present. One of them you have carried into execution, and have returned late, but dusty, and not disagreeably tired. As you walk up the broad steps of the hotel you see at a glance that all is changed for you. Family groups that might have slipped out of Mr. Frith's picture of Ramsgate sands are swarming upon the benches under the portice. Family groups that might have supped out or mr. Frith's picture of Ramsgate sands are swarming upon the beaches under the portice. The gentlemen's faces for the most part range in the extremes of rosiness or sallowness; they are either come fresh from the English country to expand their bucolcal minds with foreign travel, or either they have broken away from close confinement in city warshows or counting-houses. There is no harm in that, of course, and you shall shall make you conside to winds in the imposent enloyment of so make or counting-houses. There is no harm in that, of course, and you feel that you ought to rejoice in the innocent enjoyment of so many of your fallow-creatures. But somehow you don't, and you may tell your sonscience there is extenuation for your selfiabless when you see how hoisterous their enjoyment is. They have had time to shake down from more acquaintance into fast, if fleeting, friendSir Henry, however, was married to a young wife who keeps all-his relatives away from him, and gets him to make a will in her favour. He dies, and there is some fear that his 12,000% a year—that, if we remember rightly, is the sum he can will away—will will have the Haughton family altogether. This would in itself for here hie spile material not merely for a two-volume, but you have may a novel, had only Hugh been as virtuous as You to course supply meat a property almost demanded

r here we may agove, had only Hugh been as virtuous as all is changed hivocations are an everything and et an never became white teeth when to quit. Your civil friem to take an emiling shows the self-conducted party, who will pay him and possible worself the self-conducted party, who will pay him and possible worself the self-conducted party, who will pay him and possible worself the self-conducted party, who will pay him and possible worself the self-conducted party, who will pay him and possible worself the self-conducted party, who will pay him and possible worself the self-conducted party, who will pay him and possible worself the self-conducted party, who will pay him and possible worself the self-conducted party, who will pay him and possible worself the self-conducted party, who will pay him and possible worself the self-conducted party, who will pay him and possible worself the self-conducted party, who will pay him and possible worself the self-conducted party, who will pay him and possible worself the self-conducted party, who will pay him and possible worself the self-conducted party, who will pay him and possible worself the self-conducted party, who will pay him and possible worself the self-conducted party, who will pay him and possible worself the self-conducted party who will pay him and possible worself the self-conducted party who will pay him and possible worself the self-conducted party who will pay him and possible worself the self-conducted party who will pay him and possible worself wor

tracting calls that are made on their services. You have to toll time after time for the chambermaid, and then you must wait patiently till she comes panting with the water for your bath. You descend to the dinner you ordered in the morning to find no cend to the dinner you ordered in the morning to find no preparations made. A cluster of corpulent women, highly flushed, are drenching themselves with tea at your favourite table, and project themselves obtrusively into the foreground of the landscape as you look out at the hills or the hanging vineyards. The meal is a spasmodic scramble for the leavings of the hungry multitude The moul that swept most things out of the larder in satisfying their cravings at the table d'hôte. You are woke next morning at an unconscionable hour by the Boots thundering at your door in common with all others along the corridor, but you care the less for the unseasonable disturbance that your mind is fully made up to go. For an excursion, as you have learned, is in Mr. Cook's programme for the day, and your new friends would all be back with you in the even-

day, and your new friends would all be back with you in the evening, while this company is only the advance guard of a main body which may be duly expected in a couple of days.

You may be selfish, we admit; for the excursionists are evidently enjoying themselves, and the greatest happiness of the greatest number should be the most ardent desire of every right-thinking man. But a scene like that comes as a sad reminder of the uncertainty of all terrestrial tranquility; and on the Riffel or the Æggischhorn, or in the valleys of the Eggadine, as much as on the Rigi, you are haunted with nightmare fears of a similar surprise. For there is no disputing that the excursionists, as a rule, are not the sort of people you care to form travelling friendsimilar surprise. For there is no disputing that the excursionists, as a rule, are not the sort of people you care to form travelling friendships with; nor are you likely to find yourself greatly instructed in their company. You might hit off many exceptions no doubt, if you cared to search. Many of them are most estimable members of society, and figure possibly as the travelled ornaments of local circles; all are supposed to be in the enjoyment of unimpeachable moral characters. But the very fact of their being willing to renounce their individual wills and hand themselves over into professional leading-strings implies the absence of any marked idioxynersay, or of those pronounced tastes which inuly marked idiosyncrasy, or of those pronounced tastes which imply some previous cultivation. It can scarcely be said that they travel to learn, for the pace at which they are hurried along altogether procludes the idea of that. They come abroad simply for the excitement of change, or in the discharge of a duty they owe to their position, and which, like duties in general, is often a sovere and sustained effort. They would be happier perhaps in the more familiar scenes of Margate and Southend, where they might be sure of their daily shrimps and Christy Minstrels, relaxing in the evening in "Halls by the Sea." But the next best thing is to the evening in "Halls by the Sea." But the next best thing is to carry congenial society along with them, to talk the familiar talk or recall the external associations of their native island in strange countries among strange people. Gradually they have been tempted further and further from home, as Mr. Cook became more tempted further and further from home, as Mr. Cook became more tempted further and further from nome, as Mr. Cook became more and more enterprising, and we must confess, in common justice, that, as year after year they enlarge the spheres of their touring, they are being leavened more and more largely by members of a superior class. Many a person who knows little of the East, except that Orientals are notoriously given to extortion, may prefer as the lesser of two evils to make one of a party where the expenses are precisely ascertained beforehand, and all trouble is spared him, even when the chiest is to visit shrings and access where he would recent when the object is to visit shrines and scenes where he would most prefer to pick his company. He submits to a serious drawback on his enjoyment presumably with his eyes open. Conceive a visit to the Hill of Zion or the Cave of Machpelah, even to the Column of Heliopells or the Temples of Luxor, paid in company with a mob of the people who have made the Rhine in autumn an abomi-

nation.

Very possibly the more fastidious travellers who dislike being done, and object to trouble, will prefer to resort to the old dragomans, now that they have been brought to a sense of the error of their former ways, and offer guarantees in print for more considerate charges in future. But, should it be so, they ought to remember in common fairness that they have great reason for gratitude to Mr. Cook and the speculators who have followed in his footsteps. Let the dragomans say what they will, and whatever may have been the conduct of particular individuals, there can be no doubt that as a class they were excessively extertionate in their charges. However well they travel the travellar when the arrangement was made and the contract signed, and however trustworthy the traveller found them, they always drave a hard hangain. It was only human nature. All other classes of people who live by travellers do the same thing, so far as they can. The hotelkeepers all over Europe charged just as much as

ope all in her ought to have known, and even now thet are not till a stanif of the courage of th people are not listened to, and dull writers are not me their inaccuracies do not get a wide circulation. What What n readers can they be who, when they come to a few pages of talk as the following, do not either pitch the book across the r in a passion, or let it fall to the ground in a slumber?—

But, mamma, that's precisely where you make the mistake," said the mistake, " and the mistake," said the mamma has never called."

details "markey, I'm sure, and if she doesn't, she's no great loss to be committee withly soon. So that's all we want." of committee withly soon. THE ITALIAN OPERAS.

NO fewer than twenty-four operas have been produced at Covent Garden since the beginning of the season, every one of which is more or less familiar to the public. This fact plainly shows that Mr. Gye has a very extensive reportory at di of which, thanks to the zealous activity of his orchestral chiefs, he can make what immediate use he may deem fit; but it says very little for his enterprise. The system of two conductors is maintained, and no doubt with certain material advantages to the director, who thereby gets the work in hand more expeditiously performed, if not in quite so finished a manner as might be desired. Nevertheless it can hardly be advocated on the plea of orchestral disci-pline, against which it inevitably, however unintentionally, acts. Signors Vinnesi and Bevignani are clever musicians, and the first has earned considerable distinction abroad; but they are not like the Siamese twins. The orchestra at the Royal Italian Opera is almost identically the same which last year did excellent service; and the chorus is as numerous and strong, if occasionally as rough and unsteady, as before. In the present company most of the old favourites are to be found—the chief exception being Madame l'auline Lucca, whose advent was announced in the prospectus as "uncertain," and who still remains in the United States. It has, able worth, among whom—rare phenomenon!—are two "rob tenors." As we have no unfamiliar much make the control of moreover, been reinforced by the addition of artists of unquestion-As we have no unfamiliar works to speak of, we may, without further preliminary, say a few words about the claims of the new aspirants, and record what, up to the present moment, they

Signor Itolis made his first appearance in Guillousse Tell in the part of Arnold, which, by means of the formidable "set de poitrine" of Duprez, after a period of public indifference, brought that opera, the greatest ever written by an Italian, again into favour—the incen-ed composer, but in his dignity again into favour—the meen-ed composer, nurt in an august, as artist, thereupon deciming further commissions for the Parisian stage, and retiring upon his well-carned laurels. Ressini would possibly have been satisfied with Signor Bolis, who, although possessing no "at de postrine" to bring the last Rossini would possibly have been attailed with Signor Bolis, who, although possessing no "ut de poètrese" to bring the last act premuturely to a chinax, sings the music well, and, were he more of an actor, might defy criticism. At the same time, he is not quite equal to the great trie, with its high "C sharp," which he ingeniously shirks, just as he does the O natural in "Corriam" (the "Suivez Moi" made famous by Duprez). Nevertheless he was a large of the control of the same time. theless he was received, according to his deserts, with liberal applause. He afterwards appeared as Maurico in the Troustors, and later in Il Guarany, the reproduction of which, by th and later in Il (inarany, the reproduction of which, by storing a storits failure two years ago, unless with the object of giving a fresh part to Allie Marimon, who has second from Drury Lane and initial Covent Garden, is difficult to understand. In the tresh part to Mile. Marimon, who has second from Brury Las and joined Covent Garden, is difficult to understand. In the opera of Verdi, as in that of the young Brazilian composer, Carl Gomes, Signor Bolis produced much the same effects in Guillem Tell. That his means are exceptional was proved in the Trouston by his spirited delivery of "Di quella pira," and more than once the declamatory passages of Il Guarany. He possesses a real fine voice, mostly from the chest, which he knows how to use advantage; and if Mr. Gye has not found in him an Amadis, I has at least got an Esplandian. Signor Marini (known through Charles) advantage; and if Mr. Gye has not found in him an Amadis, he has at least got an Esplandihu. Signor Marini (known at Covent Garden, seven years ago, as Signor Marino, playing parts of little note) has a more powerful, if not a more legitimately trained, voice than Signor Bolis, but scattery the art of kneping it so well under control. The high notes which the last-named goutleman dismisses without curescopy, although existing in Rossini's score, are taken with ease by Signor Marini, who heldly and successfully attacks them. If asked which was the more gammine singer, we should unharitatingly more Signor Belis; and if, on the other hand, which can bount the ampliest means, we should as unbesitatingly more filipson Missing in the Marini, whom Mr. Gye has been as heart threats. With these two strangers and Signor Missing, who, Tanach and imband

or opinion—that she is quite and opinion—that she is quite trapedy as in sentimental drawns for a of which she has long been acknowledged the most genuine treat lines. Patti line afforded gover this senson is her performance of Outsines, in the stalian version of Auber's Primmers de la Couronse. The part of the adventurous Queen of Portugal is exactly suited to her peculiar different actions and the automate at the courons at the couron idiosyncrasy, and, as well as we can remember, she surpasses all her producesors no loss in its histrionic than in its vocal delinea-We spoke in the highest terms last year of this remarkable mance, and can bear witness that it has even increased in performance, performance, and can cear witness that it has over an increased refinement and artistic finish. As an example of anstudied expression and vocal fluorey combined, the air with variations in the second act, one of the most eriginal and perfect things of its kind in all French opera, may be signalised as faultiess. Since Mayo. Anna Thillon, the original Caterina, no one has sung this with such Thillon, no one has ever acted the part with such spirit and abiding charm. While speaking of the Dinmons de la Coursene, it is but just to add that Signor Vinusal has freely curtailed the accompanied recitatives which he himself composed for the performance last season, and, by abundoning interpolations and restoring as much as possible the original text, has allowed Auber a chance of expressing what he intended to express after his own incomparable manner. The only serious objection now is to the bronzes air from one of Auber's earlier operas which Muss. Patti introduces as foode, thereby depriving the climax of its point and meaning—just as Miss Louist Pyne was wont to do when, in the same places, she brought in Rode's air with variations. Muss. Putti should know better. She stands in nead of no such arternasses atts. Miles better. She stands in need of no such extraneous aids. Mile. Albani, Mr. Gye's most recent and valuable acquisition in the prime donne line—for prime donne she is, and nothing lesson has made still further advance in public esteem. We are mistaken if this young Canadian lady does not speedily reach the highest position in her art. She improves year after year; and the improvement, which cannot fail to be noticed by councisscurs, is clearly the result of persovering study. With so exquisite seurs, is clearly the result of persovering study. With so exquisite a voice, so charming a presence, and such are natural capabilities, it would be surprising, indeed, if Mile. Albani failed to make way. La Somandala and Lucia, the opense in which she first appeared this season, justified all that had been said and written in her praise; and subsequently by her assumption of Elvira in the Turtani she almost successful in galvanizing that quasi-office composition. In Verdi's Rigalette she obtained another legitimate success; and verhous since Assimilar Lasic a many sense of and success; and yerhaps since Angiolina Bosio a more generall and sympathetic Gilda has not been seen. Mile, Albani was ansympathetic Gilda has not been seen. Mile. Albani was an-nounced to appear on Tuesday night as Mignon in the opera of M. Ambroise Thomas, made famous here through the enchanting impersonation of the heroine by Mme. Nilsson; but Mile. Marmoin, who was to play Filins, being indisposed, the production of Mignon was deferred, and the Sommenbula given in its place. All operatic London is anxious to know what Mile. Albani will do with Greefick meetic creation. One thing is contain—that also has the Coethe's poetic creation. One thing is certain—that she has the personal requisites for an ideal embodiment of the character, topether with the vocal power and fluoney indispensable to an adequate execution of the massic. About the return of Muss. Vilda, who came again before us as Norma, the character with which, as far back as 1866, she first appeared in London, and who has since energed a part less congenial to her strongly marked individuality—that of Valentine, in the Huguenote—we need say no more at present than that the Mine. Vilda of 1874 is very much the same as the Muse Viids whom we remember seven or eight yearsayo. As Norma she created about the same impression and was received with about the same favour; but with repard to her Valentine opinions were by no means unanimous. Of this and other matters, however, we must speak on a future occasion. Mannwhile, in his prospectus Mr. Gye declares an intention to produce at least three of the following works—Lavies Miller (Verti), for Mms. Addina Patti, Mignon (Ambroix Thomas), for Mile. Albani; the Scraptio Patti, Negron Camina's known, for white Alman; I no sergular, of Mozart), for More. Vilda; I Promess Syoni (Ponchiello); and Life for the Car (Clinka). It is to be feared that, at this late period of the season, the "at least three" may be reduced to "at most two," and that these two will be Maynen, announced for to-night, and Luna Miller, said to be in released.

Any nave been dwell upon.

Any anye only to mention cottino and Bianco Bianchi more than respectable. The former than the which, charming as it is in many respects, can never mobile us for its having driven from the Italian boards an opera (Gustave III.) in which Auber has so much more brilliantly and comprehensively treated the same theme. We have no other strangers to speak of except Mile. Heilbron, who played twice at the beginning of the sonson the part of Violetta in Verdi's thread have and despite certain musical beauties not to be ignored, very implement opera, La Traviata. Mile. Heilbron, Dutch by birth, we are informed, was recently one of the "stars" at the Italian Opera in Paris, under the direction of Herr Maurice Strakosch. Her engagement at Covent Garden was purely accidental, the cause being the temporary indisposition of Mile. D'Angeri, who was to have opened the season. Thus Mile. Heilbron was only heard twice; but on those two occasions she gained many admirers; and it is generally hoped that she will form one of the company of the

Royal Italian Opera next year. Mile. Heithron has personal attractions of no ordinary kind; she is a natural and graceful

actress, and if not yet a practised mistress of the vocal art, she is carnest in all she does, and gifted with a voice which, properly cultivated, may lead her to the highest honours, and insure for her a brilliant future. This was evidently the feeling of the

andience, more than usually emphatic in demonstrations of approval.

So much for Mr. Gye's recent engagements, which have certainly done credit to his theatre. With their aid, and that of his old and well-tried company, he has been able to give, as we have already said, some four-and-twenty operas—the Travista (Verdi), Crapino e la Comara (the brothers Ricci), the Figlia del Reggimento (Donizetti), the Africains (Meyerbeer), the Barbiera di Siciglia (Rossini), the Favorita (Donizetti), Guallauma Tell (Rossini), the Huguenota (Meyerbeer), Lucia di Lammermoor (Donizetti), the Somannbula (Bellini), the Ballo in Maschera and Trocatore (Verdi), the Flauto Magico (Mozart), Faust a Maschera (Gounod), the Faritani (Bellini), Il Guarany (Gomez), Rigoletto (Verdi), Innorah (Meyerbeer), Hamlet (Ambroise Thomas), Don Giovanni (Mozart), Der Fraischutz (Weber), the Diamans de la Couronne (Auber), Ernani (Verdi), and Norma (Bellini). That these have all been presented in so short a space of time, and creditably presented, says no little for the means which the director has at command, and should embolden him oftener to venture upon something to interest his patrons on account of novelty no less than on account of merit.

A glance at what has been done by established favourites of the public—the vielle gards of the establishment—must follow as a matter of course. With the first appearance of Mnss. Adelina Patti, as has been the case for many years (for it should not be forgotten that this art-phenomenon began to shine in the London musical hemisphere no more than three years later than that other art-phenomenon, Mile. Tistjens), Mr. Gye's season at once reached its zenith. A universal favourite from the first, some thirteen or fourteen years ago, Mms. Patti is just as much at Covent Garden a universal favourite at the present time. But what in a critical sease is there now to be written about her?—what praises are to be lavished upon one who by this time must be satisted with praise affects the baleony (for Mms. Patti came out once more as Rosina, although Mile. Marimon had already played the part), there is a shout of recognition; and that when, dulce subridens, she trips gaily before the lamps to sing "Una voce poco fa," the dunt with Figure, "Danque io son," and once again after the believe from the Verus Scilicones—anything more out of place than which, by the way, could bardly be imagined in the "Lesson" seeme, if we only except "Home, sweet home," usually sung in English for the "encore." One is constrained to agree with Rartolo when he says, "Bella voce!"—for that the voice of Mms. Patti is "beantiful exceedingly" it is impossible to deny; but we agree no less with the Dector's strictures upon what she sings in this particular situation. Then, can enything he said shout Mms. Patti is "beantiful exceedingly" it is impossible to deny; but we agree no less with the Bactow-ang, "Ombas laggiars," to marfaction, and acts the part as no one but Mile. Ilms di Musska has ever ected it, since Mayarbase, lifeen years ago, brought and the part and one part and over and over such that he can all can be such the said shout "Mss. Patti is partent of the since of the said shout Mss. Ima di Musska has ever ected its.

ASCOT.

THE first day of Ascot was fully up to its established reputation, sithough, in consequence of the hard state of the pround, the fields were hardly as large as we have seen them in former years. The Trial Stakes, which on paper appeared to be a match between Thunder and Oxonian, fell to the Epson Oup winner without difficulty, Oxonian finding the severe sale beyond his compass, and also appearing to show the effects of the hard work he has been doing with little internation since the commencement of the season. A Maiden Plate for two-year-olds was won by the Sir Henry, however, was married to a young wife who kneps all his relatives away from him, and gets him to make a will in her that, if we remember rightly, is the sum he can will away will place with the Haughton family altogether. This would in itself youngater, here he haughton family altogether. This would in itself youngater, here he haughton family altogether. This would in itself youngater, here he haughton family altogether. This would in itself youngater, here he haughton family altogether. This would in itself youngater, here he haughton family altogether. This would in itself youngater, here he haughton family altogether. This would in itself youngater, here he haughton family altogether. This would in itself youngater, here he haughton family altogether. This would in itself youngater, here he haughton family altogether. This would in itself youngater, here he haughton family altogether. This would in itself youngater, here he haughton family altogether. This would in itself youngater, here he haughton family altogether. This would in itself youngater, here he haughton family altogether. This would in itself youngater, here he have known, and even now they are neather insecurate, they may well mistrust him in his density of the haughton family altogether. Insecurate, they may well mistrust him in his density of the haughton family altogether. Insecurate, they may well mistrust him in his density of the haughton family altogether. Insecurate, they may well mistrust him in his density of the heave known, and even now they are neather insecurate, they may well mistrust him in his density of the heave known, and even now they are neather to have known, and even now they are neather to have known, and even now they are neather to have known, and even now they are neather to have known, and even now they are neather to have known, and even now they are neather to have known, and even now they are neather to have known, and even now they are neather to have known, and even now they are neather to have known of Wales's Stakes, and of those six Atlantic take and smalling shows Lemnos and Sugarcane were penalized 3 lbs. det. In the local shows had the normal weight of 8 st. 10 lbs., and Leolink. Possessing of Tyne were favoured by 7 lb. allowances, then weight being thus reduced to 8 st. 3 lbs. The race was generally considered to be a match between the two stable companions at lantic and Leolinus, and the great question was whather the stable companions. rally considered to be a match between the two stable companions Atlantic and Leolinus, and the great question was whether the former could give the latter 12 lbs. In the Derby there was certainly not more than 5 lbs. between the pair, but then Atlantic had been injured two days before, and carried the marks of his injury shout him. Besides, Leolinus had been proved capable of staying over a longer course than Atlantic has yet compassed in public, and, in addition, it was currently asserted before the Derby that Atlantic, Aquilo, and Leolinus were so near together in merit as to be hardly separable at home. It was a bold idea, therefore, to imagine that the Two Thousand winner could give 12 lbs. away over the severe Ascot course to a stable companion who, both in private and in public, had proved himself so nearly his equal; and imagine that the 'Wo Thousand winner coild give 1210s, away over the severe Ascot course to a stable companion who, both in private and in public, had proved himself so nearly his equal; and the event proved that the estimate which had been formed of their relative merits was pretty nearly correct. Taking advantage, as he was bound to do, of his lenient weight, and following the example which seems fashionable as well as successful in the great races of this year, Loolinus made the running almost entirely for himself, and though Atlantic struggled gamely to reach him in the last two hundred yards, the effort was fruitless, and Sir R. Bulkeley's horse won by two lengths, Atlantic, as might have been expected, beating the remainder with equal case. A two lengths' beating is perhaps hardly equivalent to 12 lbs., and it is very possible that at even weights Atlantic might have been successful. But at even weights there would always be a good race between the pair, and Leolinus, who relishes a distance of ground, would not be easily shaken off. Lemnos ran fairly well, but is evidently not best served by a long course, and King of Tyne showed little improvement on his Perby running. Subsequent races point out the Derby of 1874 as a true-run race, and till we see some signal reversal of the Derby form, we shall be disposed to consider it as an accurate guide to the merits of the three-year-olds.

accurate guide to the merits of the three-year-olds. For the Ascot Stakes there were ten competitors, including Shannon, Royal George, Aldrich (the winner of the City and Suburban), theneagle, Fève—whose prominent running in last year's Cesare witch was much noticed at the time—and his stable companion Coventry. Oddly enough, just as Fève had to give way to King Lud in the Cesare witch, so now he had to yield the first place to Lord Lonsdale's representative, Coventry. With King Lud out of the way, Fève would probably have won the Cesare with; with Coventry out of the way, he would assuredly have won the Ascot Stakes. It is, however, useful no doubt to have two strings to one's bow; and as last Tuesday the public fastened exclusively on Fève, who did not win, and altogether neglected his stable companion Coventry, who did win, let us hope, for their own sakes, that those most interested in the pair pursued an opposite policy. Scamp was third, and really we are not certain that Scamp is not trained in the same stable as the first and second. Aldrich was fourth, but Royal George, who, despite his unreasonably heavy weight, ran Gleneagle, Fève -whose prominent running in last year's Cesarewitch Royal George, who, despite his unreasonably heavy weight, ran with considerable gameness, might have been nearer had he not been eased at the finish. Shannon, 6 years, 8 st. 7 lbs., ought of course to have won if she had been in anything like her old form but she has probably seen her best day, and her temper has not improved with age. The succeeding race, for the Queen's Stand Plate, was the great surprise of the day, and must have been a great source of affliction also to people who indulge in the injudicious habit of laying adds. The invincible Prince Charlie, for the chiral thing this property was the live thing the property and the large that the chiral the chiral than the control of the control of the chiral than the control of the chiral than the control of the chiral than the chi cious habit of laying odds. The invincible Prince Charlie, for the third time this season, met Blenheim, and, for the first time, suffered defeat, and a decisive defeat, too. He was giving 7 lbs., it is true, but he required more than a 7 lbs. beating, and appeared incapable of acting up the hill. It seems almost ludicrous to talk of such a horse as Prince Charlie over short courses being chopped at the start, but that was the casualty which befell him last Tuesday; for Fordham sent Blenheim to the front directly the flag fell, and drove him along as hard as he could go from start to finish, and Prince Charlie vainly endeavoured to count to him still more vainly to pass Charlie vainly endeavoured to go up to him, still more vainly to pass him. It was remarked that Prince Charlie did not gallop with his wonted freedom to the starting-post, but still extravagant odds ere laid on him, and more than one melancholy face was observ-ble after the winner's number had been hoisted. M. Lefevre corshie after the winner's number had been hoisted. M. Lefèvre certainly deserves a turn of luck, for he has been peculiarly unfortunate throughout this season, and he has also been peculiarly persevering in his efforts to lower Prince Charlie's colours. Indeed people had begun to think that a race meeting was incomplete without a contest between Prince Charlie and Blenheim, and that the letter was kept for their express amusement to run exhibition matches with the magnificent chestnut, and to enable them to pay the expenses of the week. The race of last Tuesday will have intended such persons with different reflections. For the Gold Vasi readers can they be who, when they come to a few pages of a talk as the following, do not either pitch the book across the re in a passion, or let it fall to the ground in a slumber?—

in a passion, or let it fall to the ground in a slumber?

"But, mamma, that's precisely where you make the mistake," said the fore with the "You set far too high a value on our knowing Hugh. You can eater bring has never called."

including brails was day, I'm sure, and if she docan't, she's ne great loss, including brails was day, I'm sure, and if she docan't, she's ne great loss, including brails was day, I'm sure, and if she docan't, she's ne great loss, including brails was day, I'm sure, and if she docan't, she's ne great loss, including brails was not a single false start for the passion, and said, "Well, we'll see," as she was not a single false start for there is not said, we'll see," as she delay of half or three-quarters of an laperil the saver it, and at length this year the twenty-six competitors we're ther case, and to have the twenty in the Derby or the dozen in the Oaks. Thence John that twenty in the Derby or the dozen in the Oaks. cident of this race, namely the success of the first favorations again illustrated by the success of Lowlander, a slashing son Dalesman, who, after attaining to eminence as a hurdle-racer, has returned to the flat. Reclaimed hurdle-racers seldom do much in flat racing except in very moderate company; but Lowlander is a brilliant exception to the rule. If a had the race in hand at any point and won with the greatest ease, Maid of Perth and Flower of Dorset securing second and third places, the latter after a desporate struggle with Oxford Mixture, who again was within an ace of fulfilling her destiny of running into a place. We shall reace of fulfilling her destiny of running into a place. We shall revert to the Hunt Cup next week, but we may remark now that the puffed-up Mr. Fox was fairly beaten by his trial horse, Flower of Dorset, and that most of the competitors were pulled up when the pursuit of Lowlander was hopeless. A select and most brilliant pursuit of Lowlander was hopeless. A select and most brilliant field, well worthy of the most distinguished trophy of the meeting, came to the post for the Gold Cup. Mr. Merry ran both Marie Stuart and Doncaster, the former carrying the proper colours of the stable; Flagcolet represented M. Lefèvre, kaiser Mr. Savile, France sent Boiard to do battle with the English horses, and Gang Forward was the sixth. Thus we had a Derby, St. Leger, and Two Thousand winner, a winner of the Prince of Valer's Stakes, and Grand Prince of the Prince of Vale Thousand winner, a winner of the Prince of Wales's Stakes, and a Grand Prix winner, all meeting together, and all in good condition for the race. The six horses were not only distinguished performers, but they were also all sound and well, and as they cantered down to the post it was generally thought that we should have such a Cup race as had not been seen for years. And certainly it was a good race, only Marie Stuart, who was the first beaten, failing to show anything of her three-year-old form. The running was made by Flaggolet, who held a commonding lead for running was made by Flagcolet, who held a commanding lead for a mile and a hulf, after which he was joined by Boiard, and the pair raced together to the distance, where Boiard, after a little rousing, got in front of M. Lefèvre's horse, and, retaining his advantage to the end, won in real good style. Doncaster came with a tremendous rush in the last two hundred yards and succeeded in making a dead heat with Flageolet for second place; and Kaiser and Gang Forward—the two inseparables of last year—were well up with the dead-heaters. Boiard is a grand specimen of a race-horse, not particularly handsome, but full of power; just one of those animals with which our neighbours surprise us every now and then, and a worthy successor to Gladiateur and Mortemer. No distance is too long for him; indeed the popular belief is that he would stay six miles if required. Flageolet also ran stoutly and gamely; and the fact of the first and second for the Ascot Cup being French-bred horses will be fresh matter for reflection to those who are not altogether satisfied with the present condi-tion of our own thoroughbreds.

We must not omit, however, to mention that, as a set-off, the reat French prize has been again won by an English horse, and that, moderate as the English three-year-olds may be this that, moderate as the English three-year-olds may be this year, those of France must be more moderate still. In a field of fourteen, and for the richest race of the year, there were only two English horses, Trent and Tomahawk, and these two finished first and third. Between them came Saltarelle, the winner of the French Derby, and behind them eleven representatives of the leading French stables. It has been said that the easy victory of Trent—who could not get within three lengths of George Frederick in the Derby—shows that the English three-year-olds must be better than has been supposed; but we should rather say it showed that the French three-year-olds must be exceptionally bad. It is impossible by any public running to make out Trent a horse of high calibre, and his victory at Paris must be attributed to the fact that he had nothing worth speaking of to beat. The absence of English horses from the competition may seem remarkable, since prizes to the amount of five thousand pounds and upwards are not to be picked up every day; but it must be remembered that the time fixed for the great Paris race is highly inconvenient to English owners, being just midway between two of their greatest most-English horses, Trent and Tomahawk, and these two finished first owners, being just midway between two of their greatest meetings, Epsom and Ascot, and further that it is in accordance with the conservative instincts of English sportsmen to prefer a small race on their own grounds to a large, one in a foreign consisty. The prises at Ascot are more highly covered than any that are offered elsewhere during the racing season; but an English horse offered elsewhere during the racing season. by taking part in the Grand Priz on the Sunday I

...on of ..very interest in for its publication. major southwards, besides long interior, and penetrating to the cases of the Sahara, he has qualified himas no traveller has yet done of the country and the pie of the remarkable, and in many respects singular, province which forms the north-western angle of the African continent, comprised in the main between the Atlas and the sea. Resides the inducement to present the country as a traveller, he was the inducement to present the country as a traveller, he was a number of the Sultan as a much had been said in Algeria and Spain of a superior of the Sultan as a superior of the Sult New Morocco, of reorganization and reform set on foot by the Sultan in the army, in finance, and in the State at large, that he began to build castles in the air, and to think that he could make himself as much at home at Morocco as a few years' residence in Algeria had made him with the Arabs. Dr. Rohlfs had many qualifications for the enterprise, to which Mr. Winwood Rende does no more than justice in his short introduction. indeed to see why, unless from motives of superfluous modesty, a vriter so competent as Dr. Rohlfs proves himself to be should have delegated the task of introduction to one so little heedful or exact as, in his opening sentence, to set down the Sahara as on the "eastern" side of the Egyptian valley. His main passport and safeguard among so many dangers and difficulties was his character as a medical man. But of little avail would have been even this qualification, potent as it is invariably found to be in semi-barbarous countries, had he not added to it the repute of going as a true believer, or at least as a convert seeking the right faith and bent upon laying himself for guidance, consolation, and instruction at the feet of the supreme and all but inspired and infallible Sherif Sidi el Hadj Abd-es-Salam, the most famous saint of the land, at his secluded sanctuary at Uesan.

In a country so bigored and intolerant it was with great sagneity that Dr. Rohlfs set himself forth as a neophyte in pursuit of truth, rather than as a hadji or a true believer. Any little slip in Moslem etiquette or decorum had thas its explanation and excuse, whilst the rigid atickler for forms, or the fanatic in propriety of phrase, was conciliated and flattered by an attitude of modesty which courted correction. The semi-Moorish costume in which he travelled, though it everywhere drew attention and curiosity, carried with it no sucpicion. He must have cut a queer figure in his long white woellen shirt, or djelaba, with a hood to it, yellow slippers on his bare feet, a Spanish cap within which was stitched a five-pound note (his whole stock of money), his trousers cut short at the knees, and, to crown all, a loose black English overcost as a burnous. He had no weapons. A small note-book and pencil were hidden in his pocket. His stock of Arabic consisted of but few phrases beyond the talismanic, all-potent Open Sesame, variously as it is represented in equivalent European phraseology—Lah ilah il allah, Mohammed ressul ul Lah; "Except God, no God, Mohammed is the Messenger of God." The painful process of having the head shaved by means of a pocket-knife by one of his earliest Moorish entertainers was duly gone through, the far more serious initiatory Moslem rite being happily not rigorously exacted in Morocco. With his whole worldly goods, a small bundle of linen carried on a stick over his shoulder, the adventurous pilgrim set forth from Tandja, as the Moors call Tangiers, on the road to Fez, having for his guide a native, Si-Embark, who seized the first opporthinity of decamping with the bundle before reaching L'xor (as Alkassar is pronounced). Pushing on alone to this place half in despair, he found himself no welcome guest half-auspected of being an escaped criminal; but, being summoned before the Kaid, he was enabled to continue his journey in company with a farmer from Tetuan, till the city of the tireat

Adventures in Morocco and Searness through the Guess of Dran and Fastles. By Dr. Gerhard Robits, Gold Midalist of the Royal Geographical besiety, With an Introduction by Winwood Rende. London: Sampson law & Co. 1822.

raying his sinful ... epeat such God-forgotten ... e believers. Dinner, coupled with ... having his mouth crammed by the ... having his mouth crammed by the ... accurate heat, was a trying ordeal. Reaching ... craveller was hospitably welcomed by the Sherif, a remaile man who exercised all but supreme away over the whole land, and to whose intervention the ruling Sultan had been indebted for his elevation to the throne when it was disputed in 1859. Sidi was then about thirty-one years of age, tall and carpulent; the negro blood on his mother's side traceable in his dark complexion and thick lips. He affected very advanced or liberal views, wearing a French military uniform, with a scarf of silk interwoven or fringed with gold, in defiance of the Koran. He showed to Mustapha (Dr. Rohlf's assumed name) his European curiosities—a model of a steamship with paddle-wheels, another of a train upon a railway, with some rure flowers and plants from Europe and America, watered by ingenious fountains. The Sultan, he complained, and his grandees, and the doctors of the law, would not hear of progress and improvement, and hence their defeat by the Spaniards. He was himself for introducing all that the Christians have; at all events, a good Legislature and a regular army. The European doctor must have been to him a god-sond. He took Mustapha the first thing to see all the lions—his own palace with its European furniture, decorations, and musical instruments, the great mosque of Mulei Abd-Allah Scherif, the founder of Ucsan, the Holy Sanctuary where the father of the present Grand Shorif was buried, a holy man and a potent, who could make barren women bring forth, though he himself had but this one son born of a slave girl. Gladly as he would have retained Mustapha in his own service, Sidi sent him forward in handsome

The whole intervening country, rich in wheat and barley, and other fruits, belongs to the Sherif, who entertains by the thousand the pilgrims who flock to the Sanctuary. At the capital the letter of introduction from the holy man secured forthwith the commission in the service of the Sultan which the Doctor had in view, and, what with his duties as military surgeon and his rapidlygrowing private practice, he had as much as he could get through. A vast sensation was created when a mighty signloard, a thing nover seen in Morocco before, was set up over the shop which he opened in partnership with a French apothecary named Abdallah, on which was painted, in large and beautiful Arabic letters, "Mustafa the Gorman, physician and surgeon." The most interesting and instruction wast of his bank are made in the beautiful and interesting and instruction wast of his bank are interesting and instruction was the same in the contraction of the con "Mustafa the Gorman, physician and surgeon." The most interesting and instructive part of his book consists of what he has to tell us of his professional experience, combining the practice of the native physicians, their materia medica, and the appliances of their profession, with what he found himself shie to introduce of Program and pages. The healing are in appropriately making and pages. European science and usage. The healing art is prosecuted under serious difficulties when the death of the patient following the administration of any internal remedy is set down to the effe the medicine, involving a charge of murder against the mediciner. The wise physician consequently confines himself very much to external applications, exhibiting few doses beyond texts of the Koran made up into pills and swallowed as amulets. Dr. Robli's stock as surgeon and apotherary consisted of a large charcoal fire, with irons kept at a white heat, some pota containing cintments, emetics, and purges, with various inneceous, highly-coloured powders for cases of hypochondria and hysteria. Later on his pharmacopteia was advantageously enlarged by the use of the medicine-chest presented to the Sultan by Queen Victoria. His chapter on the diseases of Morocco is full of information. The practice, and even the pages of the full of information. The practice, and even the names, of the grand old physicians of their race who lived in Spain, as well of to-day, who have never heard of Averroes, of Avenzoar, or of Abu-el-Kaesem-Calif-hen-abbes (Albu-casis), who invented lithotomy. The physician is generally a Sherif as well, and deals most in charms and written prayers. He has generally by way of generates to available the retired has prescribed lithotomy. The physician is generally a Sherif as well, and deals most in charms and written prayers. He has generally by way of gonuntee to swallow half the potion he prescribes, as happened to Dr. Rohlfs when he gave a dose of salts to Ben Thalab, the Bascha of Fez. The most common disease is syphilis, known as the "great sickness," from which scarcely a family, if an individual, north of Morocco is exempt. The best known remedies are the sulphur baths of Ain-Sidi-Yasauf, probably the Aqua Dacica of the Romans, three months of which form the shortest course. Mercury is seldom used, being mostly applied by inhalation, the mercury being heated in a pan. Barasparilla is in vogue, but active perspiration, next to written charms, is most relied on. Our author began well with moreury and jadkali, but his drugs being exhausted, had to fall back upon annilets. Intermittent fevers are common in the lower and marshy tracts, usually of the tertian, but sometimes of the quartan form, and are treated by strong purpatives, quinine being unknown. For fiver complaints and jaundice, which are common, Cummum command (Linn.) is used; and for dysentery and diarrhova gain archive, a decoction of the plant Capparis spinosa and mw opium. Discover of

Sir Henry, however, was married to a young wife who keeps all his relatives away from him, and gets him to make a will in her favour. The Fee are fire-doctors, who sit in the street which joins the Old Town to the New Town. Before them they have an non-pet, with a grate, on which a fire is burning. A little basket with charcoal is on one side, and a goatskin bellows. A patient appears: be has perhaps slept out of doors in the sain, is till in consequence, and supposes that he has been hewitched. He presents himself before the famous fire-doctor, Si-Edris, a man all the more famous because he is a Thaleb—that is, he can read—no a proof of which a thick folio lies beside him. The ductor does not read very well—no better, in fact, than a child of six, although he is sixty; but, on the other hand, it is not a book that is very difficult to read, for from beginning to end it is only one sentence over and over again, "There is no god but God, and Bohammed is His mosenger."

In the meantime, he has worked the fire with his bellows to a glow, and made white-hot several iron reds about two feet long, and with wondrous knobs and hooks at the end. The sick man lies down on his face and draws up his clother from his back; the passers-by collect into a crowd; the doctor draws a red-hot iron from the fire, and saying, "In the name of food," passes it with great deliberation here and there over the back and loins, so that it makes a hissing noise, and a smell of burnt flesh ascends into the air. The patient does not utter a cry: he grinds his teeth together, and only the drops of sweat upon his forehead betray the pain he undergoes.

The operation being over, he lies for some time upon the ground, as if in a fainting state; the spectators pass their beads through theh dingers and praise God and Mohammed. Presently the man turns his head and and says, "Si Edris, Si-Edris I" "What do you want?" "Another fire." "Then give me my due," replies the doctor. The patient produces a mosma clasuit the fourth part of a groschen) from a fold of his clothes, and the operation is renewed. Si-Edris is always paid in advance, and will never pornit any disputing as to his fo The Fez are thre-doctors, who sit in the street which joins the Old Town

For this rough and roady cure, which he allows to be attended in some cases with good results, Dr. Rohlfs substituted what he called the "cold fine," en-nar-bird, or hunar caustic, with such success that his colleagues began to threaten mischief, and he had to give out that his stock of cold five was exhausted. Surgery is in a far more advanced state in Morecce than medicine, as our anthor had occasion to recognize with gratitude. His arm having Lorn all but cut off, and hanging by skin and muscle only, when he was rebbed and left shashed with many wounds by a rescally guide in the Dras casis, he himself, on recovering his senses, called for amputation. This being forbidden by Mahom-medan law, his saviours set and bound up the limb with cane aplints and a bandage of goatskin, smeared over with clay, which

muidly hardened, a thorough cure being the result.

Resides these particulars of his professional experience, Dr. Rohlfs's book abounds with incidents of Moorish life and manners, in addition to statistical facts and figures connected with the government, the political and social condition, and the financial resources of Morocco, which make it altogether the best summary of information concerning a country very little known.

HOURS IN A LIBRARY.

BOTH those who have and those who have not read Mr. Leslie Stephen's critical essays in their separate form will be glad to see them collected. In these days of works of tiction written at a speed necessarily reckless, and read as it were by flashes of lime-light, it is good to find a writer who has the power and the will to go deep into the productions of imaginative literature which require, as they deserve, real study, and who gives us in unblamished. English the impression made by such study upon in unblemmaked English the impression made by such study upon his mind. This the author of Hours in a Library has done. He begins with De Foe, and by a careful analysis arrives at the secret both of that author's wonderful power of making fiction at the same time so vivid and so matter-of-fact as to appear absolutely tran, and of the immense superiority of Robinson Crusse, in so far as regards popularity, over its writers other works. "To De Foe," says Mr. Stephen, "if we may imitate the language of the Arabian says Mr. Siephen, "if we may imitate the language of the Arabica Nights, was given a tengue to which no one could listen without believing every word that he uttered." Having paid this tribute to Boe's certainly great power in the line of making what have seem absolutely true, Mr. Stephen goes on this power as one might dissect a puzzle, how carefully and yet how simply the pieces are combined to produce the proper effect. When this is done, it appears that the favourite devices which the suther employed peers first to knit together a chain of evidence curreborative of his story, so artfully forged that in following up its links the reader

9 Moure in a Library. By Leelie Scephen. Smith, Alder, & Co. 1894.

ought to have known, and even now thou are not in any part in canvassing. When his reachers find him in his description of Government office. Inaccurate people, happily, are often a dull people, and to this rule Mr. Listado is the exception. It people are not listened to, and dull writers are not read, so it their inaccuracies do not get a wide circulation. What manner readers can they be who, when they come to a few pages of at talk as the following, do not either pitch the book across the roin a passion, or let it fall to the ground in a slumber?—

"But, mamma, that's precisely where you make the mistake," said

Besides this, the history of Robinson Crusor had in it some elements of autobiography; many of Crusoc's sufferings on the island represented the suthor's own sufferings in prison; and it is naturally and Flower class of mind should be at his best when a story a story a class of mind should be at his best when a story periences. Mr. Stephen's judgment of De Foe, that he was "a man of very powerful but very limited imagination, able to see certain aspects of things with extraordinary distinctness, but little able to rise above them," seems to hit the truth exactly. After De Foe comes Richardson, of whom Mr. Leslie Stephen has

already observed that, as De Foe's novels are simply history minus the facts, so Richardson's are a series of letters minus the correspondents. Perhaps the fact of these novels being narrated through the medium of correspondence must partly account for the small degree of attention bestowed upon them by readers nowadays. To persons accustomed to receive half a dozen letters every morning there is something appalling in the idea of a single one which tills several pages of print. Richardson attributed to his characters a power of letter-writing which was extravagant and inordinate even in his days; for, as Mr. Stephen points out, Miss Byron in three days covered no less than 96 pages. Mr. Stephen dwells upon the novelist's skill in the accumulation of small incident, in tilling in his story with the minuteness of a Dutch painter, and yet gradually facts, so Richardson's are a series of letters minus the correspondents. story with the minuteness of a Dutch painter, and yet gradually developing one central idea, as being a great source of his success. He points out also the feminine character of his mind, which, a necessary component of genius, was in him perhaps over-developed; and, analysing the character of Sir Charles Grandisor, that subdispute, that in spite of his pomp and ceremony we feel a certain affection for him. It is true, however, that it is hard to give credit for nustery over his passions to a man who has none. Just as Sir Charles's virtue is overlaid, so is Lovelace's villany. His wickedness is so continual, so vast, and also at times so purposeless, that one ceases to believe in its reality. Mr. Stephen finishes his notice by a fanciful process which yet has much truth in it, of building up an imaginary Richardson out of a great French novelist placed in Richardson's circumstances. At first sight nothing could be more unlike than a French writer of romance and the historian of Clarissa Harlowe; yet the author ingeniously succeeds in establishing a considerable resemblance.

Two essays which should be taken together follow this; the first on Pope as a moralist, the second on Mr. Elwin's edition of Pope. It is certainly a misfortune that Pope should be so little read and so purposeless, that one ceases to believe in its reality.

It is certainly a misfortune that Pope should be so little read and appreciated as he is at the present day. Yet there are lines of his which have passed into proverbs, quoted daily by men of education who have no idea to what source they, owe these convenient epigrams. It has come to pass that the poet who raised his voice with such striking effect against the march of dulness is now himself accused of that vice; but it is probable that those who make the charge know nothing of Popu's writings. Those who take the trouble to read the extracts which the author of Hours in a Library makes, and his comments upon them, will, it is to be hoped, be induced to take yet more trouble and find how well the will be repaid for it in reading some one of ropes worms in amendment of the trouble of editing Pope with the express purpose of depreciating him; that he dwells bitterly upon the faults which Pope really had, and manages to add to them a good many which he had not. Admirers of the poet will, kowever, find his reputation amply vindicated in Mr. Stephen's easey. It is with less pleasure that many people will read what is said of Sir Walter Scott. Even those who never read the novels of that master of romance yet retain a kind of dim reverance for his name and power. The process of pointing out the defects of an object, of worship is, like many useful processes, an unpleasant enc, especially to worshippera. In these days, too, one is thenkful to have something to worship, and one cannot help appreciant on the second hy a too curious criticians. Of cannot the estimate untermished by a too curious criticians. Of cannot that Scott's heroes were will be repaid for it in reading some one of Pope's works in its entirety. Mr. Stephen complains that Mr. Elwin seems to have

at Hawov his living in a concurb. But probable enough. But ar to say that the surround-entic for a romance"; that Hilda's ormation is really less poetical than Phobe aret. A slight exagreration of this would lead to cuon that a kitchen would make a better background than a court for the figure of Hamlet. Again, the writer does the Twice Told Tales but scant justice when he compares them to Brummell's failures. They have neither the full grace nor the full power of the arther's later and completer works; but they will be shought by his addirers to have lar greater interest than that which me the test of slopesses, of "illustrating his intellectual development." Mr. Stephen, speaking of Hawthorne's leveral development, and misty half-supernatural influences. lectual development." Mr. Stephon, speaking of Hawthorne's love of dim twilight phantoms and misty half-supernatural influences, gives a good description of his peculiar method, and contrasts his style with that of Edgar Poe:

gives a good description of his peculiar method, and contrasts his style with that of Edgar Poe:—

This special attitude of mind is probably easier to the American than to the English imagination. The craving for something substantial, whether in cookery or in poetry, was that which induced Hawthorne to keep John Bull rather at arm's length. We may trace the working of similar tendencies in other American, peculiarities. Spiritualism and its attendant superstitions are the gress and vulgar form of the same phase of thought as it occurs in men of highly-strong nerves but defective cultivation. Hawthorne always speaks of these modern goblins with the contempt they deserve, for they shocked his imagination as much as his reason; but he likes to play with fancies which are not altogether dissimilar, though his redined taste warms him that they become disgusting when grossly translated into tangible symbols. Meanerism, for example, plays an important part in the Blithedule Romance and the House of the Scient Gables, though judiciously softened and kept in the background. An example of the danger of such tendencies may be found in his countryman, Ligar Pee, who, with all his eccentricities, had a most unnistatable vein of genius. Pee is a kind of Mawthorne and deligious treasess. What is exposately fauctul and any in the genuine artist is replaced in his rival by an attempt to overpower us by dabblings in the charnel house and prurient appeals to our fears of the horribly revolting. After reading some of Poe's stories one feels a kind of check to one's medesty. We require some kind of spiritual ablution to cleanes our minds of his disgusting images; whi reas Hawthorne's pure and disgusting and generally succeed in throwing a harmonious colouring upon some objects in which we had previously falled to recognize the beautiful. To perform that duty effectually is perhaps the highest of artistic merits; and though we may complain of Hawthorne's colouring as too evanescent, its charm grows upon us the nore weastage that th

Seldom has a description been more happily hit off in a few words than that which we have here emphasized by italies.

There could hardly be a more strongly marked transition than from the delicate, refined, kindly play of Hawthorne's lancy to the hitterly cynical power of Balzac, who was quite as fanciful as Hawthorne, but fanciful in a very different way. Both lived and wrote in a kind of dreamland, but Balzac's dreams were nightmares. He created a world of his own, which he placed in Paris, and peopled with imaginary horrors and monsters to which he had the secret of imparting a terrible reality and life. He added a little, it may be, to this air of reality by introducing the same characters over and over again in his books, a babit which probably arese from his own complete belief in their existence:-

He did not so much invent characters and cituations as watch his imaginary world, and compile the memories of its celebrates. All English readers are acquainted with the little circle of clergy neu and wives who inimit the town of Barchester. Balgac had carried on the same device on a gignatic scale. He has peopled not a country town, but a metropolis. There is a whole society, with the members of which we are intimate, whose family secrets are revealed to us, and who drop in, as it were, in every novel of a long series, as if they were old triends.

And this intense belief in his own ereations cannot, we think, but save him altogether, as Mr. Stephen admits that it does in part, from the suspicion of trying to impress the reality of his characters upon his readers by resorting to De Foe's trick of throwing in superfluous bits of information concerning them. What De Foe did in a spirit of falsehood, Halzac seems to have done in a spirit of enthasissm. If it was a trick, certainly it was trouble thrown away, for so convinced are Halzac's readers of the truth of what he says that, as Mr. Stephen remarks, "Every one must sympathize with the English lady who is eaid to have written to Paris for the address of that most imposing physician Hosace Blanchon." With those of Raizac's performances which tend to extravegance the writer seems to have little sympathy. He twice stigmatizes the Histoire der Treize as "a ladierton malodmans." Malodramatic it certainly is in a sense, ladierton inclined to consider it terrible rather than ladicrous. The melodrama certainly rises to tragedy in the story of the English as the Language. The melodrama certainly rises to tragedy in the story of the And this intense belief in his own creations cannot, we think, but

y-apica ausion that the Constill

Ausion that the Comedian intensely powerful, but is not the highest alone represents a special phase of manners, particularly pleasant one." More than that, it was a manner one, and there is comfort to be found in this effection when one has shuddered over some of Balzac's herrors. The Quincey completes the series of Hours in a Library. The writer begins by a reference to the opium-eater's odd habits, or rather want of habits, in his life. One characteristic anecdote of him is that he wont once to stay for a night with Christopher North, and stopped a year. This was after he had taken to opium accounts and those of others, he seems to have been a strange morbid creature, little fitted to battle with the world as it is. Mr. Stephen's essay is occupied in great part with discussing De Quincey's claim to a super-eminent mastery of the English lan-Quincey's claim to a super-eminent mastery of the English lan-guage, and he certainly disputes that claim with great success, although he fully admits the wonderful music and beautiful cadence of De Quincey's prose. That prose ought to be onli-ployed as a musical instrument is with a great deal of reason denied. Yet its employment in that manner lod to a great deal of beautiful writing by De Quincey, and by one author who has in beautiful writing by De Quincey, and by one author who has in that respect followed in De Quincey's tracks—Mr. Disraoli. In Contarini Fleming, especially, the capabilities of prose are turned to a most musical use; and there is one passage in that book wherein the author, speaking in the character of Contarini, and it may be presumed in his own also, distinctly asserts that prosperly handled may become yet more forcible and numerical than properly. Mr. Strathau assails De Character assails and a market as a later than prosect. property named may become yet more foreing and musical than poetry. Mr. Stephen assails Do Quincey's reputation as a humourist and a logician as mercilessly as he does the position which Mr. Elwin assumes with regard to Pope. This no doubt will be a blow to violent admirers of Do Quincey, though not so pread one as the too contemptions sentence with which Mr. Stephen concludes. Destinant of martingles without and that Partisans of particular authors will find plenty to concludes. rouse their defensive valour in Hours in a Library; they find plenty worth attending to. The book contains much acute and thoughtful writing, and not a little of a yet rarer quality-

CLARKE'S MEDICAL RECOLLECTIONS.

MR. CLARKE introduces his "Autobiographical Recollec-IVI tions" by a modest preface, in which he disclaims any literary merit for the papers thus reprinted from the Medical Times and Gazette. He has, he says, preferred the "discursive and gossiping style" to the "more elaborate and ornamental." We have no doubt that his preference was quite right, and we could wish that it were shared by a larger number of writers. The more simple the style the better it is litted for the conveyance of personal gossip. Neither is it true, as Mr. Clarke seems to essume, that a simple style implies the absence of literary merit. We do not think that his pages would be improved in a literary or any other sense by being starched and stiffened into respectability. He can tell an anerdote or describe a character with prost liveliness, and it is probable that he would only have speciff his book by reas, and it is protested that he would only have spoint he book by translating it into newspaper English. As it stands, it is a pleasant collection of incidental remarks about the medical celebrities of the last half-century which will be annising to outsiders, though perhaps more specially suited to members of his own profession. We are unable to say how far to members of his own profession. We are unable to say how far the aneedotes have the merit—perhaps a questionable merit regard to aneedotes—of servile fidelity to facts. Here sand there we suspect that Mr. Clarke might be caught tripping. We may remark, for example, that it is hardly possible that filipion should have dedicated the Deline and Full to the "Butcher" Dake of Cumberland, and that the "liliterate old regue" should have said to the historian, on receiving his seventh volume, "What, another demund, him source, hade. Mr. Cibber ?"—insample here the to the historian, on receiving his seconth volume, "What, another danned big squere book, Mr. Gibbon?"—inassuch as the "Butcher" died eleven years before the publication of the first volume. Another familiar anecdote which Mr. Clarke recounts from a familiar work offers a curious example of the way in which such stories grow. When Dr. Johnson was haunted with his belief in ghosts, says Mr. Clarke, he declared that he had seen the apparition of old Cave, and, on being asked to describe "the appearance of the apparition," said that it was a shadowy being. The story, as it stands in Boswell, is the shadowy being. While the meaning of a modern superstition, he is the shadowy giving an illustration of the mode in which the meaning of a modern superstition, he is the said the superstitions is manufactured.

superstitions is manufactured.

For the most part, however, Mr. Clarke confines himself to matters with which he was personally familiar, and there we have no reason—except a general incredulity as to the truth of annualing stories—for doubting his accuracy. Mr. Clarke was for many years connected with the Lancet, and he has much to tell of the war-

^{*} Mitableprophical Recollections of the Medical Profession. By. J. R. Churchill. 1874.

Sir Henry, however, was married to a young wife who keeps all favour. He dies, and there is some fear that his 12,000 a year that if we remember rightly, is the sum he can will away will tor, which have the Haughton family altogether. This would in itself tor, which have the Haughton family altogether. This would in itself the haughton family altogether. This would in itself the masterial not merely for a two-volume, but feasions. In the new house, had only Hugh been as virtuous as ments which are of a supported a property almost demanded that everybody knows some fations and the stage we saw that he educated men have heard much fitted in the stage we saw that he educated men have heard much fitted in the stage we saw that he educated men have heard much fitted in the stage we saw that he educated men have heard much fitted in the stage we saw that he educated men have heard much fitted in the stage we saw that he educated men have heard much fitted in the stage we saw that he educated men have heard much fitted in the stage we saw that he educated men have heard much fitted in the same heard much fitted in the opinion of a bar meas, the history white teeth when-the early Tractarians, or about Essayists and shift in same heard much fitted in the possible of a bar meas, the history white teeth when-the early Tractarians, or about Essayists and shift in the outside world of their own. They quarrel at times with all the bitterness of scientific disputants. They sometimes manage, like all other people, to wash their dirty linen in public; and call in the outside world to sit in judgment upon some case in which a patient has died under the knife, or a same man been locked up in a madhouse. But such scandals are fortunately rare; and under other circumstances we are apt to regard a doctor as something to be brought out in case of emergency, and to be thought about as little as possible on all other occasions. We are glad to know that scalpels and medicines exist in the world somewhere, but the associations which they

if they think the selection promising.

Mr. Clarke was born at Olney, and has an anecdote or two of no great importance to relate of Cowper. He was sent to school in Walworth, a district now covered with bricks and mortar. At that period, however, it was still almost country; and one lucky day one of the masters whilst walking through the grounds found a cuckoo in a hedge-sparrow's nest. The fact was noticed in the papers; and it is a striking proof of the intelligence of the ordinary British parent that the number of scholars was consequently British parent that the number of scholars was consequently doubled in a single year. The process of reasoning by which a man convinces himself that his son ought to go to a school because a cuckoo has been found in a nest on the grounds might repay investigation if we had space for the inquiry. Mr. Clarke afterwards went through the usual course of training, and gives us an anusing account of some of his teachers. The medical student of those days belonged to the class which is happily becoming traditional. Mr. Olarke describes how Dermott, lecturer at the Germand Street School of Anatomy, used to begin his lectures annually begins because the manufacturally begins to be a superficient of the second annunctually, having frequently to wait for the entrance of a noisy body of students singing "See the Conquering Hero comes," and displaying the knockers and other sports of the past night. Dermott, we are assured, always insisted upon strict decorum after these young gentlemen had arrived; but he often invited his class to drink punch at his own house, and used to inform them that, if any of them were intercepted on the way home, he always made it a point to sit up in order to be ready to give bail. "Unfortunately," adds Mr. Clarke, "this promise required to be often acted upon, and it is to the honour of Dermott that he never failed to fulfil it." Another lecturer was in the habit of eking out his time Another lecturer was in the habit of eking out his time by an ingenious expedient which may be useful to professors. After recounting the circumstances of a case at the hospital, he took a list from his pocket and read the names of a hundred and fifty students who had attended his practice. Such a host of witnesses, he said, proved that his treatment must have been correct. In spite, however, of these little failings, Mr. Clarke tells us that both these professors were competent teachers of the art. Soon after entering the profession Mr. Olarke became reporter for the Lancet. At that time Wakley was the editor, and imitated the slashing style of his friend Cobbett. The language used was brutal in the extreme. Wakley was in the habit of giving to his enemies such nicknames Waldey was in the habit of giving to his enemies such nicknames as "owl," "cocksparrow," and "oyster," and employing "adjectives of the most offensive kind." Some years before Mr. Clarke's connexion with the paper the abusiveness of the Lancet had led to the once celebrated trial of Cooper v. Wakley, the defendant having charged Mr. Bransby Cooper with the grossest mismanagement of a serious operation, resulting in the death of the patient. The illfeeling thus caused was minous to two or three of the people conarned; and Mr. Clarke had naturally a good deal of jeniousy to accome when he appeared as representative of the obnoxious forcome when he appeared as representative of the obnexious mal. Gradually, however, he overcame the objection; and he may tells the story of the various quarrels of those days with perfect impartiality and good feeling. On one occasion his duties brought him into serious trouble. He had written a report tending to show the gross incompetence of the senior consulting-surgeon of the Westminster Hospital. The surgeon returted by an address to the students, advising them, in case of the reappearance of the obnexious reporter, to drive him from the hospital with "large sticks," but not to do him "much bedily harm." Mr. Clarke, however, attended a meeting of the governors of the hospital a few days later, when he was attacked in the hall by a body of students. One of them soized and tried to throw him ones the hospital but Mr. Clarke, having in his hand a small umbedle with the parale, judiciously gave his antagonist a thrust in the same parale, judiciously gave his antagonist a thrust in the same contents. ought to have known, and even now they are not like any part in canvassing. When his deders find him control in accurate, they may well mistrust him in his description of Government office. Inaccurate people, happily, are office and dull people, and to this rule Mr. Listado is an exception. Bull people are not listened to, and dull writers are not read, accident their inaccuracies do not get a wide circulation. What manner is readers can they be who, when they come to a few pages of such talk as the following, do not either pitch the book across the room in a passion, or let it fall to the ground in a slumber?—

"But, mamms, that's precisely where you make the mistake," side the work of you set far too high a value on our knowing Hagh. You that they has never called."

BABINGTON'S HISTORY OF ST. JOHN'S COLLEGE CHAPEL.

WE gave some account of the changes which had been made in St. John's College, and of the discoveries which were brought to light in the course of them, when Professor Babington put forth his first account of those discoveries in the Transactions of the Cambridge Antiquarian Society. He has now worked up the history, including the matter of his former papers, into a small illustrated volume. We have now a fuller record of a very remarkable set of changes, not the least remarkable as showing how it often happens that the history of a building cannot be fully made out till its history has come to an end. Had it not been thought necessary to pull down and rebuild the chapel of St. John's College, the exact course of the changes which had so transformed the chapel itself and the neighbouring infirmary would never have been brought to light.

been brought to light.

Professor Babington begins by setting himsel/ to answer the question, "Why has St. John's College built a new chapel in a style two centuries older than the college itself?" His argument is that the old chapel, strangely transformed as it was, was still essentially a building of the earlier date, and that the present college, though in its present shape dating only from a charter of 1511, is to be looked on as continuing the earlier foundations which occupied the same site. "It is," he says, "as completely a continuation of the much older community which went by the name of the Hospital of St. John the Evangelist, as our present nunicipal corporations of those which existed in the middle ages, for they have been several times dissolved and reimographically yet their continuity is never disputed." There is leavener this difference, that, greatly as the form of a municipal corporation may change, the objects which it at least profiles we always the same, much more nearly the same than the objects pro-

History of the Inglituncy and Chapte of the Mounted and College of St. Juliu the American at Combridge. By Chapter Guidale Bablington, M.A., F.R.S., F.S.A. Combridge: Delghium & On. Loudon: Bell & Sons. 1874.

thou hast no business between Merton College, and between Merton College, All Souls, and Magdalen, whose to speak, central and western at once; the adjuncts to it on each aide have externally the form, but not the proportion, of transepts, and inside there is something strenge in what seems to seed hardly my the two arches and their pillar seems to seed hardly my the two arches and their pillar seems to see hardly my the two arches and their pillar seems to see hardly my the two arches and their pillar seems to see hardly my the two arches and their pillar seems to see there is something like it both at ach same and the proportion of ideas, or at least an attempt to do two things at once to reconcile the arrangements of the basilics and of the central dome. If a college wants a bell tower, surely the detached campanile, as at New College and Magdalen, is the right thing. There is room for one at Cambridge also. St. John's has lost its chance, but a tower placed at some well-chosen point to group with the matchless chapel of King's College—placed therefore, as at Magdalen, not in a direction exactly parallel with the chapel—is a thing for which Cambridge has been waiting for four hundred years.

four hundred years.

But though Professor Babington begins with a slight discussion of this point as to the style of the present chapel, his real business is with the history of the buildings which went before it, a history which he has now put into a complete shape. The foundation, as we have said, which has occupied this site for more than seven hundred years, has changed its nature several times, and the principal changes involved a reconstruction of the building. The first foundation in the twelfth century was for a purpose purely charitable; naither friars nor scholars were, or indeed could be, thought of. It was a hospital for poor and infirm persons, and as soon as it was able to raise for itself a stone building in the last years of the twelfth century, that building took the shape of one of those hospitals the surviving examples of which at Chichester and elsewhere are such a constant pusile to those who do not grasp the principle of the ancient arrangements. The old or sickly inmates live under one roof in a long building opening into a chapel at the sast end, so that they can attend divine service without going out of doors, and indeed, if need be, without leaving their beds. This original building survived till the building of the new chapel, which occupies part of its site. But, having been turned into a stable in the course of the sixteenth century, it was so changed and disfigured that its real nature was not understood, though a tradition half accurate, half inaccurate, called it the old chapel. It was not till it began to be pulled down to make way for the new chapel that its real purpose and the way in which it had been attested were clearly brought to light. Meanwhile, not long after this original building, a body of Austin friars was placed in the hospital for the purpose of looking after the sick and old people, and to them, about 1280, Bishop Hugh of Balaham added a third element in the form of secular scholars studying in the still young University. This incongranous union of poor and sic

PRINCE SEREBRENNI.

Alexis Tolstoy to write the historical romance known in Russia as Kniaz Serebreny, and Princess Galitzine (Marchioness Incontri) to translate it for the benefit of English readers. But there can be as little doubt that the period of Russian history with which it deals is precisely that of which Russian patriotism most discreetly to conceal from foreign eyes. It happens to be a period about which an exceptional amount of information has been contributed by English pens; in forming their opinious respecting it Russian historians have been to a great extent indebted to the narrative of one of the English seys-witnesses of the horrors by which it was marked. So gloomy a tale of tortures and executions as Sir Jerome Horsey revealed in the record of his travels cannot have failed to convey to English minds a most unfavourable idea of the far-off land the ruler of which so unsuccessfully attempted to obtain the hand, first of Queen Elizabeth, and then of Lady Mary Hastings. And it is probable that the abourd ideas of Russian barbarism which are still to some extent prevalent among us may be based on the just indignation which must have been excited in England, during the second half of the sixteenth century, by the recitals of the crimes to which Ivan IV. owes his designation of "The-Terrible." With the exception of the sanais of the Spanish Inquisition, there probably exists no such sickening record of cold-blooded atrocity as the history of the reign of that regal sevage. It may be well for a philosophical Russian author—outs who wishes to point the moral that the abounce power of an individual, utterly uncontrolled by fixed laws, is dangerous to Stats—to dwell upon the ruin to which Russia as Russian merits are concerned, a more agreeable story might readily have been found.

* Prince Serdrauni. By Count A. Tolstoy. Translated from the Rumbes by Princess Gallanian, a vols. London: Chapman & Hall. 1874.

Sir Henry, however, was married to a young wife who keeps all his relatives away from him, and gets him to make a will in her favour. He dies, and there is some fear that his 12,000l. a year that, if we remember rightly, is the sum he can will away will say part in canvassing. When the readers had him any part in canvassing. When the readers had him the part in canvassing. When the readers had him the part in canvassing. When the readers had him the part in canvassing. When that, if we remember rightly, is the sum he can will away will the first rightly, is the sum he can will away will the Haughton family altogether. This would in itself that, we here his may anovel, had only Hugh been as virtuous as a hope had not morely for a two-volume, but had not have may anovel, had only Hugh been as virtuous as a property almost described in the sum of his may anovel had only Hugh been as virtuous as a property almost described in the sum of the s high me, may movel, had only Hugh been as virtuous as highich are of a high cations and some the stage we saw that he except under 12 some mankind, as we in the one respects and to a miling shows measoning obedience to the bloodthirm high him attacking a party of marauders belonging to the other mankind, and refusing to believe that they enjoy his beloved mond confidence. He has been away for years from his native land, and the sovereign whom he left gracious and sensible, but who has become in the meanwhile a merciless madman. And so, when he is in the meanwhile a merciless madman. And so, when he is enjoying an idyllic scene of pastoral life, gazing at the young men and maidens who are moving in the mazy measures of a rustic dance, and listening to its accompanying song, during the pauses of which his soul is cheered by the laughter of rustic innocence and the cooling of the plentsous village pigeons, his heart suddenly becomes hot within him on the mirth of the virtuous peasantry being interrupted by a party of "Apritchniki," or Muscovite Practorians, who begin to carry off girls, and slash boys, and hang up old people. So he falls upon the intruders with his armed followers, and thus gives rise to an hostility which pursues him through

the rest of the story.

This opening scene is marked by many improbabilities, and the presence of similar obstacles to stage illusion makes itself unpleasantly perceptible throughout. But a novelist who deals with a remote and unfamiliar period has to grapple with many difficulties, and perhaps we ought rather to be grateful to him for what he has achieved than to call him to account for his shortcomings. There are several passages in the present story which are spirited and true to nature, and it is a more agreeable task to point them out than to criticise others in which the artist has failed in his attempt. Among the former may be classed the picture drawn by Count Tolatoy of the village of Alexandrova, the abode chosen by the Ozar after his madness had grown upon him, when he fled from his capital to live among the infamous agents of his crimes, solacing himself partly by assisting at religious services, partly by watching the prolonged agences or the death-threes of his numerous victims. We are shown the royal residence, separated from ous victims. We are shown the royal residence, separated from the other dwellings by a deep moat, covered from top to bottom by "gold, silver, and many-coloured tiles," and crowned by a bevy of dazzling cupolas. We see the courtyard filled with crowds of beggars "praying loudly, singing psalms, and showing their disgusting sores," while in striking contrast with them appear the Can's dissolute soldiery, clad in "gold and silver tissue, or velvet embroidered with pearls and precious stones." And then we are introduced into the great handucting-hall, where covers are laid introduced into the great banqueting-hall, where covers are laid for six hundred guests, and we see Ivan the Terrible slowly enter and take his seat in the royal armchair curved and adorned with pearl and diamond tassels. Then "about two hundred golden dishes with reasted swans" are brought in, followed by 300 similarly-treated peacocks, and the majestic banquet begins. A manhary traces a peace of the royal manifest abode, taken at the time when, as Count Tolstoy remarks, "Darknoss came over the village. The moon rose behind the wood. The gloomy palace looked ghost-like with its numerous cupolas. It resembled some enormous monster coiled up and ready for a spring. One window alone was lit, and resembled the eye of the moneter."

The best scene in the book is that in which two of those "brigands" who often played an important part in old Russian history, members of the marauding bands into which the cruelty of the monarch and his agents drove so many desparate men, find their way into the Czar's bedroom under the disguise of blind storytellers, and attempt to steal the keys of the dungeon in which Prince Nikita Romanovitch is immured. As the strangers manneder on with their holy legends and their takes about the Estrail-bird, and the beast Indra, and the stone Alatire, the Estrail-bird, and the beast Indra, and the stone Alatire, the Char's terrible ages close in feigned slumber, and the hands of his diagnised visiting draw nearer to the spot where the keys hang at his bed-head, while through the window shines the lurid glare of the burning buildings which their associates have fired. Suddenly, just as one of the robbersés about to remove the keys, the Czar opens his eyes and meets the tell-take glance of the pretended alliad meet. Up aprings the terrible monarch in his wrath, and falls the detected impostor, whose companion effects his escape through the window into the night.

Another striking episode is that of the fight between a party of of the monarch and his agents drove so many desperate me

through the window into the night.

Another striking episode is that of the fight between a party of trigands and a roving band of Tartars. The actual fighting is not interested by described, but the landscape before and after the picturesquely rendered. Still life suits Count Taltare, the best; his figures are more in drawing while in repeat than in action. Thus the wide plain is successfully desicted as it appeared just before the struggle, dotted with camplions round which ait groups of Tartare, their long appears

in a passion, or let it fall to the ground in a slumber?

"But, mamma, that's precisely where you make the mistake," said the state of the state of

the novelist's by no means exuberant imagination, it is a relief to return to the marked personality and vigorous vices of the historic Czar. And so, by way of concluding our notice of Count Tolstoy's well-meaning and elaborate attempt to illustrate in mosaic-work which he represents the Czar in his bedroom, tornented by the recollection of his crimes, perhaps by the effects of a roasted swan or poscock. We are shown the room lighted only by the lamps burning before the sacred images, and the moonbeams falling on the many-coloured tiles composing the low stove. A cricket chirps shrilly; a mouse is grawing the wainscot. Presently the Carrawakes with a start. The floor seems to open, and before his terrified eyes appears an old noble whom he has recently poisoned, gazing eyes appears an old noble whom he has recently poisoned, gazing at him with fixed eyes, uttering words of terrible accusation. The apparition vanishes, but after it follows a long train of shadowy forms, "monks, aged hermits, and nuns, all in black robes, and covered with blood,"warriors souned by fearful wounds inflicted by the Czar's executioners, "young girls with torn garments, and mothers holding babes in their arms," until the room seems "crowded with ghosts," and the monarch appears to be likely to take leave of the few vestiges of wits which his dissolute life has left him. The dead seem "to shrick and to hover round the Czar, like autumn leaves driven about by the wind." The rain falls in torrents, the wind howls, the ghosts gibber, and the Czar hears in fancy the last trump sounding, and a gibber, and the Czar hears in fancy the last trump sounding, and a voice summoning him before the judgment-seat of God. With a wild abriek he rouses his servants. The bell is rung for matine, wild shrick he rouses his servants. The bell is rung for matine, and in a few moments the church is filled with a most unrighteous congregation of ribald soldiers, in the midst of whom kneels their mad master, pireously praying to heaven for mercy, and beating his head against the stone floor. Far away into the darkness streams the sound of these nocturnal devotions, waking up captives in gloomy dungeous, whose chains rattle as they remark that the Czar is saying his prayers and hope that they will do him good, and startling little children, whose not unnatural howls are not silenced until their mothers threaten them with the ven-geance of this tragic drama's First Murderer.

OWENS COLLEGE ESSAYS.

THE volume before us is another specimen of the application of the co-operative principle to literature, almosty examplified some well-known cases. The book, however, differs from most its predecessors in that the bond of union is supplied, not by conmunity of subject or sentiment, but by the community of positions of the community of t munity of subject or sentiment, but by the congaunity of position its authors. Owen College at Manchester has lately conthe possession of new buildings, erected at an expense of co.,cool, and is making presseworthy efforts to extend the of its utility. It has an able staff of pressuors, who have bined in this volume to give some sample of their various ments. It is therefore to be backened as a merit that the so are highly miscellaneous, and indeed treat more or less direct most branches of halves howevers a moreograph, who is the formal to the contract of the contrac Professor of Greek, opens by some appropriate remarks on the advantages of a comprehensive culture. Professor Roscoe follows in an interesting paper on "Original Research as a Musat "V" cation." Two Professors of Natural Philosophy give a V"

applies an other publication meeting. He may possibly get which supervenes upon attention meeting. He may possibly get resistion meeting. He may possibly get ween the solar system and the English rail-almud. But we need hardly say that a little care will obviate this difficulty; and there is, on the other hand, the advantage that each contributor deals with topics upon which he can speak with some authority. The Ecoursy meets of the articles very widely; but none the price of them illustrate Professor Rescores theories as to the beneficial influence of original research; and we may perhaps fancy that a band of professors, thus appearing in all the dignity of their official character, may be a little afraid of risking their character by novelties. The articles, however, show that the views impressed by the Principal as to the importance of a sufficiently wide culture may be fairly carried out in the institution over which he presides. If the students at Owens College do not distinguish themselves in many departments of inquiry, it is not for want of competent guides. It is, however, difficult to give any fair opinion of such a book, because the critic, unless he were a whole staff of professors rolled into one, could hardly be qualified to speak adequately of its contents. We may perhaps venture to say that, for the general reader who has the happy impartiality of ignorance, the most interesting essays will probably be those upon the Psace of Europe. Professor Bryce, though he shows his usual clearness and vigour, discusses a subject which cannot well be made interesting to others than lawyers; and one or two of the scientific essays, which are otherwise excellent, are addressed to a still smaller number of readers. Without attempting to deal with the other essays, we will vonture to make a few remarks upon the able contribution of Professor Ward.

Many philosophers have discussed the means by which universal peace was to be introduced into the world. The zealous advocates of the Franch Revolution in its first period generally declared their belief that the revelation of the new reign of reason was deatined to put a final stop to wars; inasmuch as they were the product of the selfishness and stupidity of kings and aristocrats. These expectations were not precisely realized. It is not, however, many years since Mr. Buckle demonstrated in the most conclusive manner that the warlike spirit was decaying, and that the time was rapidly approaching for the conversion of swords into ploughshares. Just at the present moment there seems to be some excuse for scepticism as to the accuracy of his reasoning. The Peace Society, however, is not altogether discouraged, and it continues to make speeches and pass resolutions which imply a hope that a system of arbitration will before long supersede the appeal to physical force. Anybody who expresses a doubt as to the efficacy of the plan is regarded by these amiable enthusiasts as a cynic who despairs of the progress of his race. No argument is very likely to convince them, but it is a pity to see so much zeal for the good of the race thrown away for want of a little appreciation of the true studitions of the problem. It may do them good to study the basic but able historical sketch in which Professor Ward traces the working of the political expedients hitherto adopted. The main purpose of his easely is to show the true nature of the "balance of power" theory, now generally described as an obsolete fallacy, and yet, according to Professor Ward, the balance of power theory during the pariod of its vitality had a decided tendency to make wars "less frequent, less protracted, less extended, and less execution in their issue than they would otherwise have been." The statement of the eighteenth century in desiring to preserve the balance of the metalous to combine against the aggressive tendencies of any preponderating Power. T

their fear of each other. The conditions of monarchy, aristocracy, and democracy were to be so judiciously mixed that each might neutralize the inflaence of the two other constituent parts. The theory as applied to independent governments was certainly mover rational than as applied to a single organization; for absolute independence might be desirable in the first case, though, if fully carried out in the second, it could only be equivalent to anarchy. But both theories were natural in a period of political stagnation. When everybody was pretty well content with standing still, a creed which regarded equilibrium instead of development as the highest ideal expressed people's natural sentiments. Of course it broke ap as soon as the revolutionary impulse made one part of the nation really anxious to after the distribution of power. In like manner, the theory of the balance of power worked admirably so long as general politics were not disturbed by any strong passions, but it collapsed as soon as people really had semething to fight for. In an epoch, that is, of stagnation it afforded a convenient pretext for preserving the peace; but it had no vital power in it calculated to restrain any vehement popular impulse. We should therefore regard the balance of power doctrine more as a result, and loss as a cause, than Professor Ward seems inclined to do. The various treaties in which it was more or less embodied acted very well, as arbitration acts very well, so long as the parties to the bargain were sincerely anxious to avoid fighting; but they became so much waste paper as soon as any stronger motives came into play. We cannot therefore attribute much importance to this particular dogma, though we quite agree with Professor Ward's view of the judiciousness of the policy which it was invoked to sanction. It was perfectly right that England and Holland should be jealous of France under Louis XIV, and if they liked to describe the jealousy france under Louis XIV, and if they like to describe the jealousy under the name

BOSWELL.

I N our recent review of Bosselliana we were forced by the length which our notice of the Memoir and Annotations had already reached to put off to another occasion any consideration of the anecdotes themselves. "There is some mystery," says Lord Houghton in his Introductory Remarks to the volume, "in the insertion of certain occasional Johnsoniana which could hardly have found their way into this collection if Hossell had at the time been keeping special memorands of his great Oracle. They are not very numerous nor consecutive, nor do they imply that if the time they were taken down they were intended as portions of the magnum opiss." Lord Houghton is exceely correct when he says that the anecdotes that are common to both hocks are not consecutive. They are not indeed numerally, but, if we are not mietaken, at least half of them belong to the first ten weeks of Boswell's acquaintance with Johnson. At this time Boswell was "keeping special memoralds of his great Oracle." He mentions indeed, as Lord Houghton should have sumembered, in describing his return with Johnson from Granwalls by sight on the river, in July 1763, at the end of the ten sealing that he was the more sensible of the coldness of the sealing that he was the more sensible of the coldness and unfilter in his journal what he thought worthy of preservations.

Baing disappointed in my hopes of meeting Johnson, so that I could hear none of his admirable sayings, I shall components for this want by inserting a collection of them, for which I am indebted to my worthy friend Mr. Langton. Very few articles of this collection were committed to writing by himself, he not having that habit. I however found, in conversation with him, that a good store of Johnsoniana was treasured in his mind. The authenticity of every article is unquestionable. For the expression I, who wrote them down in his presence, am partly answerable.

It is quite clear from this that Boswell had, to use his own word, "Johnsonised" the stories with which Mr. Langton supplied him. His friend gave him the substance of what Johnson had said, and Boswell then gave it a Johnsonian turn. So Johnson himself in his early life had given an oratorical turn to the notes of the Parliamentary debates that had been taken down for him by Chathala. Tohnson as doubt over at his first start made a few Guthrie. Johnson no doubt, even at his first start, made a far greater change than ever Boswell did, for he could have supplied, and supplied with success, the greatest speakers, not only with words, but also with facts and arguments. Now Boswell, with all his great merits, was utterly incapable of imitating Johnson in the substance of what he said. Of that neither he was capable, nor was Garrick, or Goldsmith, or Reynolds, or Burke. As Gerald Hamilton said on Johnson's death, "He has made a chasm, which not only nothing can fill up, but which nothing has a tendency to fill up. Johnson is dead. Let us go to the next best. There is nobody; no man can be said to put you in mind of Johnson." But yet, just as Garrick, with his little body, could in a most ludicrous way take off Johnson's huge frame, so Boswell had, we have little doubt, a considerable power of taking off his style. He did not, we believe, trust solely to his memory, tenacious though It was, when he was reproducing Johnson's conversation. If his memory did not preserve the exact words, he would draw on his imagination for them. If we are justified in assuming that the stories given in the present collection, that are common to both books, were recorded in the Boswelliana at the time they were books, were recorded in the Boswelliana at the time they were heard, then we have clear proof that Boswell to a certain degree changed the sayings of Johnson which he had collected. We have a remarkable instance of this in the two following stories from Romelliana:

Mr. Sheridan, though a man of knowledge and parts, was a little fancifull (sic) in his projects for establishing oratory and altering the mode of British education. "Mr. Samuel Johnson," said Sherry, "cannot abide me, for I allways (sic) ask him, Pray sir, what do you propose to do?" (From Mr. Johnson.)

Dr. Rogers, by the way, has made a rather material mistake in his punctuation of this passage. Of course it should have run:—
"Mr. Samuel Johnson said, 'Sherry cannot," &c. The second anecdote is as follows :-

Boswell was talking to Mr. Samuel Johnson of Mr. Sheridan's enthusiasm for the advancement of eloquence. "Sir," said Mr. Johnson, "it won't do. He cannot carry through his scheme. He is like a man attempting to stride the English Channel. 'Sir, the cause bears no proportion to the effect. It is setting up a condle at Whitschapel to give light at Westminster."

Now there is good internal evidence that these two anecdotes, as well as all the realist once were accorded at the sime that

well as all the earlier ones, were recorded at the time they were heard. For in every one of them Boswell calls his friend, Mr. Samuel Johnson, and not Dr. Johnson or Johnson. Boswell was Johnson was complimented by the University of Dublin with the degree of Doctor of Laws, and Boswell, in the Life, writes:—"I returned to London in February, and found Dr. Johnson in a good returned to London in February, and found Dr. Johnson in a good house in Johnson's Court." In none of the later anecdotes of Displaines do we find "Mr. Samuel Johnson." In the Life, however, these two stories about Mr. Sheridan are not only run into one, but they are also not a little altered. Board writes:—

He'now added, "Sheridan cannot bear me. I bring his declaration to a point. I ask him a plain question, 'What do you mean to teach a baddes, eir, what influence can Mr. Sheridan have men the language of this great, country by his narrow exertions,? Sir, it is heighing a farthing at Elever Winbow light at Calaia."

ought to have known, and even now the are not the are not the are not the any part in carvassing. When the readers find him in his descriptions downment office. Inaccurate people, happily, are often down the people are not listened to, and dull writers are not read, and their inaccuracies do not get a wind simulation. people are not hatened to, and dun writers are not read, must their inaccuracies do not get a wide circulation. What manner of readers can they be who, when they come to a few pages of such talk as the following, do not either pitch the book across the room in a passion, or let it fall to the ground in a slumber?

knows I despise his chake rode away comforted by oratory," but, though "old Mr. Sheril from the path of duty." came out, lloswell shows a certain kindled his heart, for he pressing the severer of the two saving has a severe of the two saving has a pressing the severer of the two saying bounds from the interest To return to the earlier anecdotes, Tourse animple but

To return to the earlier anecdotes, leave makingle but as to the date when they were reconges could more can have the following:—

Boswell asked Mr. Samuel Johnson what was he creatures of children first. "Why, sir," said he, "there is no man. "It is them first. It matters no more than which leg you put first into bretches (sic). Sir, you may stand disputing which you shall put in first but in the meantime your legs are bare. No matter which you put in first so that you put 'em both in, and then you have your bretches on. Sir while you think which of two things to teach a child first, another boy is the common course has learnt both." (I was present.)

This is thus given in the Life in a much more pithy form :-

We talked of the education of children; and I asked him what he thought was best to teach them first. Johnson. "Sir, it is no matter what you teach them first, any more than what leg you shall put into your breeches first. Sir, you may stand disputing which is best to put in the that in the meantime your breech is bare. Sir, while you are considerate which of two things you should teach your child first, another boy has learn them both."

If in Boswelliana we have the exact report of what Johnson or this occasion said, Boswell may surely claim some small degree or merit for the still more pointed way in which it is given in the

In reporting one of the numerous attacks which Johnson made or Ossian, Roswell in the Life considerably weakens its force. He says that "Dr. Blair asked Dr. Johnson whether he thought any man of a modern age could have written such poems? Johnson replied, 'Yes, sir, many men, many women, and many children.' In the Boswelliana the story is thus told:—

Doctor Blair asked him if he thought any man could describe these bar-barous manners so well if he had not lived at the time and seen them "Any man, sir," replied Mr. Johnson, "any man, woman, or child might have done it."

At the same time that he has weakened what Johnson said by changing "any" into "many," he has made it in another way a greater exauguration; for Johnson had not said (if are to trust to the authority of Bonoelliana) that any child could have written the poems, but that any child could have described the barbarous manners. One of Johnson's sayings is by no means clear as it is given in Boswelliana, though it is easy enough to understand it as given in

Mr. Samuel Johnson [we quote from Boswelliana] said that all sceptical innovators were vain men; and finding mankind allready (sic) in possession of truth, they found they could not gratify their vanity in supporting her, and so they have taken to error. Truth (said he) is a cow which will yield such people no more milk, and so they are gone to milk the bull.

We may be quite sure that Johnson did not make such a confu of images as this. If this is the only note Boswell retained of the conversation, he must have licked it into shape when he came to write his book; for in the Life we find it thus reported:—

"Hume, and other aceptical innovation, are vain men, and will gratify themselves at any expense. Truth will first afford sufficient food to their vanity; so they have betaken themselves to error. Truth, sir, is a new which will yield such people no more milk, and so they are gone-go milk the bull. If I could have allowed myself to gratify my vanity at the expense of truth, what fame might I have acquired."

There is another story which is certainly more pointed as given in the Life than as it thus stands in Boswelliens:—

Boswell told Mr. Samuel Johnson, that a gentleman of their acquaintunes maintained in public company that he could see no distinction between virtue and vice. "Sir," said Mr. Johnson, "does he intend that we should believe that he is lying, or that he is in earnest? If we think him a list, that is not honouring him very much. But if we think him in earnest, when he leaves our houses let us count our spoons."

How much better is this told in the Life :-

"Why, sir, if the follow does not think as he speaks, he is lying; at see not what honour he can propose to himself from having the characte a lier. But if he does really think their there is no distinction between and view, why, sir, which his heaves our heatens let us count

School Magazine or the Sixth Form Debating Society day to the question of exchanging Latin verse composition for the state of many precised utility the next things to expect is studies of more practical utility, the next thing to expect is a deputation to the "Governing Body," to be followed, after due importunity, by a measure of so-called reform which will seriously affect our scholarship and literature.

affect our scholarship and literature.

Hitherto our best scholars, critics, poets, and prose-writers have, more often than not, been able to point to eminence in this field. And that the day for it is not yet past is shown by the three fruits off an old and venerable tree which are now before us—three translations of well-loved English poems by scholars who represent the flower of the Cambridge prizelists of thirty years ago, and of whom, whilst all bear practical witness to the admirable training of classical schools, two owe their pre-eminence as verse-writers to the "fausta penetralia" of Shrewsbury. In speaking of these works it may be convenient to compare them with rival productions by Mr. Calverley and Lord Lyttelton—the former of somewhat later date at Cambridge than Mesars. Paley, Evans, and Munro; but the latter and Lord Lyttelton—the former of somewhat later date at Cambridge than Mesers. Paley, Evans, and Munro; but the latter nearly a contemporary, and one who there and since has well sustained the prestige of Eton scholarship. There is not one of the five who has not given sufficient proof of solid scholarship in the field of education or criticism; and it is unnecessary to cite the distinction of Mr. Paley and Mr. Munro as editors of classical works, in proof that their faculty of Latin verse, which a German professor would despise because it is beyond him. has not interfered with the production of more substanhim, has not interfered with the production of more substan-tial contributions to literature. But it may be worth while to draw attention to one or two indications in the choice specimens of Anglo-Latin verse now claiming our notice, that skill in translation is no isolated or casual gift, useless beyond its immediate purpose, but rather one requiring nice perception of the beauties of the English language, and calculated to improve that perception for the best purposes of criticism.

perception for the best purposes of criticism.

In some respects Mr. Taley's is the most interesting of the three pieces before us. With a scholar's instinct he has reprinted Lycides from the first edition of 1638, collated with the autograph copy in Trinity College Library, and this English text he has turned into Latin hexameters with as much closeness as seemed to him consistent with good the and poetic feeling. And he tells us in his preface that he has purposely executed his version without examining those of Calverley and Munro, one of whom had been before him over the whole ground, and the other over a part of it. There is internal evidence of this in more than one place. One or two niceties of Mr. Calverley's rendering would have laken strong hold, we should say, upon a rival who had allowed himself the advantage of a preliminary glance at his competitor's work. Where Milton speaks of the bark in which Edward King was lost (v. 100) as

Built in th' eclipse and rigg'd with carets dark-

Munro, M.A., they at Thinky Callege, Cambridge. Cambridge University Press. 1874.

o English lines (50 ... abvo Lycidas:-Ah me l I fo.. Had ye been there,

At "dream" in the original edition there is a n and Mr. Paley translates the text of Milton as he finds it:—

Hei mini! quid frustra fallentia somnia fingo?
Presentes quid suim faceretis tempore tali?
Ipsa suo mater potuit succurrere nato
Pieria, atque allos mulcentem carmine prolem
Tutari? illum omnia doluit natura peremptum,
Cum turba raptus strepitante fareque tumultu
Ora caputque cruentatum domitteret Hebro,
Hebrus et ipse ruens Lessi portaret ad oras.

There is no very marked difference here between Mr. Paley and Mr. Calverley, except that the latter is clearer in his expression of the Muse's interference on behalf of her "inchanting sonne":—

Numquid Pieris ipsa parens interfuit Orphst, Pieris ipsa suse sobolis, qui carmine rexit Corda virûm ?

But when we come to examine Mr. Munro's version of this passage, in Sabrine Corolla, it will be found that the text from which he translates has no stop or note of admiration at "dream" in v. 56, and that he translates upon the plausible supposition that the poet means to express his vain regrets at the absence of the nymphs:-

Ah me i I fondly dream "Had ye been there" . . .

It is cortain that there is no countenance to this emendation of the text in the original edition or in the autograph copy, yet it is worth while to see how felicitously the translation proceeds, on the hypothesis of such a reading :--

Hei mihi vos vana deceptus imagino fingo Presentes : quid en presentia vestra juvaret?
Musa quid ipaa, inquam, genetrix Orpheia juvit,
Quem doluit miserana Natura unversa peremptum,
Tempore quo thiasus pertericrepos ululatus
Ingeminana dedit ora Hebri velocibus undia,
Ora cruenta viri, portara ad litora Leebi.

In the absence of authority the temptation would be strong to adopt Mr. Munro's punctuation, or non-punctuation, in the first and second lines. With an eye, he pleads, to convenience of metre, but also, it would seem, with the mind of a botanist, Mr. Paley has so far taken a liberty with the translation of Milton's text as to bring v. 147, "With cowslips wan that hang the pensive head," into juxtaposition with "the rathe primrose that forsaken dies" of v. 142. No reader will need to be told that pinks, pansies, violets, and other flowers intervene in Milton's lines. The result of Mr. Paley's transposition is very satisfactory in translation:—

Huc veniat que nunc moritur deserta per agros Primula vere novo, parilique illa altera formă, Demissi capitis luctua imitata decentes,

Mr. Calverley keeps his cowalip ("acerbo flexile vultu Verbascum") at a respectable distance from the primrose, its cousin; but we note that both are led to a periphrasis for the "pansic freakt with jet" in the same passage. Having regard to the etymology of pansy, in the same passage. Having penase, Mr. Paley translates:-

Et folils carbone notata, Nomen habeas luctûs, et nominis simula sure ;

whilst his rival is equally ingenious in grouping 🔝

Primula ; quique ebeno distinctus centera flava Fice, es qui specie nomen detrectat aburnă.

Not to devote undue space to Lycides, though rendered by such competent hands, we shall but note that, whilst Mr. Culverley has the advantage of Mr. Paley in translating v. 187-

While the still morn went out with sandals gray Processit dum mans silens telaribus albis (C); Aurora ponente allentem in gramine plantam (P)-

and v. 55-

Nor yet where Deva spreads her wisurd stress Nec quos Deva losos magicis amplectitur undis (C); Magico sut ad figmina Deve (P)-

there are single lines so well as longer passages where the latter distinctly excels the former. In the passage (25-8) where the post

Sir Henry, however, was married to a young wife who keeps all his relatives away from him and gots him to make will in her fivor. It does not there is some fear that his 12 could a year of the Hangston family altogether. This would in face the first to have smooth, and material not merely for a two-volume, but a fine the first produce the material not merely for a two-volume, but a fine the first produce the material not merely for a two-volume, but a fine the first produce the material not merely for a two-volume, but a fine the first produce the material not merely for a two-volume, but a fine the first produce the material not merely for a two-volume, but a fine the first produce the

original. In another passage (57, 58) this is less dubious. It is there said of Paris that

White-breasted as a star Fronting the dawn he moved.

Mr. Evans translates this :-

Sistere candidor poetus sese ille farchat Obvius aurone,

connecting "fronting" with the hero, and not the star. Lord Lyttelton is as likely to be right in taking the opposite view,

where he renders

Illum mox albo pectors, ut atras Stella fugat penotrans adversa fronte tenchas, Vidi affulgentem

But, whichever way it may be decided, the case is one of nice interpretation, brought out by the touchstons of translation. Often the pretation, brought out by the touchstons of translation. Often the pretation of two run neck and neck, as where the one translates "the charm of married brows" (74) "superclinisque venuste fu dere junctus," and the other "Frontis ameenam juncturam", and sometimes Lord Lyttelton gets ahead of his rival, as when he turns "the golden has is libraredled." bee is lily-cradled "-

Inter ennabula florum Aurea dormit apus,

which is more simple and lucid than Mr. Evans's

Apia auroa ci seat Liliaque intus habent cas a clausani

The fault of Lord Lyttelton, however, is his tendency to curtail the English original in his translation—making, for instance (see 128—31), two Latin varies of four English; whereas Mr Evans, without being too expansive, adequately represents the text in his

Had we space we could cite, as a very fine bit of translation. Mr. Evans's version of Juno's profiers to Paris (108-117), or, better still, the less attractive tender of Pallas (142-8), to which ought to be added vv. 192-202 of Lord Lyttelton's version as a st-off But it is time to speak of what we regard as in many respects the most perfect of the three translations before us, certainly the hardest to match—namely, Mr. Munro's Grav's Flegy. Not long ago we noticed the Lord Chief Justice's version of this poem in Latin elegiacs, topether with Mr. Justice Benman's Greek version, and there is a very happy translation to be found in the Arabaines Comel by a scholar to whom Mr. Justice Benman and other lovers of the elegiac couplet owe their initiation. But candour bloomly own that Mr. Munro has distanced all rivals both in his the appreciation of the sense of his ariginal and his happy translationse of it into Latin numbers. As instance of this possess to as in the lines. to be added vv. 192-202 of Lord Lyttelton's version as a 4 t-off s to me in the lines.

his own opinion also in interpreting

GIRMAN LITTRATURE.

THE able and learned work of Professor von Holst on the constitution of the United States " might, from the title, be mistaken for a more theoretical disquisition. It is in fact a political history of the States since the attainment of their independence, from the point of view of the State Rights controversy pendence, from the point of view of the State Rights controversy alone, and hence neglecting everything that has no relation to this topic. As, however, this definition includes the subsidiary questions of slavery and the tariff, which from the strictly political point of view are chiefly interesting as branches of the State Rights problem, the work deals with the very marrow of the United States Instory, and is in no want of interesting and picturesque details. The first volume comes down to the termination of the "Nullification" controversy by the compromise of 1833. The first chapter contains the history of the events which preceded the definitive adoption of the Constitution, and the second is devoted to a criticism of that famous document from the point of view is indicated by the subject of the work. The author's point of view is indicated by the heading of the chapter, "Canonisation of the Constitution." He seems much of the opinion of the South Carolina senator who remarked that the peculiar beauty of the American Constitution consisted in the provision it contained for the impunity of rebellion—that acts which elsewhere would be treasonable were with it within the limits of the law. The accuracy of this observation implies the right of secession, which, if we rightly apprehend the course of Professor von Holst's as yet incomplete course of reasoning, he would hold to be as deas yet incomplete course of reasoning, he would hold to be as defensible under the letter of the law as practically incommissent with the conditions of national existence. The work has a distinct bear ing on German politics, and the writer's cast of thought is a ing on therman politics, and the writer's cast of thought is manifestly affected by his own country's sorrowful experience of the permiciousness of the federal system of government when abund to the paralysis of all central authority. This turn of thinking may have led him to undervalue the merits of a Constitution which has unquestionably inspired a veneration unparalleled in the history of written legislative documents, and has withstood strains which would have been fatal to any other institution. Something of this vitality may no doubt be ascribed to the English genius for legal fiction, which has enabled all parties to maintain with apparent good faith that their buterpretation represented the real spirit of the law. It must also be a side that this reversions, like most enduring influences on national life, is to a great extensional traditional, and may be compared with a Frenchment's devotion to "the principles of 1780," with the advantages like most enduring influences on national life, is to a great e traditional, and may be compared with a Frenchi devotion to "the principles of 1789," with the advantant it is much more definite and intelligible. It may that it is much more definite and intelligible. It may had to date from the triumph, during the last decade of last century, of those statesmen represented by Jefferson, fervently believed in the Constitution as the perfection of he reason, over those represented by Hamilton, whose tendenties secretly monarchical, and who had merely accepted it as a six This great contest forms the subject of Frofessor von Holef's chapter; the next three are devoted to as many minor unions the latery of America when the pretentions of individual. vith a Frenchish with the advanta
